**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56760 factory-installed functions include four A/D acquisition IP

modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56760 to operate as a complete turnkey solution without the need to develop any FPGA IP.

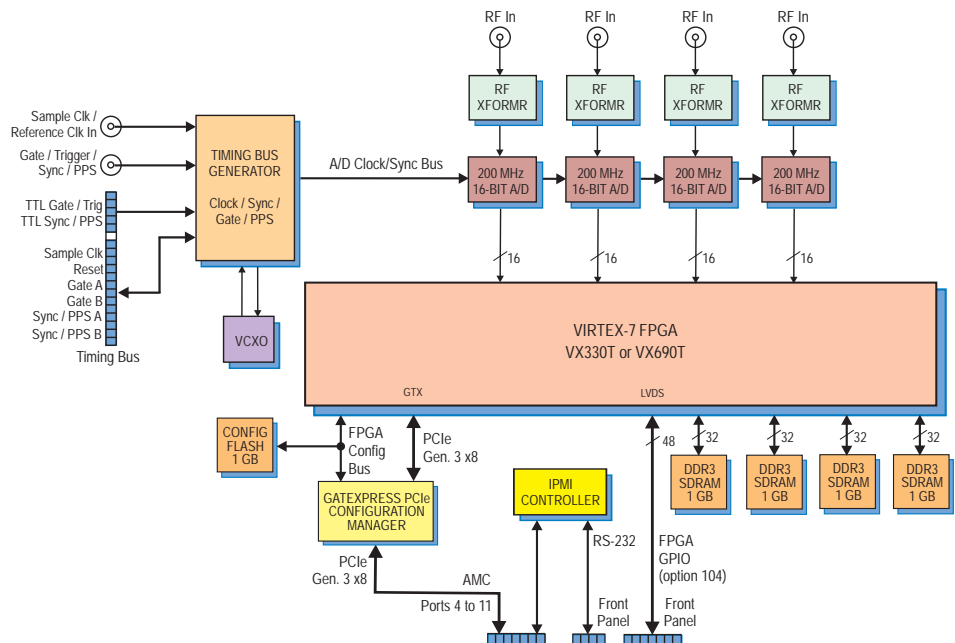

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

Clocking and Synchronization

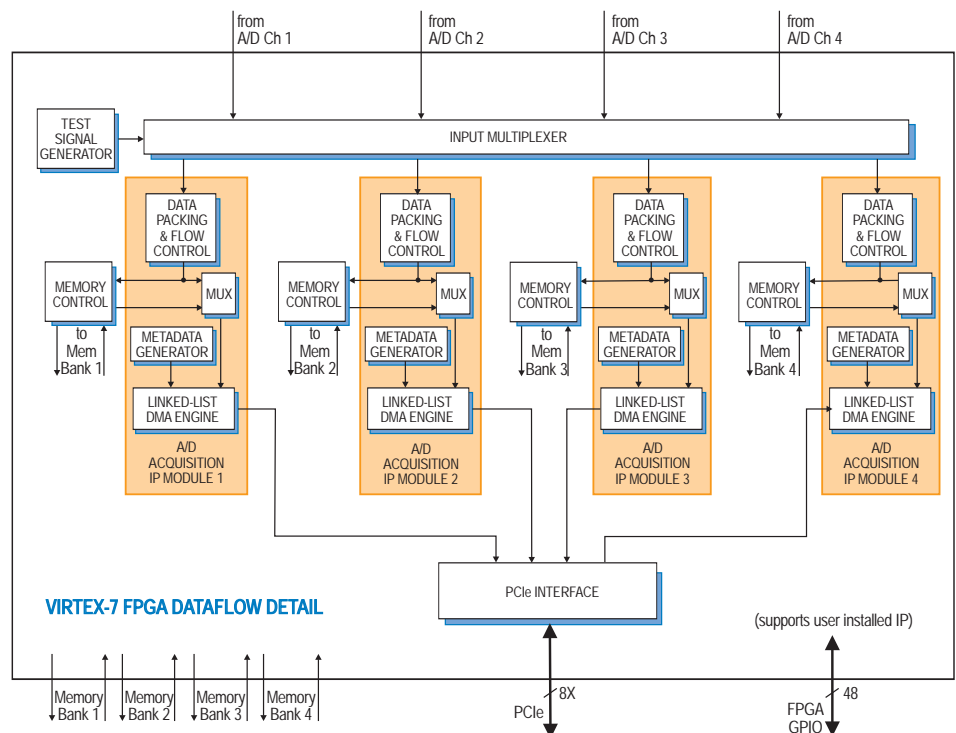

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives ►

A/D Acquisition IP Modules

The 56760 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56760's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 56760 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56760 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56760 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through front panel connector

Contact Pentek for availability of rugged and conduction-cooled versions

**General Information**

Model 56761 is a member of the Onyx® family of high-performance AMC boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with programmable DDCs (Digital Downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. It features built-in support for Gen. 1 and 2 PCI Express.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56761 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56761 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

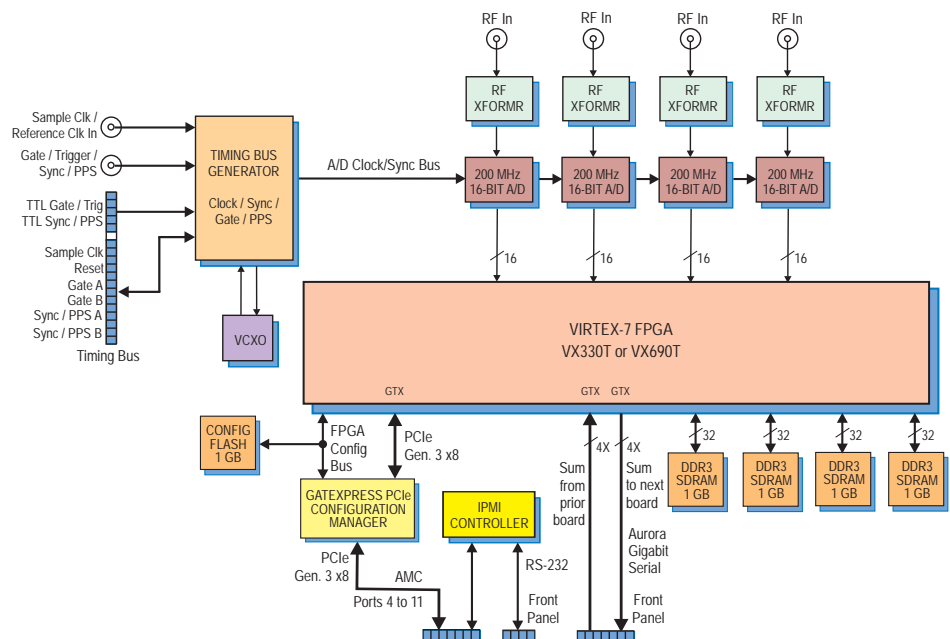

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed. ➤

**Features**

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)

**A/D Acquisition IP Modules**

The 56761 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_{sr}$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56761 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

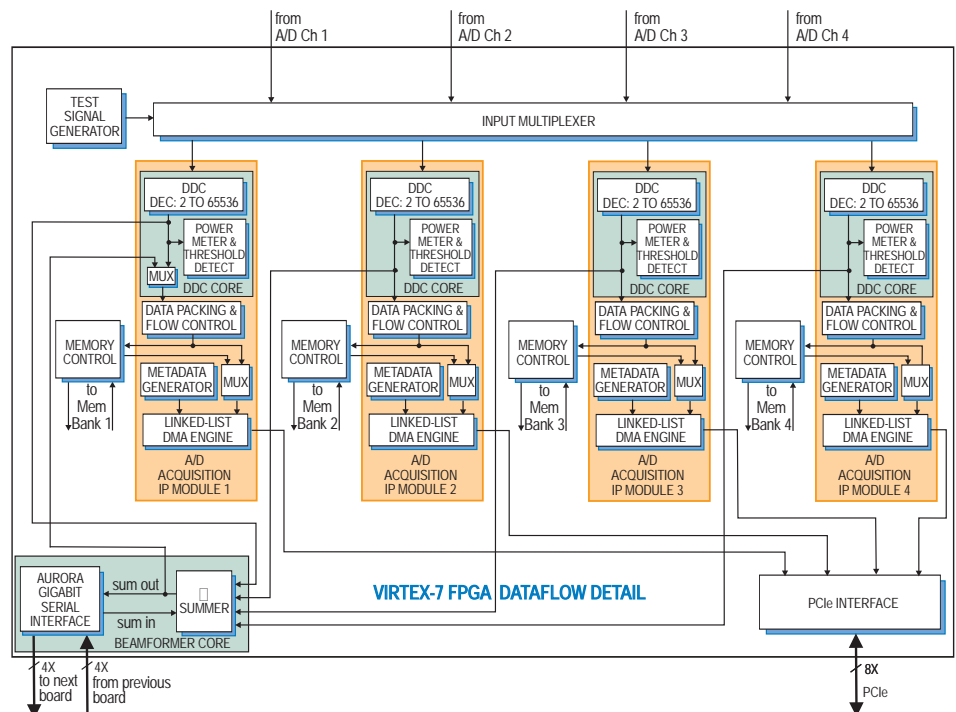

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56761's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous

sampling and sync functions across all connected boards.

### AMC Interface

The Model 56761 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### Memory Resources

The 56761 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 56761 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit  
**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

New!

# Model 56791

# L-Band RF Tuner, 2-Channel 500 MHz A/D, Virtex-7 FPGA - AMC

### Features

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA handles L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverter provides IF or I+Q baseband signals at frequencies up to 123 MHz
- Two 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2, & 3) interface, up to x8
- Clock/sync bus for multiboard synchronization
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

### General Information

Model 56791 is a member of the Onyx® family of high-performance AMC modules based on the Xilinx Virtex-7 FPGA. It is suitable for connection directly to an L-band signal for SATCOM and communications systems. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56791 includes general purpose and gigabit serial connectors for application-specific I/O.

### The Onyx Architecture

The Pentek Onyx Architecture features a Virtex-7 FPGA. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The 56791 factory-installed functions include two A/D acquisition IP modules, four DDR3 memory controllers, two DDCs (digital downconverters), an RF tuner controller, a clock and synchronization generator, a test signal generator, and a Gen 3 PCIe interface.

Thus, the 56791 can operate as a complete turnkey solution with no need to develop FPGA IP.

### Extendable IP Design

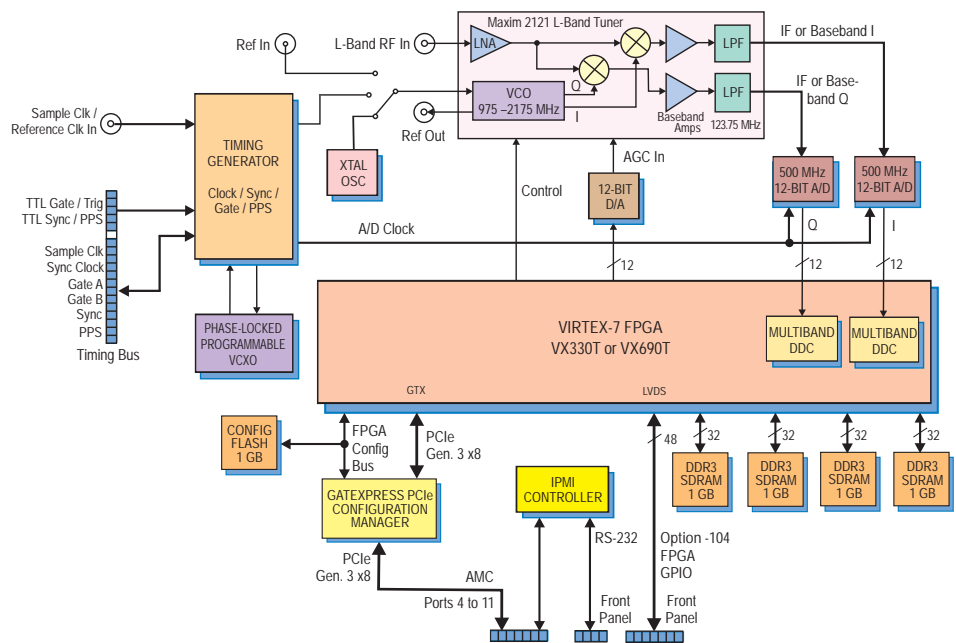

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 56791 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

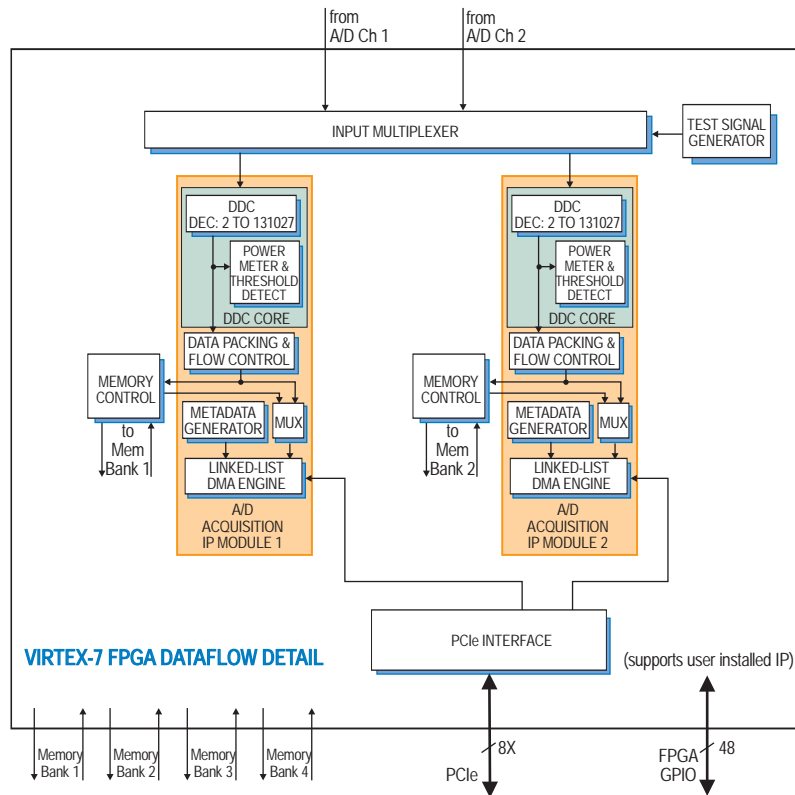

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ▶

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The two analog tuner outputs are digitized by two Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two independent A/D and DDC channels are now available for digitizing and downconverting two signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 56791 architecture supports four independent 1 GB DDR3 SDRAM for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 and 2. Banks 3 and 4 can be used to support custom user-installed IP within the FPGA.

### AMC Interface

The Model 56791 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56791 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

### ► Specifications

#### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC

**Impedance:** 50 ohms

#### L-Band Tuner

**Type:** Maxim MAX2121

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$$\text{freq}_{\text{VCO}} = (\text{N.F.}) \times \text{freq}_{\text{REF}}$$

where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**

-50 dBm to +10 dBm

**Baseband Low Pass Filter:**

3 dB cutoff frequency: 123.75 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 10 MHz to 500 MHz

**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources:** On-board timing generator/synthesizer

#### A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

#### Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3\*: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

# Model 56131

# 8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - AMC

## General Information

Model 56131 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56131 is a multichannel, high-speed data converter with multiband DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multi-board clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56131 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56131 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, multiband DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 56131 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

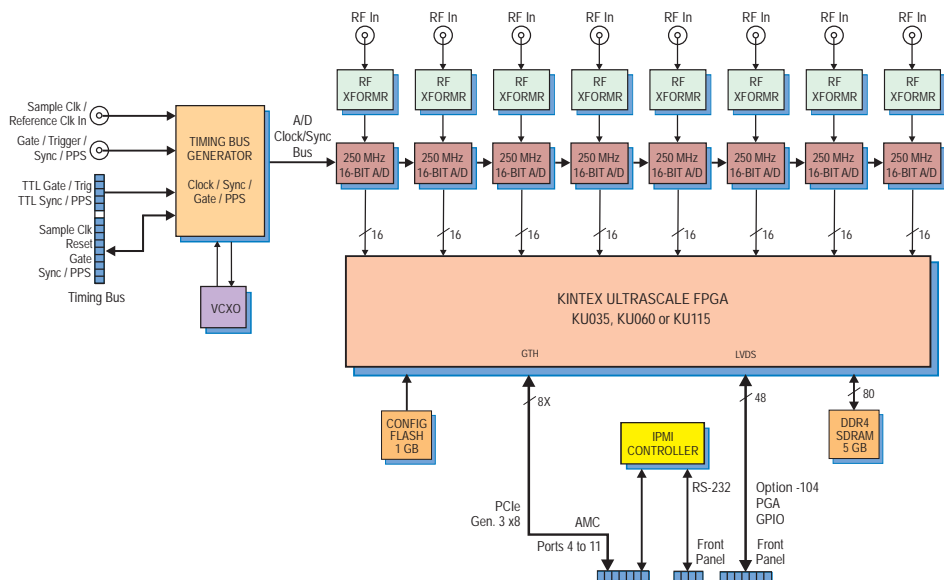

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 56131 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an

output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **KU115.** The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a

sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

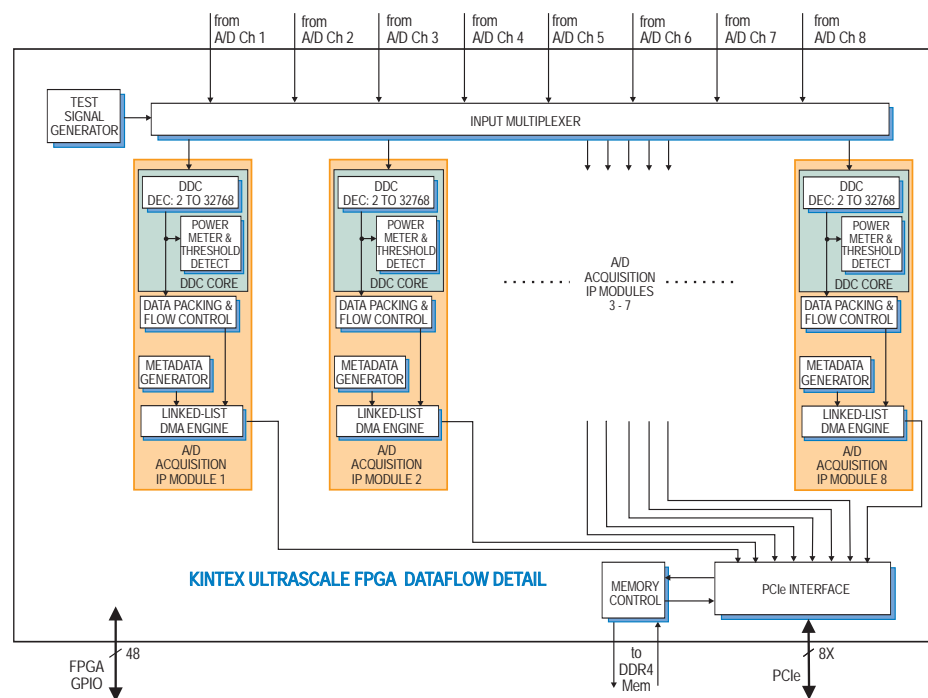

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The 56131 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

### ► PCI Express Interface

The Model 56131 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### AMC Interface

The Model 56131 complies with the AMC 1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >108 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

#### Memory

**Type:** DDR4 SDRAM  
**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

### General Information

Model 56132 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56132 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56132 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56132 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

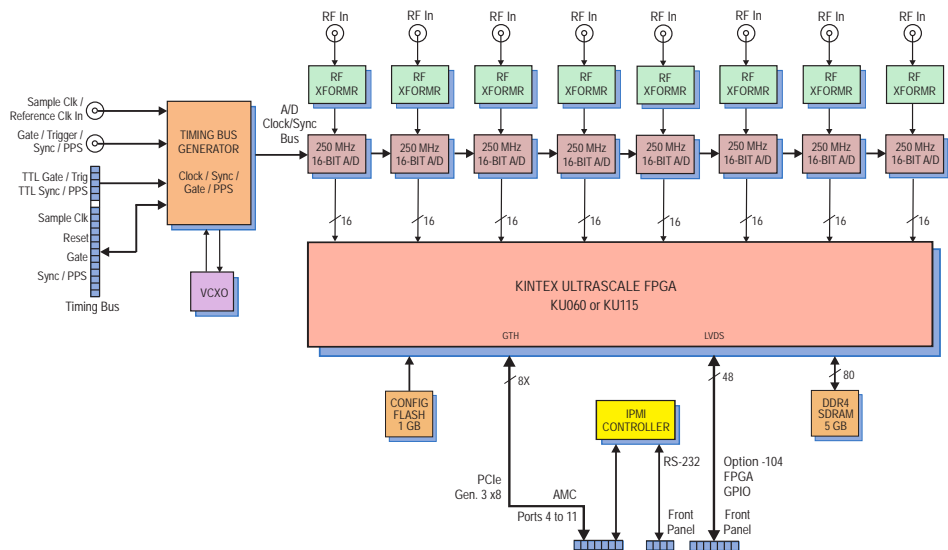

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 56132 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU 115. ➤

**A/D Acquisition IP Modules**

The 566862 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each acquisition module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

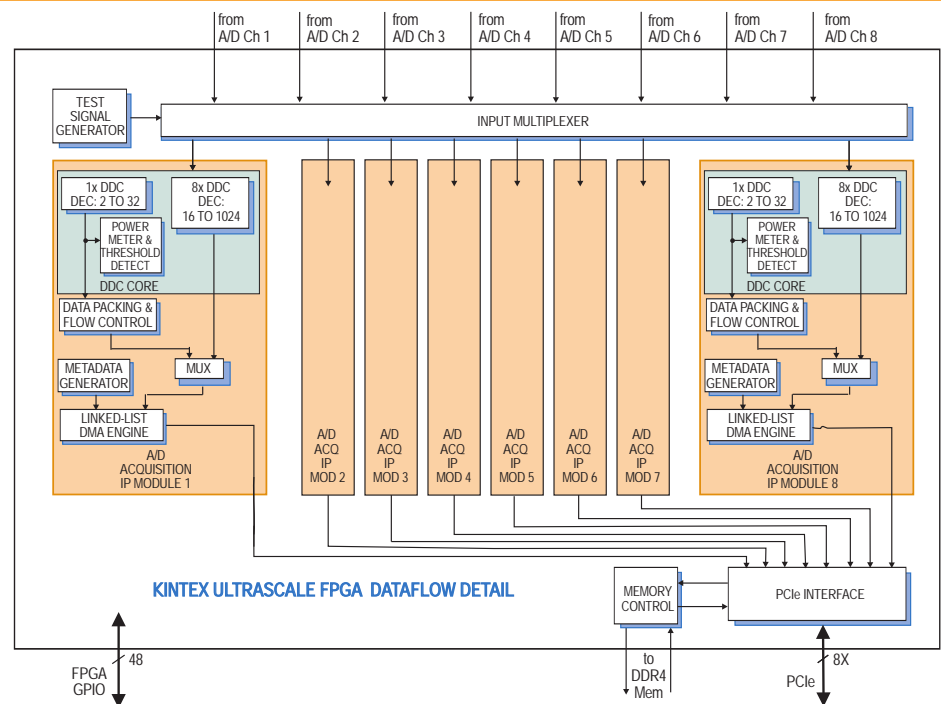

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 5693 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of it for custom applications. ►

### ► PCI Express Interface

The Model 56132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### AMC Interface

The Model 56132 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

#### Wideband Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Multiband Digital Downconverters

**Quantity:** Eight banks, 8 channels per bank  
**Decimation Range:** 16x to 1024x in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104** provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module  
2.890 in x 7.110 in (73.40 mm x 180.6 mm)

# Model 56141

# 1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - AMC

Model 56141

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 6.4 GHz, 12-bit A/D
- Two-channel mode with 3.2 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- Two 6.4 GHz, 14-bit D/As
- Programmable DUCs (Digital Upconverters)
- 5 GB of DDR4 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

### General Information

Model 56141 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56141 is a high-speed analog-to-digital and digital-to-analog converter with programmable DDCs (digital downconverters) and DUCs (digital upconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and generator features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 6.4 GHz, 12-bit A/D converter, dual 6.4 GHz, 14-bit D/As and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 56141 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

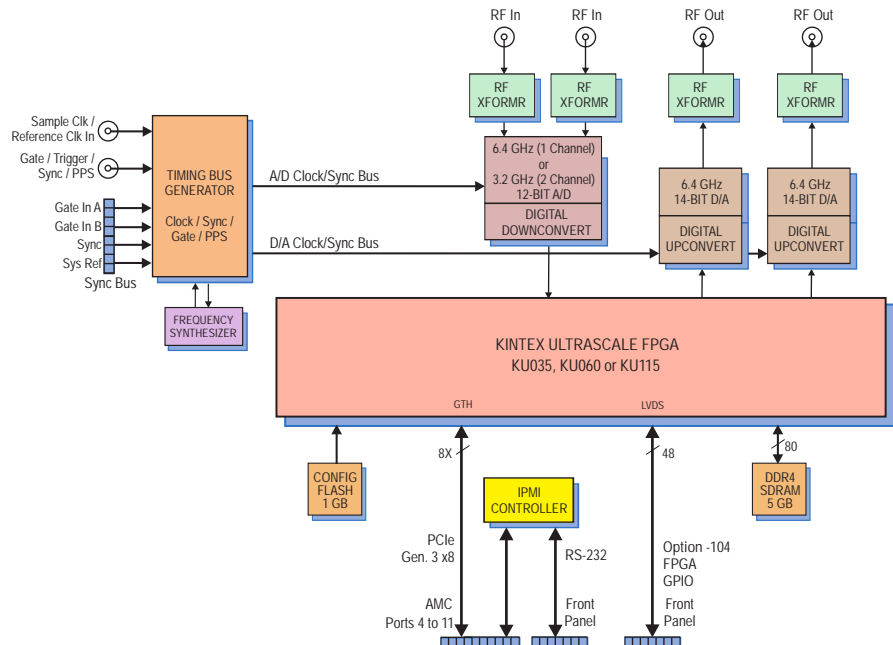

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56141 factory-installed functions include two A/D acquisition and two D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56141 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

**A/D Acquisition IP Module**

The 56141 features two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The Model 56141 factory-installed functions include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the dual D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D's built-in digital downconverters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real or complex baseband input signals. It

delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes, the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The 56141 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

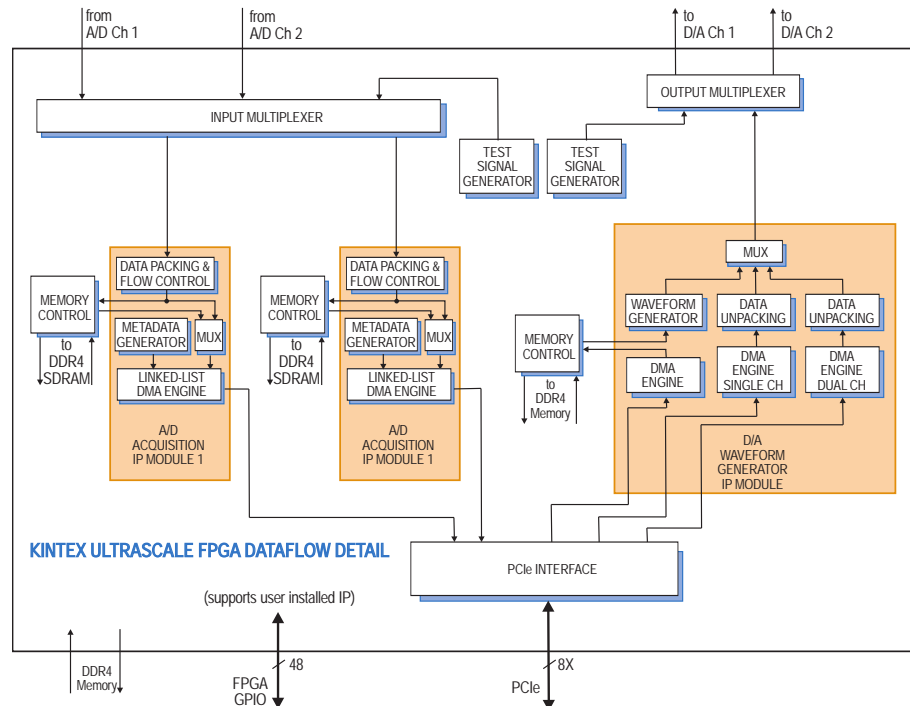

**PCI Express Interface**

The Model 56141 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

The 56141 accepts a sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. The Model 5692 high-speed sync board can be used to drive the sync bus to synchronize multichannel systems. ►

**► AMC Interface**

The Model 56141 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

**Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode: 6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 7.9 GHz; dual-channel mode: 8.1 GHz

**D/A Converters**

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module  
2.890 in x 7.110 in  
(73.40 mm x 180.60 mm)

**Ordering Information**

Model	Description
56141	1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Chan. 6.4 GHz D/A, Kintex UltraScale FPGA - AMC

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O
- 702	Air cooled, Level L2
- 713	Convection cooled, Level L3

Note: Not all combinations of sample rates, decimations and interpolations are available due to JESD204B and PCIe rate limitations.

New!

# Model 56821

## 3-Channel 200 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - AMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

### General Information

Model 56821 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56821 is a 3-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes three A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, three DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56821 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 56821 factory-installed functions include three A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

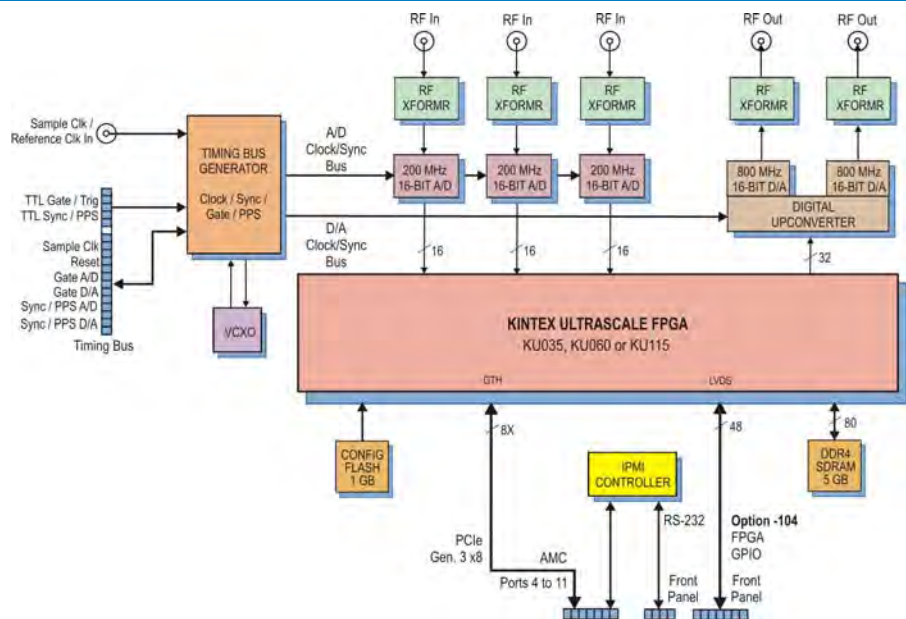

Additional IP includes: three powerful, programmable DDC IP cores; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 56821 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115. ➤

**A/D Acquisition IP Modules**

The 56821 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 56821 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources.

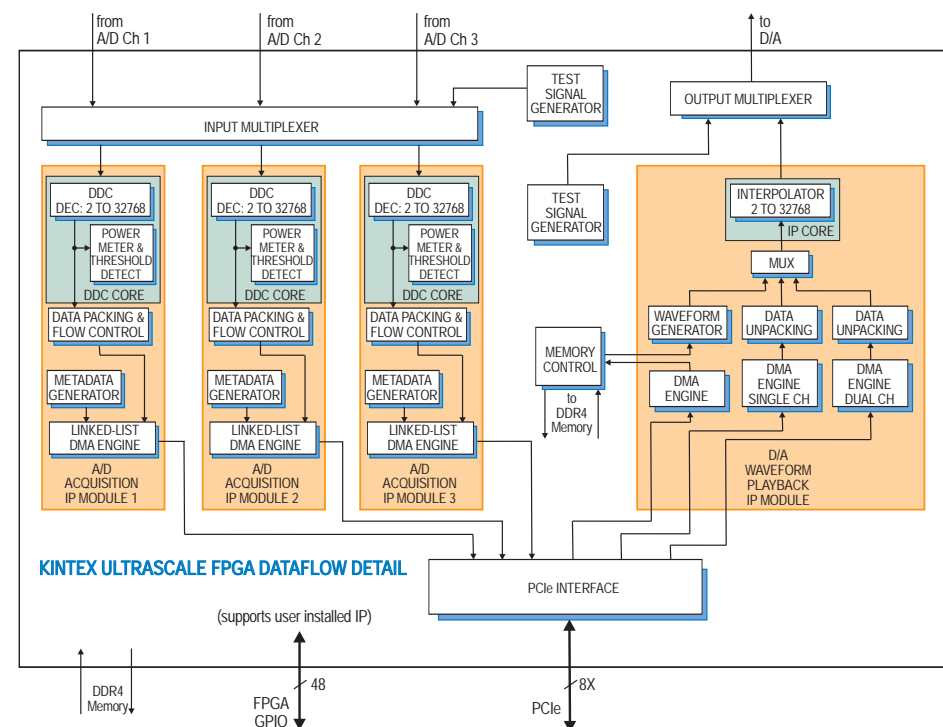

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 56821's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 56821 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### AMC Interface

The Model 56821 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56821 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator Core

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

#### Total Interpolation Range (D/A and interpolator core combined): 2x to 262,144x

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### Sample Clock Sources: On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104** provides 24pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -702: L2 (air cooled)

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -713: L3 (conduction cooled)

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module 2.890 in x 7.110 in (73.40 mm x 180.60 mm)

# Model 56841

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Kintex UltraScale FPGA - AMC

## General Information

Model 56841 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56841 is a high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 56841 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56841 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56841 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

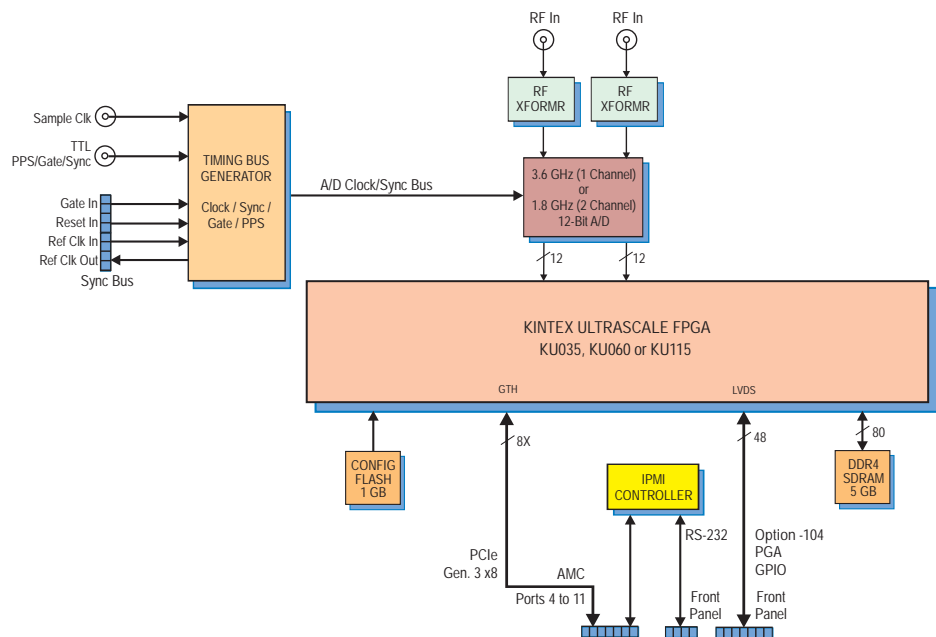

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

The 56841 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB memory bank for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

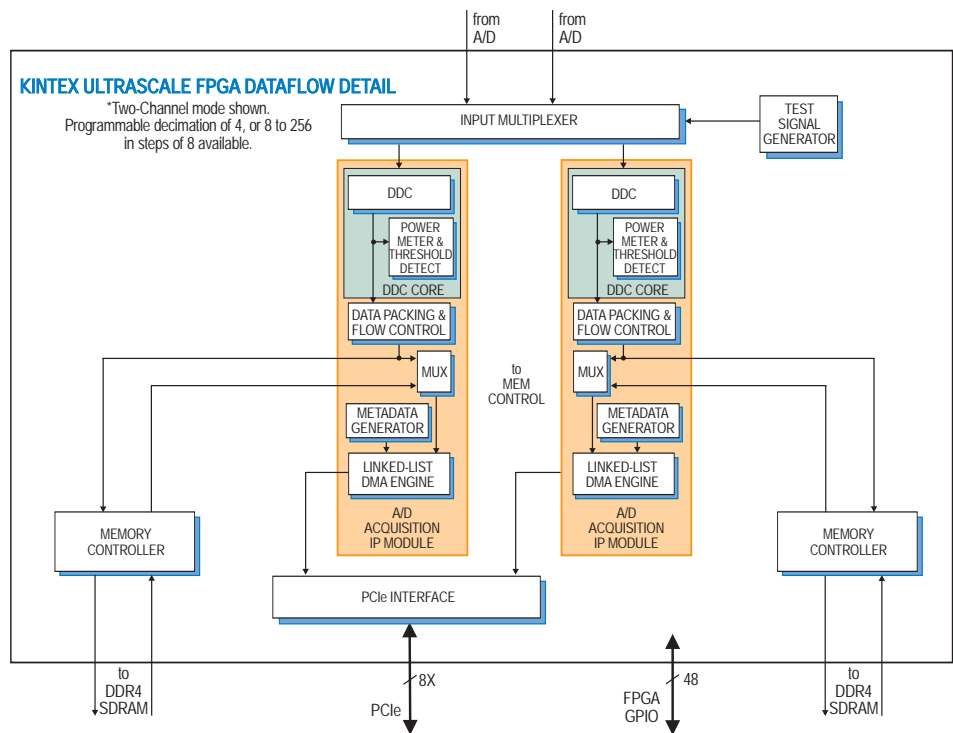

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources. ►

## Memory Resources

The 56841 architecture supports 5 GB of DDR4 SDRAM memory. The memory is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

## AMC Interface

The Model 56841 complies with the AMC 1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

## Ordering Information

Model	Description
56841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - AMC

### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through front panel connector
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

## Clocking and Synchronization

The 56841 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 56841's can be synchronized with a simple cable. For larger systems, multiple 56841's can be synchronized using the Model 5692 high-speed sync board to drive the sync bus.

## PCI Express Interface

The Model 56841 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

New!

# Model 56851

# 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - AMC

### General Information

Model 56851 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56851 is a 2-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes two A/Ds, a complete multi-board clock and sync section, a large DDR4 memory, two DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56851 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 56851 factory-installed functions include two A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 56851 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

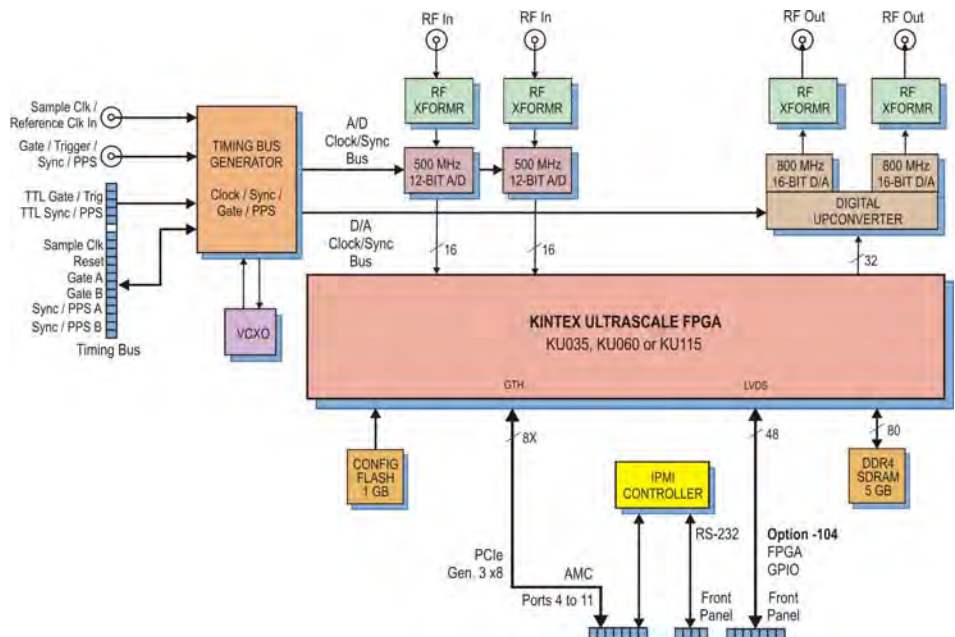

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 56851 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 56851 factory-installed functions include a sophisticated D/A Waveform Playback IP module. It allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

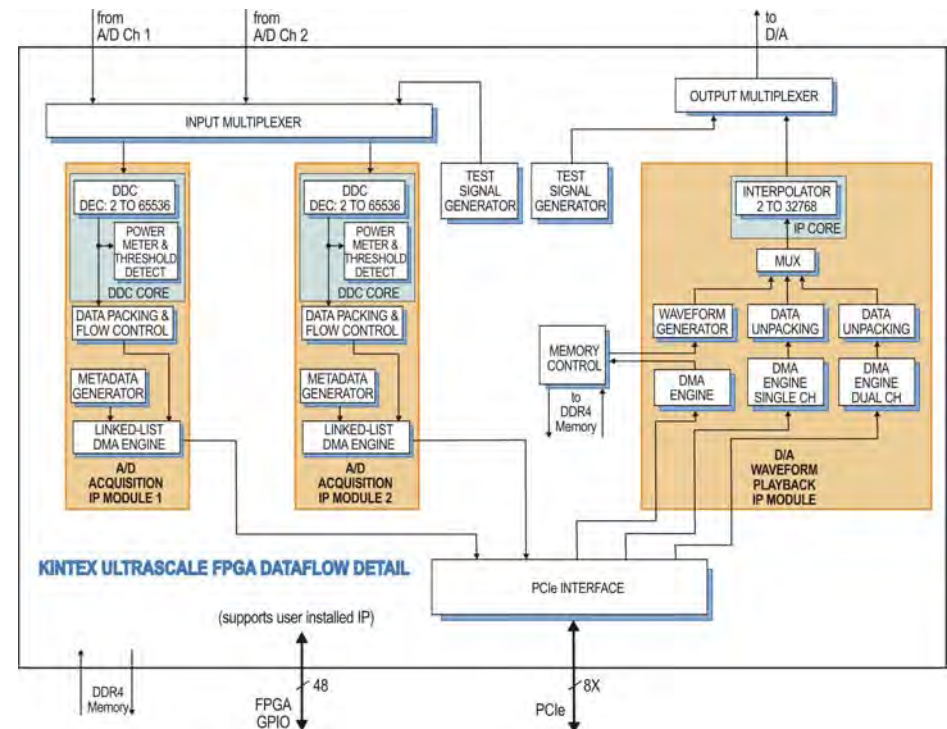

Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 71851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 56851 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### AMC Interface

The Model 56851 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56851 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

#### Digital Downconverters

**Quantity:** Two channels

**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

#### Digital Interpolator Core

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

#### Total Interpolation Range (D/A and interpolator core combined): 2x to 262,144x

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104:** provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module  
2.890 in x 7.110 in  
(73.40 mm x 180.60 mm)

### Ordering Information

# Model 56861

# 4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - AMC

### General Information

Model 56861 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56861 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56861 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56861 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

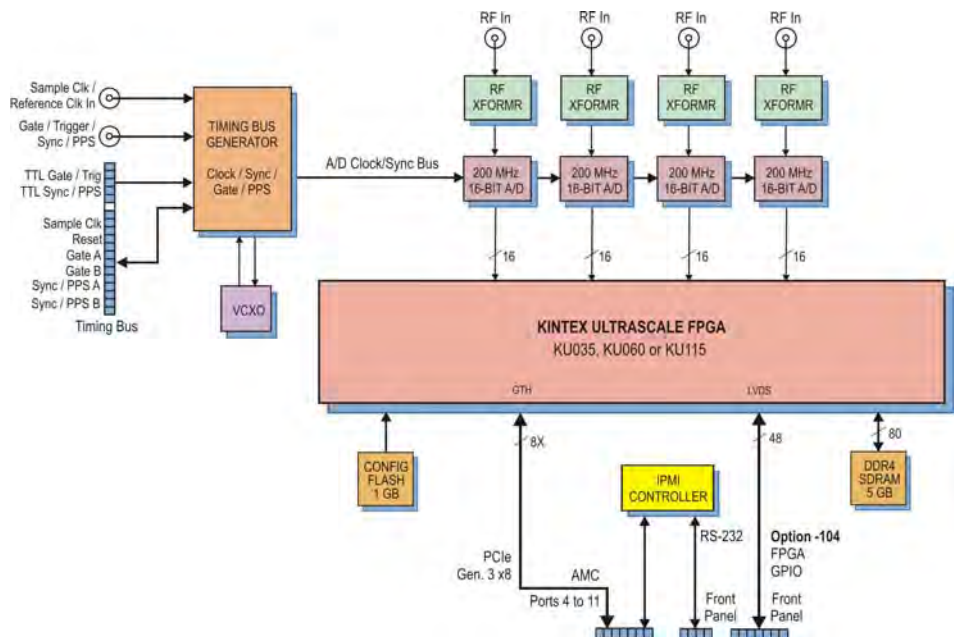

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 56861 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 56861 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

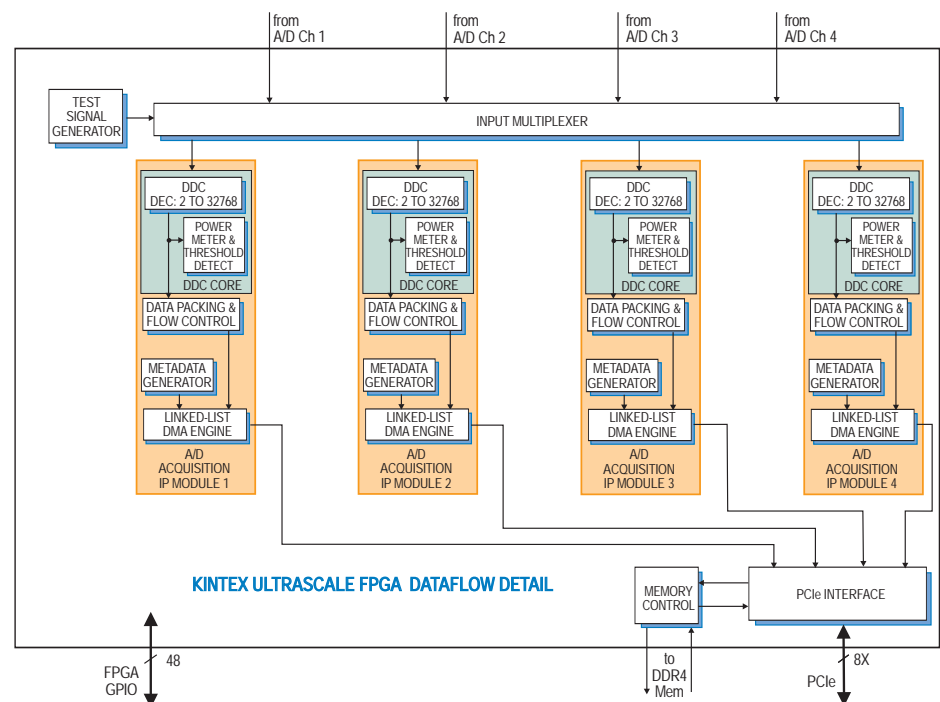

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 56861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**► PCI Express Interface**

The Model 56861 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**AMC Interface**

The Model 56861 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

**Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module

# Model 56862

# 4-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - AMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four wideband DDCs and
- 32 multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the FPGA for custom I/O
- AMC 1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

### General Information

Model 56862 is a member of the Jade™ family of high-performance AMC boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 56862 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56862 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

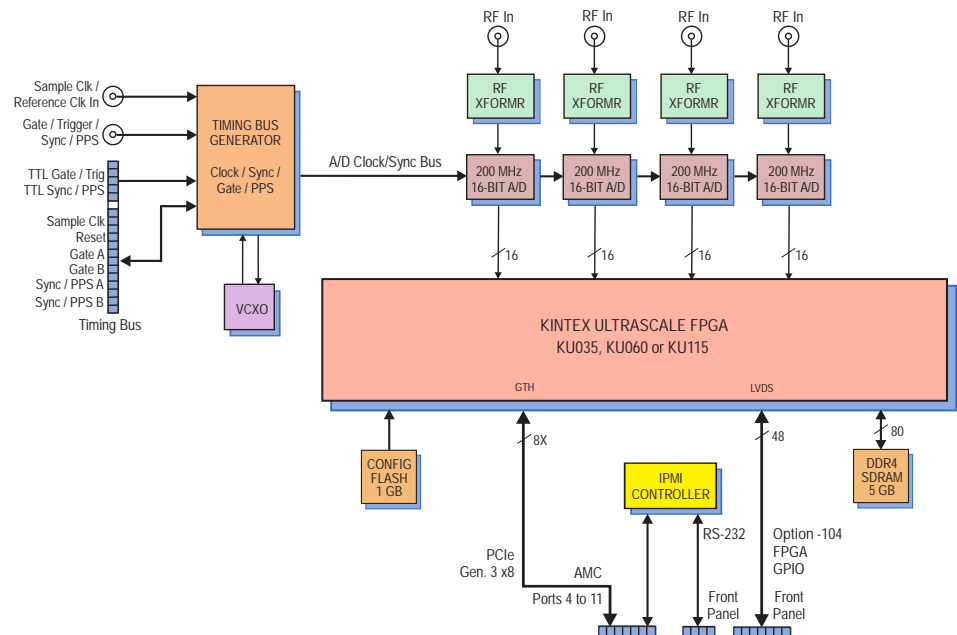

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56862 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 56862 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 56862 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filter for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

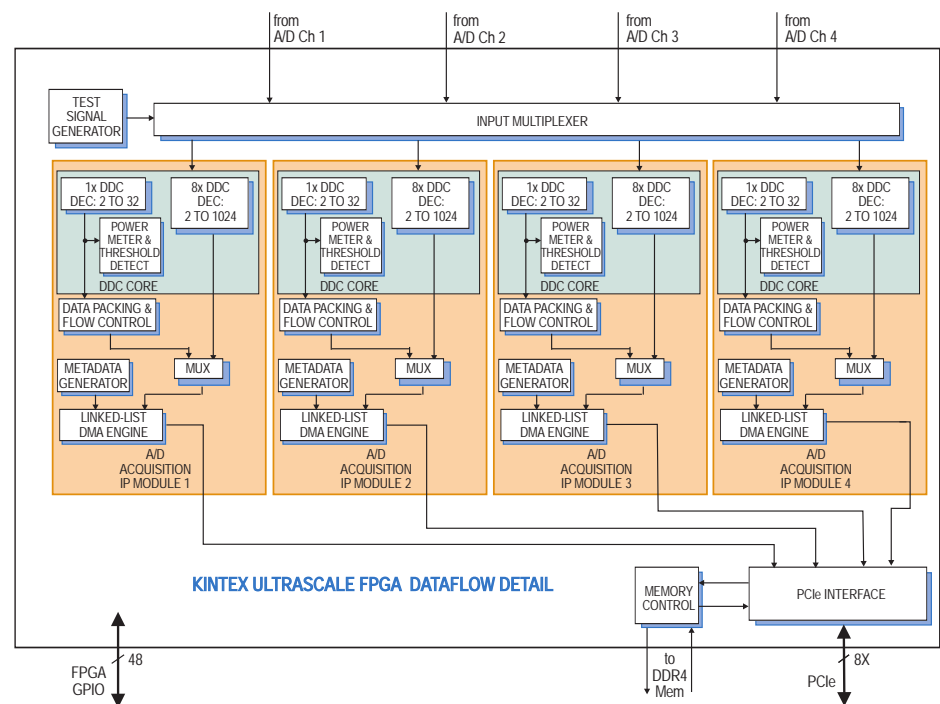

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 56862 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

### ► PCI Express Interface

The Model 56862 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### AMC Interface

The Model 56862 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Wideband Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Multiband Digital Downconverters

**Quantity:** Four banks, 8 channels per bank  
**Decimation Range:** 2x to 1024x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104** provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -702: L2 (air cooled)

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -713: L3 (conduction cooled)

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module  
2.890 in x 7.110 in 73.40 mm x 180.60 mm

# Model 56800

# Kintex UltraScale FPGA Coprocessor-AMC

### General Information

Model 56800 is a member of the Jade™ family of high-performance AMC modules. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 56800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

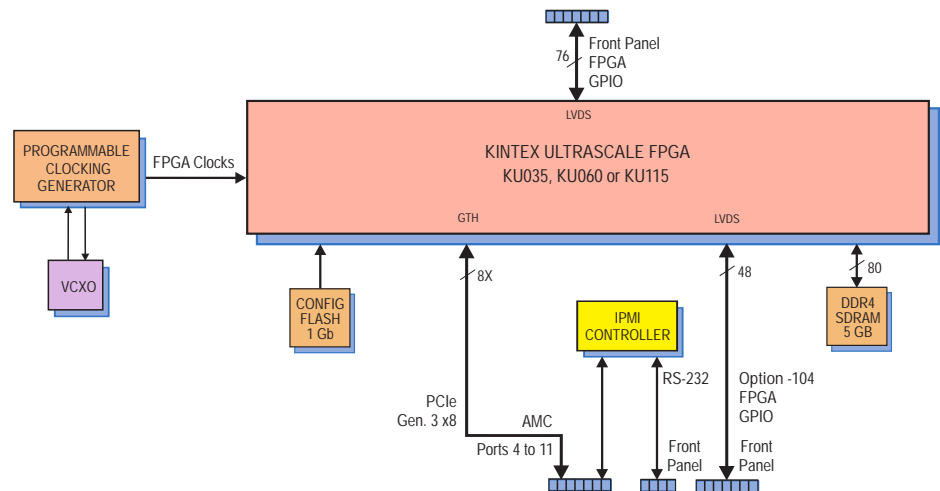

Option -104 provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O.

### Front Panel Digital I/O Interface

The 56800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path. ➤

### Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS to the FPGA for custom I/O
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Ruggedized and conduction-cooled versions available

Model	Description
56800	Kintex UltraScale FPGA Coprocessor - AMC

### Options:

- 084 XCKU060-2 FPGA
- 087 XCKU115-2 FPGA
- 104 LVDS FPGA I/O
- 702 Air cooled, Level L2
- 713 Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

### Features

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

### General Information

The Bandit® Model 5620 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded AMC board with front-panel connectors for easy integration into RF systems, the board offers programmable gain, high dynamic range and a low noise figure.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 5620 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The 5620 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

### Quadrature Mixers

The 5620 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

### Tuning Accuracy

The 5620 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

### On-board Reference Clock

In addition to accepting a 10 MHz reference signal on the front panel, the 5620 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Wideband Output

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

### ► Specifications

#### RF Input

Connector Type: SSMC

Input Impedance: 50 ohms

Input Level Range: -60 dBm to -20 dBm

Flatness:  $\pm 2$  dB from 400 MHz to 1 GHz,  
 $\pm 3$  dB from 1 GHz to 3 GHz,  $\pm 5$  dB from  
3 GHz to 4 GHz

RF Attenuator: Programmable from 0 to  
63 dB in 0.5 dB steps

#### LO Synthesizer Tuning

Frequency range: 400–4000 MHz,

Resolution: < 10 kHz

Tuning Speed: < 500  $\mu$ sec

Phase-Locked Loop Bandwidth: 100 kHz

#### Phase Noise

1 kHz: -90 dBc/Hz

100 kHz: -110 dBc/Hz

1 MHz: -130 dBc/Hz

#### Noise Figure (referred to input)

60 dB gain: 2.6 dB

#### Inband Output IP3

20 dB gain: +10 dBm

60 dB gain: +42 dBm

#### Reference Input/Output

Connector Type: SSMC

Input/Output Impedance: 50 ohms

#### Reference Input Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

#### Reference Output Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

#### OCXO Reference

Center Frequency: 10 MHz

Frequency Stability vs. Change in

Temperature:  $\pm 50.0$  ppb

Frequency Calibration:  $\pm 1.0$  ppm

#### Aging

Daily:  $\pm 10$  ppb/day

First Year:  $\pm 300$  ppb

#### Total Frequency Tolerance

(20 years):  $\pm 4.60$  ppm

#### Phase Noise

1 Hz Offset: -67 dBc/Hz

10 Hz Offset: -100 dBc/Hz

100 Hz Offset: -130 dBc/Hz

1 KHz Offset: -148 dBc/Hz

10 KHz Offset: -154 dBc/Hz

100 KHz Offset: -155 dBc/Hz

#### IF Output

Connector Type: SSMC

Output Impedance: 50 ohms

Center Frequency: User definable

Output Level: 0 dBm, nominal

#### Programming

Functions: RF Atten, IF Atten, Int/Ext

Reference Select, LO Synthesizer Frequency

Interface: USB

Connector Type: MicroUSB

#### Power

Voltage: +12 VDC

Current: 1.5 A

#### PCI-Express Interface

PCI Express Bus: Gen. 1 x4 or x8, power  
only

#### Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: Single-width, full-height AMC mod-  
ule, 2.89 in. x 7.11 in.

Model 52620 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52620 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52620 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52620 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules, ideally matched to the board's analog interfaces. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator,

and a PCIe interface complete the factory-installed functions and enable the 52620 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

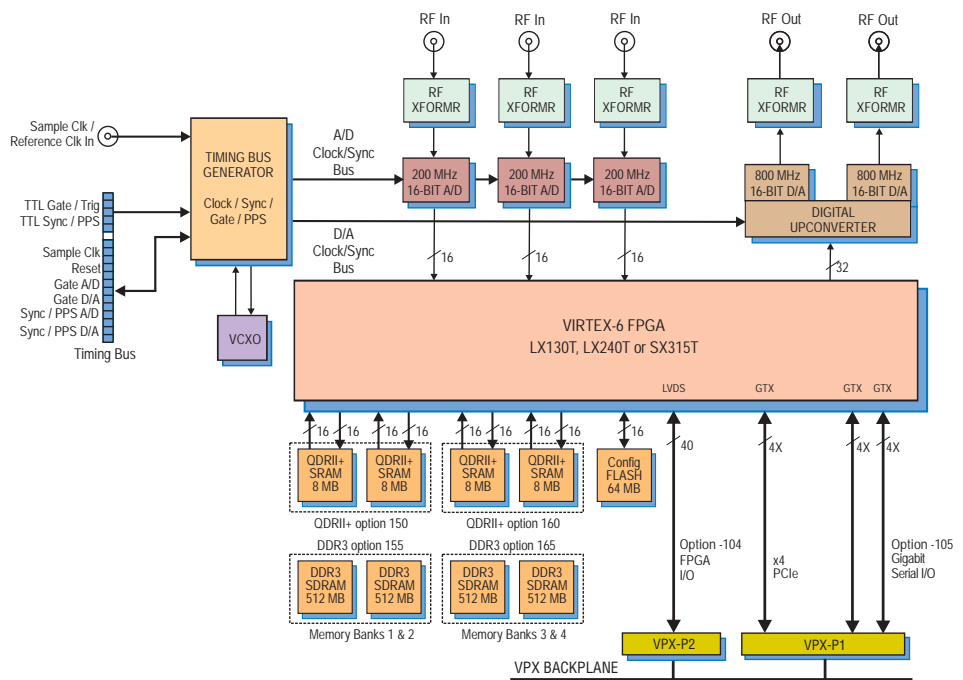

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52620 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 52620 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

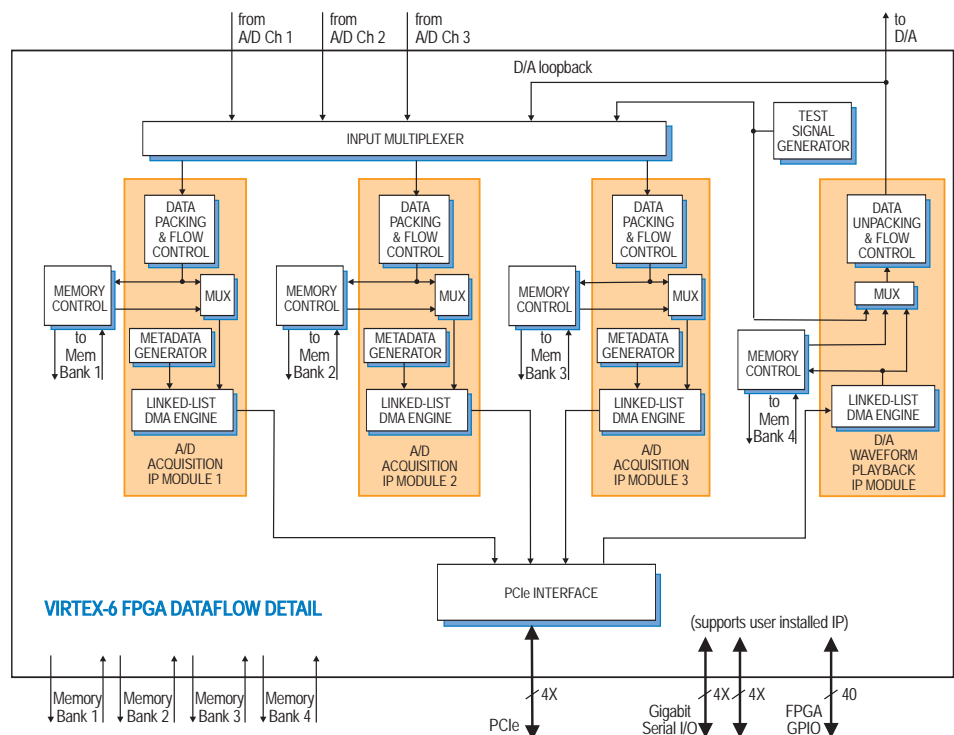

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52620's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52620 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - 3U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6V SX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► board’s DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

The Model 52620 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

- Input Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +8 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

- Type:** Texas Instruments ADS5485
- Sampling Rate:** 10 MHz to 200 MHz
- Resolution:** 16 bits

**D/A Converters**

- Type:** Texas Instruments DAC5688
- Input Data Rate:** 250 MHz max.
- Output IF:** DC to 400 MHz max.
- Output Signal:** 2-channel real or 1-channel with frequency translation
- Output Sampling Rate:** 800 MHz max. with interpolation
- Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

- Output Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Output:** +4 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

- Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus
- Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

- Standard:** Xilinx Virtex-6 XC6VLX130T
- Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6V SX315T

**Custom I/O**

- Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.
- Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

- Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR
- Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52621 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Optional LVPECL clock/sync bus for multiboard synchronization
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52621 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52621 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52621 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52621 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

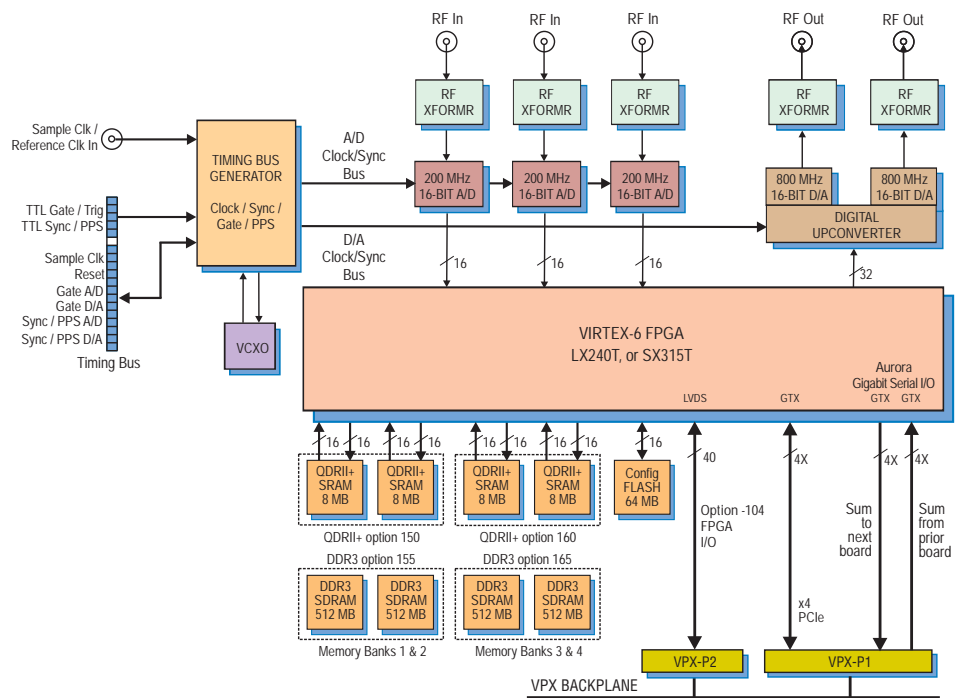

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**A/D Acquisition IP Modules**

The 52621 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency

setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52621 features a complete beamforming subsystem. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

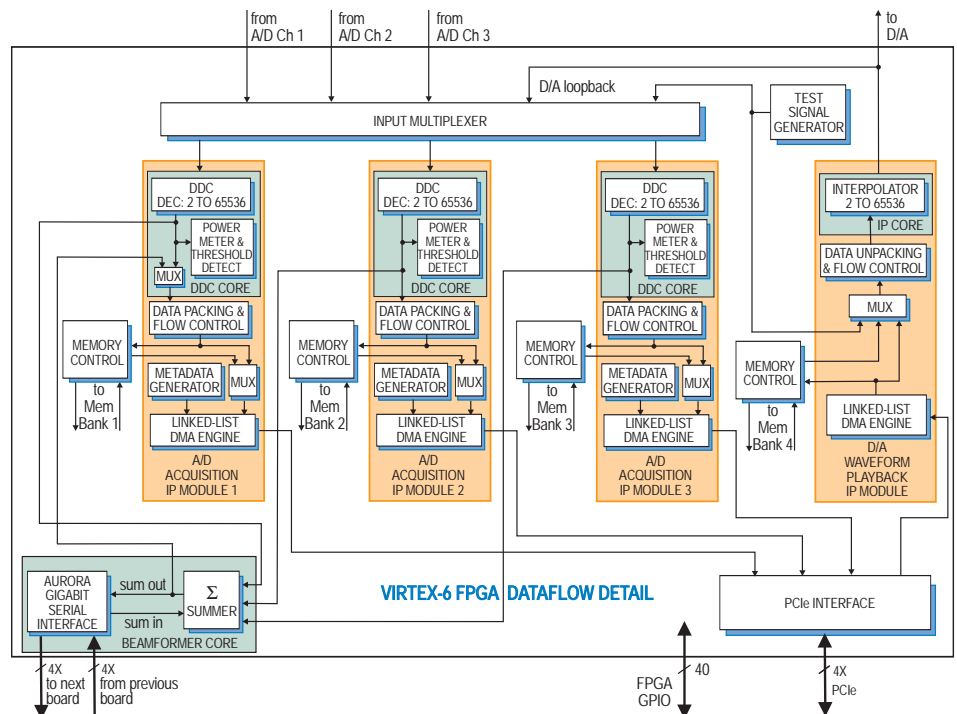

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52621's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 52621 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

► **A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52621's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52621 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

The Model 52621 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6V SX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Option 150 or 160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2

# Model 52624

# Dual-Channel, 34-Signal Adaptive IF Relay - 3U OpenVPX

Model 52624 COTS (left) and rugged version

### Features

- Modifies 34 IF signals between input and output
- Up to 80 MHz IF bandwidth
- Two 200 MHz 16-bit A/Ds
- Two 800 MHz 16-bit D/As
- 34 DDCs and 34 DUCs (digital downconverters and digital upconverters)
- Signal drop/add/replace
- Frequency shifting and hopping
- Amplitude boost and attenuation
- PCI Express Gen. 1: x4 or x8,

### General Information

Model 52624 is a member of the Cobalt® family of high-performance 3U OpenVPX boards based on the Xilinx Virtex-6 FPGA. As an IF relay, it accepts two IF analog input channels, modifies up to 34 signals, and then delivers them to two analog IF outputs. Any signal within each IF band can be independently enabled or disabled, and changed in both frequency and amplitude as it passes through the module.

The 52624 supports many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation. Applications include countermeasures, active tracking and monitoring, channel security, interception, adaptive spectral management, jamming, and encryption.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCIe Gen 1 system interface supports control, status and data transfers.

### Adaptive Relay Input Overview

The Model 52624 digitizes two analog IF inputs using two 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency. An array of 34 DDCs (digital downconverters) can be independently

programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz. Each DDC can independently source IF data from either of the two A/Ds.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCIe system interface to target memory, typically associated with a system processor. Here, the signals can be analyzed, classified, demodulated, decrypted or decoded, depending on the application.

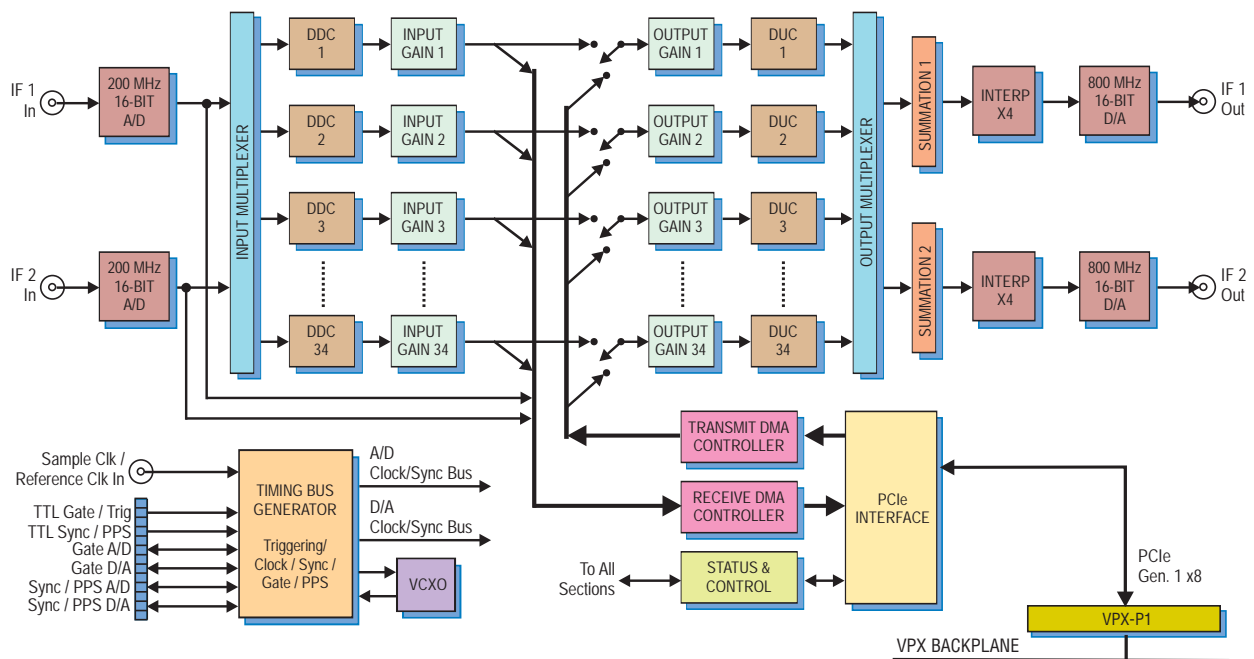

Samples from each A/D converter can also be delivered across PCIe to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

### Adaptive Relay Output Overview

The Model 52624 output stage consists of 34 DUCs (digital upconverters) and two 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stage. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two summation blocks, each ➤

► associated with one of the two D/A converters using a final interpolation factor of  $\times 4$ . After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the Model 52624 adaptive relay. Because of the complexity and proprietary nature of these functions, the FPGA cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in

gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controller

Two output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2.

When a target memory buffer is filled, the 52624 issues an interrupt to the system processor and then begins filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, the 52624 signals the processor with an interrupt and moves to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz. ►

► A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts two summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two transformer-coupled analog IF outputs are delivered through a pair of front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52624's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI Express Interface

The Model 52624 includes an industry-standard interface fully compliant with PCIe Gen. 1 x8 bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the board.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Quantity:** Two

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► **Digital Downconverters**

**Quantity:** 34  
**Decimation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >100 dB  
**Phase Offset:** 1 bit, 0 or 180 degrees  
**FIR Filter:** 18-bit coefficients  
**Output:** Complex, 16-bit I + 16-bit Q  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Input Gain Blocks**

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

**Output Gain Blocks**

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

**Digital Upconverters**

**Quantity:** 34  
**Interpolation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**FIR Filter:** 18-bit coefficients, 16-bit output  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Analog Output Channels:** 2  
**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 200 MHz max.  
**Output Signal:** Real  
**Output Sampling Rate:** 800 MHz max. with 4x interpolation  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Required:** Xilinx Virtex-6 XC6VSX315T

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8;

**Environmental**

**Standard:**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Option 702 L2 Extended Temp (air-cooled):**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Option 712 L2 Extended Temp (conduction-cooled):**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 3U VPX board, 100 x 160 mm (3.937 x 6.299 in.)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52630 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52630 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes 1 GHz A/D and D/A converters and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52630 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the

factory-installed functions and enable the 52630 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

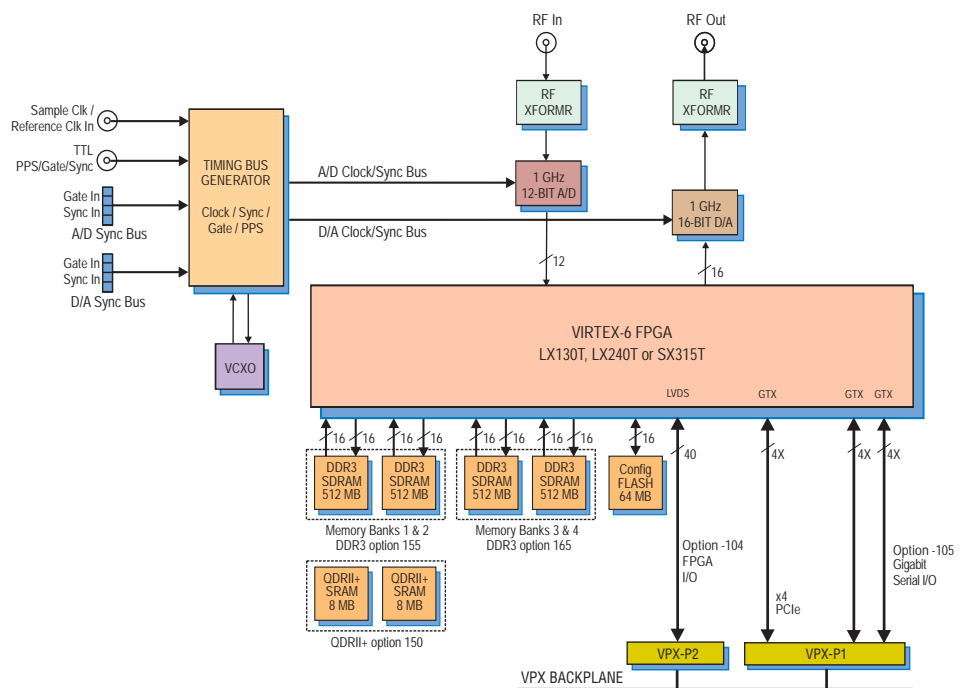

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 52630 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 52630 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 52630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

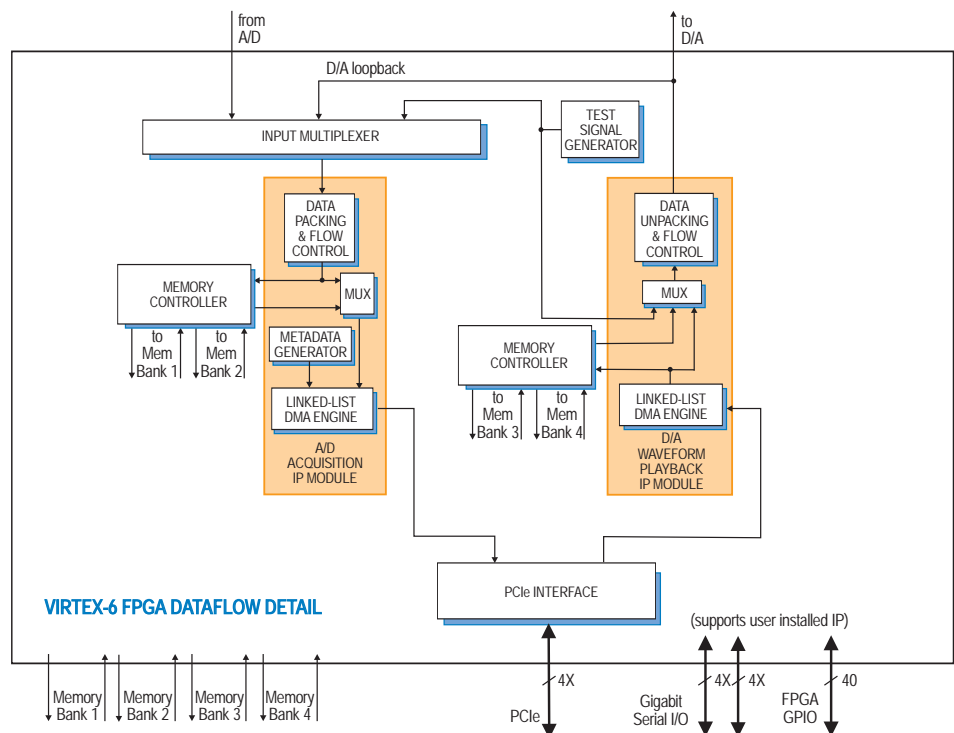

A pair of front panel μSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 5292 and Model 9192 Cobalt Synchronizers can drive multiple 52630 μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 52630 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

► **PCI Express Interface**

The Model 52630 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52640 COTS (left) and rugged version

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52640 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The 52640 includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52640 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-

installed functions and enable the 52640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

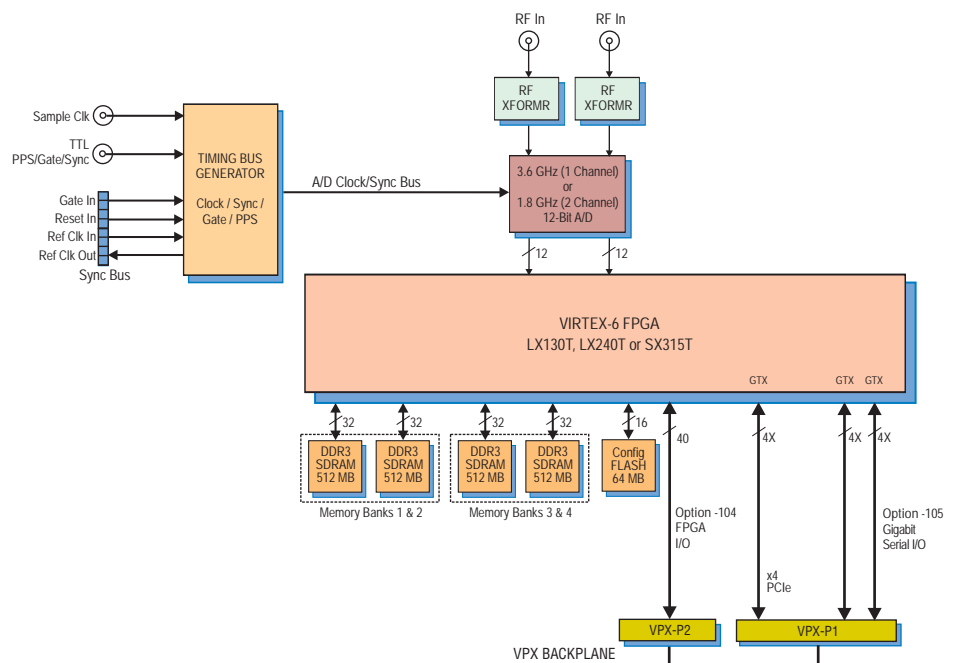

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides dual 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► **A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 52640 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

The 52640 accepts an 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 52640's can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

**Memory Resources**

The 52640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

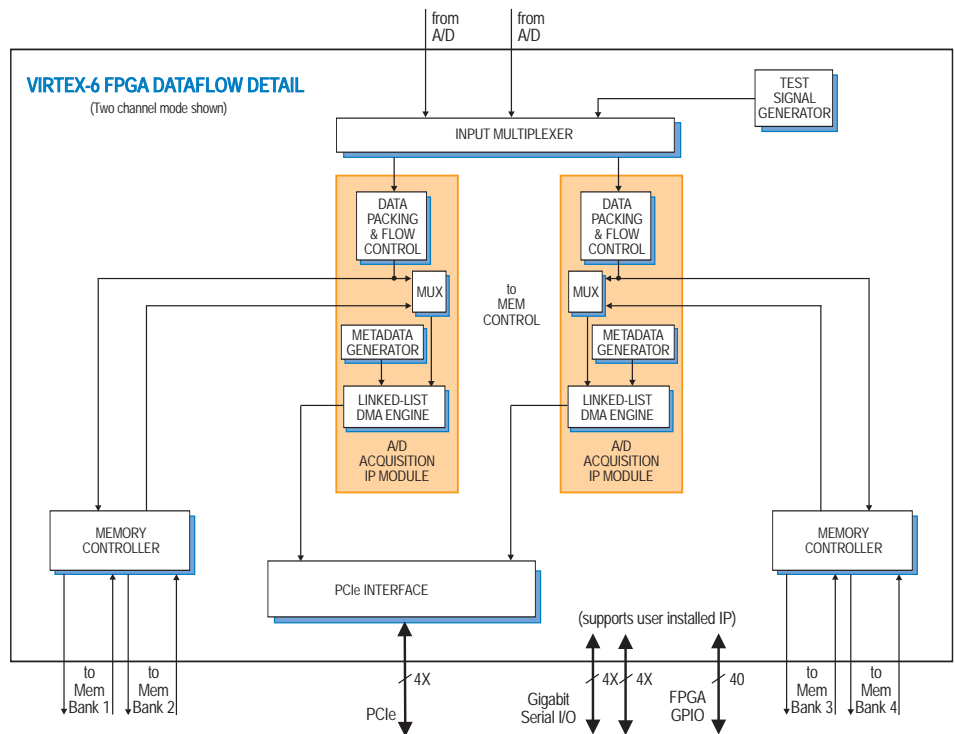

The Model 52640 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**A/D Acquisition IP Module**

The 52640 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52640	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multi-pin connectors, bus includes gate, reset and in and out reference clock

**External Trigger Input**

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm).

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52641 COTS (left) and rugged version

**General Information**

Model 52641 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

The 52641 includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52641 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchro-

nization functions, a test signal generator and a PCI interface complete the factory-installed functions and enable the 52641 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

For applications that require additional control and status signals, option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**A/D Converter Stage**

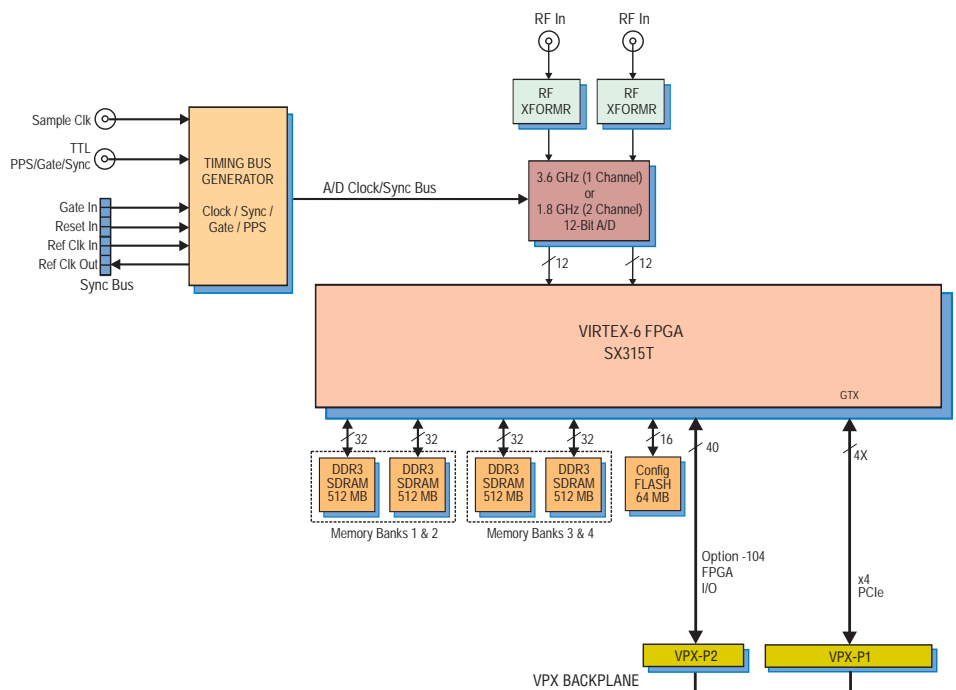

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 52641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources. ➤

**Features**

- Ideal radar and software radio interface solution
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Programmable one- or two-channel DDC (Digital Downconverter)
- PCI Express (Gen. 1 & 2) interface, up to x4
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

The 52641 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

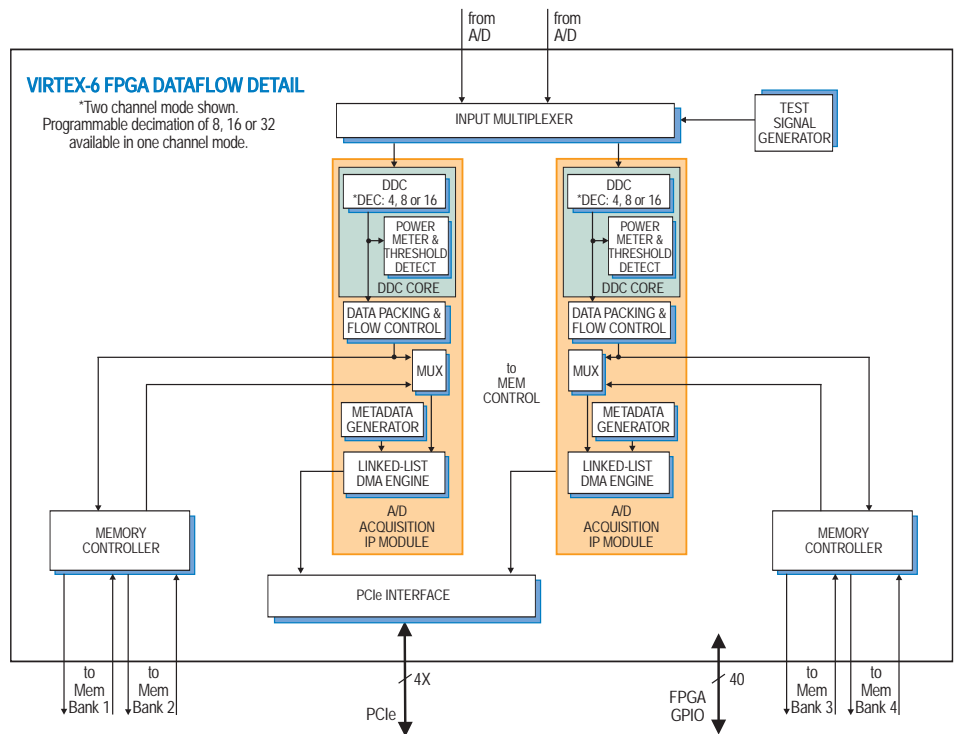

**Clocking and Synchronization**

The 52641 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 52641's can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

**Memory Resources**

The 52641 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model 52650 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Two 500 MHz 12-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52650 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A two-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52650 includes two A/Ds, one DUC (digital upconverter), two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52650 factory-installed functions include two A/D acquisition and one D/A waveform playback IP modules. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete

the factory-installed functions and enable the 52650 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

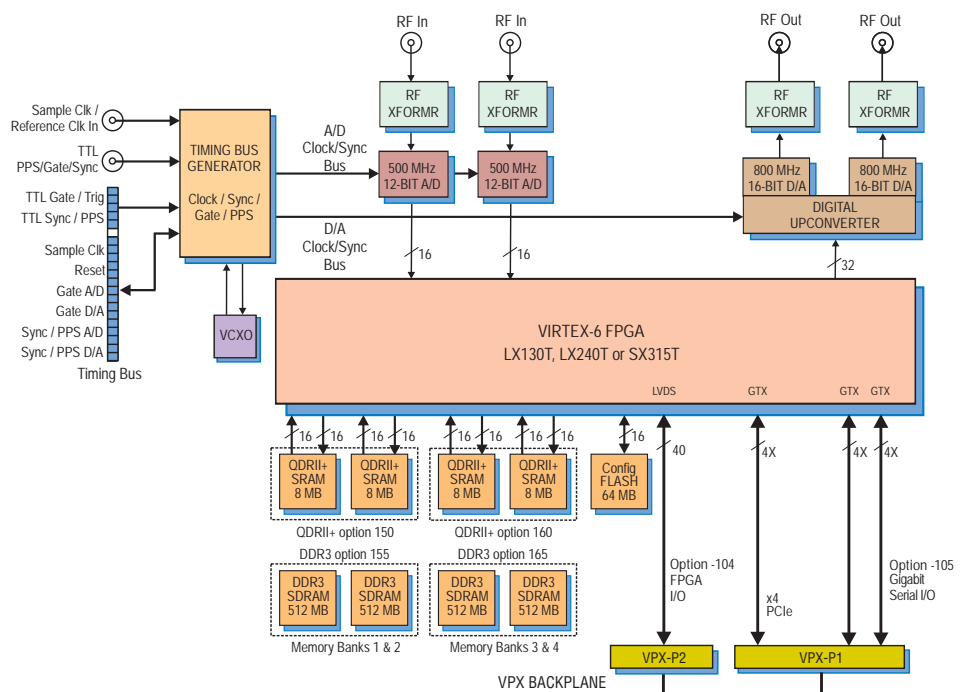

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52650 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfers, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 52650 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts two full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

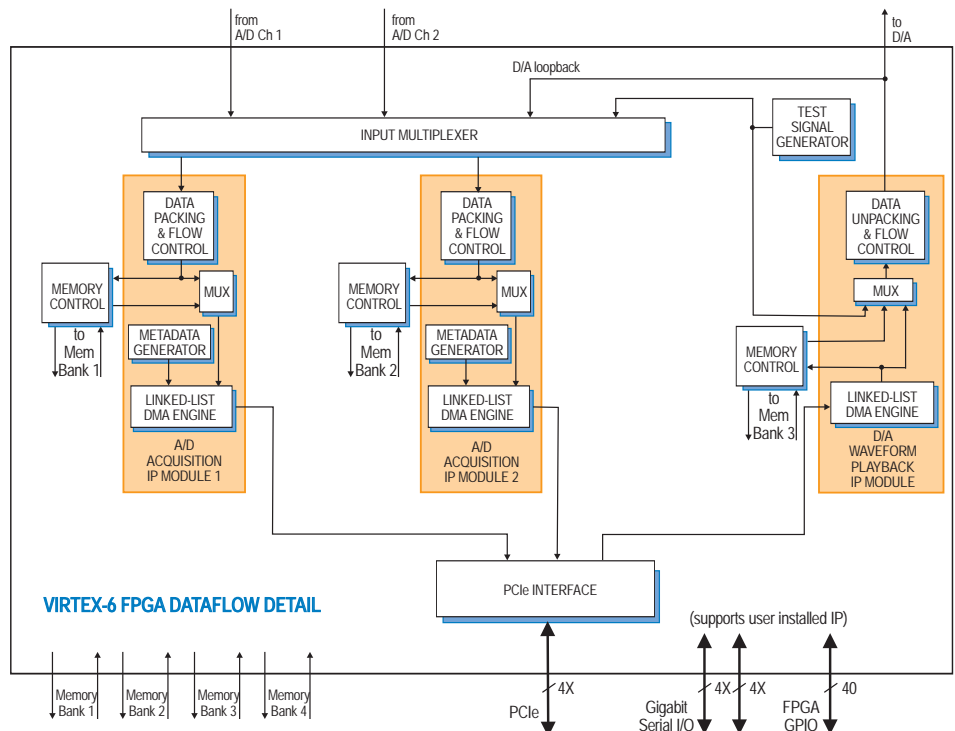

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52650's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52650 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

**PCI Express Interface**

The Model 52650 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Resolution:** 12 bits

**A/D Converters (option 014)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**D/A Converters**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52651 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52651 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A two-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52651 includes two A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52651 factory installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3

or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52651 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

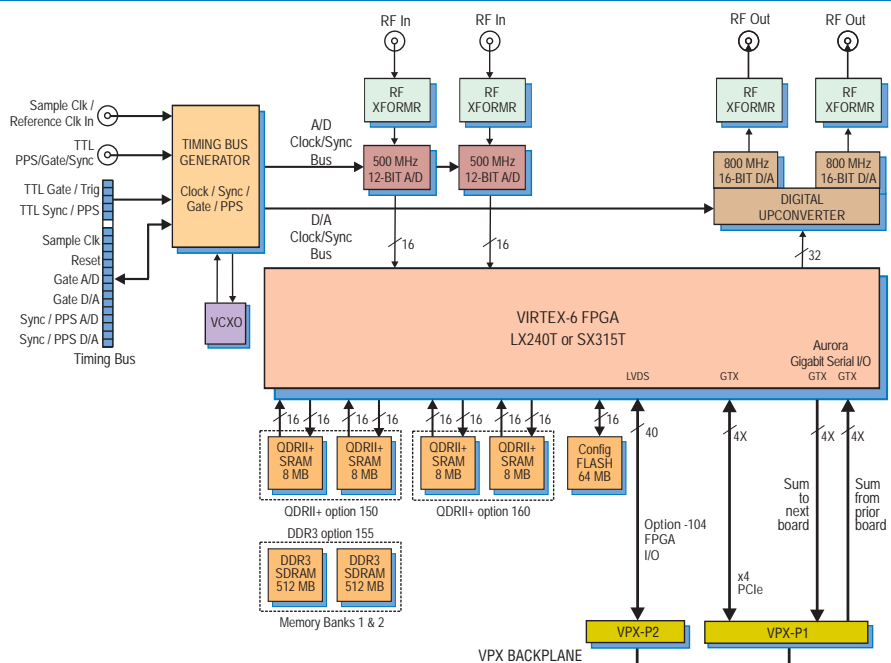

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

**A/D Acquisition IP Modules**

The 52651 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52651 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

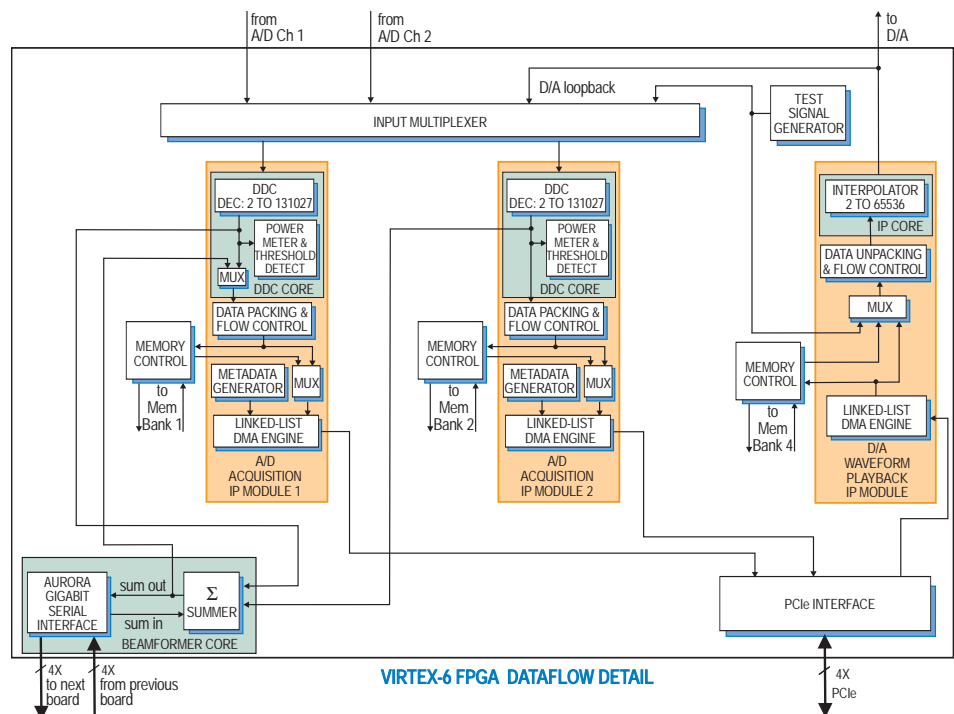

A programmable summation block provides summing of any of the two DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52651's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 52651 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52651's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52651 architecture supports up to three independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the boards's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 52651 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits ►

**Model 8267**

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt and Onyx VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240 FPGA
-064	XC6VSX315 FPGA
-104	LVDS FPGA I/O through the VPX P2 connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

➤ **A/D Converters (option -014)**  
**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

**Digital Downconverters**  
**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**  
**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator**  
**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformer**  
**Summation:** Two channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link over the VPX P1 connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs**  
**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**  
**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock  
**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference  
**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**  
**Standard:** Xilinx Virtex-6 XC6VLX240T-2  
**Optional:** Xilinx Virtex-6 XC6VSX315T-T2

**Custom I/O**  
**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**  
**Option -150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option -155 or -165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**  
**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52660 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Four 200 MHz 16-bit A/Ds
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52660 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

The 52660 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52660 factory-installed functions include four A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable

the 52660 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

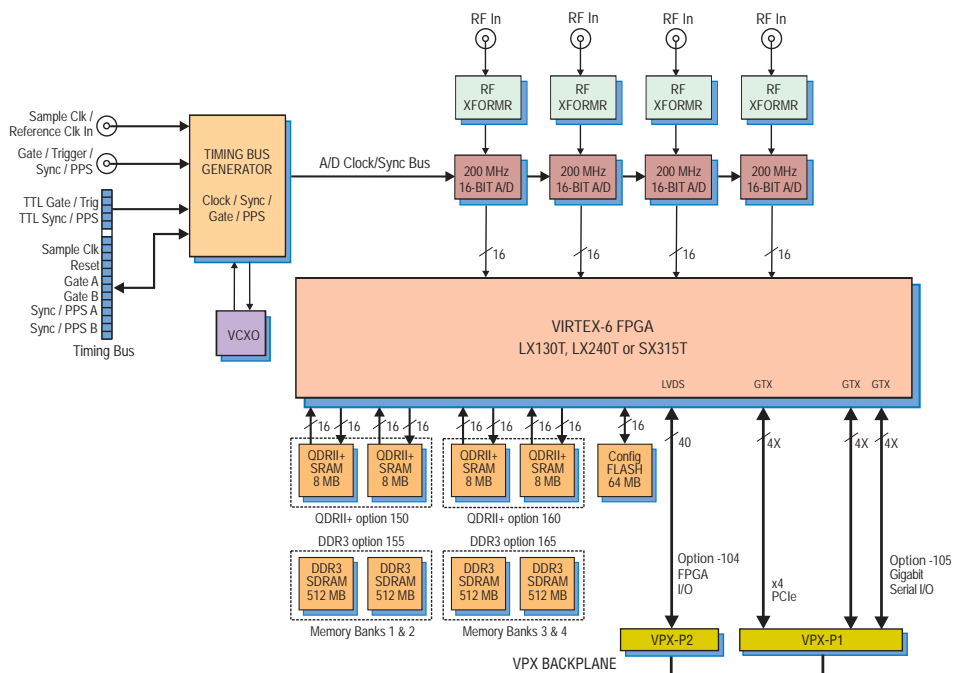

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52660's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

The 52660 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

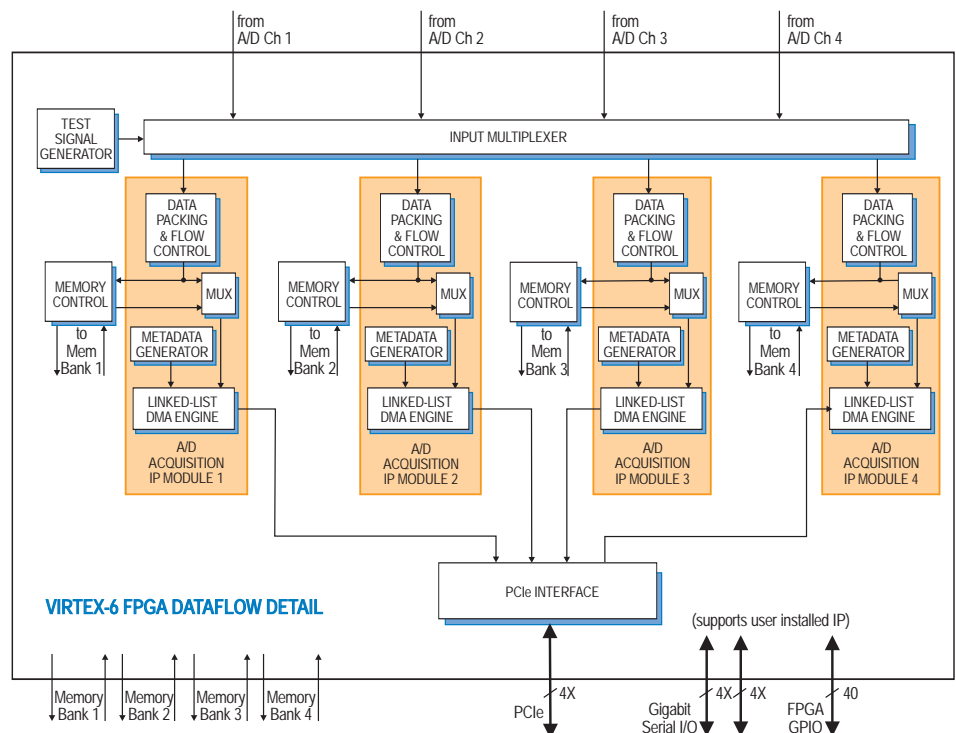

The Model 52660 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

A/D Acquisition IP Modules

The 52660 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52661 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52661 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52661 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52661 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (digital downconverter) IP core. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchro-

nization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52661 to operate as a complete turnkey solution without the need to develop any FPGA IP.

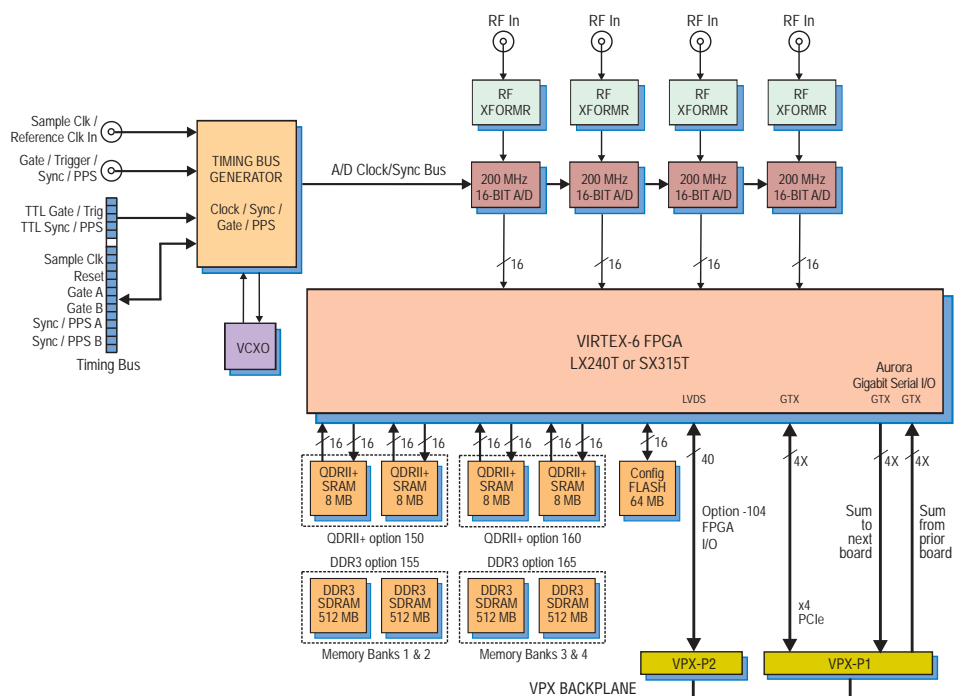

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 52661 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52661 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

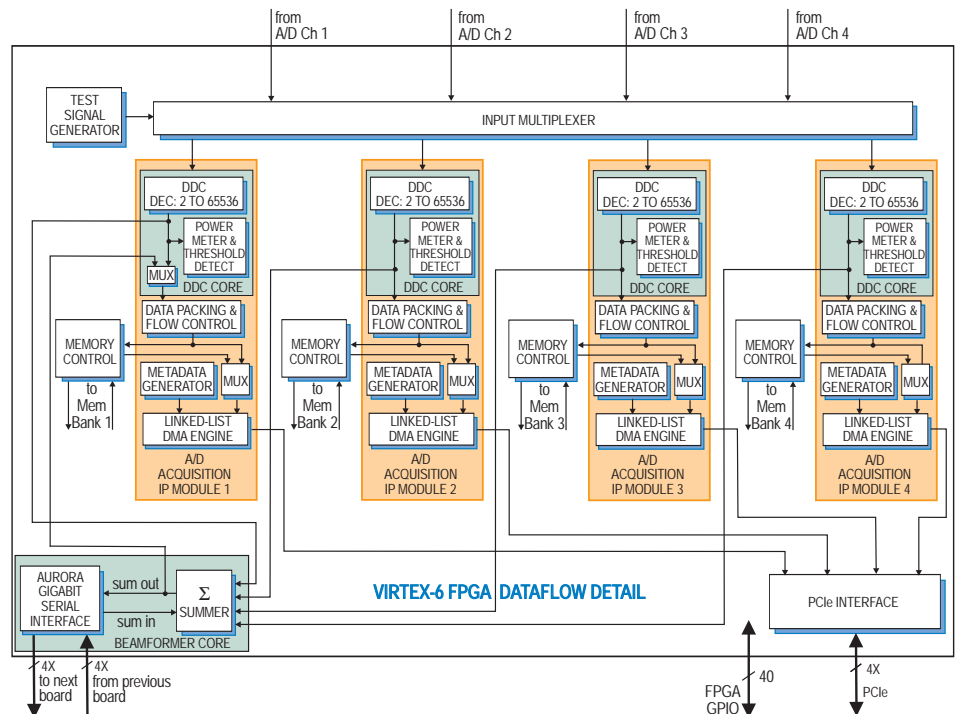

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage

**PCI Express Interface**

The Model 52661 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52661	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - 3U VPX
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

**Memory Resources**

The 52661 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For deeper memory resources, DDR3 SDRAM banks are 512 MB deep.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit

**Multiboard Sum Expansion:** 32-bit  
**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52662 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Up to 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52662 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed data converter with programmable DDCs (digital downconverters) is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution.

The 52662 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52662 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and trigger functions, a test signal generator, voltage and temperature monitoring, DDR3

SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable the 52662 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

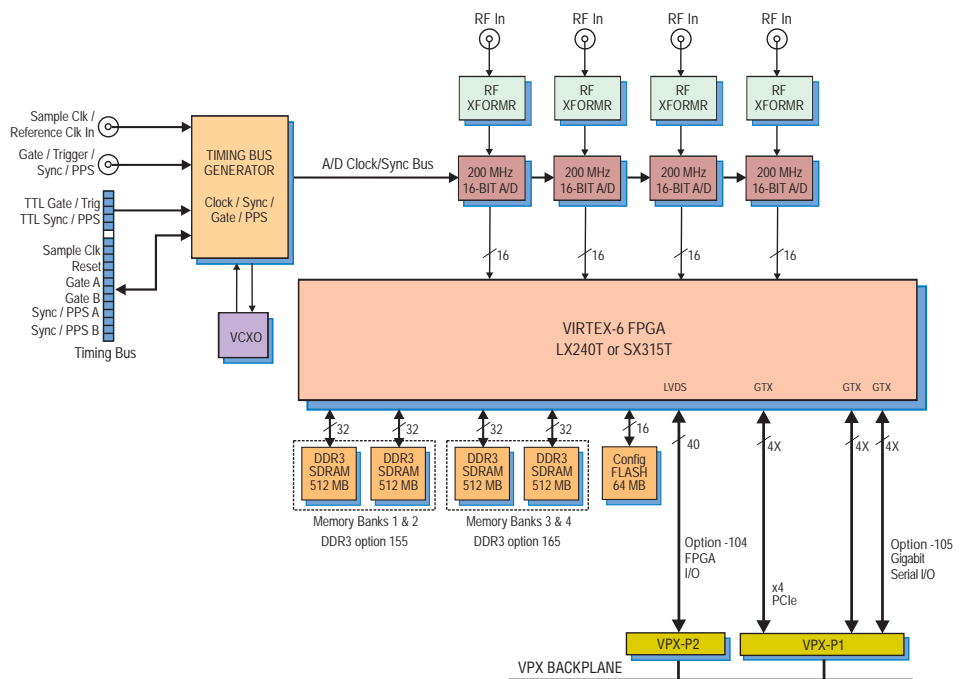

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52662 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range is programmable in steps of 8 from 16 to 1024 and steps of 64

from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

**► A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

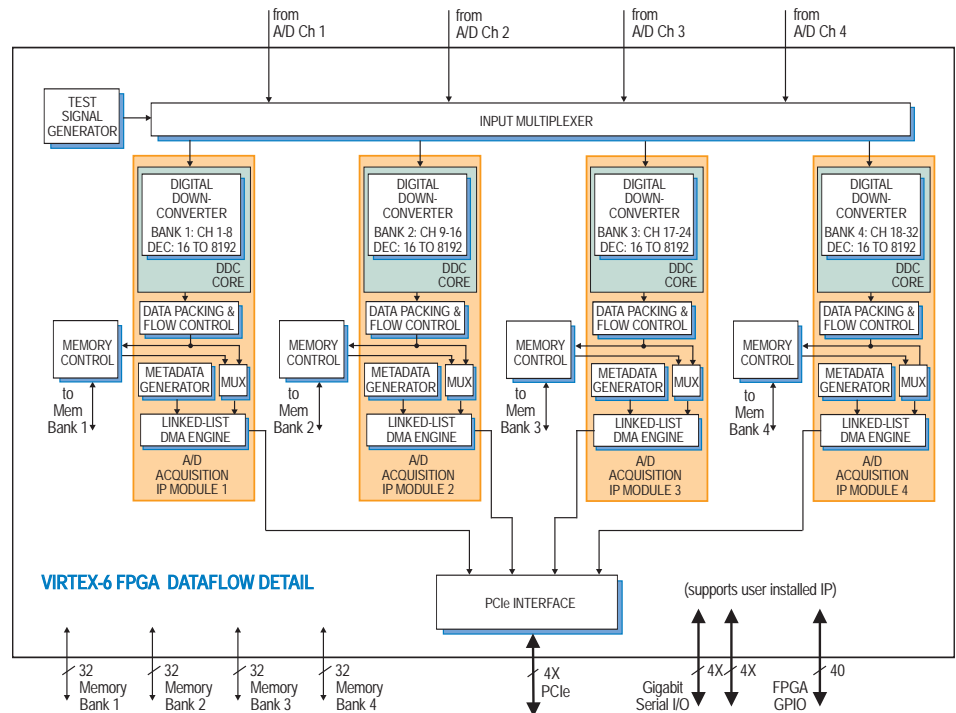

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52662’s can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52662 architecture supports up to four independent memory banks which can be configured with DDR3 SDRAM. ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52662	4-Ch 200 MHz A/D with 32-Ch DDC and Virtex-6 FPGA - 3U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6V SX315T FPGA
-104	LVDS FPGA I/O through VPX P2
-105	Gigabit serial FPGA I/O through VPX P1
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

The Model 52662 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user-programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6V SX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Lowest Price	Yes	No

Model 52663 Commercial (left) and rugged version

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x4
- 3U VPX form factor provides a compact, rugged platform

**General Information**

Model 52663 is a member of the Cobalt® family of high-performance VPX boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 2 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 52663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

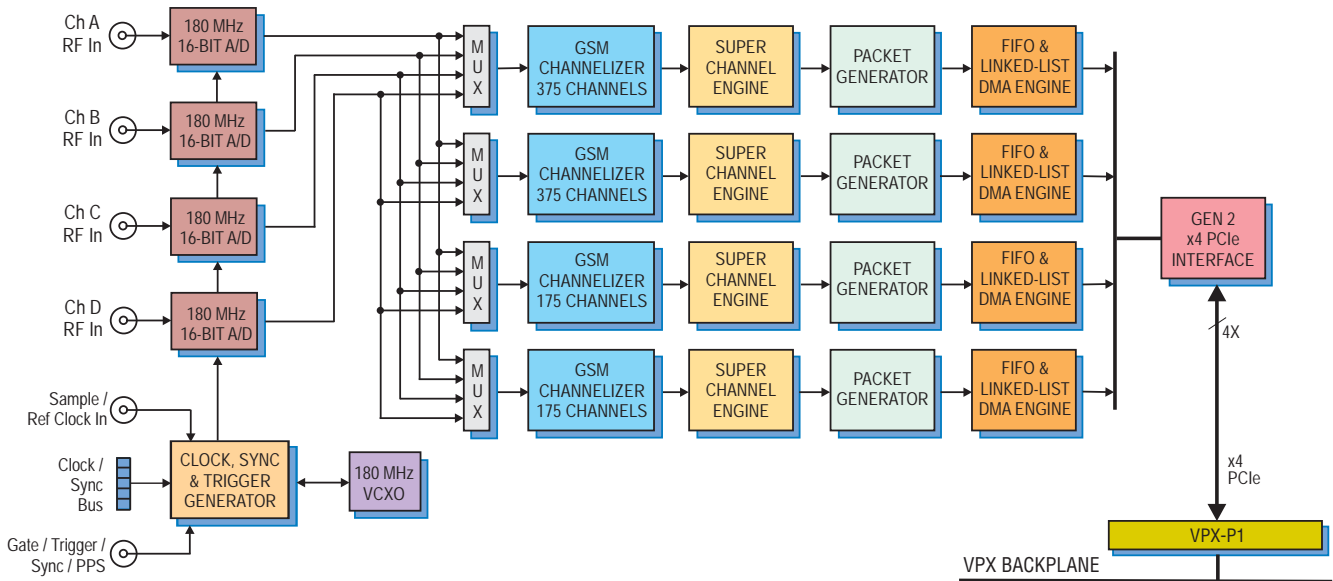

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**GSM Channelizer Cores**

The 52663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 52663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 52663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 2 GB/sec peak rate of PCIe Gen 2 x4 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is slightly above the capability of the PCIe Gen 2 x4 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 52663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x4, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 52663 and host. ►

► Specifications

Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

Clock Synthesizer

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 10 MHz system reference

External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

GSM Channel Banks

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs  
**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks  
**IF (Center) Freq:** 45, 135 or 225 MHz

DDC Channels

**Channel Spacing:** 200 kHz, fixed  
**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where k = 0 to 87, or 0 to 187

DDC Channel Filter Characteristics:

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)  
 > 18 dB attenuation at  $\pm 100$  kHz  
 > 78 dB attenuation at  $\pm 170$  kHz  
 > 83 dB attenuation at  $\pm 600$  kHz  
 > 93 dB attenuation at  $\pm 800$  KHz  
 > 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to  $180 \text{ MHz} * 13 / 2160 = 1.0833333 \text{ MS/sec}$

**DDC Data Output Format:** 24 bits I + 24 bits Q

Superchannels

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

Frequency Offsets for each DDC:

First:  $-f_s/4$  (-270.8333 kHz)  
 Second: 0 Hz  
 Third:  $+f_s/4$  (+270.8333 kHz)  
 Fourth:  $+f_s/2$  (+541.666 kHz)

Superchannel Sample Rate:  $f_s$

**Superchannel Output Format:** 26 bits I + 26 bits Q

**Number of Superchannels per Bank:** 175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6V5315T

PCI Express Interface

**PCI Express Bus:** Gen. 2 x8

Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 52664

# 4-Ch. 200 MHz A/D w. DDCs, VITA 49.0, Virtex-6 FPGA - 3U VPX

Model 52664 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- PCIe output supports VITA 49.0 Radio Transport (VRT) Standard
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 52664 is a member of the Cobalt® family of high-performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution. The 52664 PCIe output supports fully the VITA 49.0 Radio Transport (VRT) Standard.

The 52664 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52664 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (digital downconverter) IP core. IP modules for either DDR3 or QDRII+ memories, a

controller for all data clocking and synchronization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52664 to operate as a complete turnkey solution without the need to develop any FPGA IP.

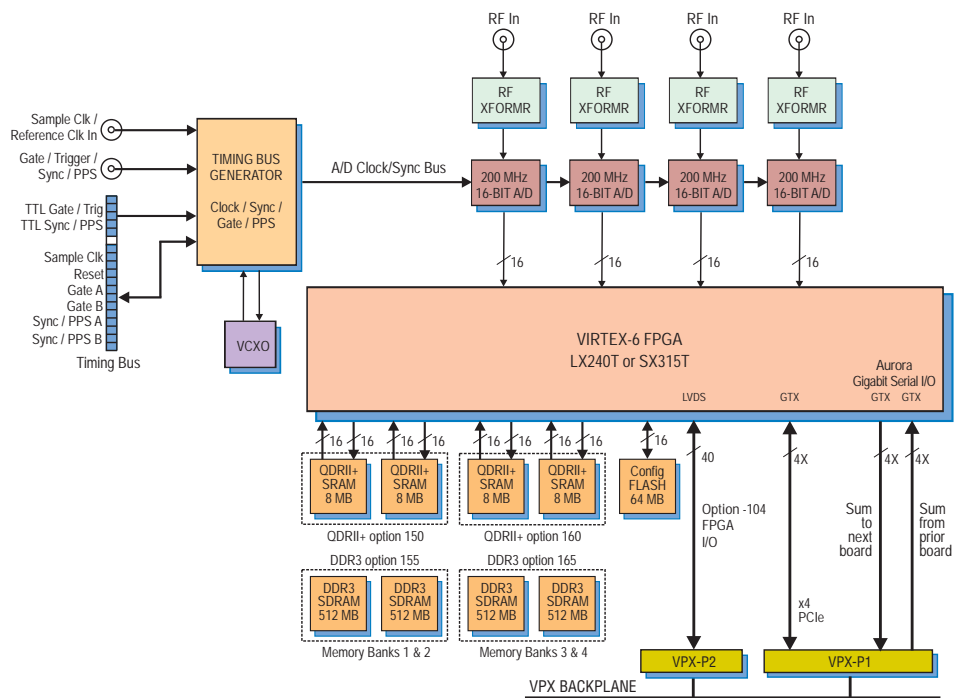

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 52664 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52664 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

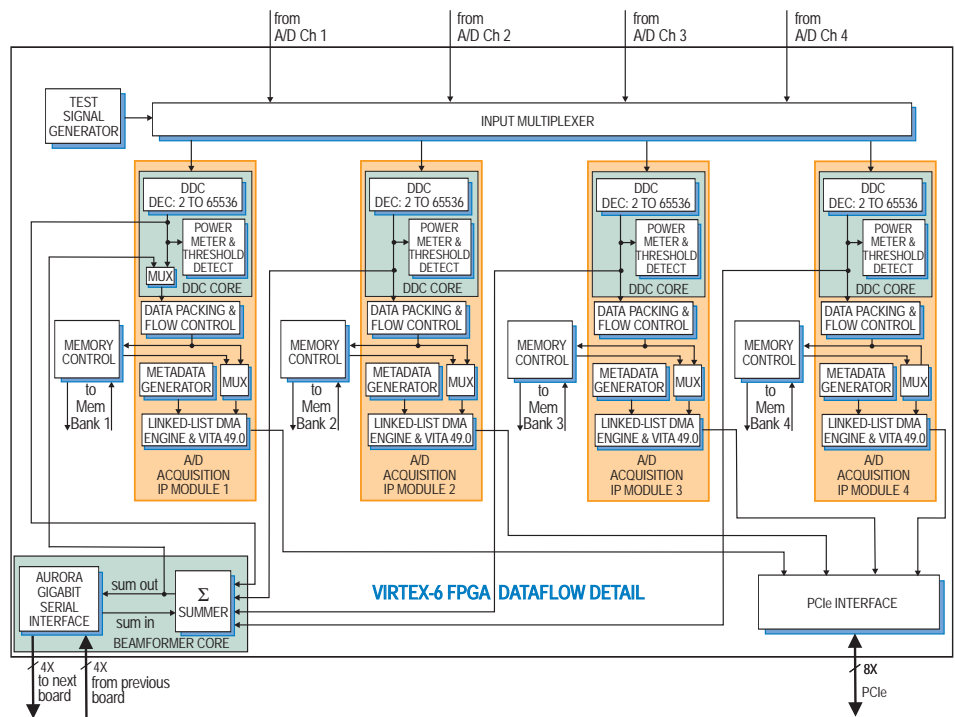

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52664's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA-49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

The 52664 supports fully the VITA 49.0 specification. ➤

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52664's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52664 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 52664 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► Specifications

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Sum Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VXSX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52670 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- User-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52670 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 over the 3U VPX backplane, the Model 52670 includes general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52670 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions,

a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 52670 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

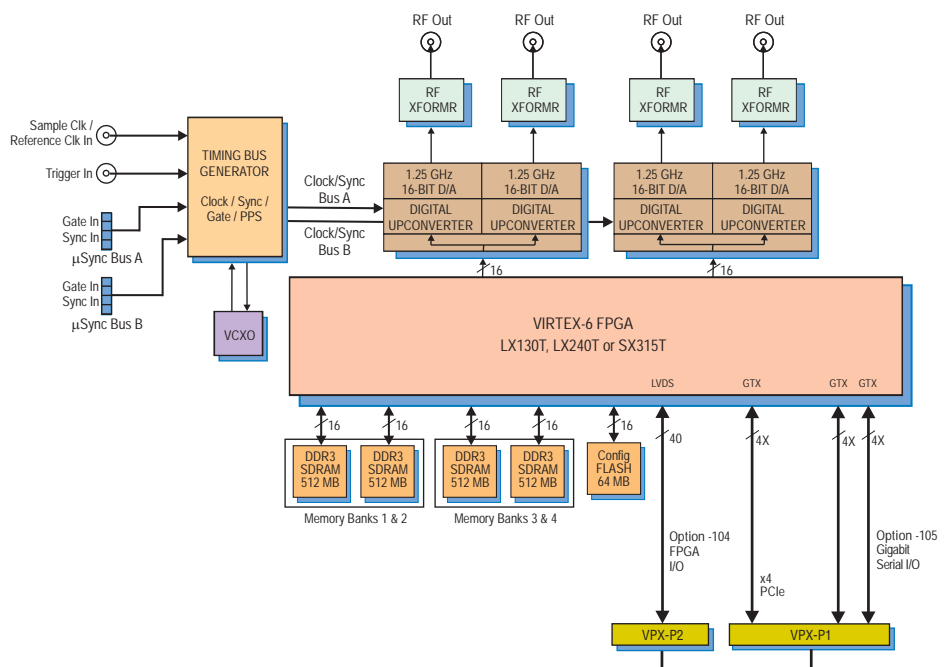

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by

2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 5292 or 9192 Cobalt Synchronizers can drive multiple 52670 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 52670 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

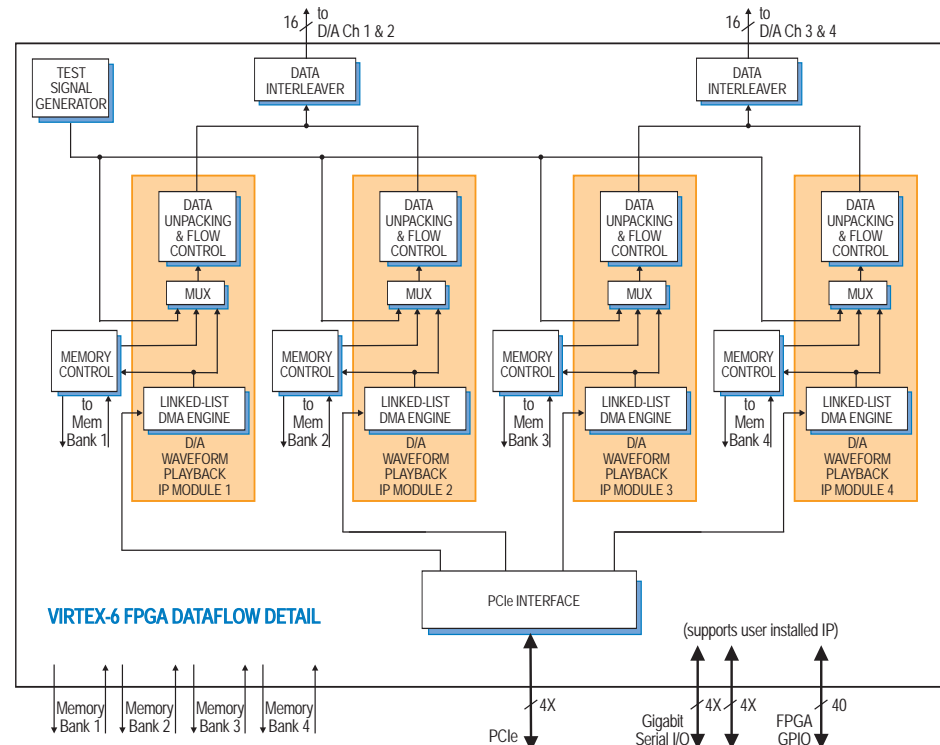

The Model 52670 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x4 lane interface includes multiple DMA controllers for efficient transfers to and from the board. ►

D/A Waveform Playback IP Module

The Model 52670 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4. Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**D/A Converters**

- Type: TI DAC3484
- Input Data Rate: 312.5 MHz max.
- Output Bandwidth: 250 MHz max.
- Output Sampling Rate: 1.25 GHz max. with interpolation
- Interpolation: 2x, 4x, 8x or 16x
- Resolution: 16 bits

**Front Panel Analog Signal Outputs**

- Quantity: Four D/A outputs
- Output Type: Transformer-coupled, front panel female SSMC connectors
- Full Scale Output: Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps
- Full Scale Output Programming:  $1.0 \times (G+1) / 16$  Vp-p, where 4-bit integer  $G = 0$  to 15

**Clock Synthesizer**

- Clock Source: Selectable from on-board programmable VCXO or front panel external clock
- VCXO Frequency Ranges: 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz
- Synchronization: VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz
- Clock Dividers: External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

**External Clock**

- Type: Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

**External Trigger Input**

- Type: Front panel female SSMC connector
- Function: Programmable functions include: trigger, gate, sync and PPS
- Timing Bus: 19-pin  $\mu$ Sync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

**Field Programmable Gate Array**

- Standard: Xilinx Virtex-6 XC6VLX130T-2
- Optional: Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

- Option -104: Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O
- Option -105: Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen 2: x4

**Environmental**

- Operating Temp: 0° to 50° C
- Storage Temp: -20° to 90° C
- Relative Humidity: 0 to 95%, non-cond.
- Size: 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52671 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- Extended interpolation range from 2x to 1,048,576x
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52671 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As with a wide range of programmable interpolation factors, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 over the 3U VPX backplane, the Model 52671 includes optional general-purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52671 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all

data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 52671 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

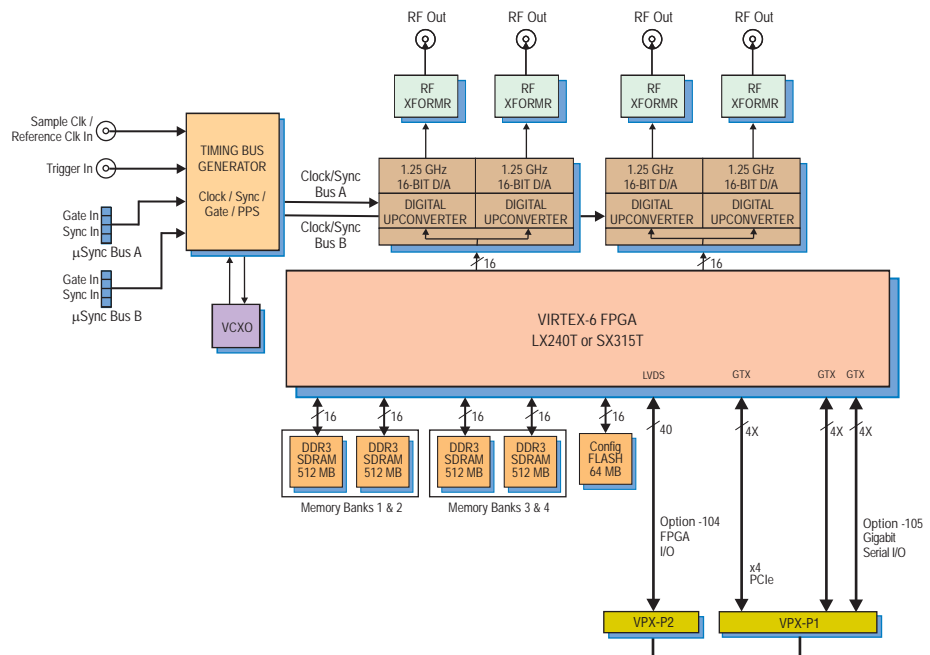

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, the 52671 features an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An

on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 5292 or 9192 Cobalt Synchronizers can drive multiple 52671 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 52671 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

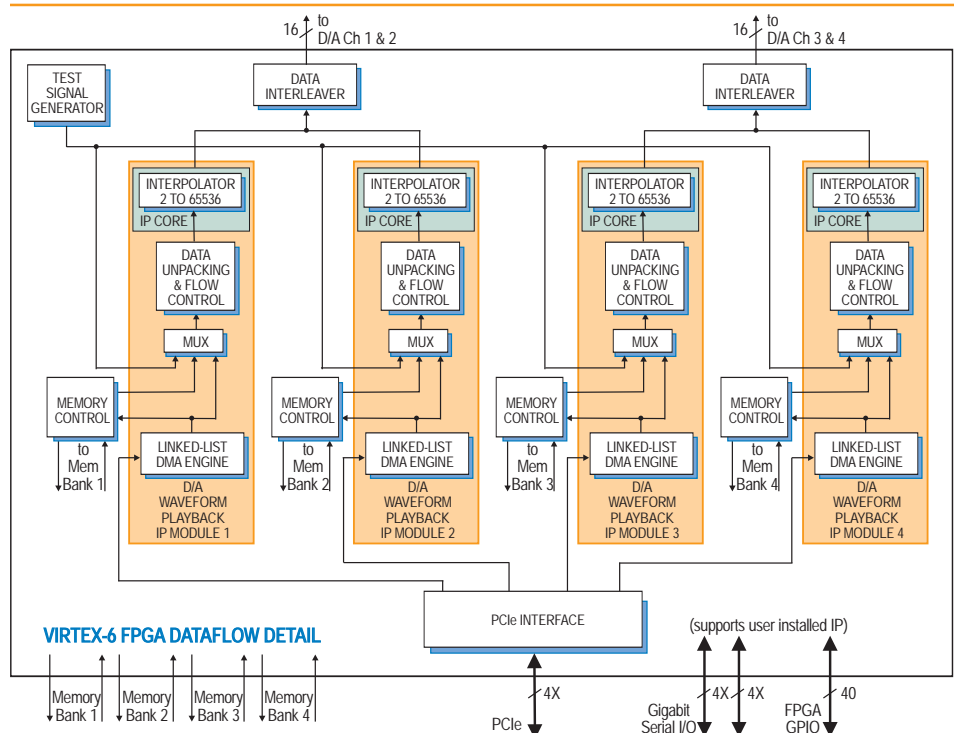

D/A Waveform Playback IP Module

The Model 52671 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked-list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52671	4-Channel 1.25 GHz D/A with DUC, Extended Interpolation and Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

**► PCI Express Interface**

The Model 52671 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x4 lane interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**D/A Converters**

- Type:** TI DAC3484
- Input Data Rate:** 312.5 MHz max.
- Output Bandwidth:** 250 MHz max.
- Output Sampling Rate:** 1.25 GHz max. with interpolation
- Interpolation:** 2x, 4x, 8x or 16x
- Resolution:** 16 bits

**Digital Interpolator**

- Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Front Panel Analog Signal Outputs**

- Quantity:** Four D/A outputs
- Output Type:** Transformer-coupled, front panel female SSMC connectors
- Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps
- Full Scale Output Programming:** 1.0x(G+1)/16 Vp-p, where 4-bit integer G = 0 to 15

**Clock Synthesizer**

- Clock Source:** Selectable from on-board programmable VCXO or front panel external clock
- VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz
- Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz
- Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

**External Clock**

- Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

**External Trigger Input**

- Type:** Front panel female SSMC connector
- Function:** Programmable functions include: trigger, gate, sync and PPS
- Timing Bus:** 19-pin µSync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

**Field Programmable Gate Array:**

- Standard:** Xilinx Virtex-6 XC6VLX240T-2
- Optional:** Xilinx Virtex-6 XC6VSX315T-2

**Custom I/O**

- Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O
- Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52690 COTS (left) and rugged version

**Features**

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA boosts LNB antenna signal levels with up to 60 dB gain
- Programmable analog downconverter provides I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two 200 MHz 16-bit A/Ds
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52690 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A 2-Channel high-speed data converter, it is suitable for connection directly to the RF port of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The Model 52690 includes an L-Band RF tuner, two A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52690 factory-installed functions include two A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the

factory-installed functions and enable the 52690 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

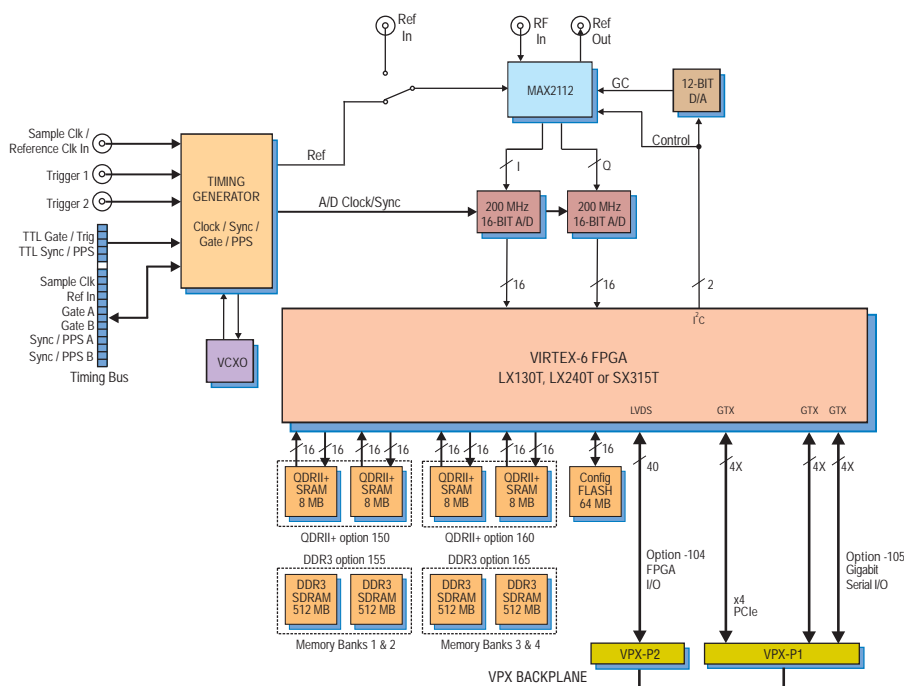

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides dual 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► RF Tuner Stage

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz from an antenna LNB (low noise block). A Maxim MAX2112 tuner directly converts these L-Band signals to baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA (low noise amplifier), a PLL (phase-locked loop) synthesized local oscillator, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

An integrated lowpass filter with variable bandwidth provides bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

A/D Converter Stage

The analog baseband I and Q analog tuner outputs are then applied to two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

A/D Clocking and Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

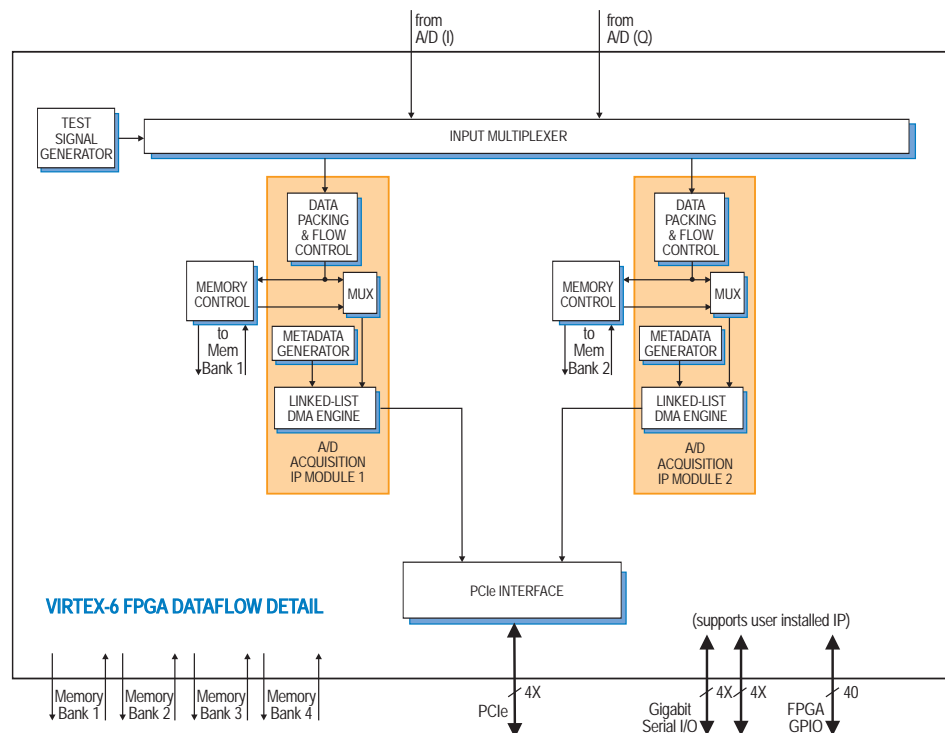

The 52690 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

A/D Acquisition IP Modules

The 52690 features two A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**PCI Express Interface**

The Model 52690 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52690	L-Band RF Tuner with 2-Channel 200 MHz A/D and Virtex-6 FPGA - 3U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6V SX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-150	Two 8 MB QDR II+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDR II+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► Each QDR II+ SRAM bank can be up to 8 MB deep and is an integral part of the module’s DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D Acquisition Modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA .

**Specifications**

**Front Panel Analog Signal Input**

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

**L-Band Tuner**

**Type:** Maxim MAX2112  
**Input Frequency Range:** 925 MHz to 2175 MHz  
**Monolithic VCO Phase Noise:** -97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$freq_{VCO} = (N.F) \times freq_{REF}$   
 where integer N = 19 to 251 and fractional F is a 20-bit binary value  
**PLL Reference (freq<sub>REF</sub>):** Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*  
**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

\***Usable Full-Scale Input Range:** -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board timing generator/synthesizer

**A/D Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Input**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled,

50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6V SX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 150 or 160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

Model 52720 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 and 2) interface up to x4
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52720 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52720 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52720 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 52720 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

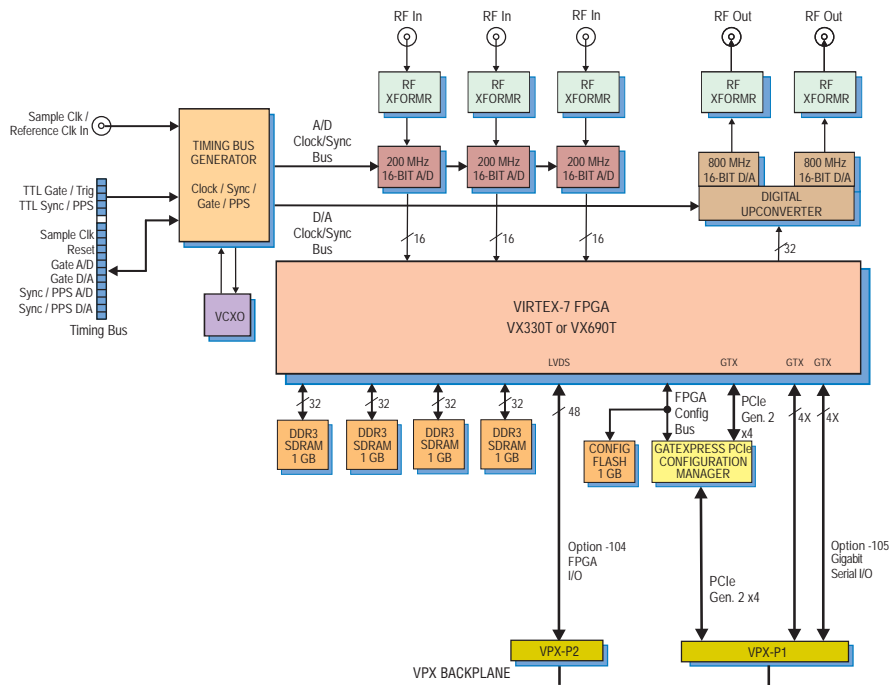

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52720 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 52720 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

**A/D Converter Stage**

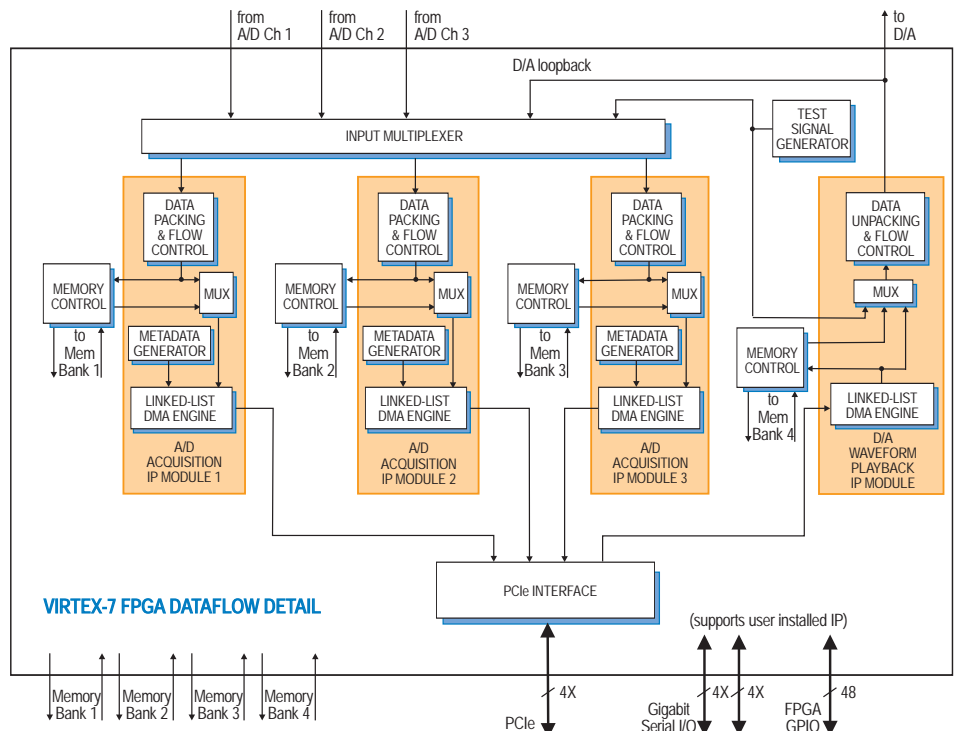

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband ►

**Memory Resources**

The 52720 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

**PCI Express Interface**

The Model 52720 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - 3U VPX

**Options:**

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

► input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable VCXO. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the VCXO.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52721 COTS (left) and rugged version

**Features**

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52721 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52721 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52721 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

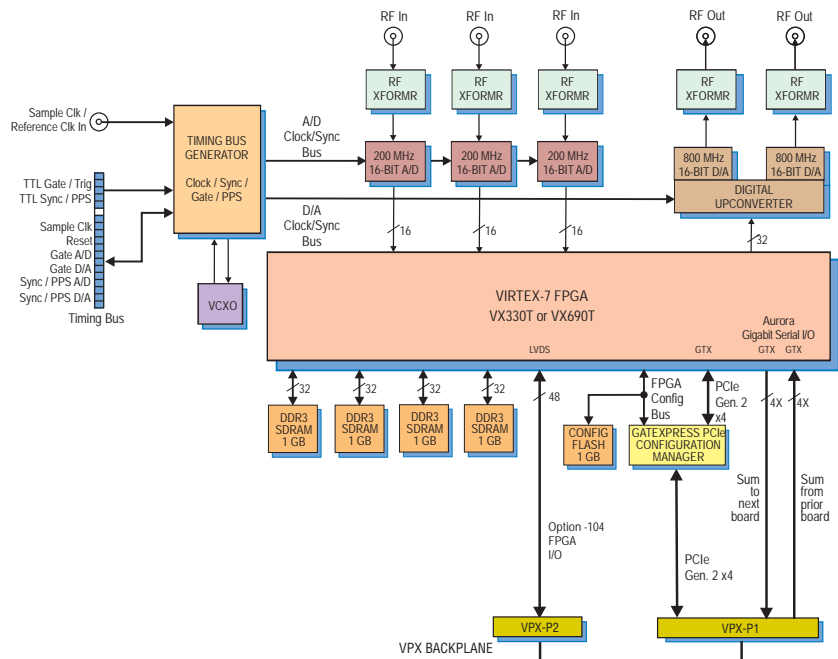

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 52721 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52721 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

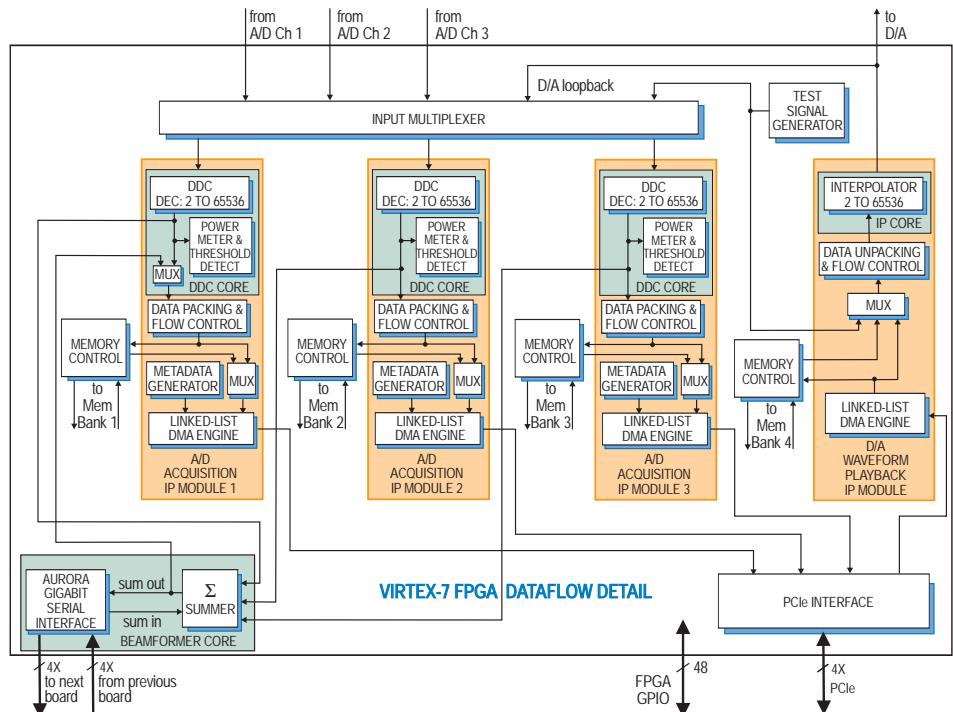

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52721's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 52721 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

## Memory Resources

The 52721 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 52721 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

## Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52721's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ►

► Specifications

Front Panel Analog Signal Inputs

**Input:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

Digital Downconverters

**Quantity:** Three channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4

Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Lowest Price	Yes	No

Model 52730 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 and 2) interface up to x4
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52730 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes 1 GHz A/D and D/A converters and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52730 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 52730 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

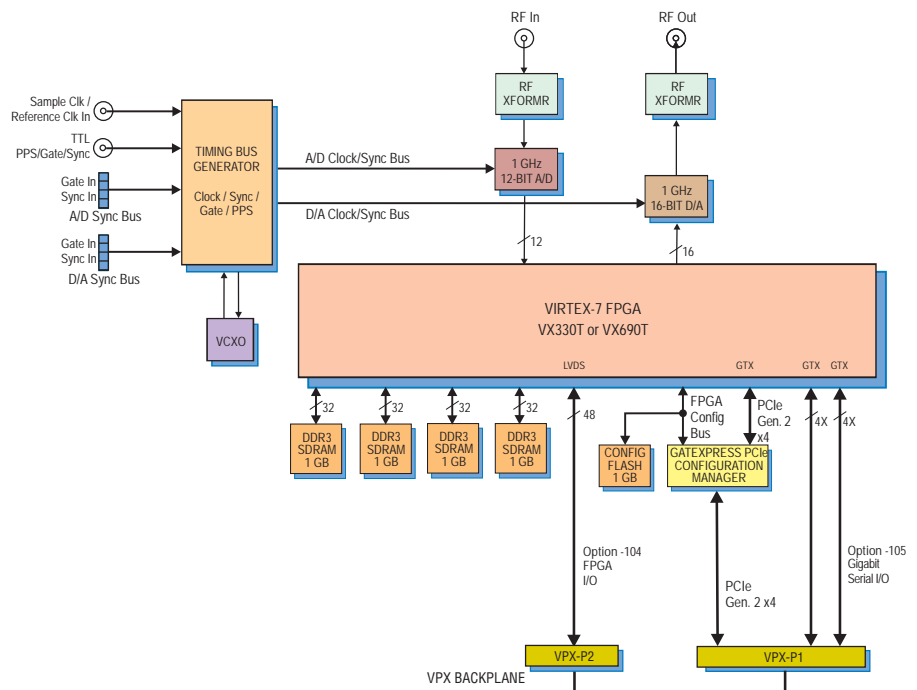

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 52730 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 52730 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board’s configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board’s PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

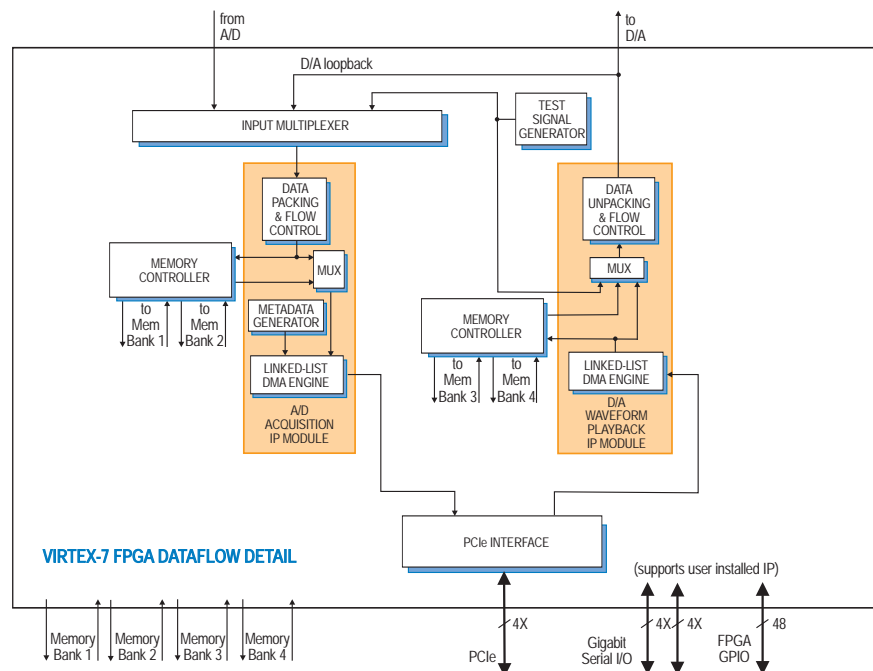

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 52730 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector. ►

**Memory Resources**

The 52730 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

**PCI Express Interface**

The Model 52730 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
52730	1 GHz A/D and D/A, Virtex-7 FPGA - 3U VPX

**Options:**

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel µSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 5292 and Model 9192 Cobalt Synchronizers can drive multiple 52730 µSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52741 COTS (left) and rugged version

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 4 GB of DDR3 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)

**General Information**

Model 52741 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 52741 includes an optional connection to the Virtex-7 FPGA for custom I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 52741 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR3 SDRAM

memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 52741 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

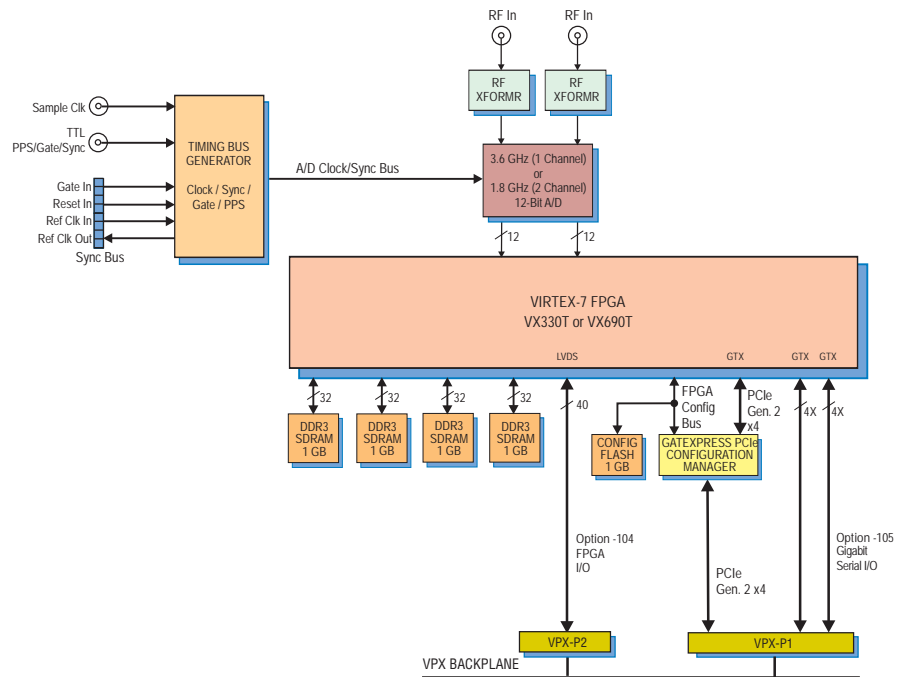

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 52741 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

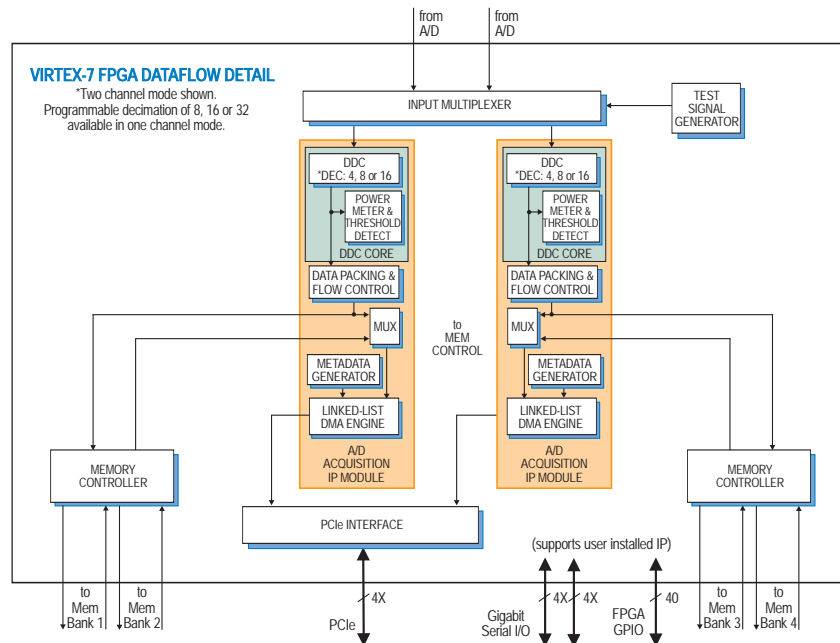

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply ►

**Memory Resources**

The 52741 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

**PCI Express Interface**

The Model 52741 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 52741 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

**Clocking and Synchronization**

The 52741 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 52741's can be synchronized with a simple cable. For larger systems, multiple 52741's can be synchronized using the Model 5292 high-speed sync board to drive the sync bus.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR3 SDRAM

Model 52751 commercial (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)

**General Information**

Model 52751 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A two-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 52751 includes two A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52751 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates

to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 52751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

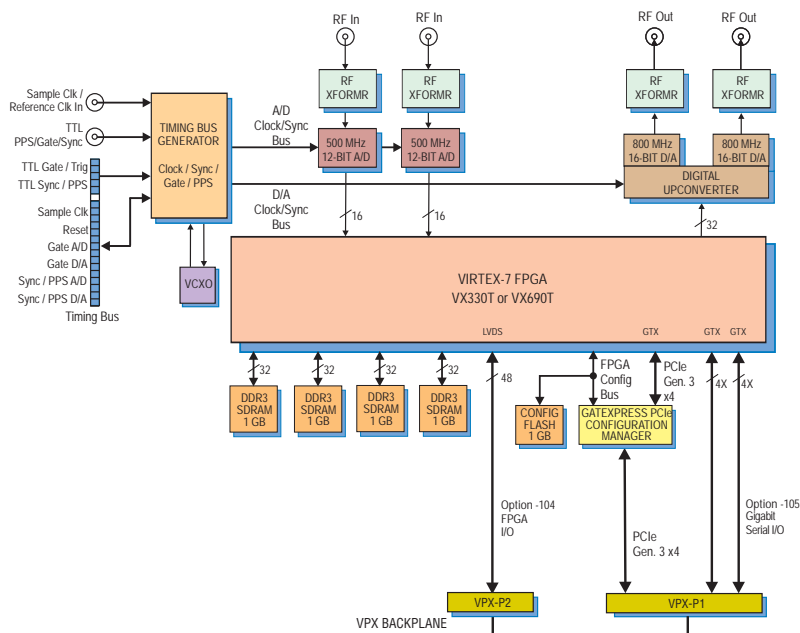

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 52751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

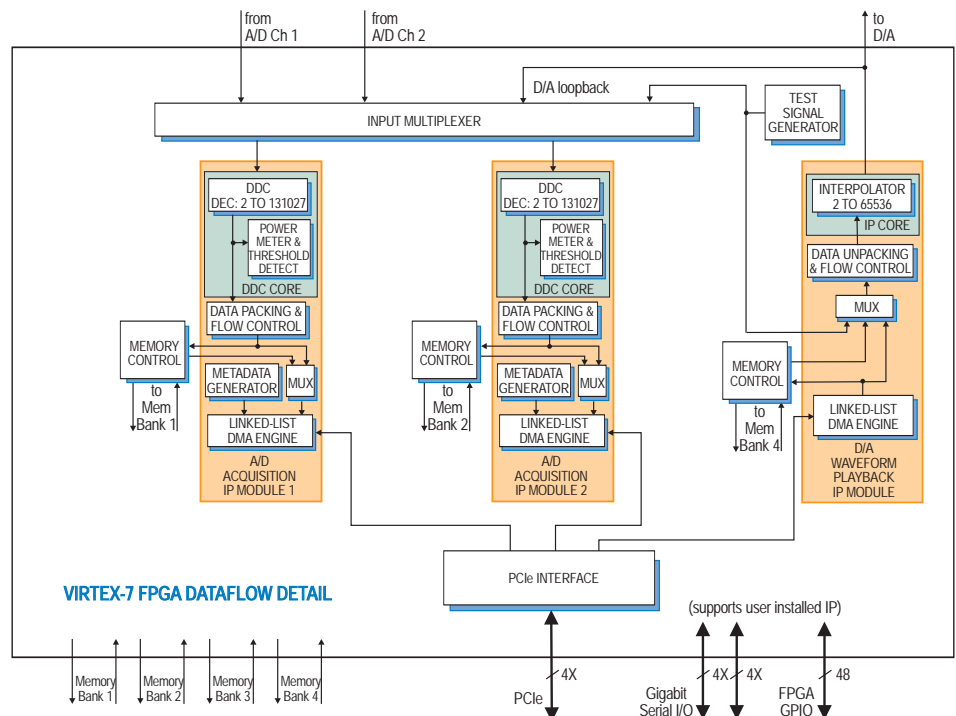

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 52751 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3\* bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

\* Gen 3 requires a compatible backplane and SBC

► Specifications

Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

Timing Bus: 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3\*: x4

Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Ordering Information

Model	Description
52751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 3U VPX

Options:

-014	400 MHz, 14-bit A/Ds
-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

\* Gen 3 requires a compatible backplane and SBC

Model 52760 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52760 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The 52760 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt Family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52760 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer. IP modules for DDR3 SDRAM memories, a controller for all data clocking

and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 52760 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

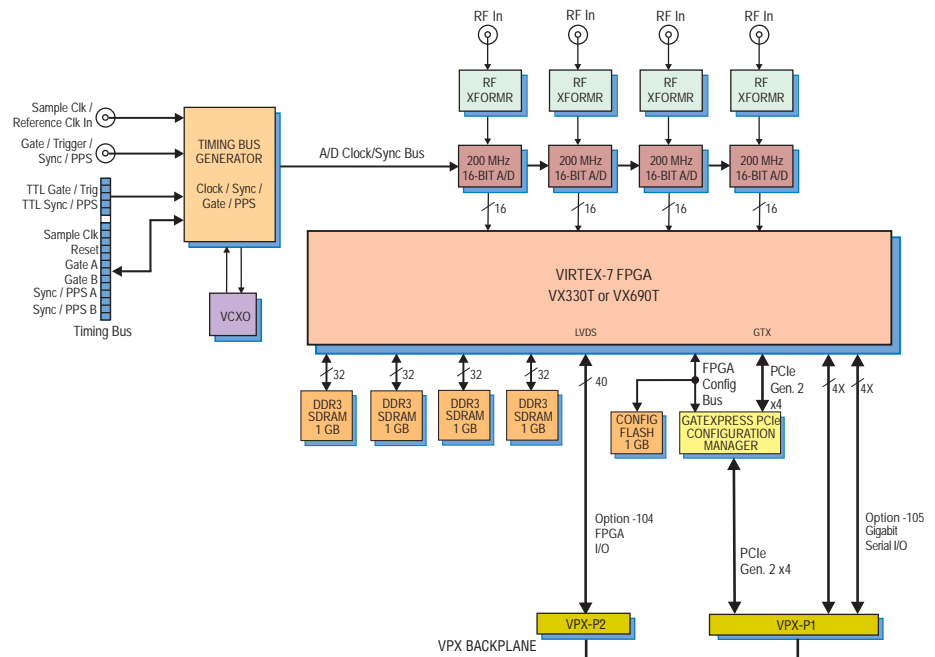

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

Clocking and Synchronization

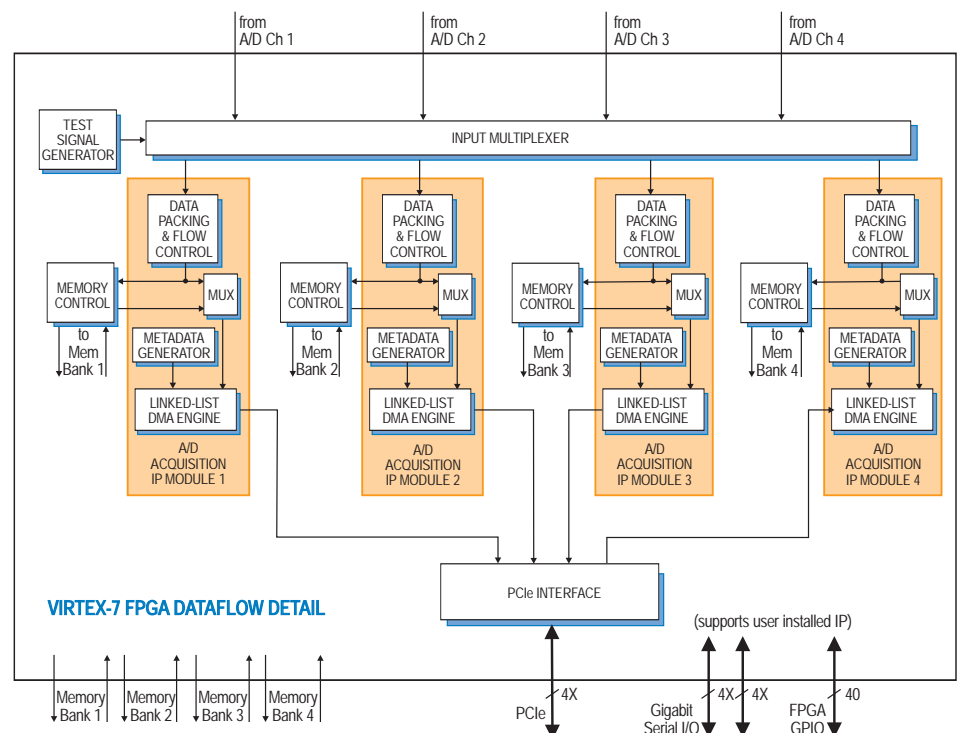

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel ►

A/D Acquisition IP Modules

The 52760 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**PCI Express Interface**

The Model 52760 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52760's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52760 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52761 COTS (left) and rugged version

**Features**

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52761 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with programmable DDCs (Digital Downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52761 includes an optional connection to the Virtex-7 FPGA for custom I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52761 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 52761 to operate as a complete turnkey solution without the need to develop any FPGA IP.

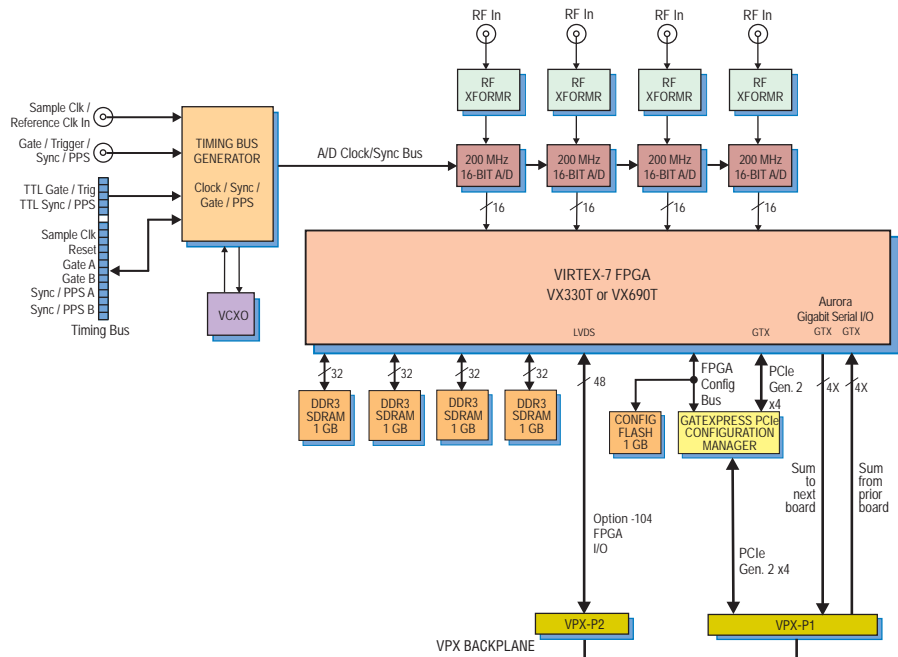

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

**A/D Acquisition IP Modules**

The 52761 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_{sr}$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 52761 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

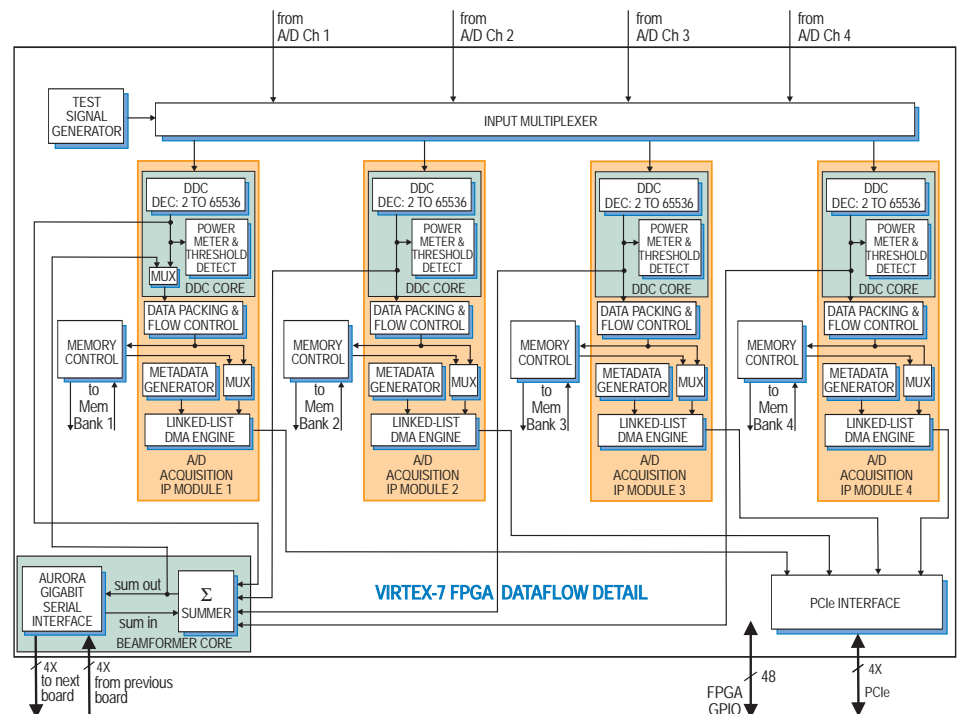

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 52761's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous

sampling and sync functions across all connected boards.

### Memory Resources

The 52761 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 52761 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► Specifications

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Model 52791

# L-Band RF Tuner, 2-Chan. 500 MHz A/D, Virtex-7 FPGA - 3U VPX

Model 52791 COTS (left) and rugged version

## Features

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA handles L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverter provides IF or I+Q baseband signals at frequencies up to 123 MHz
- Two 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2, & 3) interface, up to x4
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

## General Information

Model 52791 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. It is suitable for connection directly to an L-band signal for SATCOM and communications systems. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52791 includes general purpose and gigabit serial connectors for application-specific I/O.

## The Onyx Architecture

The Pentek Onyx Architecture features a Virtex-7 FPGA. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The 52791 factory-installed functions include two A/D acquisition IP modules, four DDR3 memory controllers, two DDCs (digital downconverters), an RF tuner controller, a clock and synchronization generator, a test signal generator, and a Gen 3 PCIe interface.

Thus, the 52791 can operate as a complete turnkey solution with no need to develop FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

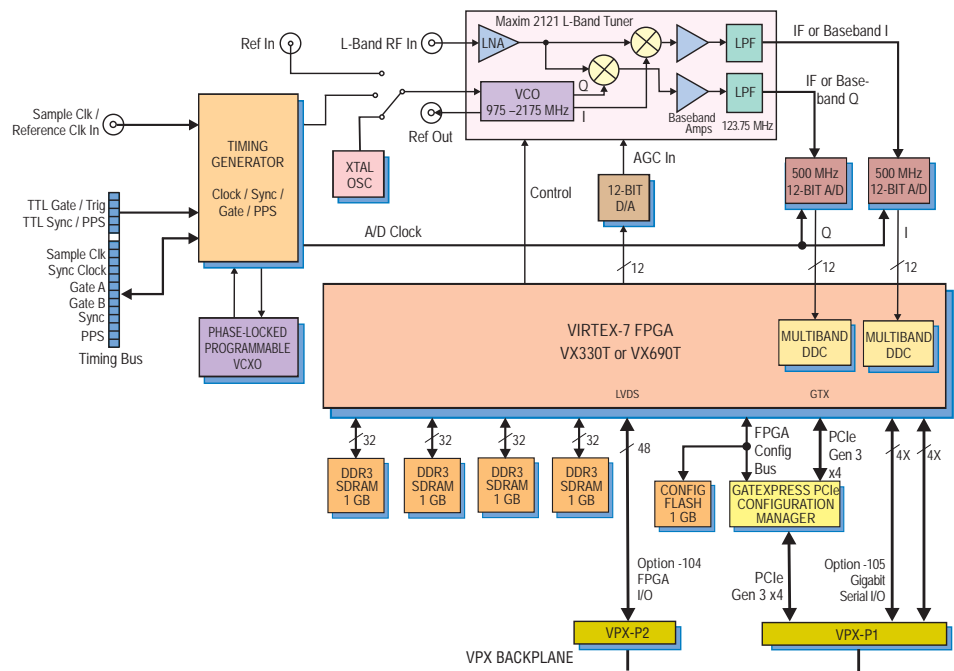

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 52791 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

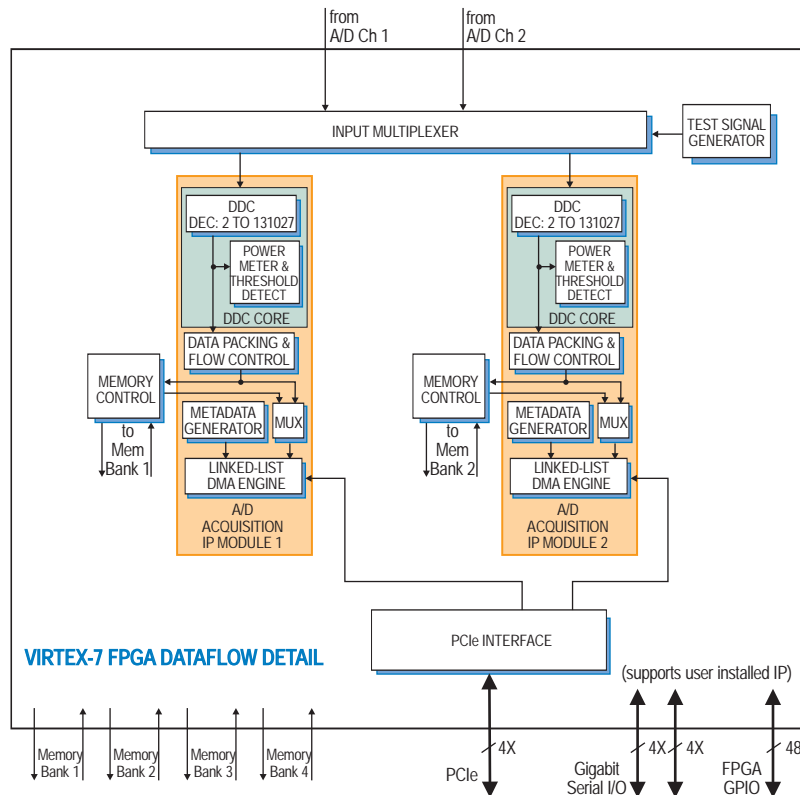

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each.

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The two analog tuner outputs are digitized by two Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two independent A/D and DDC channels are now available for digitizing and downconverting two signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front-panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52791 architecture supports four independent 1 GB DDR3 SDRAM for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 and 2. Banks 3 and 4 can be used to support custom user-installed IP within the FPGA.

### PCI Express Interface

The Model 52791 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► Specifications

Front Panel Analog Signal Input

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

L-Band Tuner

**Type:** Maxim MAX2121  
**Input Frequency Range:** 925 MHz to 2175 MHz  
**Monolithic VCO Phase Noise:** -97 dBc/Hz at 10 kHz  
**Fractional-N PLL Synthesizer:**  
 $f_{req_{VCO}} = (N.F.) \times f_{req_{REF}}$   
 where integer N = 19 to 251 and fractional F is a 20-bit binary value  
**PLL Reference** ( $f_{req_{REF}}$ ): Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz  
**LNA Gain:** 60 dB range, controlled by a programmable 12-bit D/A converter  
**Usable Full-Scale Input Range:** -50 dBm to +10 dBm  
**Baseband Low Pass Filter:** 3 dB cutoff frequency: 123.75 MHz

A/D Converters

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 10 MHz to 500 MHz  
**Resolution:** 12 bits  
**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources:** On-board timing generator/synthesizer

A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

External Trigger Input

**Quantity:** 2  
**Type:** Front panel female SSMC connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O  
**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3\*: x4

Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Model 52131

# 8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

Model 52131 COTS (left) and rugged version

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 52131 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52131 is a multichannel, high-speed data converter with multiband DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multi-board clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52131 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52131 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

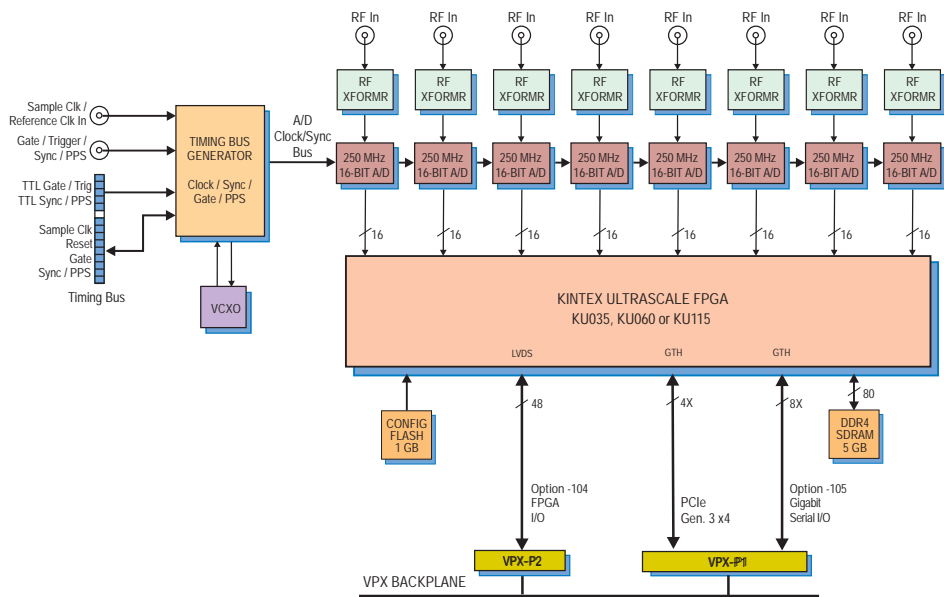

Each of the eight acquisition IP modules contains a powerful, multiband DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 52131 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through ➤

**A/D Acquisition IP Modules**

The 52131 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an

output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **KU115.** The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 connects one 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the

A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

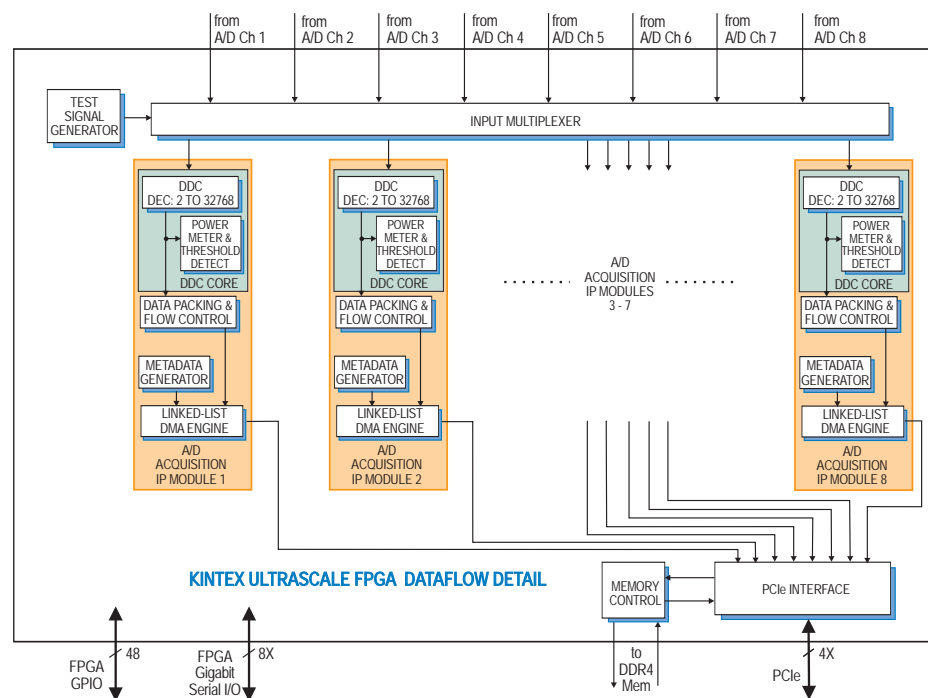

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The 52131 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-105	Gigabit serial FPGA I/O
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**► PCI Express Interface**

The Model 52131 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >108 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female MMCX connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Connects 24 LVDS pairs between the FPGA and VPX P2  
**Option -105:** Connects eight gigabit serial lanes between the FPGA and VPX P1

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Standard: L0 (air cooled)**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing  
**Option -702: L2 (air cooled)**  
**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing  
**Option -713: L3 (conduction cooled)**  
**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100.00 mm x 170.60 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

New!

# Model 52132

# 8-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - 3U VPX

Model 52132 COTS (left) and rugged version

## General Information

Model 52132 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52132 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52132 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52132 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 52132 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

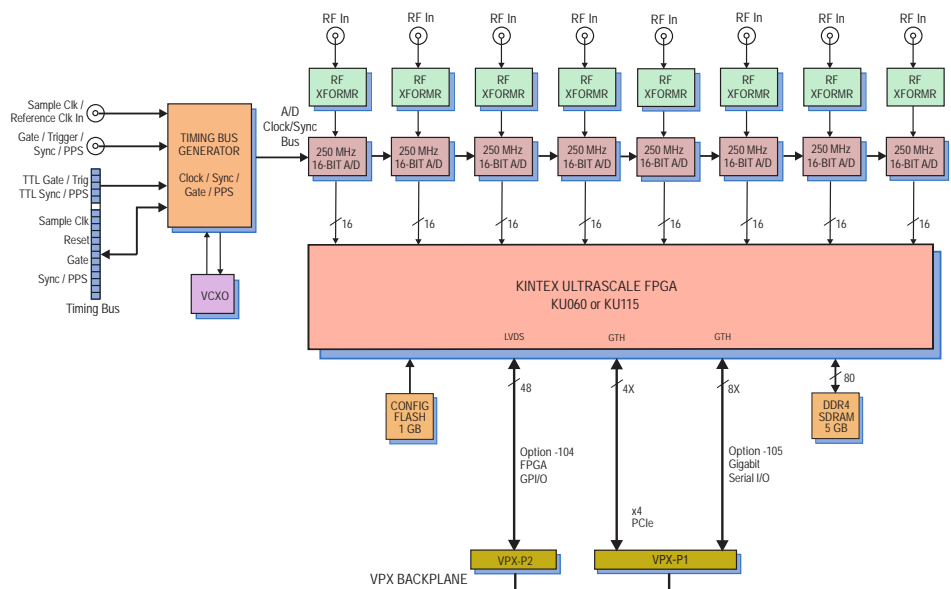

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU 115. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight wideband DDCs (digital downconverters)
- 64 multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 52132 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each acquisition module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

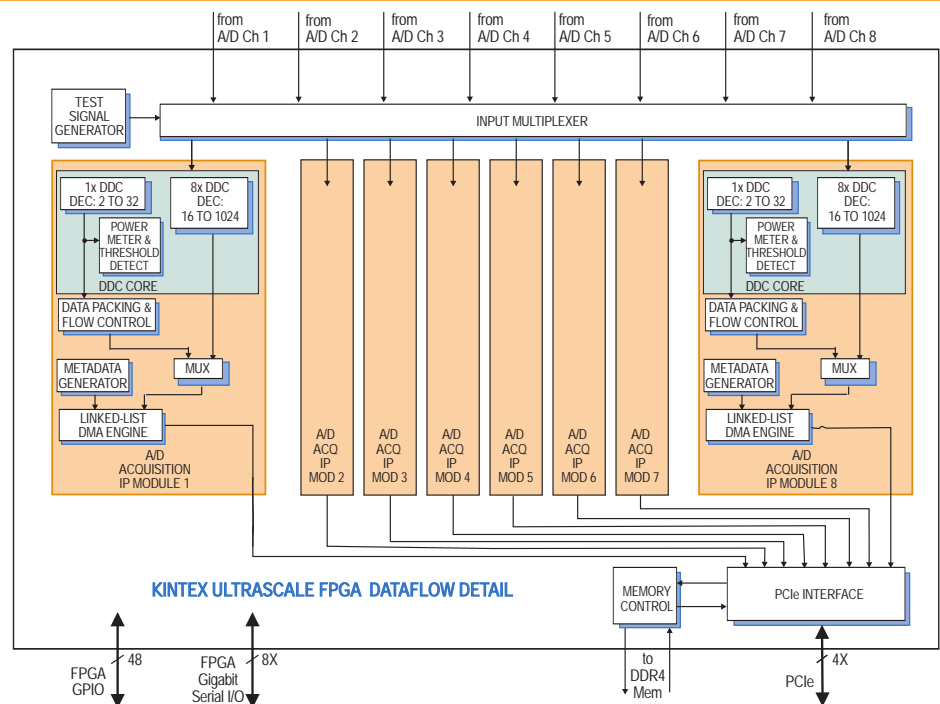

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 5293 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of it for custom applications. ►

► **PCI Express Interface**

The Model 52132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
52132	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX
<b>Options:</b>	
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through VPX P2
-105	Gigabit serial FPGA I/O through VPX P1 connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Specifications**

**Front Panel Analog Signal Inputs**  
**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**  
**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

**Wideband Digital Downconverters**  
**Quantity:** Eight channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Multiband Digital Downconverters**  
**Quantity:** Eight banks, 8 channels per bank  
**Decimation Range:** 2x to 1024x in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**  
**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**  
**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female MMCX connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.  
**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Standard: L0 (air cooled)**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C

**Option -702: L2 (air cooled)**  
**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C

**Option -713: L3 (conduction cooled)**  
**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity in all cases:** 0 to 95%, non-condensing  
**Size:** Board 3.937 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, refer to its datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
<b>Form Factor</b>	3U VPX	
<b># of XMCs</b>	One XMC	
<b>Crossbar Switch</b>	No	Yes
<b>PCIe path</b>	VPX P1	VPX P1 or P2
<b>PCIe width</b>	x4	x4 or x8
<b>Option -104 path</b>	24 pairs on VPX P2	20 pairs on VPX P2
<b>Option -105 path</b>	One x8 on VPX P1	One x8 on VPX P1 or P2
<b>Lowest Power</b>	Yes	No
<b>Lowest Price</b>	Yes	No

New

# Model 52141

# 1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - 3U VPX

Model 52141CORS (left) and Rugged versions

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 6.4 GHz, 12-bit A/D
- Two-channel mode with 3.2 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- Two 6.4 GHz, 14-bit D/As
- Programmable DUCs (Digital Upconverters)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 52141 is a member of the Jade™ family of high-performance PCIe modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52141 is a high-speed analog-to-digital and digital-to-analog converter with programmable DDCs (digital downconverters) and DUCs (digital upconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and generator features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 6.4 GHz, 12-bit A/D converter, dual 6.4 GHz, 14-bit D/As and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 52141 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

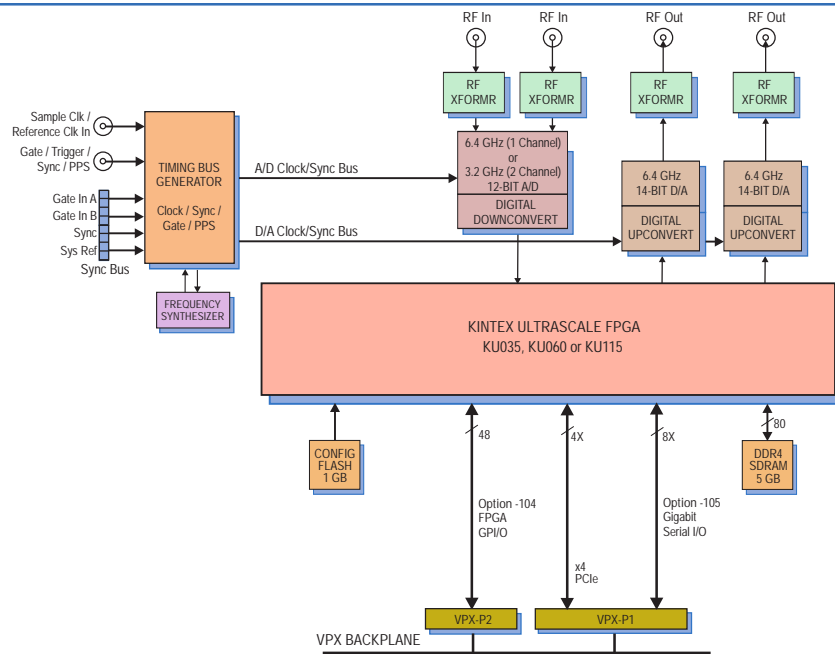

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52141 factory-installed functions include two A/D acquisition and two D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 52141 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

**A/D Acquisition IP Module**

The 52141 features two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The Model 52141 factory-installed functions include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the dual D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D’s built-in digital down-converters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real

or complex baseband input signals. It delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The 52141 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

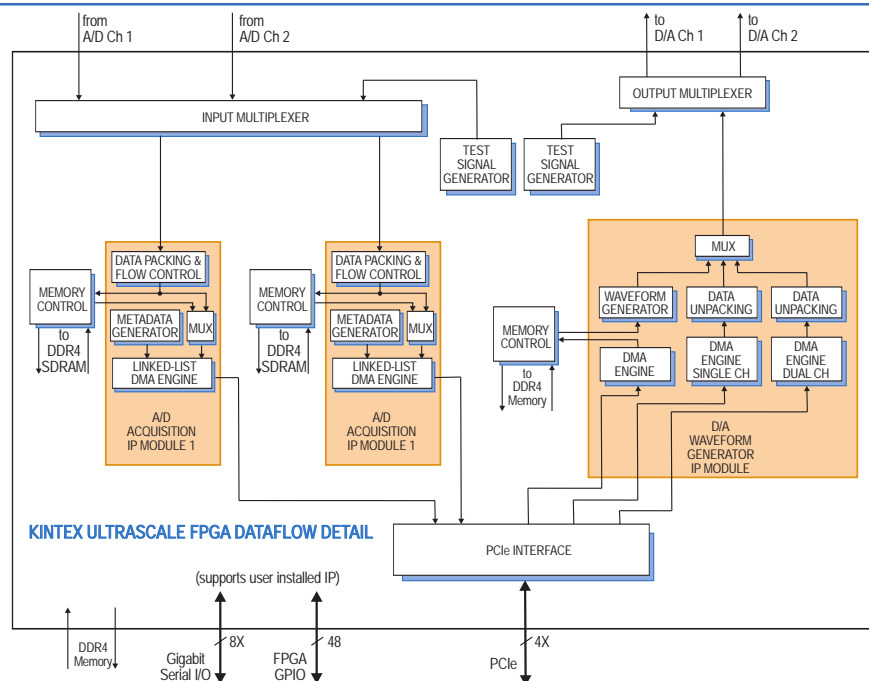

**PCI Express Interface**

The Model 52141 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

The 52141 accepts a sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. The Model 5292 high-speed sync board can be used to drive the sync bus to synchronize multichannel systems. ►

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
52141	1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084 XCKU060-2 FPGA
- 087 XCKU115-2 FPGA
- 104 LVDS FPGA I/O
- 105 Gigabit serial FPGA I/O
- 702 Air cooled, Level L2
- 713 Convection cooled, Level L3

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode: 6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 7.9 GHz; dual-channel mode: 8.1 GHz

**D/A Converters**

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.037 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their many features.

**VPX Family Comparison**

	52xxx	53xxx
<b>Form Factor</b>	3U VPX	
<b># of XMCs</b>	One XMC	
<b>Crossbar Switch</b>	No	Yes
<b>PCIe path</b>	VPX P1	VPX P1 or P2
<b>PCIe width</b>	x4	x8
<b>Option -104 path</b>	24 pairs on VPX P2	20 pairs on VPX P2
<b>Option -105 path</b>	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
<b>Lowest Power</b>	Yes	No
<b>Lowest Price</b>	Yes	No

Note: Not all combinations of sample rates, decimations and interpolations are available due to JESD204B and PCIe rate limitations.

## Model 52821

# 3-Channel 200 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - 3U VPX

Model 52821 COTS (left) and rugged version

### General Information

Model 52821 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52821 is a 3-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes three A/Ds, a complete multi-board clock and sync section, a large DDR4 memory, three DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52821 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 52821 factory-installed functions include three A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: three powerful, programmable DDC IP cores; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 52821 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

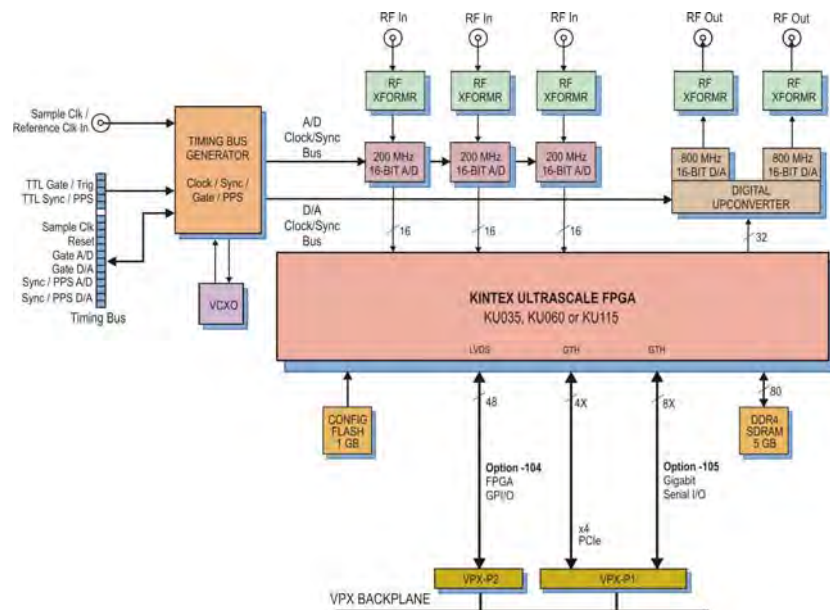

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 52821 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 52821 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources.

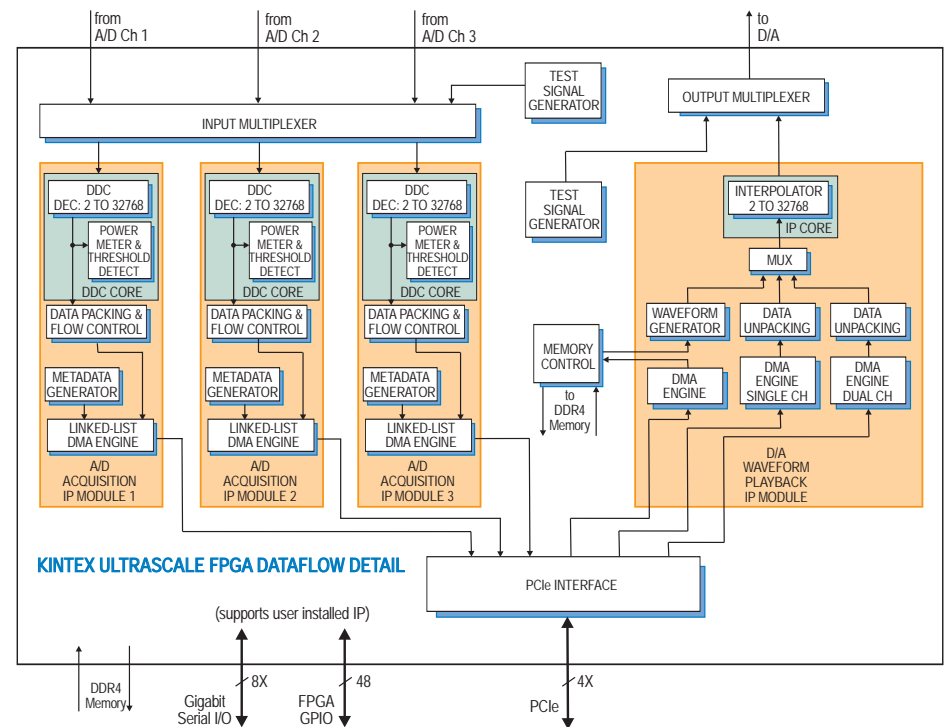

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52821's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52821 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 52821 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
52821	3-Channel 200 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 3U VPX

**Options:**

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through VPX P2
-105	Gigabit serial FPGA I/O through VPX P1
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► **Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator Core**

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.937 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**3U VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	One x8 on VPX P1	One x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 52841

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Kintex UltraScale FPGA - 3U VPX

Model 52841 COTS (left) and rugged version

## General Information

Model 52841 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52841 is a high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 52841 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52841 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 52841 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

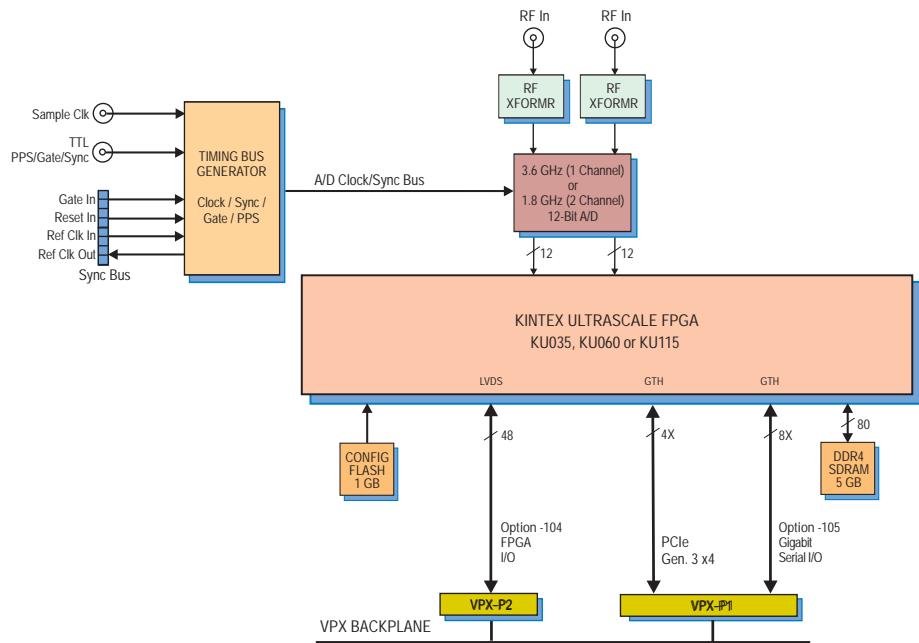

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Down-converter)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

The 52841 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has an associated 5 GB memory bank for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

➤ and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 connects one 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

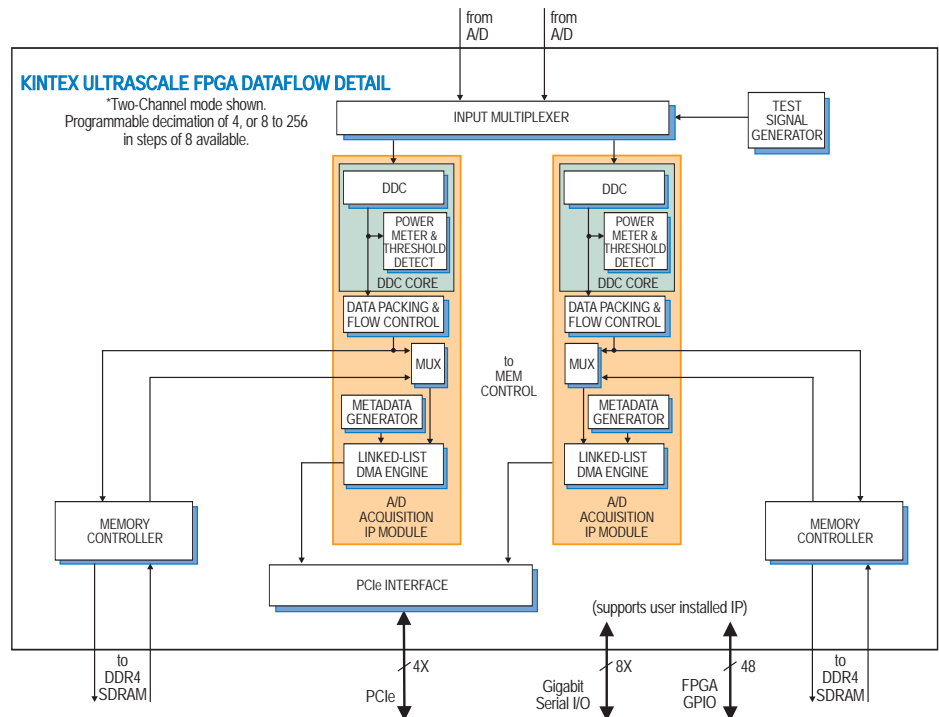

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other board resources.

**PCI Express Interface**

The Model 52841 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the module. ➤

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Memory Resources**

The 52861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**Ordering Information**

Model	Description
52841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O
- 105	Gigabit serial FPGA I/O
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Clocking and Synchronization**

The 52841 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 52841's can be synchronized with a simple cable. For larger systems, multiple 52841's can be synchronized using the Model 7192 high-speed sync module to drive the sync bus.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits,

0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Connects 24 LVDS pairs between the FPGA and VPX P2

**Option -105:** Connects eight gigabit serial lanes between the FPGA and VPX P1

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4;

Subject to speed limitations of backplane and SBC

**Environmental**

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702:** L2 (air cooled)

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713:** L3 (conduction cooled)

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX

## Model 52851

# 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - 3U VPX

Model 52851 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

### General Information

Model 52851 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52851 is a 2-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes two A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52851 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

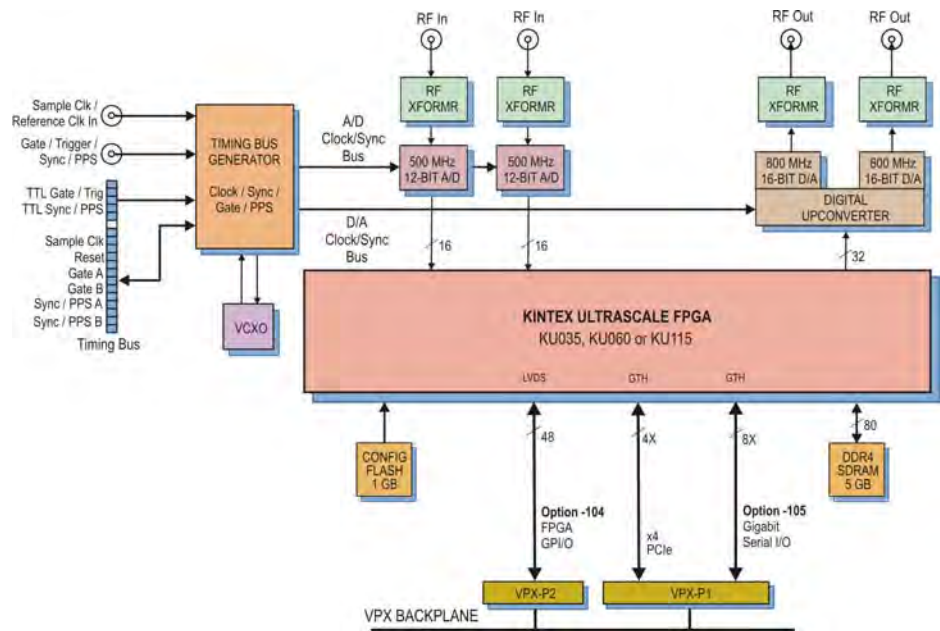

The 52851 factory-installed functions include two A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 52851 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 52851 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 71851 factory-installed functions include a sophisticated D/A Waveform Playback IP module. It allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

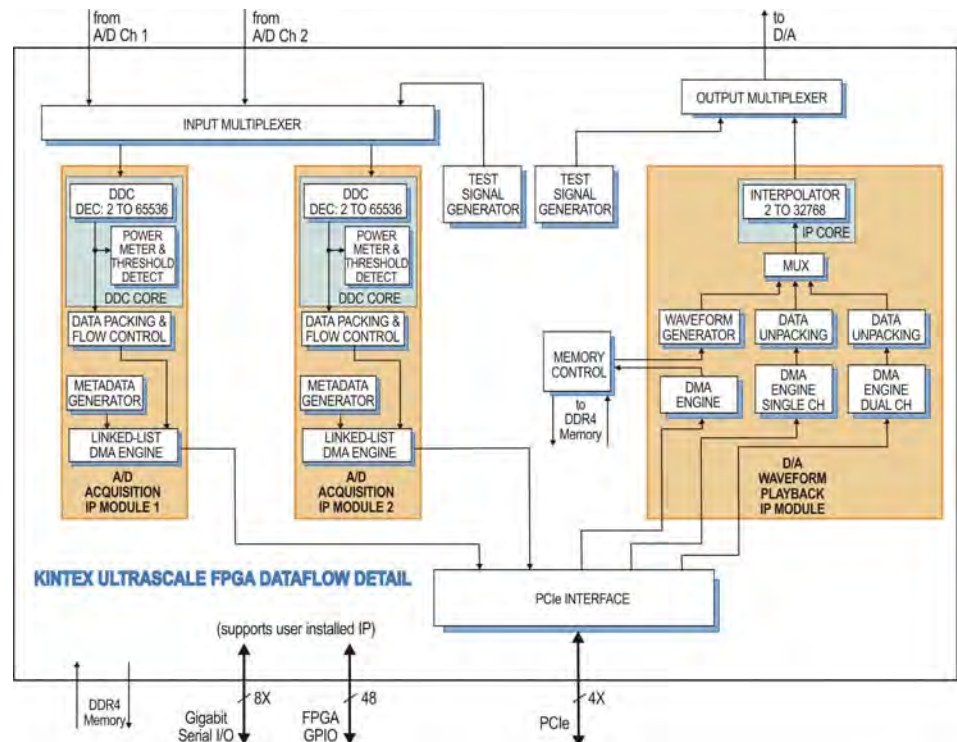

Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector

can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 52851 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 52851 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
52851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 3U VPX

**Options:**

-014	400 MHz, 14-bit A/Ds
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through VPX P2 connector
-105	Gigabit serial FPGA I/O through VPX P1 connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► **Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator Core**

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O  
**Option -105:** Provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Standard: L0 (air cooled)**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.937 in x 6.717 in (100.00 mm x 170.61 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	One x8 on VPX P1	One x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 52861

# 4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

Model 52861 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 52861 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52861 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52861 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

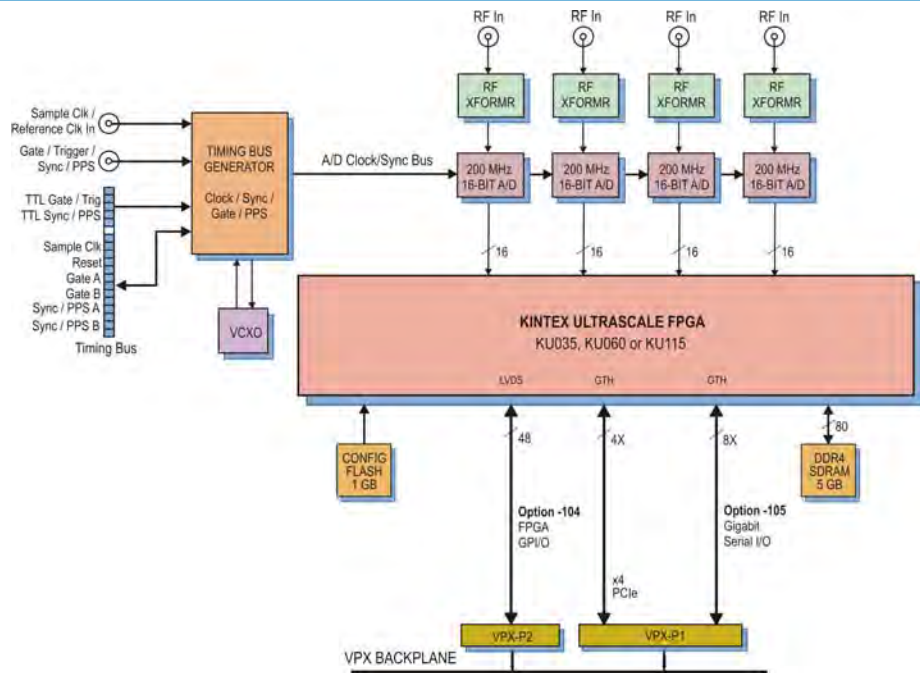

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52861 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 52861 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 52861 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

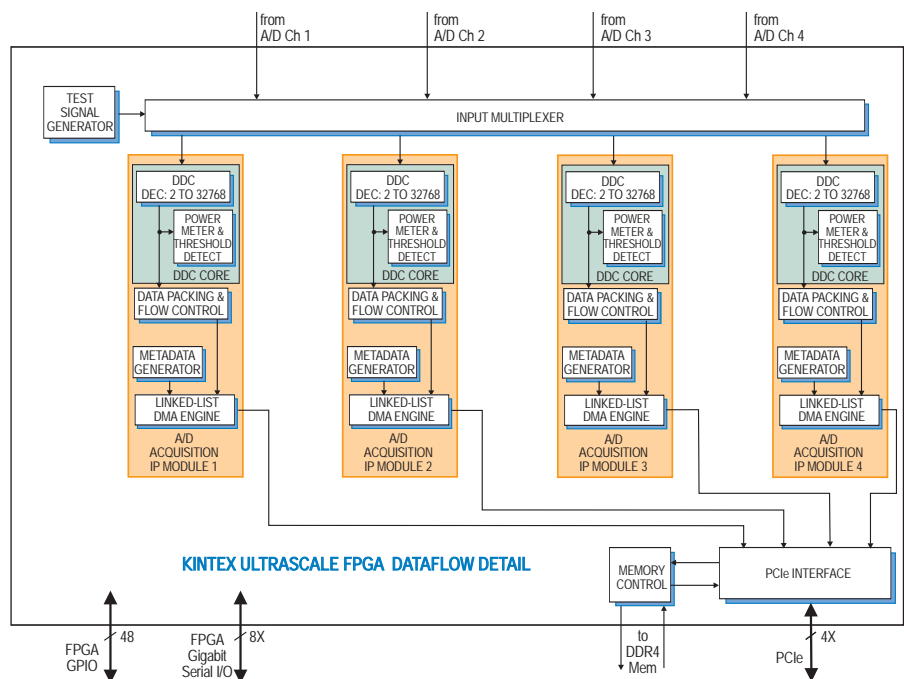

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

New!

# Model 52862

# 4-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - XMC

Model 52862 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four wideband DDCs and
- 32 multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 52862 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 52862 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52862 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

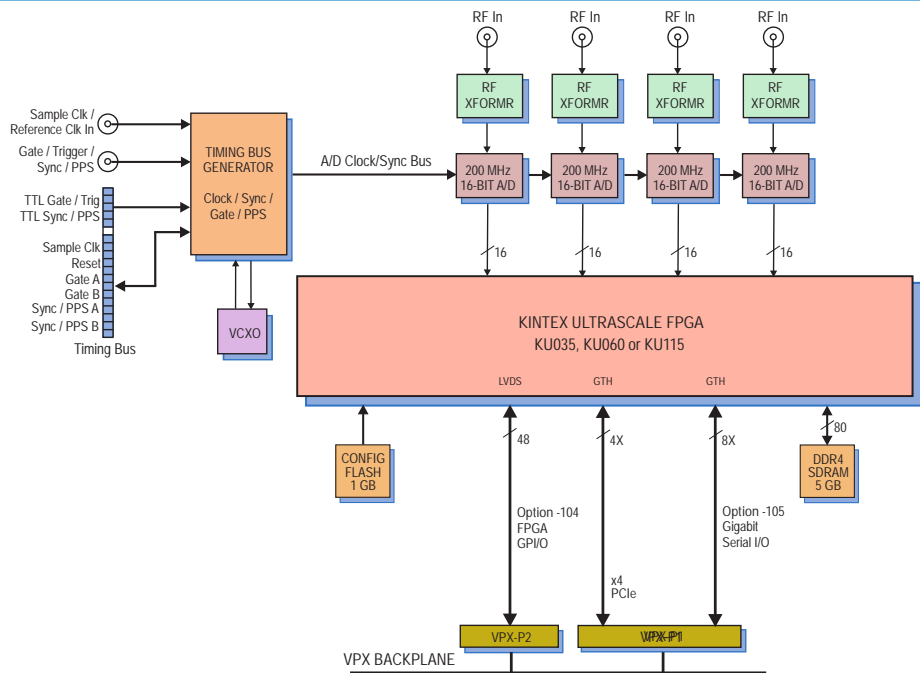

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 52862 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 52862 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 52862 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Kintex

UltraScale FPGA for signal processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

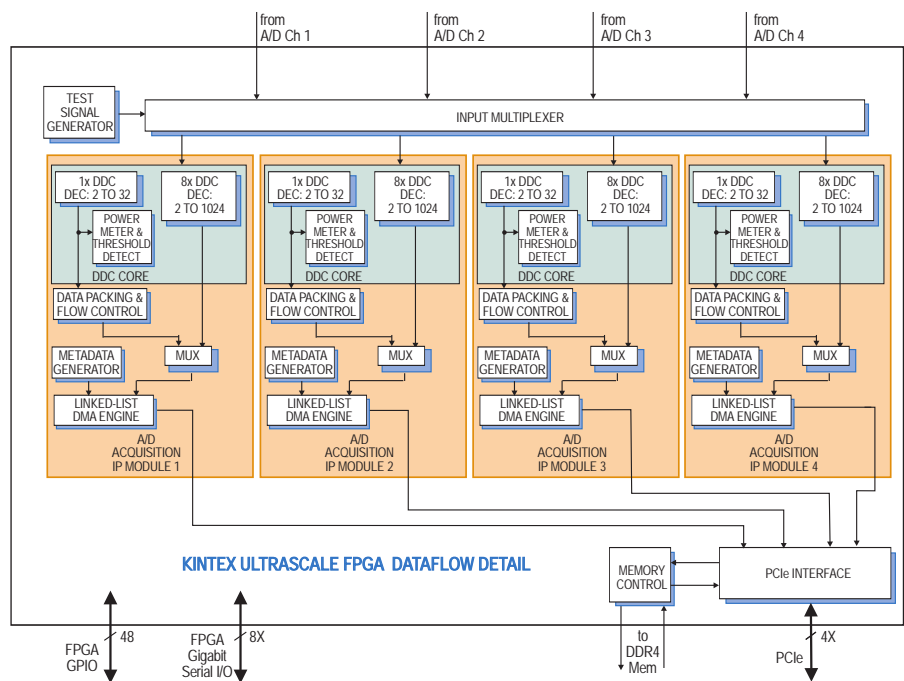

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 52862 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

► **PCI Express Interface**

The Model 52862 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
52862	4-Channel 200 MHz A/D with multiband DDCs and Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Wideband Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Multiband Digital Downconverters**

**Quantity:** Four banks, 8 channels per bank  
**Decimation Range:** 2x to 1024x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity in all cases:**

0 to 95%, non-condensing

**Size:** Board 3.937 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, refer to its datasheet. The table below provides a comparison of their main features.

**3U VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	One x8 on VPX P1	One x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 52800

# Kintex UltraScale FPGA Coprocessor- 3U VPX

Model 5280 COTS (left) and rugged version

## General Information

Model 52800 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 52800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 52800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

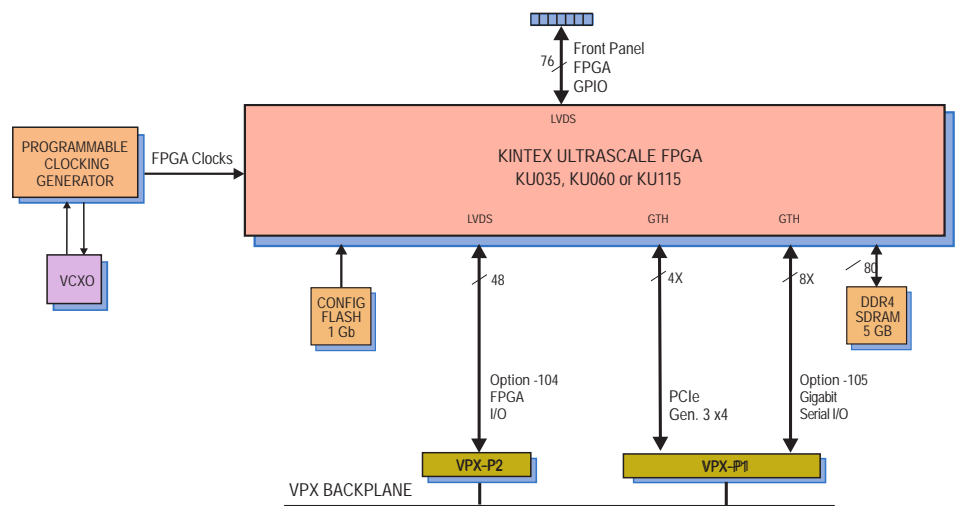

Option -105 connects an 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

## Front Panel Digital I/O Interface

The 52800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path. ▶

## Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

Model 5220 COTS (left) and rugged version

### Features

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

### General Information

The Bandit® Model 5220 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded 3U VPX board with front-panel connectors for easy integration into RF systems, the board offers programmable gain, high dynamic range and a low noise figure. With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 5220 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The 5220 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

### Quadrature Mixers

The 5220 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

### Tuning Accuracy

The 5220 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

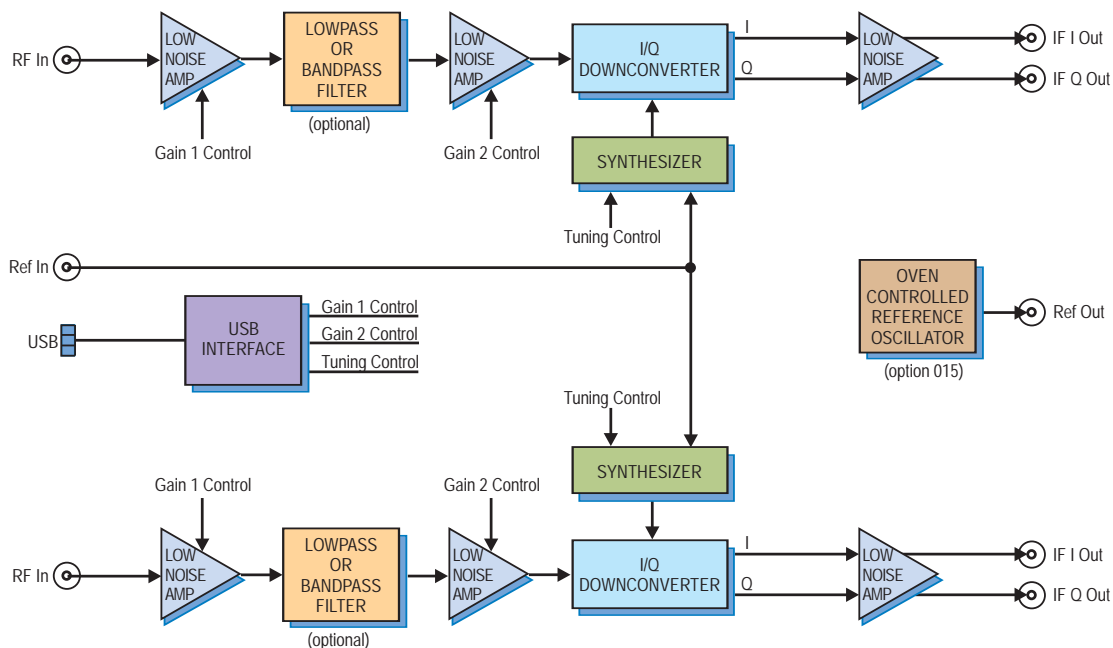

### On-board Reference Clock

In addition to accepting a 10 MHz reference signal on the front panel, the 5220 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Wideband Output

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

## ► Specifications

### RF Input

Connector Type: SSMC

Input Impedance: 50 ohms

Input Level Range: -60 dBm to -20 dBm

Flatness:  $\pm 2$  dB from 400 MHz to 1 GHz,  
 $\pm 3$  dB from 1 GHz to 3 GHz,  $\pm 5$  dB from  
3 GHz to 4 GHz

RF Attenuator: Programmable from 0 to  
63 dB in 0.5 dB steps

### LO Synthesizer Tuning

Frequency range: 400-4000 MHz,

Resolution: < 10 kHz

Tuning Speed: < 500  $\mu$ sec

Phase-Locked Loop Bandwidth: 100 kHz

### Phase Noise

1 kHz: -90 dBc/Hz

100 kHz: -110 dBc/Hz

1 MHz: -130 dBc/Hz

### Noise Figure (referred to input)

60 dB gain: 2.6 dB

### Inband Output IP3

20 dB gain: +10 dBm

60 dB gain: +42 dBm

### Reference Input/Output

Connector Type: SSMC

Input/Output Impedance: 50 ohms

### Reference Input Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

### Reference Output Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

### OCXO Reference

Center Frequency: 10 MHz

Frequency Stability vs. Change in

Temperature:  $\pm 50.0$  ppb

Frequency Calibration:  $\pm 1.0$  ppm

### Aging

Daily:  $\pm 10$  ppb/day

First Year:  $\pm 300$  ppb

### Total Frequency Tolerance

(20 years):  $\pm 4.60$  ppm

### Phase Noise

1 Hz Offset: -67 dBc/Hz

10 Hz Offset: -100 dBc/Hz

100 Hz Offset: -130 dBc/Hz

1 KHz Offset: -148 dBc/Hz

10 KHz Offset: -154 dBc/Hz

100 KHz Offset: -155 dBc/Hz

### IF Output

Connector Type: SSMC

Output Impedance: 50 ohms

Center Frequency: User definable

Output Level: 0 dBm, nominal

### Programming

Functions: RF Atten, IF Atten, Int/Ext

Reference Select, LO Synthesizer Frequency

Interface: USB

Connector Type: MicroUSB

### Power

Voltage: +12 VDC

Current: 1.5 A

### PCI Express Interface

PCIe Bus: x4, power only

### Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Model 8267

# 3U VPX Development System for Cobalt, Onyx and Flexor Boards

### Features

- 9-slot, 4U 19-inch rackmount, 12-inch deep chassis which houses 3U VPX boards
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box ready-to-run examples

### Ordering Information

Model	Description
8267	3U VPX Development System for Cobalt, Onyx and Flexor Boards

#### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS
-101	Upgrade to 16 GB DDR3 SDRAM

The addition of third-party VPX boards may affect system performance. Please consult with us before doing so.

### General Information

The Model 8267 is a fully-integrated, 3U VPX development system for Pentek Cobalt®, Onyx® and Flexor™ software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8267 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

### ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8267. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

### System Implementation

Built on a professional 4U rackmount workstation, the 8267 is equipped with the latest Intel i7 processor, DDR3 SDRAM and a high-performance single-board computer. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces. The 8267 can be configured with 64-bit Windows or Linux operating systems.

The 8267 uses a 19" 4U rackmount chassis that is 12" deep. Nine VPX slots provide ample space for an SBC, a switch card and multiple Pentek boards. Enhanced forced-air ventilation assures adequate cooling for all boards and dual 250-W power supplies guarantee more than adequate power for all installed boards. Mounting provisions for two 3.5 in. drives with front-accessible trays allow for easy removable storage. Front-panel access to USB, display, Ethernet and RS-232 ports simplifies development; an optional rear transition module supplements the front-panel connections with SATA, audio, a second video interface, and additional USB ports.

### Configuration

All 8267 systems come with software and hardware installed and tested. Up to seven Pentek boards in the 8267 can be supported. Please contact Pentek to configure a system that matches your specific requirements.

### Options

Available options include high-end multi-core CPUs and extended memory support.

### Specifications

**Operating System:** 64-bit Windows 7 Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB standard

**Dimensions:** 4U Chassis, 19" W x 12" D x 7" H

**Weight:** 35 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

## DESCRIPTION

3/6-Ch 200 MHz A/D, 2/4-Ch 800 MHz D/A, Virtex-6 FPGA - 6U VPX  
3/6-Ch 200 MHz A/D, DDCs, DUC, 2/4-Ch. 800 MHz D/A, Virtex-6 FPGA - 6U VPX  
2- or 4-Channel, 34- or 68-Signal Adaptive IF Relay - 6U VPX  
1/2-Ch 1 GHz A/D and 1/2-Ch 1 GHz D/A, Virtex-6 FPGA - 6U VPX  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz 12-bit A/D, Virtex-6 FPGA - 6U VPX  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz 12-bit A/D, DDC, Virtex-6 FPGA - 6U VPX  
2/4 500 MHz A/Ds, 1/2 DUCs, 2/4 800 MHz D/As, Virtex-6 FPGA - 6U VPX  
2/4-Ch 500 MHz A/D w. DDC, DUC w. 2/4-Ch 800 MHz D/A, Virtex-6 FPGA - 6U VPX  
4/8-Channel 200 MHz, 16-bit A/D, Virtex-6 FPGA - 6U VPX  
4/8-Ch 200 MHz A/D with DDCs, Beamformer and Virtex-6 FPGA - 6U VPX  
4/8-Ch 200 MHz A/D with 32/64-Ch DDC and Virtex-6 FPGA - 6U VPX  
1100/2200-Channel GSM Channelizer with Quad or Octal A/D - 6U VPX  
4/8-Channel 200 MHz A/D with DDCs, VITA-49, Virtex-6 FPGA - 6U VPX  
4/8-Channel 1.25 GHz D/A with DUC, Virtex-6 FPGA - 6U VPX  
4/8-Ch 1.25 GHz D/A with DUC, Extend. Interpol. and Virtex-6 FPGA - 6U VPX  
1/2-Ch L-Band RF Tuner, 2/4-Ch 200 MHz A/D, Virtex-6 FPGA - 6U VPX  
3/6-Ch 200 MHz A/D, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U VPX  
3/6-Ch 200 MHz A/D, DDC, DUC, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U VPX  
1/2-Ch 1 GHz A/D and 1/2-Ch 1 GHz D/A, Virtex-7 FPGA - 6U VPX  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz, 12-bit A/D, DDC, Virtex-7 FPGA - 6U VPX  
2/4-Ch 500 MHz A/D, DDC, DUC, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U VPX  
4/8-Channel 200 MHz, 16-bit A/D, Virtex-7 FPGA - 6U VPX  
4-Channel 200 MHz, 16-bit A/D with DDCs and Virtex-7 FPGA - 6U VPX  
L-Band RF Tuner, 2-Channel 500 MHz A/D, Virtex-7 FPGA - 6U VPX  
8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U VPX  
8-Channel 250 MHz A/D with Multiband DDCs and Kintex FPGA - 6U VPX  
1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, and Kintex FPGA - 6U VPX  
3-Channel 200 MHz A/D, DDC, DUC 2-Channel 800 MHz D/A, Kintex FPGA - 6U VPX  
1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, Wideband DDC, Kintex FPGA - 6U VPX  
2-Ch. 500 MHz A/D, DDC, DUC, 2-Ch. 800 MHz D/A, Kintex FPGA - 6U VPX  
4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U VPX  
4-Channel 200 MHz A/D with Multiband DDCs, Kintex Ultrascale FPGA - 6U VPX  
Kintex UltraScale FPGA Coprocessor - 6U VPX  
Development System for 6U VPX Cobalt, Onyx, Jade, Flexor, and Jade boards

# Models 57620 and 58620

# 3- or 6-Channel 200 MHz A/D, 2- or 4-Channel 800 MHz D/A, Virtex-6 FPGA - 6U OpenVPX

Model 58620

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three or six 200 MHz 16-bit A/Ds
- One or two DUCs (Digital Upconverters)
- Two or four 800 MHz 16-bit D/As
- 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDR1+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57620 and 58620 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71620 XMC modules mounted on a VPX carrier board.

Model 57620 is a 6U board with one Model 71620 module while the Model 58620 is a 6U board with two XMC modules rather than one.

These models include three or six A/Ds, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. IP modules for either DDR3 or QDR1+ memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions

and enable these models to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

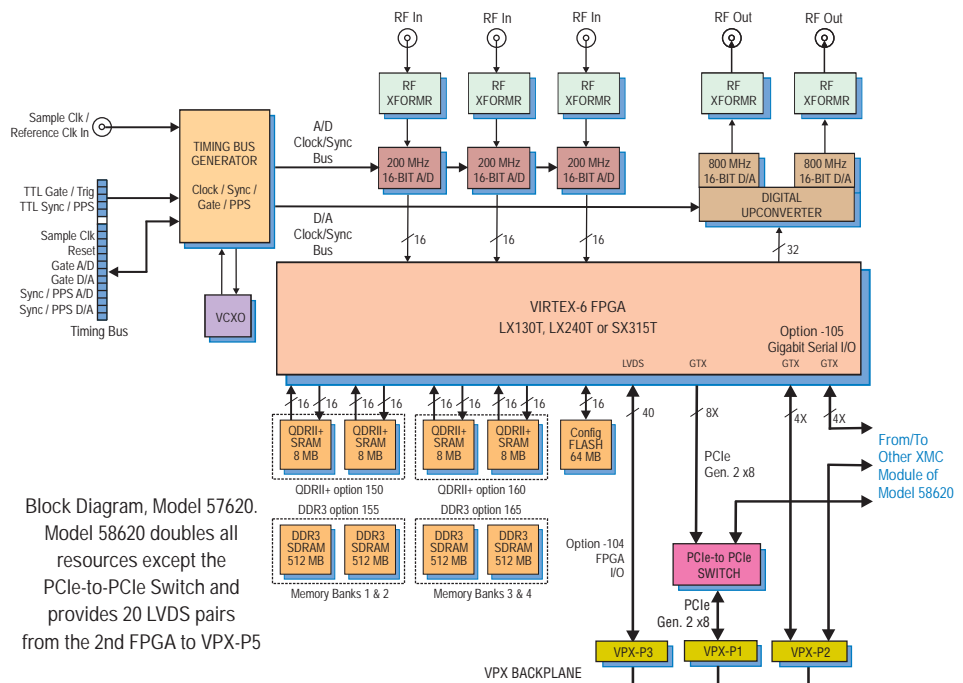

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57620; P3 and P5, Model 58620.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57620; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58620. ▶

**A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts three or six full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes, the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

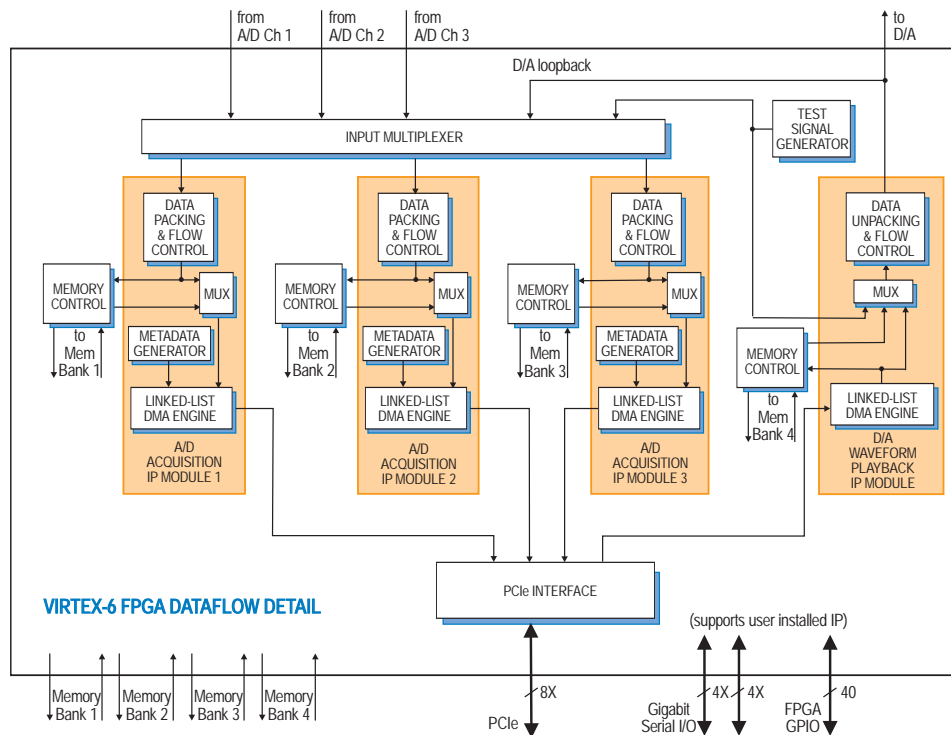

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. ➤

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - 6U VPX
58620	6-Channel 200 MHz A/D and 4-Channel 800 MHz D/A with two Virtex-6 FPGAs - 6U VPX
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VXSX315T FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57620; P3 and P5 connectors, Model 58620
-105	Gigabit link between the FPGA and P2 connector, Model 57620; gigabit links from each FPGA to P2 connector, Model 78620
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57620: 3 A/Ds, 1 DUC, 2 D/As**

**Model 58620: 6 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VXSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57620; P3 and P5, Model 58620

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57620; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58620

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks. 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57621 & 58621

# 3 or 6-Channel 200 MHz A/D with DDC, DUC with 2- or 4-Channel 800 MHz D/A, with Virtex-6 FPGA - 6U OpenVPX

Model 58621

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs (Digital Downconverters)
- One or two DUCs (Digital Upconverters)
- Two or four 800 MHz 16-bit D/As
- One or two multiboard programmable beamformers
- 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57621 and 58621 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71621 XMC modules mounted on a VPX carrier board.

Model 57621 is a 6U board with one Model 71621 module while the Model 58621 is a 6U board with two XMC modules rather than one.

These models include three or six A/Ds, three or six multiband DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core,

ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator, one or two programmable beamforming IP cores, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions.

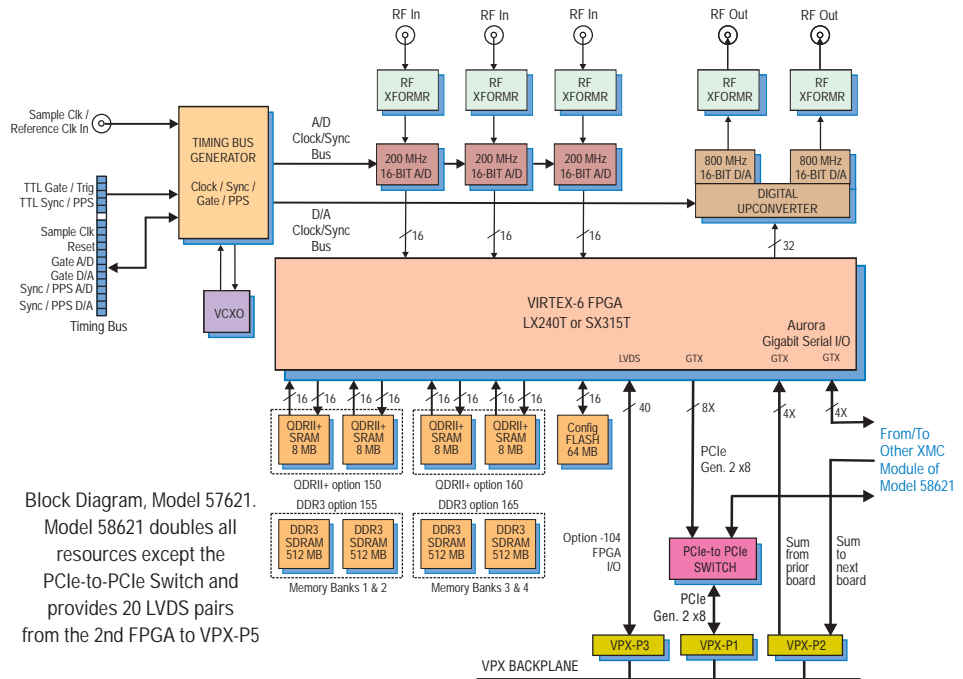

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57621; P3 and P5, Model 58621. ▶

Block Diagram, Model 57621.

Model 58621 doubles all resources except the PCIe-to-PCIe Switch and provides 20 LVDS pairs from the 2nd FPGA to VPX-P5

**► A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

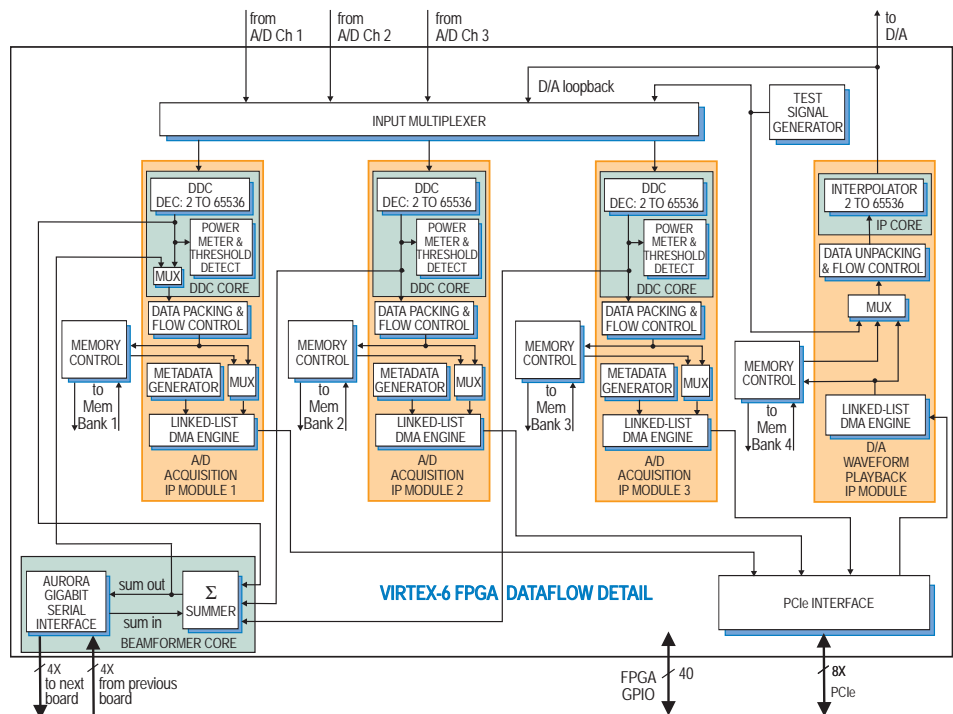

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via the built-in Xilinx Aurora gigabit serial interfaces through the VPX P2 connectors. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Modules**

The factory-installed functions include sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming. ►

### ► A/D Converter Stage

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Specifications**

**Model 57621:** 3 A/Ds, 3 DDCs, 1 DUC, 2 D/As  
**Model 58621:** 6 A/Ds, 6 DDCs, 2 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (3 or 6)**  
**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**  
**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**  
**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max.  
**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**  
**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformers (1 or 2)**  
**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via VPX P2 connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**  
 On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**  
**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**  
**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57621; P3 and P5, Model 58621

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2; x4 or x8  
**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57800 & 58800

## Kintex UltraScale FPGA Coprocessor- 6U VPX

Model 58800

### General Information

Models 57800 and 58800 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71800 XMC modules mounted on a VPX carrier board. Model 57800 is a 6U board with one Model 71800 module while the Model 58800 is a 6U board with two XMC modules rather than one.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 57800 and Model 58800 include optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally

matched to the board's interfaces. The factory-installed functions in these models include one or two test signal generators, one or two metadata generators, one or two DDR4 SDRAM controllers, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

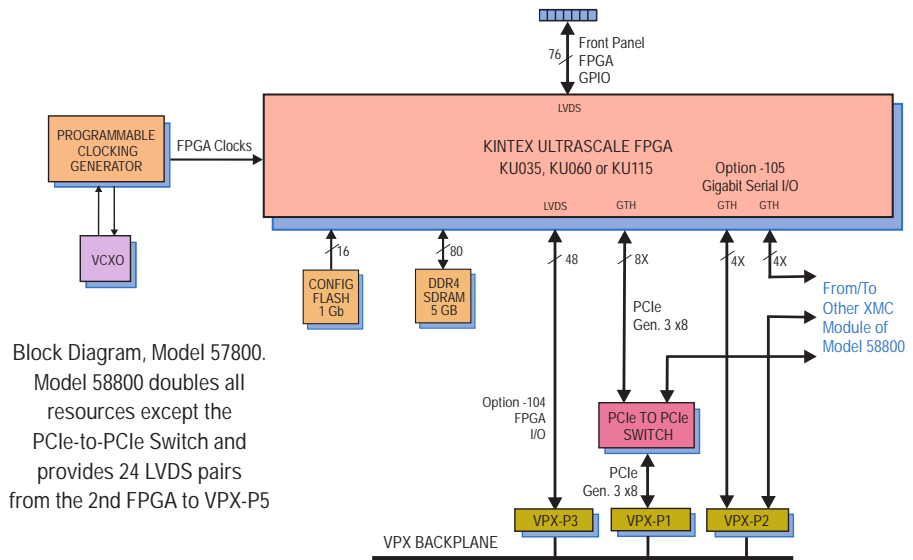

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57800; P3 and P5 connectors, Model 58800.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols. ➤

### Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**► Front-Panel Digital I/O Interface**

These models include one or two 80-pin front panel connectors that provide 38 or 76 LVDS pairs connected to one or both of the FPGAs. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path.

**Specifications**

**Front Panel Digital I/O (1 or 2)**

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 or 76 pairs
- Signal Type:** LVDS

**Field Programmable Gate Array (1 or 2)**

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O (1 or 2)**

- Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57800; P3 and P5 connectors, Model 58800
- Option -105** provides two 4X gigabit serial links between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2)**

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

- Standard: L0 (air cooled)**
  - Operating Temp:** 0° to 50° C
  - Storage Temp:** -20° to 90° C
  - Relative Humidity:** 0 to 95%, non-condensing
- Option -702: L2 (air cooled)**
  - Operating Temp:** -20° to 65° C
  - Storage Temp:** -40° to 100° C
  - Relative Humidity:** 0 to 95%, non-condensing
- Option -713: L3 (conduction cooled)**
  - Operating Temp:** -40° to 70° C
  - Storage Temp:** -50° to 100° C
  - Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U Board 9.187 in x 6.717 in (233.3 mm x 170.6 mm)

# Models 57624 and 58624

## 2- or 4-Channel, 34- or 68-Signal Adaptive IF Relay - 6U VPX

### Features

- Modifies 34 or 68 IF signals between input and output
- Up to 80 MHz IF bandwidth
- Two/four 200 MHz 16-bit A/Ds
- Two/four 800 MHz 16-bit D/As
- 34/68 DDCs and 34/68 DUCs (digital downconverters and digital upconverters)
- Signal drop/add/replace
- Frequency shifting and hopping
- Amplitude boost and attenuation
- PCI Express Gen. 1: x4 or x8,

### General Information

Models 57624 and 58624 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71624 XMC modules mounted on a VPX carrier board. Model 57624 is a 6U board with one Model 71624 module while the Model 58624 is a 6U board with two XMC modules rather than one.

As IF relays, they accept two or four IF analog input channels, modify up to 34 or 68 signals, and then deliver them to two or four analog IF outputs. Any signal within each IF band can be independently enabled or disabled, and changed in both frequency and amplitude as it passes through the board.

These models support many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation. Applications include countermeasures, active tracking and monitoring, channel security, interception, adaptive spectral management, jamming, and encryption.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCIe Gen. 1 system interface supports control, status and data transfers.

### Adaptive Relay Input Overview

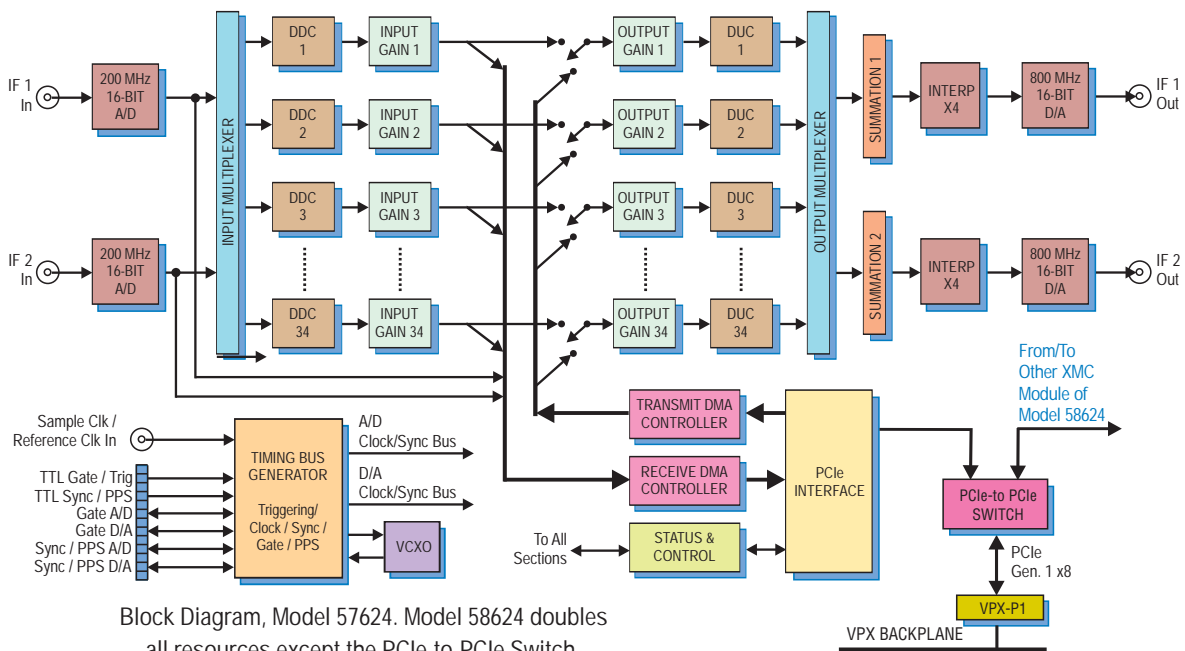

These models digitize two or four analog IF inputs using 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency. An array of 34 or 68 DDCs (digital downconverters) can be independently programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz. Each DDC can independently source IF data from either of two A/Ds.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCIe system interface to target memory, typically associated with a system processor. Here, the signals can be analyzed, classified, demodulated, decrypted or decoded, depending on the application.

Samples from each A/D converter can also be delivered across PCIe to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

### Adaptive Relay Output Overview

The output stage of these models consists of 34 or 68 DUCs (digital upconverters) and two or four 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q

► signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stages. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two or four summation blocks, each associated with one of the two or four D/A converters using a final interpolation factor of  $\times 4$ . After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 or 68 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the adaptive relay of these models. Because of the complexity and proprietary nature of these functions, the FPGAs cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two or four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into one or two Virtex-6 FPGAs for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 or 68 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controllers

Two or four output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs of the first XMC module. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2. This sequence repeats for the second XMC module of Model 58624.

When a target memory buffer is filled, these models issue an interrupt to the system processor and then begin filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controllers

Each of the FPGA-based 34 or 68 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, these models signal the processor with an interrupt and move to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB. ►

### ► Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz.

A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two or four summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts the summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two or four transformer-coupled analog IF outputs are delivered through one or two pairs of front panel SSMC connectors.

### Clocking and Synchronization

Two or four internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board

clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from one or two on-board programmable VCXOs (voltage-controlled crystal oscillators). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the internal oscillator.

One or two front panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCIe Gen. 1 x8 bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the board.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com). ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

On-board clock synthesizers generate two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connectors, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accept 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Required:** Xilinx Virtex-6 XC6VSX315T

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8;

**Environmental**

**Standard:**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Option 702 L2 Extended Temp (air-cooled):**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-cond.

**Option 712 L2 Extended Temp (conduction-cooled):**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U VPX board, 233 x 160 mm (9.173 x 6.299 in.) ►

# Models 57630 & 58630

# 1- or 2-Channel 1 GHz A/D, 1- or 2-Channel 1 GHz D/A with Virtex-6 FPGA - 6U OpenVPX

Model 58630

## General Information

Models 57630 and 58630 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71630 XMC modules mounted on a VPX carrier board.

Model 57630 is a 6U board with one Model 71630 module while the Model 58630 is a 6U board with two XMC modules rather than one.

These models include one or two 1 GHz A/D and D/A converters and four or eight banks of memory

## The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition and one or two D/A waveform playback IP modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions

and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

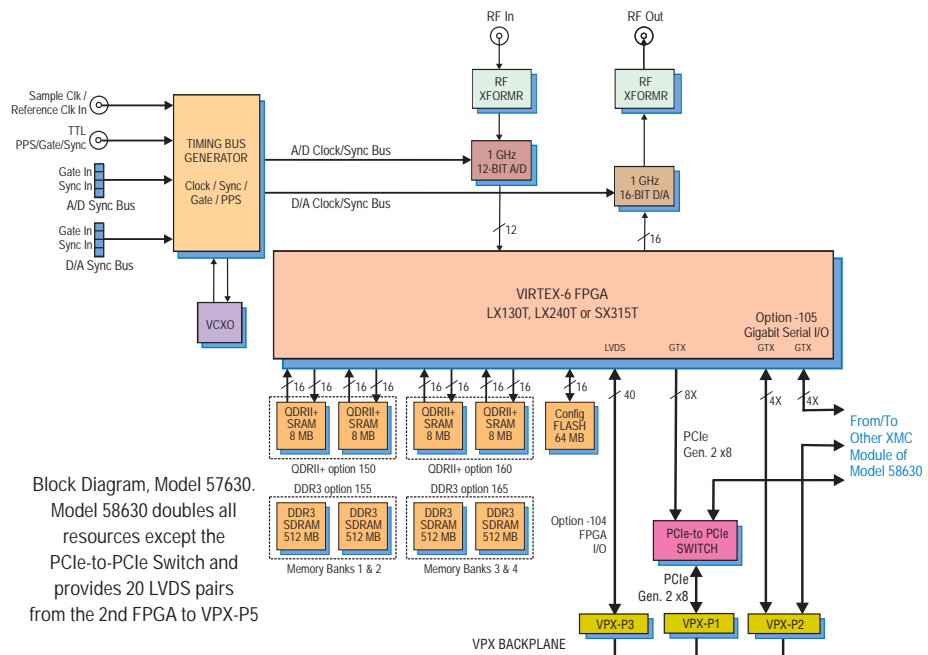

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57630; P3 and P5, Model 58630.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57630; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58630. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One or two 1 GHz 12-bit A/D
- One or two 1 GHz 16-bit D/A
- Up to 2 or 4 GB of DDR3 SDRAM; or: 16 MB or 32 MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- Dual-µSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The factory-installed functions include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts one or two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into one or two Texas Instruments ADS5400 1 GHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 71630 features one or two TI DAC5681Z 1 GHz, 16-bit D/As. The converters have an input sample rate of 1 GSPS, allowing them to accept full rate data from the FPGA. Additionally, the D/As include a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through front panel SSMC connectors.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

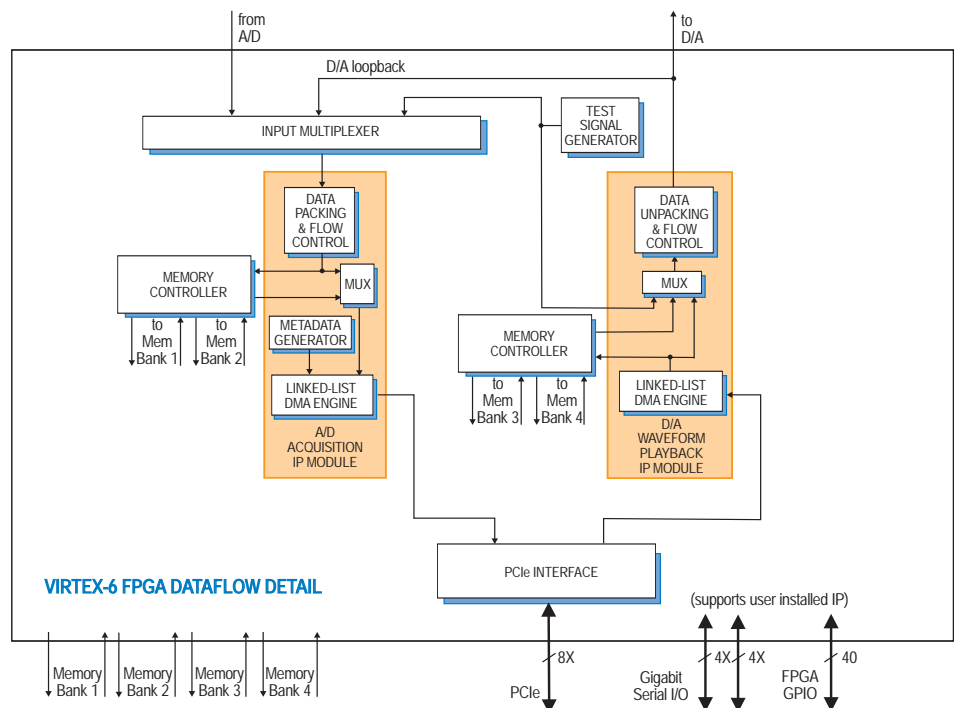

A pair of front panel μSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 9192 Cobalt Synchronizer can drive multiple μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57630	1 GHz A/D and D/A with Virtex-6 FPGA - 6U VPX
58630	Two 1 GHz A/D and D/A, with two Virtex-6 FPGAs - 6U VPX
<b>Options:</b>	
-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6V SX315T FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57630; P3 and P5 connectors, Model 58630
-105	Gigabit link between the FPGA and P2 connector, Model 57630; gigabit links from each FPGA to P2 connector, Model 78630
-160	Two 8 MB QDR II+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57630: 1 A/D, 1 D/A**

**Model 58630: 2 A/Ds, 2 D/As**

**Front Panel Analog Signal Inputs (1 or 2)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADS5400

**Sampling Rate:** 100 MHz to 1 GHz

**Resolution:** 12 bits

**D/A Converters (1 or 2)**

**Type:** Texas Instruments DAC5681Z

**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (1 or 2)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus (1 or 2):** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6V SX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57630; P3 and P5, Model 58630

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57630; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58630

**Memory Banks (1 or 2)**

**Option 150:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57640 & 58640

# 1- or 2-Channel 3.6 GHz and 2- or 4-Channel 1.8 GHz, 12-bit A/D, Virtex-6 FPGA - 6U OpenVPX

Model 58640

## General Information

Models 57640 and 58640 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71640 XMC modules mounted on a VPX carrier board.

Model 57640 is a 6U board with one Model 71640 module while the Model 58640 is a 6U board with two XMC modules rather than one.

These models include one or two 3.6 GHz, 12-bit A/D converters and four or eight banks of memory.

## The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition IP modules. In addition, IP modules for DDR3 memories, controllers for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable

these models to operate as complete turn-key solutions, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

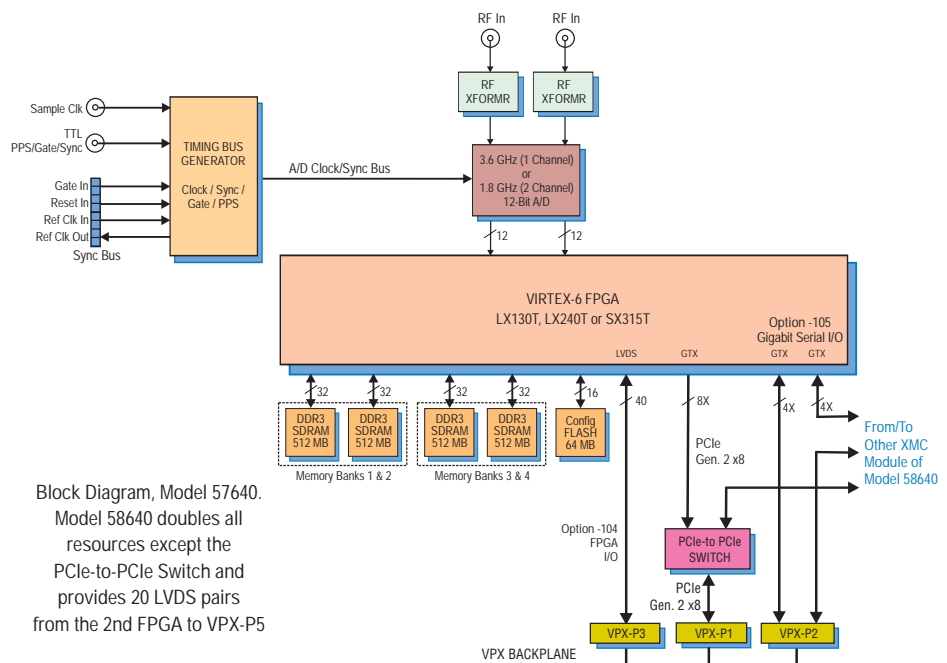

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57640; P3 and P5, Model 58640.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57640; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58640. ▶

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One or two 1-channel mode with 3.6 GHz, 12-bit A/Ds
- Two or four 2-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 or 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- μSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing these models to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

These models accept a 1.8 GHz dual-edge sample clock via front panel SSMC connectors. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple boards to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple boards can be synchronized using the Cobalt high speed sync board to drive the sync bus.

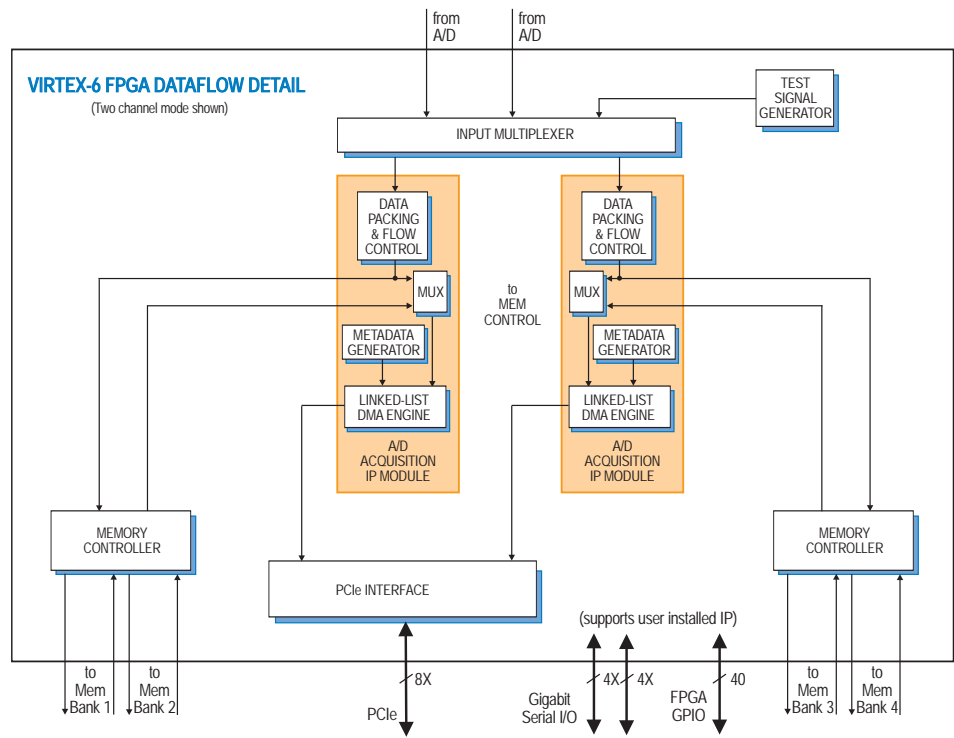

**Memory Resources**

The Cobalt architecture supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ➤

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

- One or two 1-channel mode with 3.6 GHz, 12-bit A/Ds
- Two or four 2-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDCs (Digital Downconverters)
- 2 or 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- μSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

Block Diagram, Model 57641. Model 58641 doubles all resources except the PCIe-to-PCIe Switch and provides 20 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

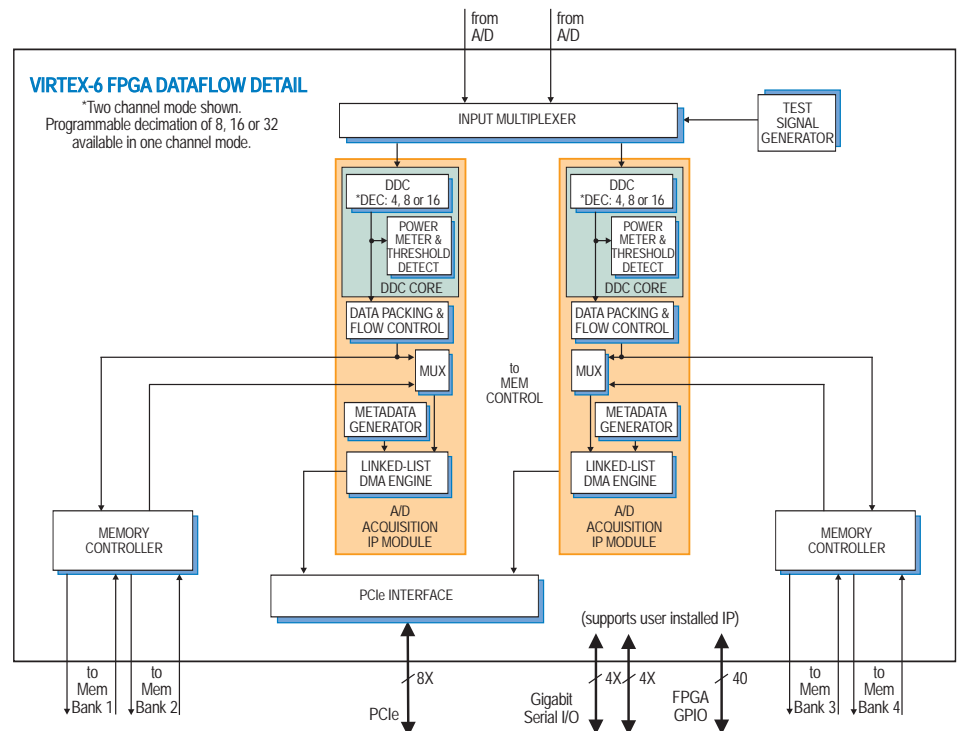

**Clocking and Synchronization**

These models accept a 1.8 GHz dual-edge sample clock via front panel SSMC connectors. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple boards can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

**Memory Resources**

The Cobalt architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ➤

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57641	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, with Wideband DDC, Virtex-6 FPGA - 6U VPX
58641	2-Ch. 3.6 GHz or 4-Ch. 1.8 GHz, 12-bit A/D, with Wideband DDC, two Virtex-6 FPGAs - 6U VPX

**Options:**

-002*	-2 FPGA speed grade
-064*	XC6VSX315T
-104	LVDS I/O between the FPGA and P3 connector, Model 57641; P3 and P5 connectors, Model 58641
-105	Gigabit link between the FPGA and P2 connector, Model 57641; gigabit links from each FPGA to P2 connector, Model 78641
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57641: One A/D**

**Model 58641: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters (2 or 4)**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources (1 or 2)**

Front panel SSMC connector

**Sync Bus (1 or 2)**

Multi-pin connectors, bus includes gate, reset and in and out ref clock

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

Xilinx Virtex-6 XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57641; P3 and P5, Model 58641

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57641; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58641

**Memory Banks (1 or 2)**

Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57650 & 58650

# 2- or 4-Channel 500 MHz A/D, DUC with 2-or 4-Channel 800 MHz D/A, Virtex-6 FPGA - 6U OpenVPX

Model 58650

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two or four 500 MHz 12-bit A/Ds
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57650 and 58650 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71650 XMC modules mounted on a VPX carrier board.

Model 57650 is a 6U board with one Model 71650 module while the Model 58650 is a 6U board with two XMC modules rather than one.

These models include two or four A/Ds, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include two or four A/D acquisition and one or two D/A waveform playback IP modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, test signal generators and a PCIe interface complete the factory-installed functions

and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

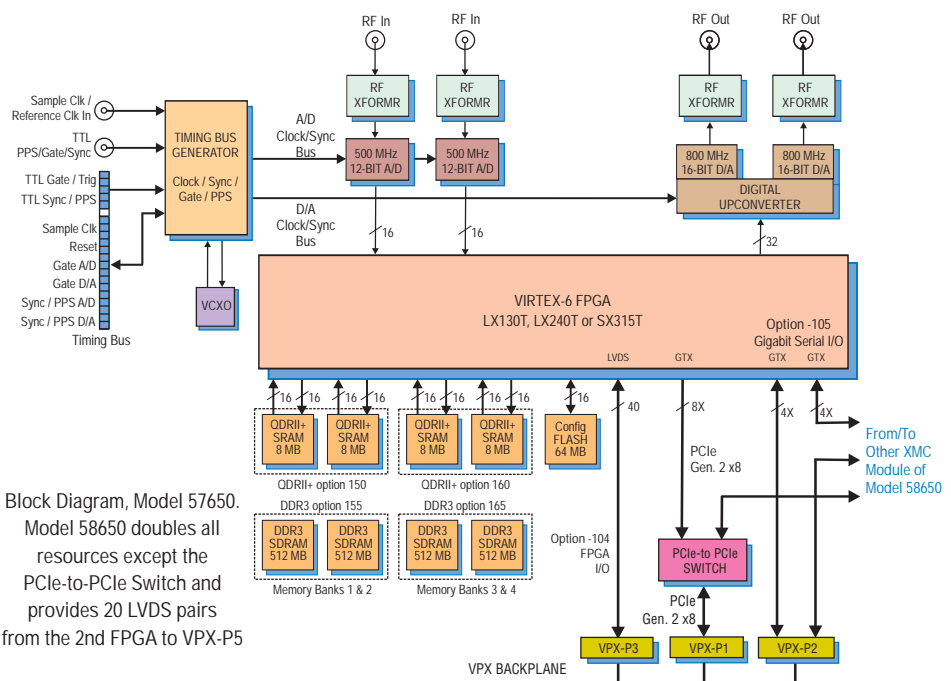

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57650; P3 and P5, Model 58650.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57650; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58650. ➤

Block Diagram, Model 57650.

Model 58650 doubles all resources except the PCIe-to-PCIe Switch and provides 20 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stages**

The front end accepts two or four full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stages**

One or two TI DAC5688 DUCs and D/As accept baseband real or complex data streams from the FPGAs and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

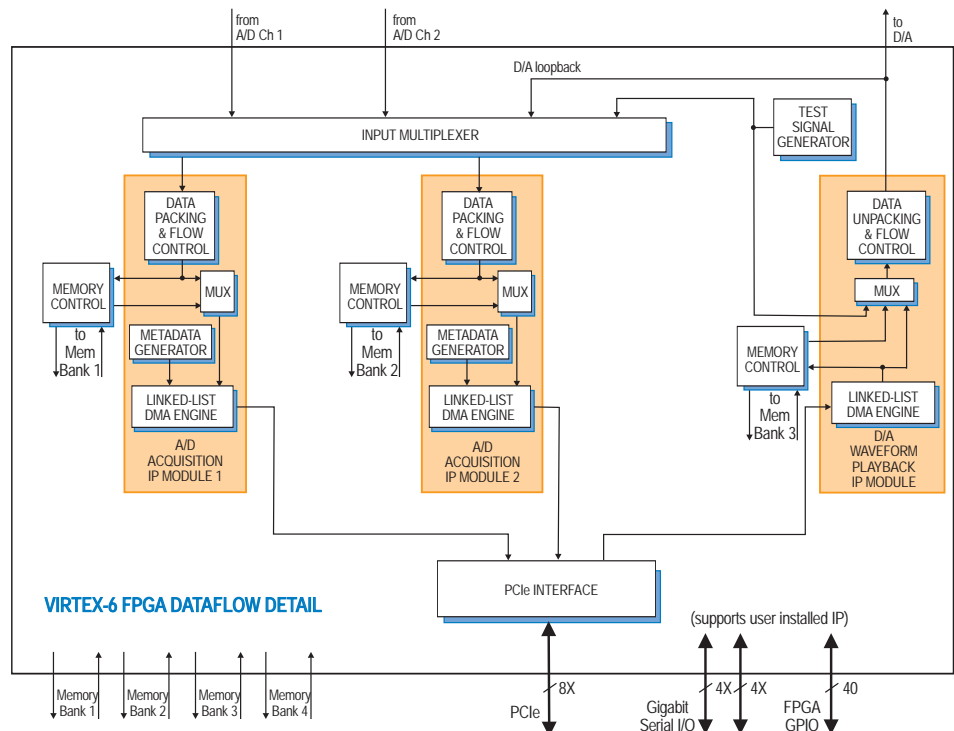

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57650: 2 A/Ds, 1 DUC, 2 D/As**

**Model 58650: 4 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57650; P3 and P5, Model 58650

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57650; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58650

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Model 57651 & 58651

# 2 or 4-Channel 500 MHz A/D with DDCs, DUCs with 2- or 4-Channel 800 MHz D/A, with Virtex-6 FPGA - 6U OpenVPX

Model 58651

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- One or two multiband programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or 16 or 32 MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57651 and 58651 are members of the Cobalt® family of high performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71651 XMC modules mounted on a VPX carrier board.

Model 57651 is a 6U board with one Model 71651 module while the Model 58651 is a 6U board with two XMC modules rather than one.

These models include two or four A/Ds, two or four multiband DDCs, one or two DUCs, two or four D/As, one or two beamformers and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include two or four A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the

data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, test signal generators, programmable beamforming IP cores, an Aurora and a PCIe interfaces complete the factory-installed functions and enable these models to operate without the need to develop any FPGA IP.

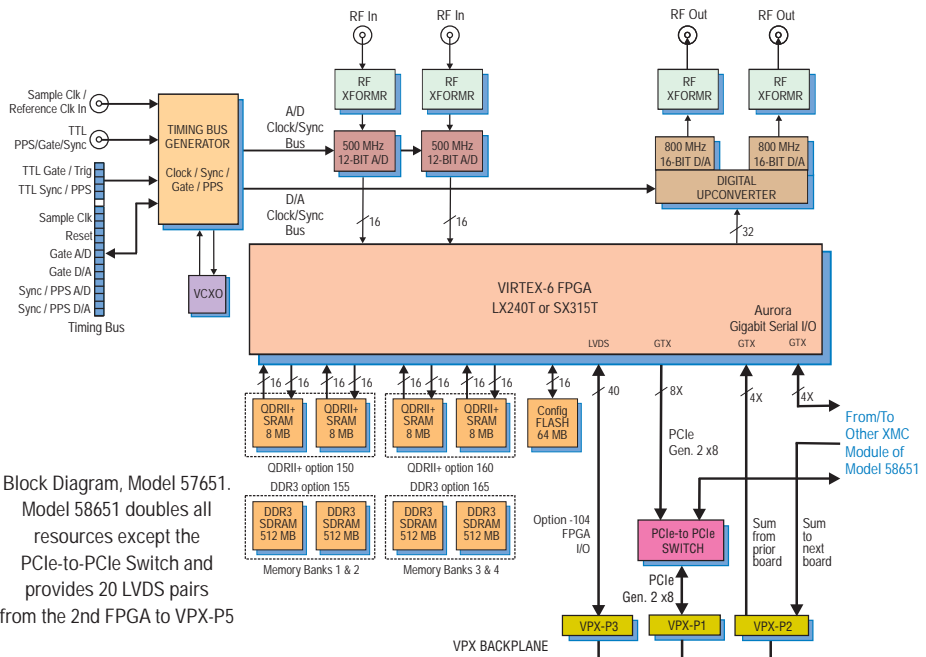

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57651; P3 and P5, Model 58651. ▶

**A/D Acquisition IP Modules**

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two or four different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

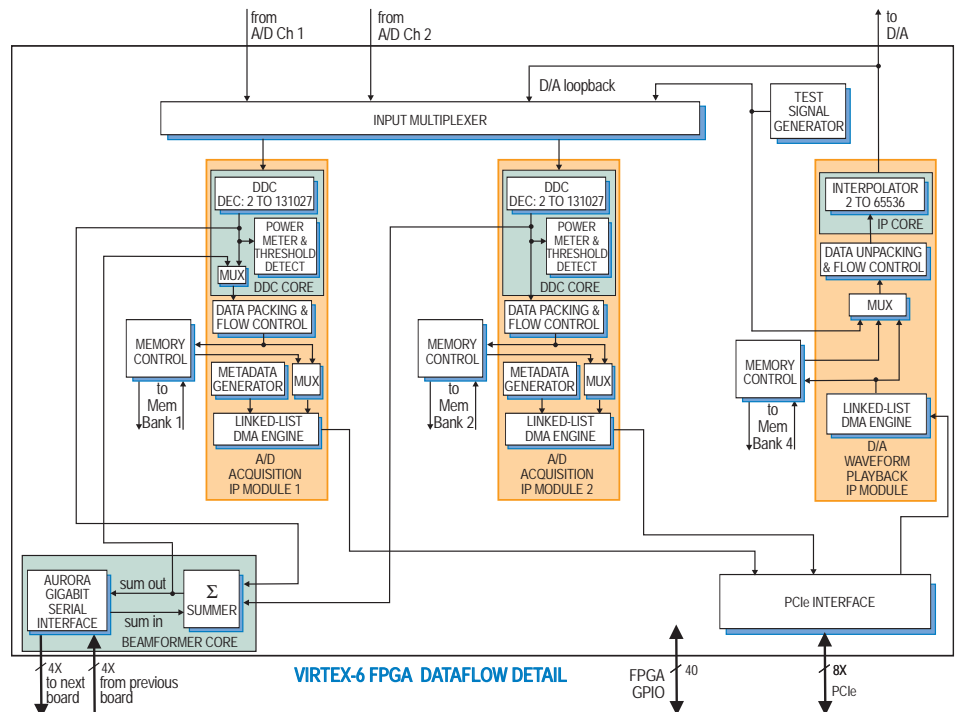

A programmable summation block provides summing of any of the DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple models can be chained together via a built-in Xilinx Aurora gigabit serial interface through the dual 4X serial connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Modules**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stages

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stages

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data from the FPGAs and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to three or six independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the boards' DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Specifications**

**Model 57651:** 2 A/Ds, 2 DDCs, 1 DUC, 2 D/As

**Model 58651:** 4 A/Ds, 4 DDCs, 2 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (Option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters (2 or 4)**

**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformers (1 or 2)**

**Summation:** Two channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via a dual 4X connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T-2

**Optional:** Xilinx Virtex-6 XC6V SX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57651; P3 and P5, Model 58651

**Memory (1 or 2)**

**Option -150 or -160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR

**Option -155 or -165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2; x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57660 & 58660

# 4- or 8-Channel 200 MHz, 16-bit A/D with Virtex-6 FPGA - 6U OpenVPX

Model 58660

## General Information

Models 57660 and 58660 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71660 XMC modules mounted on a VPX carrier board.

Model 57660 is a 6U board with one Model 71660 module while the Model 58660 is a 6U board with two XMC modules rather than one.

These models include four or eight A/Ds and four or eight banks of memory.

## The Cobalt Architecture

The Pentek Cobalt Architecture features Virtex-6 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module. Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable these

models to operate as complete turnkey solutions without the need to develop FPGA IP.

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

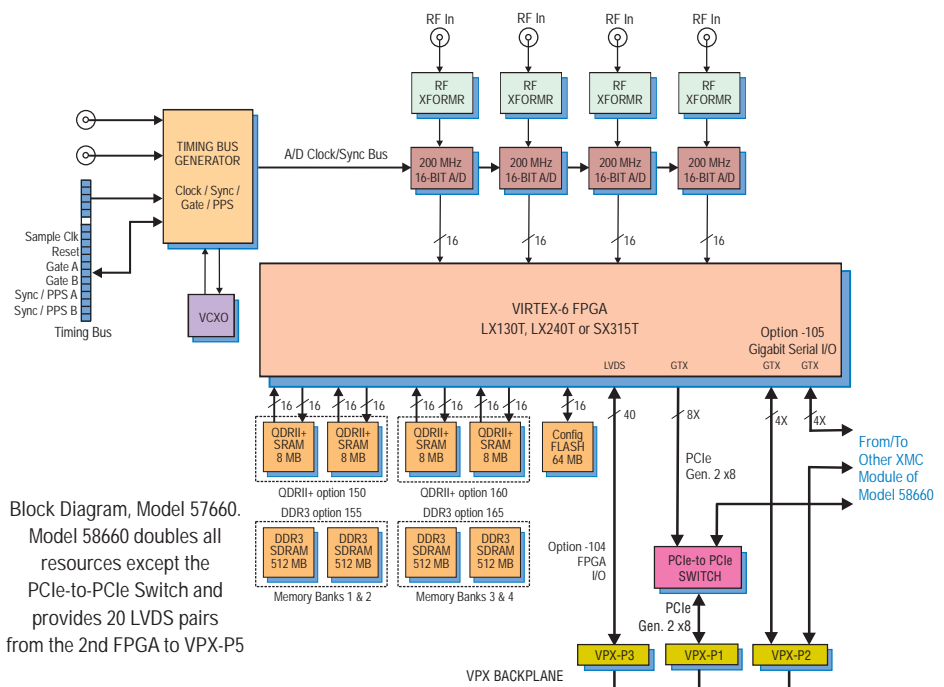

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57660; P3 and P5, Model 58660.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57660; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58660. ➤

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 or 64 MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

► **A/D Converter Stages**

The front end accepts four or eight full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture or for routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

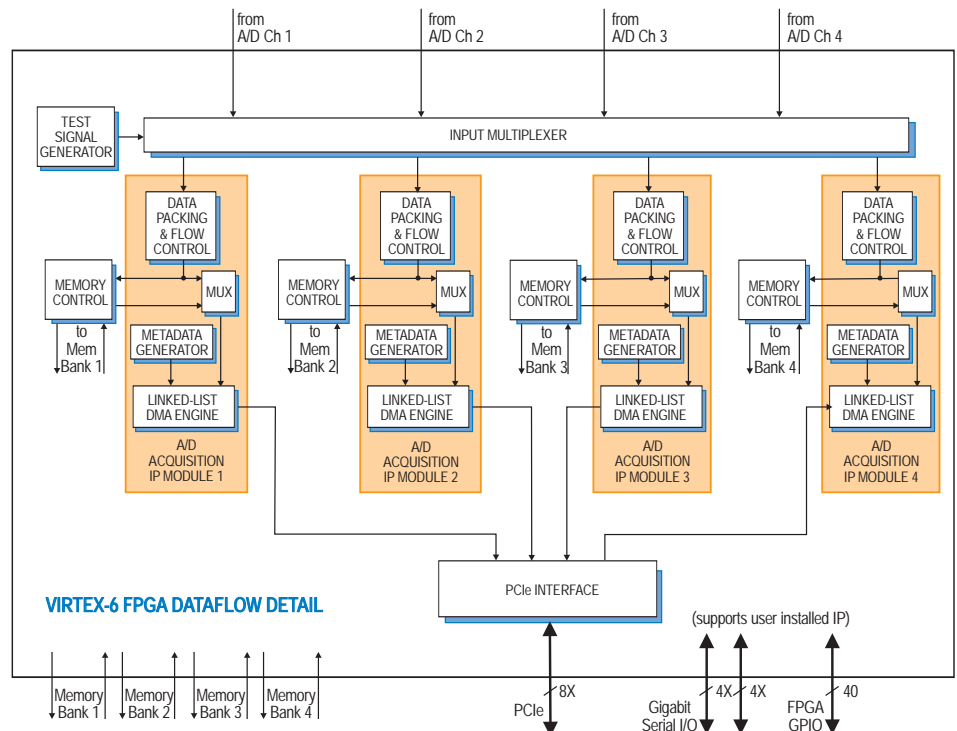

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57660	4-Channel 200 MHz 16-bit A/D with Virtex-6 FPGA - 6U VPX
58660	8-Channel 200 MHz 16-bit A/D with two Virtex-6 FPGAs - 6U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6V SX315T FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57660; P3 and P5 connectors, Model 58660
-105	Gigabit link between the FPGA and P2 connector, Model 57660; gigabit links from each FPGA to P2 connector, Model 58660
-150	Two 8 MB QDR II+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDR II+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

# Models 57661 & 58661

# 4- or 8-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - 6U OpenVPX

Model 58661

## General Information

Models 57661 and 58661 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71661 XMC modules mounted on a VPX carrier board.

Model 57661 is a 6U board with one Model 71661 module while the Model 58661 is a 6U board with two XMC modules rather than one.

These models include four or eight A/Ds, four or eight multiband DDCs, one or two programmable beamformers, and four or eight banks of memory.

## The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for either DDR3 or QDRII+ memories,

controllers for all data clocking and synchronization functions, test signal generators, programmable beamforming IP cores, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

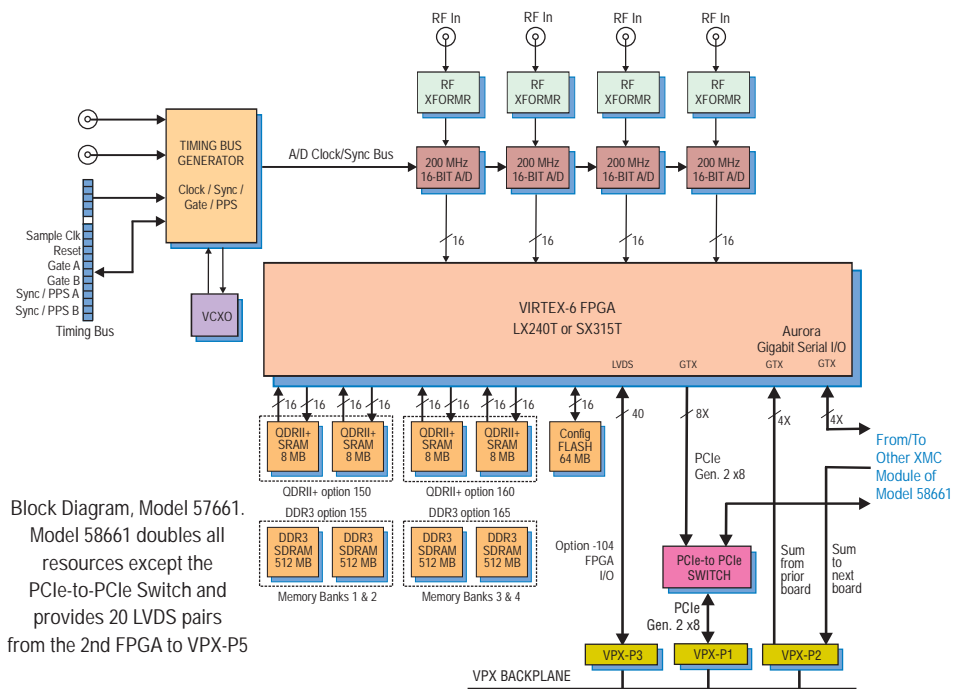

## Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57661; P3 and P5, Model 58661. ➤

## Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs (digital downconverters)
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

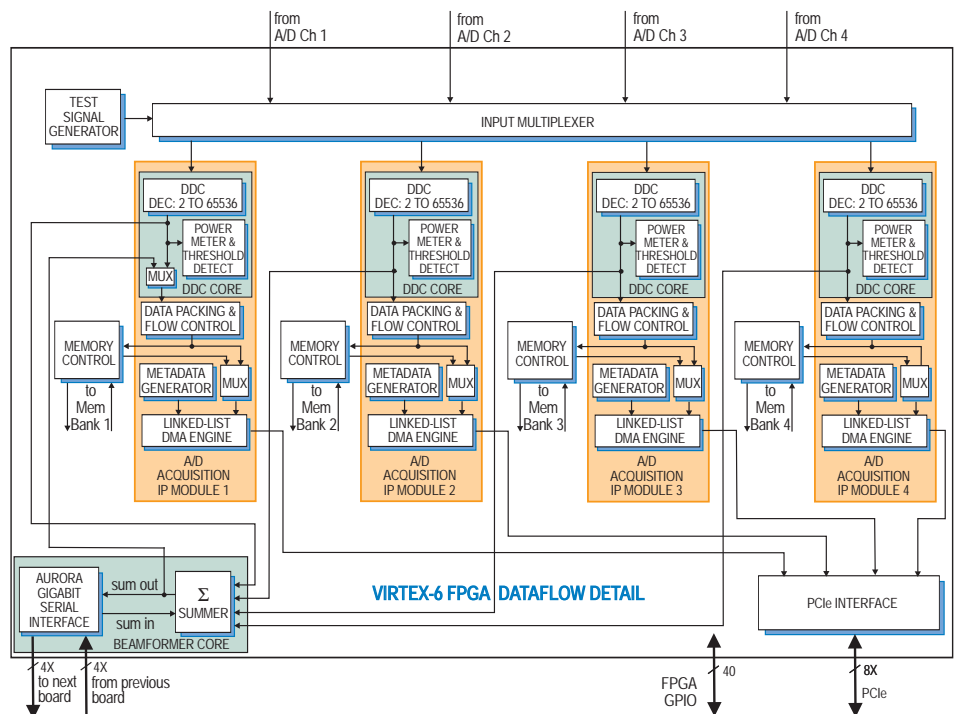

**A/D Converter Stages**

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture and for routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Specifications**

**Model 57661: 4 A/Ds**

**Model 58660: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled,

front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformers (1 or 2)**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via VPX P2 connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57661; P3 and P5, Model 58661

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 58662

## General Information

Models 57662 and 58662 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71662 XMC modules mounted on a VPX carrier board.

Model 57662 is a 6U board with one Model 71662 module while the Model 58662 is a 6U board with two XMC modules rather than one.

These models include four or eight A/Ds, 32 or 64 multiband DDCs and four or eight banks of memory.

## The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules.

Each of the acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and trigger functions, test signal generators, voltage and temperature monitoring, DDR3

SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

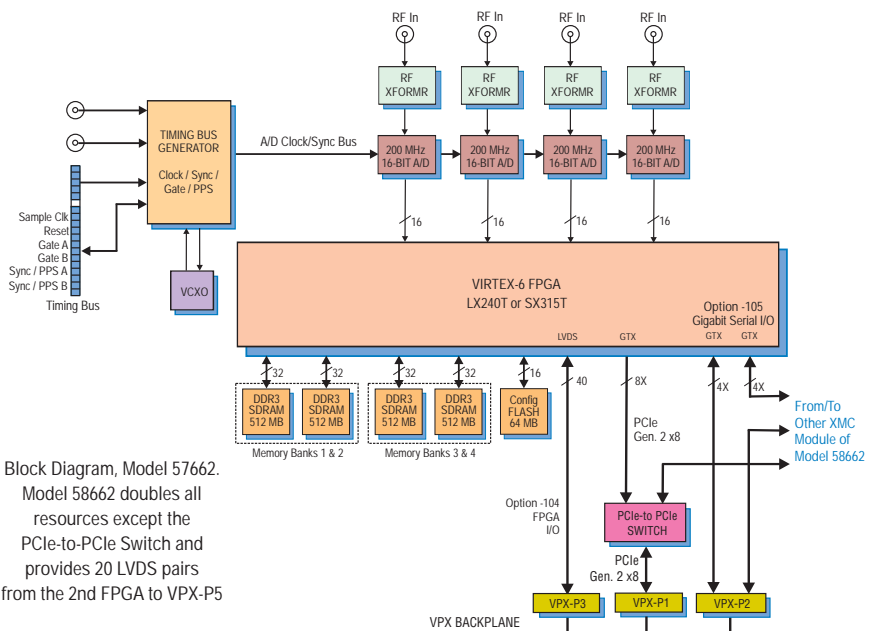

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57662; P3 and P5, Model 58662.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57662; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58662. ➤

## Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- 32 or 64 channels of multiband DDCs (digital downconverters)
- Up to 2 or 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range

is programmable in steps of 8 from 16 to 1024 and steps of 64 from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

**► A/D Converter Stages**

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture and for routing to other board resources.

**Clocking and Synchronization**

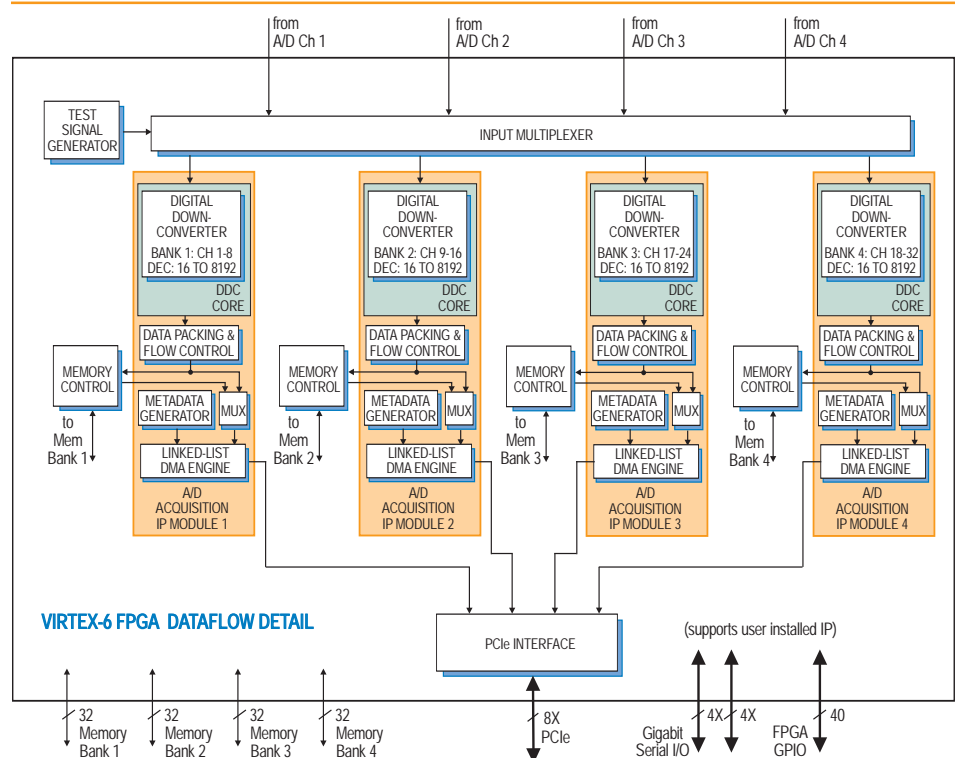

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with DDR3 SDRAM. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57662	4-Ch 200 MHz A/D with 32-Ch DDC and Virtex-6 FPGA - 6U VPX
58662	8-Ch 200 MHz A/D with 64-Ch DDC and two Virtex-6 FPGAs - 6U VPX
<b>Options:</b>	
-064	XC6VSX315T FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57662; P3 and P5 connectors, Model 58662
-105	Gigabit link between the FPGA and P2 connector, Model 57662; gigabit links from each FPGA to P2 connector, Model 58660
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57662: 4 A/Ds, 32 DDCs**

**Model 58660: 8 A/Ds, 64 DDCs**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (32 or 64)**

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57662; P3 and P5, Model 58662

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57662; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58662

**MemoryBanks (1 or 2)**

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57663 & 58663

# 1100- or 2200-Channel GSM Channelizer with Quad or Octal A/D - 6U OpenVPX

Model 58663

### Features

- Four or eight 180 MHz 16-bit A/Ds
- Two or four banks of 375 DDCs for upper GSM band
- Two or four banks of 175 DDCs for lower GSM band
- PCI Express (Gen. 1 & 2) interface up to x4
- LVPECL clock/sync bus for multiboard synchronization
- Ruggedized and conduction-cooled versions available

### General Information

Models 57663 and 58663 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71663 XMC modules mounted on a VPX carrier board.

Model 57663 is a 6U board with one Model 71663 module while the Model 58663 is a 6U board with two XMC modules rather than one.

This quad or octal, high-speed A/D converter with 1100 or 2200 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

### The Cobalt Architecture

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four or eight factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four or eight DMA controllers, PCIe interface, gating, and triggering.

These models are complete, full-featured subsystems, ready to use with no additional FPGA development required.

### A/D Converter Stage

The front end accepts four or eight analog IF inputs on front panel SSMC connectors

with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

### Clocking and Synchronization

The internal timing bus provides all timing and synchronization required by the A/D converters. It includes clock, sync and gate or trigger signals. One or two on-board clock generators accept external 180 MHz sample clocks from the front panel SSMC connectors. The clocks can be used directly by the A/Ds or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ➤

Model 58663 doubles all resources except the PCIe-to-PCIe Switch

## ► GSM Channelizer Cores

These models contain four or eight powerful GSM channelizer cores, two or four with 375 DDCs and two or four with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of four GSM channelizers.

The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to these models, the GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the four or eight A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must insure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

## Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x over sampling, and results in a reduction of the aggregate traffic by a factor of 4 to 2.383 GB/sec.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bits I + 26-bits Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank only contains three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCI-X bus. There are four superchannel mask words, one for each bank.

## Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

## PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

The PCIe interface is also used as the programming interface for all status and control between these models and host. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Specifications**

**Model 57663: 4 A/Ds, 1100 Channels**

**Model 58663: 8 A/Ds, 2200 Channels**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus (1 or 2):** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**GSM Channel Banks (1 or 2)**

**DDCs per bank:** two banks of 175

DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

**DDC Channels**

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

**DDC Channel Filter Characteristics**

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz \* 13 / 2160 = 1.0833333 MS/sec

**DDC Data Output Format:**

24 bits I + 24 bits Q

**Superchannels**

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

**Frequency Offsets for each DDC:**

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

**Superchannel Output Format:**

26 bits I + 26 bits Q

**Number of Superchannels per Bank:**

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Arrays (1 or 2)**

Xilinx Virtex-6 XC6VSX315T

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57664 & 58664

# 4- or 8-Channel 200 MHz A/D with DDCs, VITA 49.0, Virtex-6 FPGA - 6U VPX

Model 58664

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- PCIe output supports VITA 49.0 Radio Transport (VRT) Standard
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs (digital downconverters)
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57664 and 58664 are members of the Cobalt family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71664 XMC modules mounted on a VPX carrier board.

Model 57664 is a 6U board with one Model 71664 module while the Model 58664 is a 6U board with two XMC modules rather than one. Their PCIe output supports fully the VITA 49.0 Radio Transport (VRT) Standard.

These models include four or eight A/Ds, four or eight multiband DDCs, one or two programmable beamformers, and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. IP modules

for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, test signal generators, programmable beamforming IP cores, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

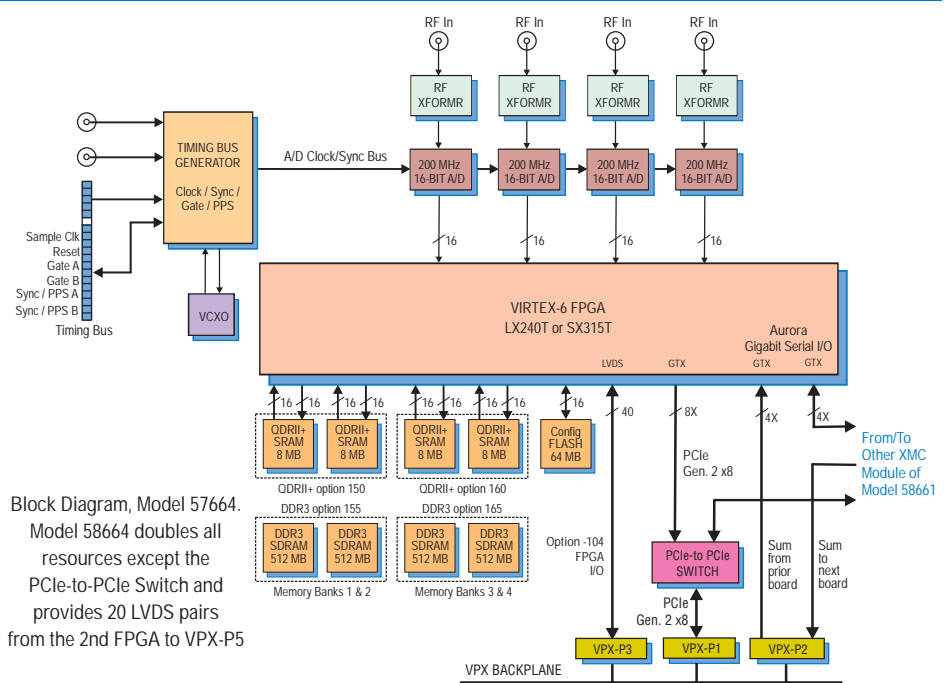

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57664; P3 and P5, Model 58664. ▶

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

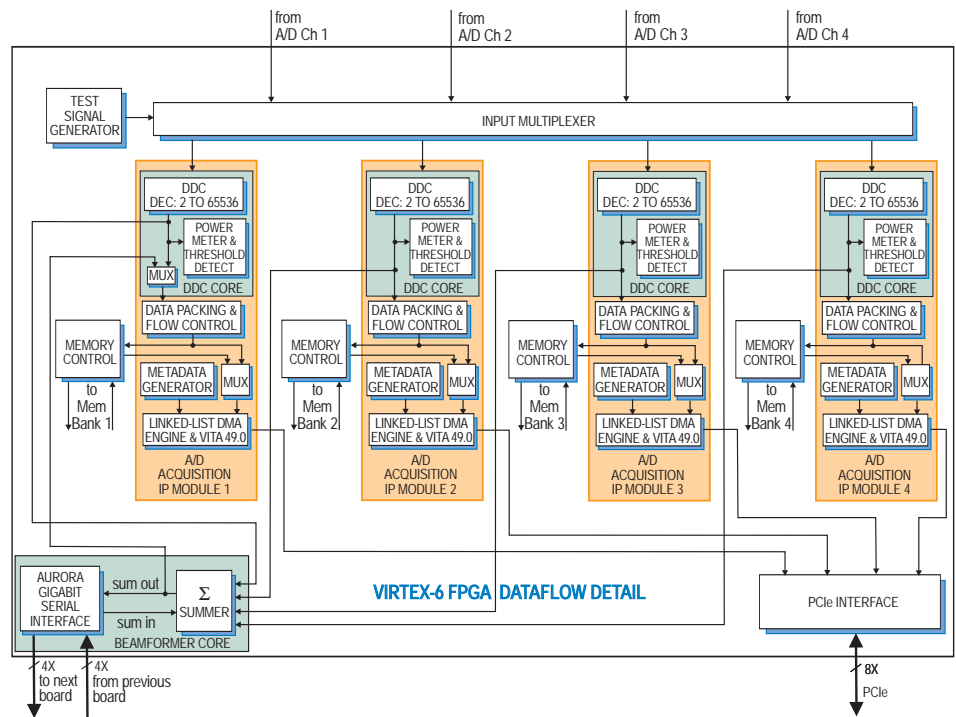

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**► VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA 49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

These models support fully the VITA 49.0 specification. ►

### ► A/D Converter Stages

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture and for routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57664	4-Channel 200 MHz A/D with DDCs, VITA 49.0, one Virtex-6 FPGA - 6U VPX
58664	8-Channel 200 MHz A/D with DDCs, VITA 49.0, two Virtex-6 FPGAs - 6U VPX
<b>Options:</b>

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Specifications**

**Model 57664: 4 A/Ds**

**Model 58664: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformers (1 or 2)**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via VPX P2 connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57664; P3 and P5, Model 58664

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2; x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57670 & 58670

# 4- or 8-Channel 1.25 GHz D/A with DUC and Virtex-6 FPGA - 6U OpenVPX

Model 58670

### Features

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 1.25 GHz 16-bit D/As
- Four or eight digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 or 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Sample clock synchronization to an external system reference
- Dual-or Quad  $\mu$ Sync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57670 and 58670 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71670 XMC modules mounted on a VPX carrier board.

Model 57670 is a 6U board with one Model 71670 module while the Model 58670 is a 6U board with two XMC modules rather than one.

These models include four or eight D/As, four or eight DUCs, and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include four or eight D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, test signal generators, and a PCIe interface complete the factory-

installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

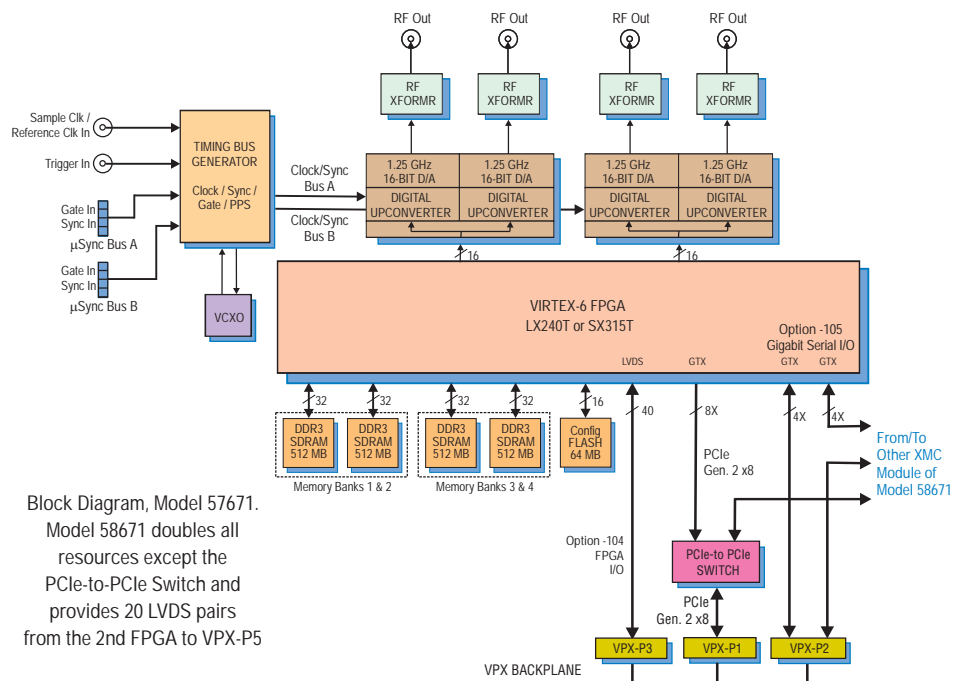

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57670; P3 and P5, Model 58670.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57670; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58670. ➤

Block Diagram, Model 57670. Model 58670 doubles all resources except the PCIe-to-PCIE Switch and provides 20 LVDS pairs from the 2nd FPGA to VPX-P5

► **Digital Upconverter and D/A Stage**

Two or four Texas Instruments DAC3484s provide four or eight DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four or eight front panel SSMC connectors.

**Clocking and Synchronization**

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO)

can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Model 9192 Cobalt Synchronizer can drive multiple µSync connectors enabling large, multichannel synchronous configurations.

**Memory Resources**

The architecture of these models supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

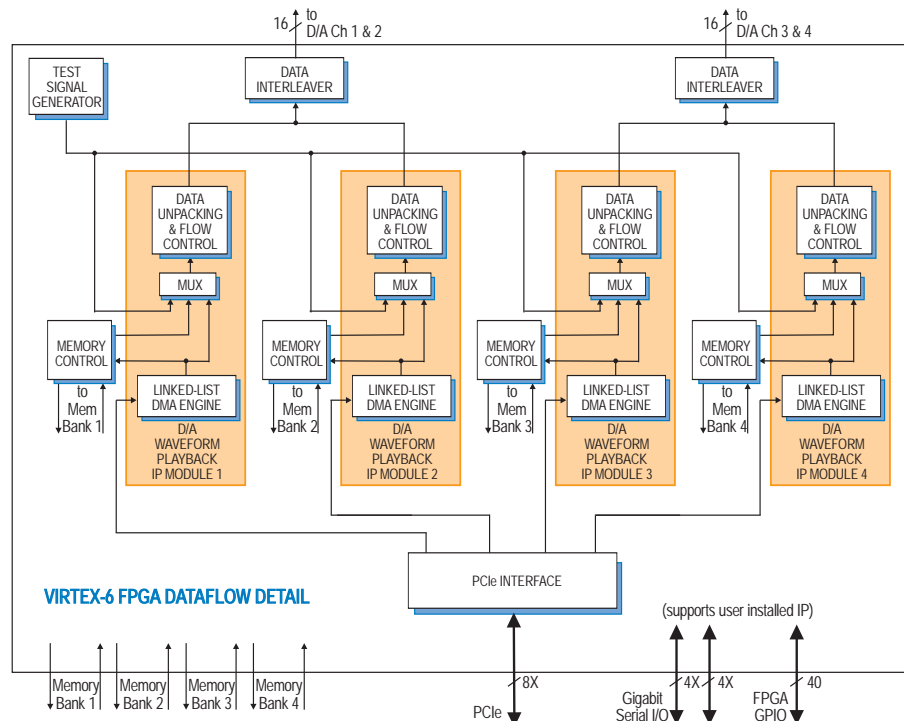

**D/A Waveform Playback IP Module**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. Four or eight linked list controllers support waveform generation to the four or eight D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4, as well as to the other four channels of Model 58670.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 or 128 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57671 and 58671 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71671 XMC modules mounted on a VPX carrier board.

Model 57671 is a 6U board with one Model 71671 module while the Model 58671 is a 6U board with two XMC modules rather than one.

These models include four or eight D/As with a wide range of programmable interpolation factors, four or eight DUCs, and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include four or eight D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, test signal generators,

and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

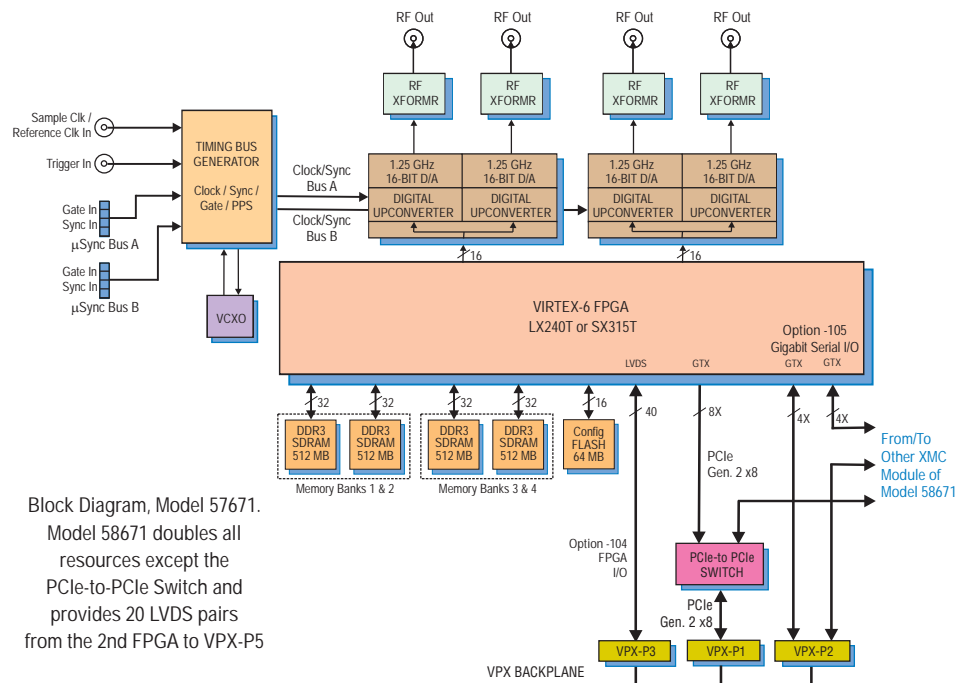

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57671; P3 and P5, Model 58671.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57671; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58671. ➤

Block Diagram, Model 57671.  
Model 58671 doubles all resources except the PCIe-to-PCIe Switch and provides 20 LVDS pairs from the 2nd FPGA to VPX-P5

► Digital Upconverter and D/A Stage

Two or four Texas Instruments DAC3484s provide four or eight DUCs (digital upconverters) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGAs and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, these models feature an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog outputs are through front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An

on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and trigger/gate signals. The Pentek Model 9192 Cobalt Synchronizers can drive multiple µSync connectors enabling large, multichannel synchronous configurations.

Memory Resources

The architecture of these models supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

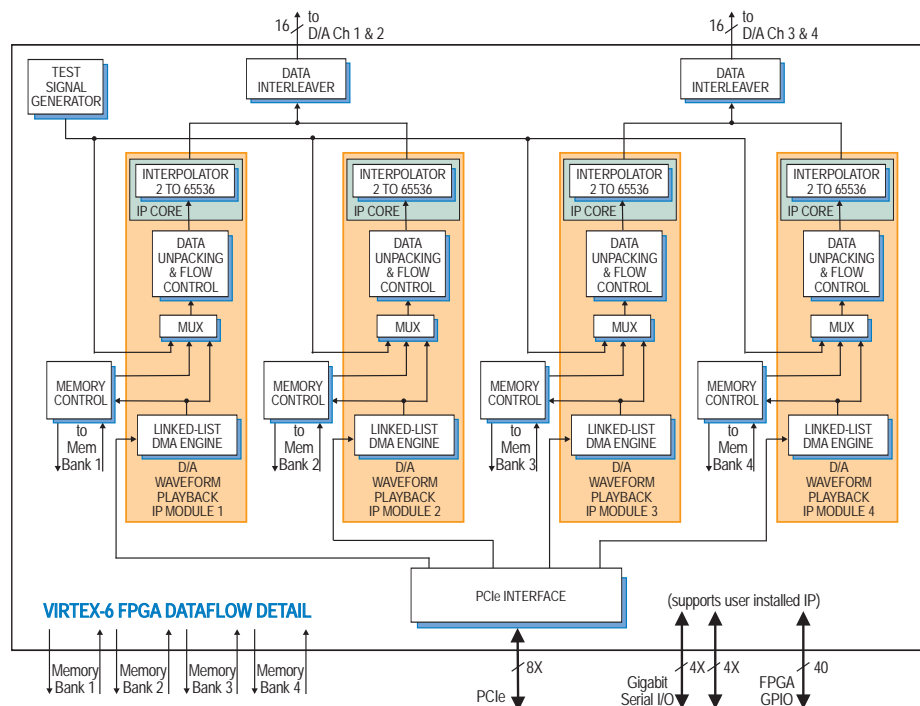

D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. Four or eight linked-list controllers support waveform generation to the four or eight D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4, as well as to the other four channels of Model 58671.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 or 128 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57671; P3 and P5, Model 58671

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57671; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58671

**Memory Banks (1 or 2)**

Four or eight 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57690 & 58690

# One or two L-Band RF Tuners, 2- or 4-Channel 200 MHz A/D, Virtex-6 FPGA - 6U OpenVPX

Model 58690

### Features

- One or two L-Band tuners accept RF signals from 925 MHz to 2175 MHz
- One or two programmable LNAs boost LNB (low-noise block) antenna signal levels with up to 60 dB gain
- One or two programmable analog downconverters provide I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two or four 200 MHz 16-bit A/Ds
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57690 and 58690 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71690 XMC modules mounted on a VPX carrier board.

Model 57690 is a 6U board with one Model 71690 module while the Model 58690 is a 6U board with two XMC modules rather than one.

These models include one or two L-Band RF tuners, two or four A/Ds and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include two or four A/D acquisition IP modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, test signal generators, and a PCIe interface complete the factory-installed functions and

enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

### Extendable IP Design

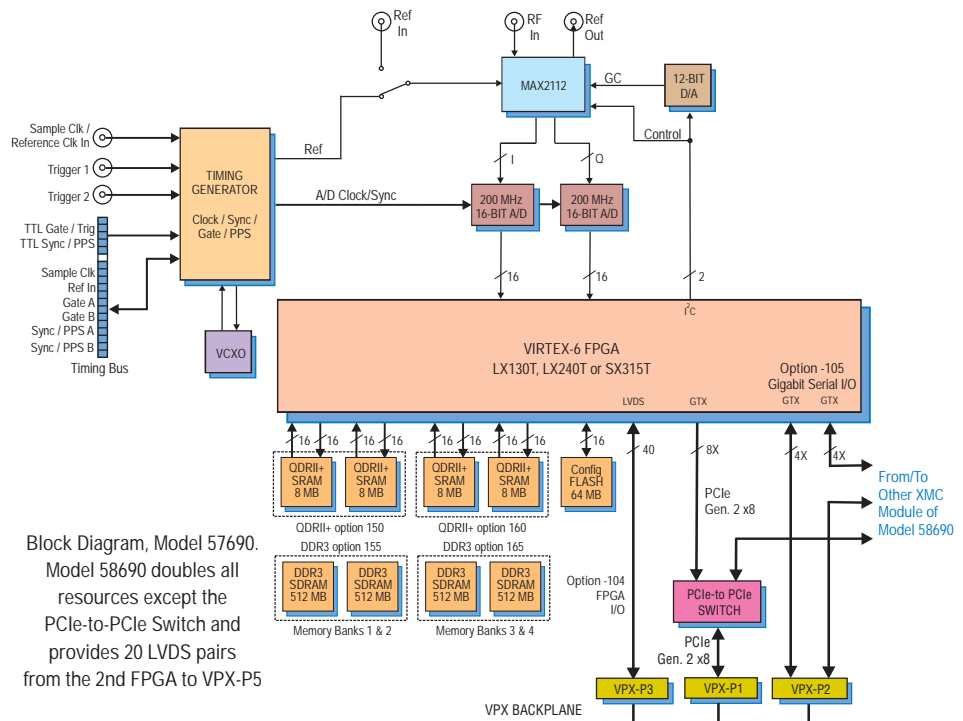

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57690; P3 and P5, Model 58690.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57690; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58690. ➤

► **RF Tuner Stages**

One or two front panel SSMC connectors accept L-Band signals between 925 MHz and 2175 MHz from the antenna LNAs (low noise blocks). The Maxim MAX2112 tuners directly convert these L-Band signals to baseband using broadband I/Q downconverters.

The devices include RF variable-gain LNAs (low noise amplifiers), PLL (phase-locked loops) synthesized local oscillators, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizers lock their VCOs to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNAs offer a programmable linear gain range of 60 dB.

The integrated lowpass filters with variable bandwidths provide bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

**A/D Converter Stages**

The analog baseband I and Q analog tuner outputs are then applied to two or four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGAs for signal processing, data capture or for routing to other board resources.

**A/D Clocking and Synchronization**

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

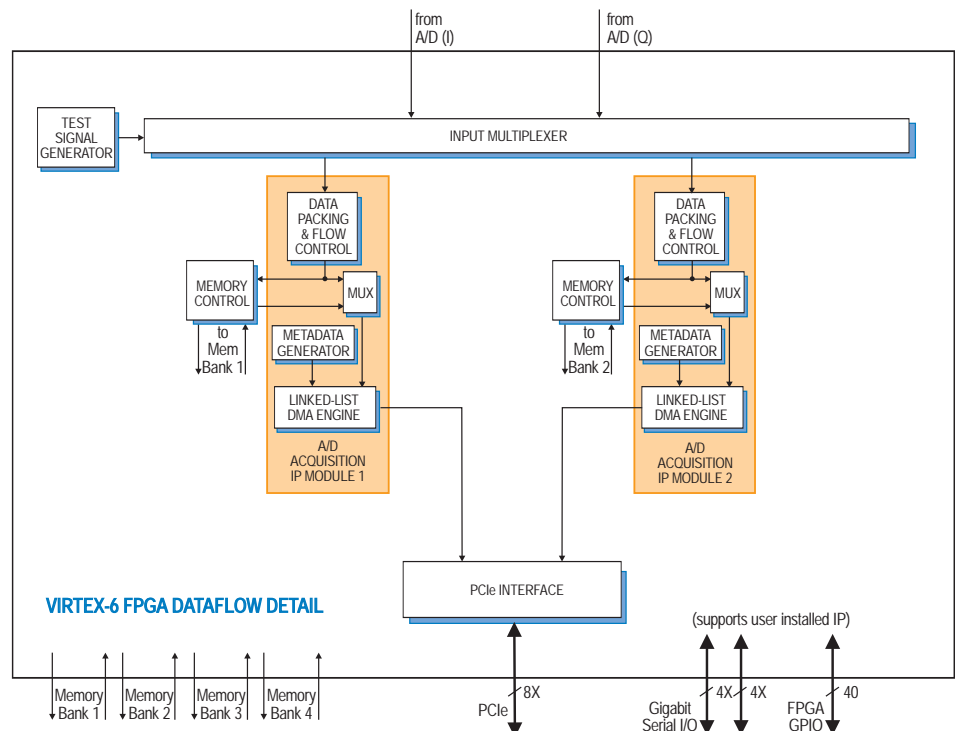

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

**A/D Acquisition IP Modules**

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57690	L-Band RF Tuner with 2-Channel 200 MHz A/D and Virtex-6 FPGA - 6U VPX
58690	Dual L-Band RF Tuner with 4-Channel 200 MHz A/D and two Virtex-6 FPGAs - 6U VPX
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57690; P3 and P5 connectors, Model 58690
-105	Gigabit link between the FPGA and P2 connector, Model 57690; gigabit links from each FPGA to P2 connector, Model 58690
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57690: One RF tuner, two A/Ds**  
**Model 58690: Two RF tuners, four A/Ds**  
**Front Panel Analog Signal Inputs (1 or 2)**

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

**L-Band Tuners (1 or 2)**

**Type:** Maxim MAX2112  
**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**  
-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**  
 $freq_{VCO} = (N.F) \times freq_{REF}$  where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference ( $freq_{REF}$ ):** Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

**\*Usable Full-Scale Input Range:** -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

**A/D Converters (2 or 4)**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources (1 or 2)**

On-board timing generator/synthesizer

**A/D Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus (1 or 2):** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (2 or 4)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57690; P3 and P5, Model 58690

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57690; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58690

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57720 & 58720

# 3- or 6-Channel 200 MHz A/D, 2- or 4-Channel 800 MHz D/A, Virtex-7 FPGAs - 6U Open VPX

Model 58720

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three or six 200 MHz 16-bit A/Ds
- One or two DUCs (Digital Upconverters)
- Two or four 800 MHz 16-bit D/As
- 4 or 8 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57720 and 58720 are members of the Onyx<sup>®</sup> family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71720 XMC modules mounted on a VPX carrier board.

Model 57720 is a 6U board with one Model 71720 module while the Model 58720 is a 6U board with two XMC modules rather than one.

These models include three or six A/Ds, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three or six A/D acquisition and one or two D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchro-

nization functions, test signal generators, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

### Extendable IP Design

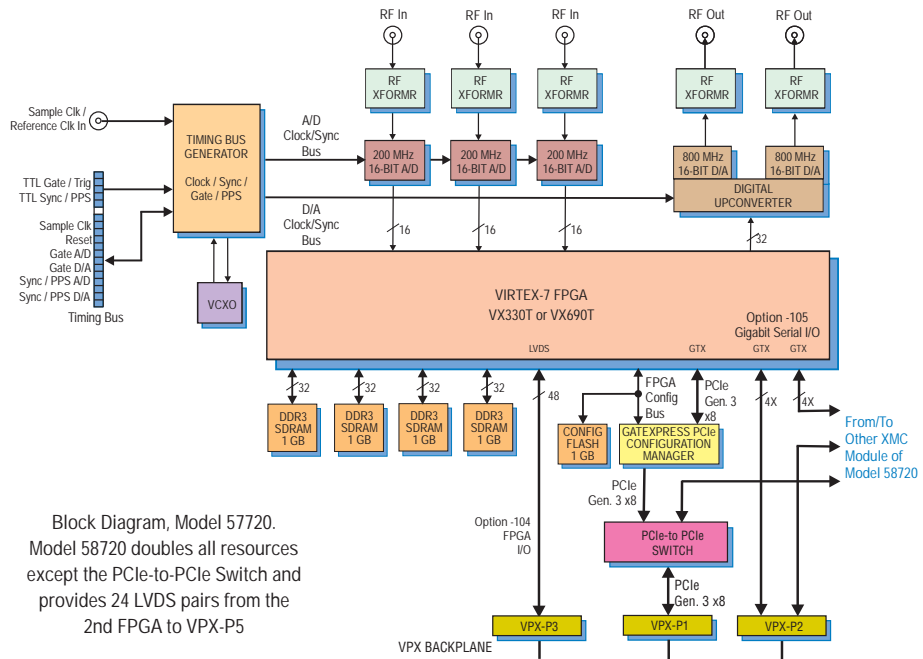

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57720; P3 and P5, Model 58720.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57720; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58720. ➤

Block Diagram, Model 57720. Model 58720 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

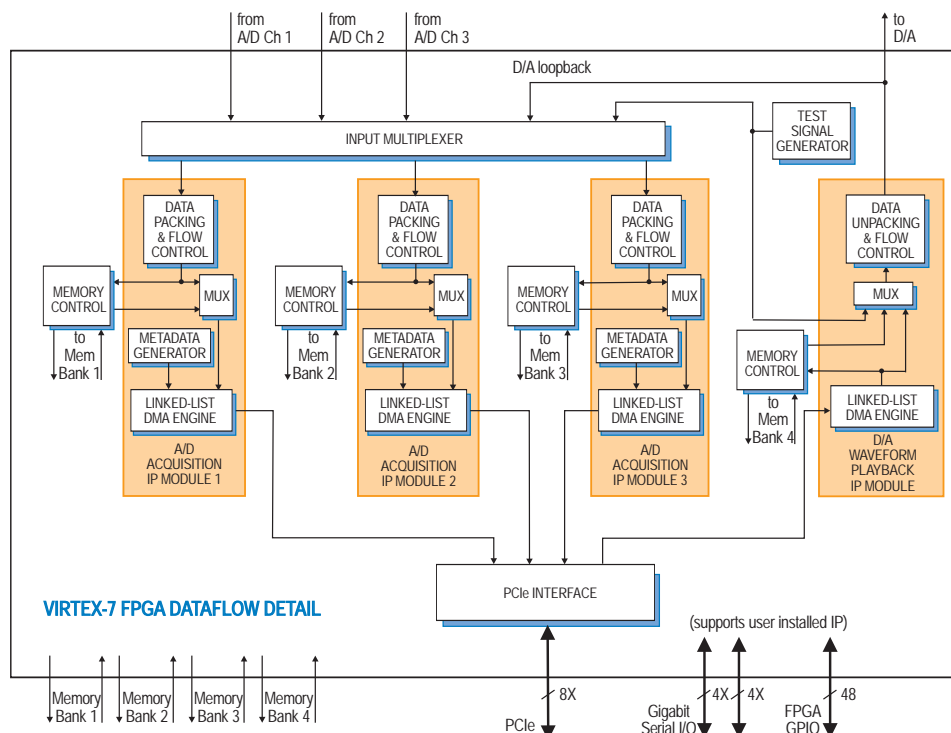

**A/D Converter Stages**

The front end accepts three or six full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stages**

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages. ►

**Memory Resources**

The architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex7 FPGA - 6U VPX
58720	6-Channel 200 MHz A/D and 4-Channel 800 MHz D/A with two Virtex-7 FPGAs - 6U VPX
<b>Options:</b>	
-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57720; P3 and P5 connectors, Model 58720
-105	Gigabit link between the FPGA and P2 connector, Model 57720; gigabit links from each FPGA to P2 connector, Model 78720

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes, the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

**Specifications**

**Model 57620: 3 A/Ds, 1 DUC, 2 D/As**

**Model 58620: 6 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57720; P3 and P5, Model 58720

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57720; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58720.

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57721 & 58721

# 3- or 6-Channel 200 MHz A/D with DDC, DUC with 2- or 4-Channel 800 MHz D/A, Virtex-7 FPGAs - 6U OpenVPX

Model 58721

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs
- One or two DUCs
- Two or four 800 MHz 16-bit D/As
- Multiboard programmable beamformer
- 4 or 8 GB of DDR3 SDRAM
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57721 and 58721 are members of the Onyx® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71721 XMC modules mounted on a VPX carrier board.

Model 57721 is a 6U board with one Model 71721 module while the Model 58721 is a 6U board with two XMC modules rather than one.

These models include three or six A/Ds, programmable DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful programmable DDC IP core. The waveform playback IP module

contains one or two interpolation IP cores, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, one or two test signal generators, one or two programmable beamforming IP cores, and one or two Aurora gigabit serial interfaces complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop FPGA IP.

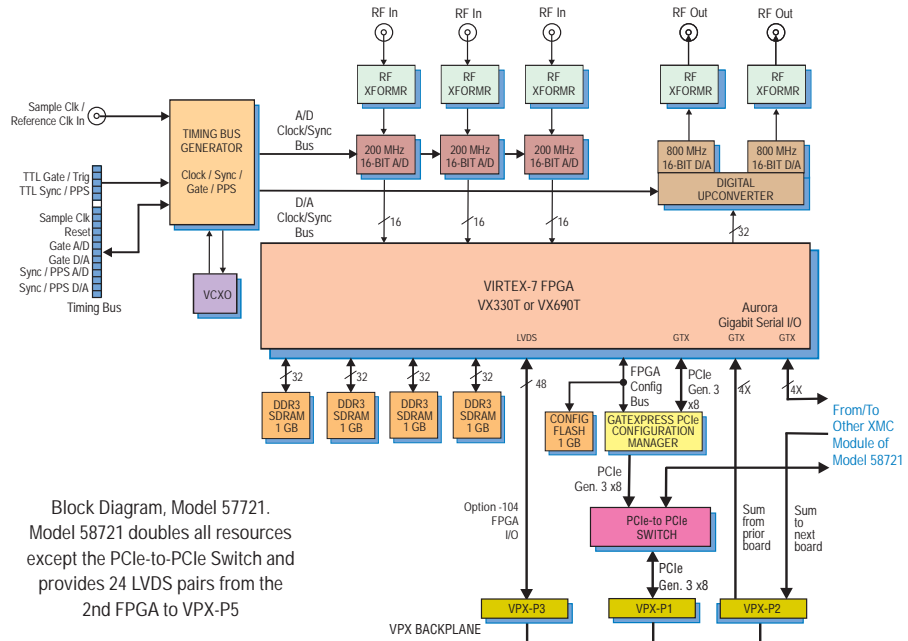

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57721; P3 and P5, Model 58721. ▶

Block Diagram, Model 57721. Model 58721 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature one or two beamforming subsystems. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

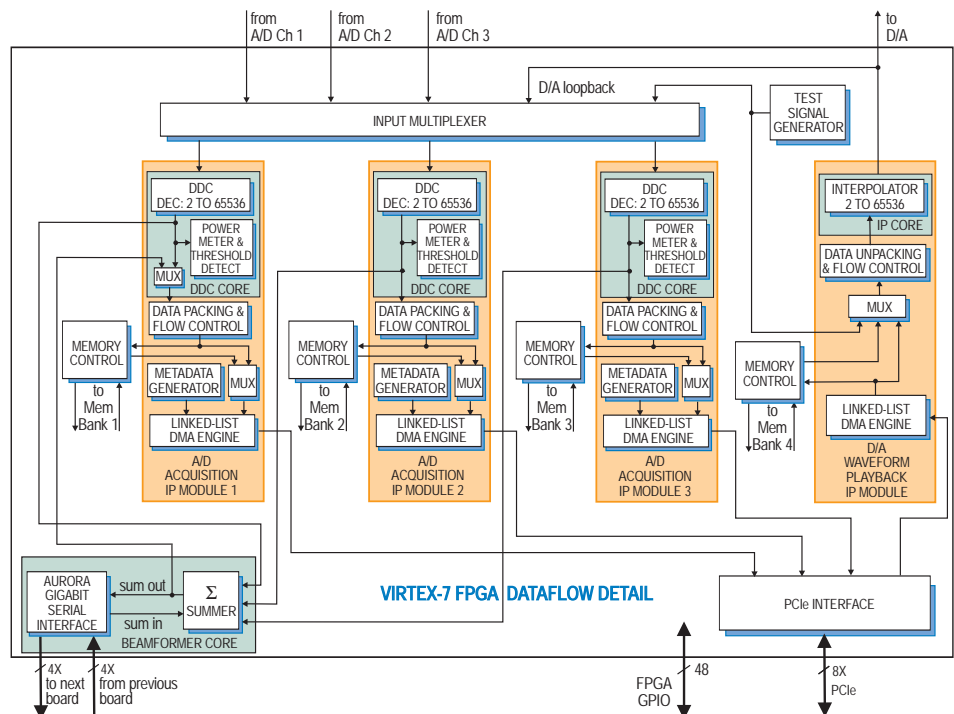

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer coupling into Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGAs for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUC (digital upconverters) and D/As accept baseband real or complex data stream from the FPGAs and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57721	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 6U VPX
58721	6-Channel 200 MHz A/D with DDCs, DUCs with 4-Channel 800 MHz D/A, and two Virtex-7 FPGAs - 6U VPX
<b>Options:</b>	
-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57721; P3 and P5 connectors, Model 58721

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Memory Resources**

The architecture supports four or eight independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Specifications**

**Model 57721: 3 A/Ds, 1 DUC, 2 D/As**

**Model 58721: 6 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (3 or 6)**

**Input:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformers (1 or 2)**

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via VPX P2 connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57721; P3 and P5, connectors, Model 58721

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 57730 & 58730

# 1- or 2-Channel 1 GHz A/D, 1- or 2-Channel 1 GHz D/A with Virtex-7 FPGA - 6U OpenVPX

Model 58730

## General Information

Models 57730 and 58730 are members of the Onyx® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71730 XMC modules mounted on a VPX carrier board.

Model 57730 is a 6U board with one Model 71730 module while the Model 58730 is a 6U board with two XMC modules rather than one.

These models include one or two 1 GHz A/D and D/A converters and four or eight banks of memory

## The Onyx Architecture

The Pentek Onyx Architecture features Virtex-7 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition and one or two D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, test signal generators,

and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

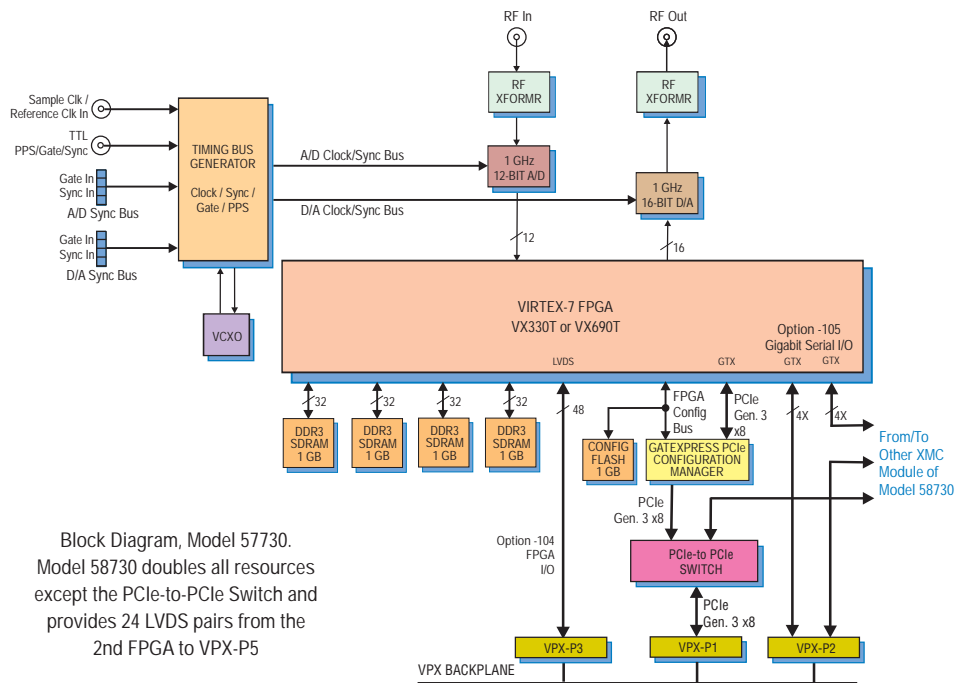

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57730; P3 and P5, Model 58730.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57730; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58730. ➤

## Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One or two 1 GHz 12-bit A/D
- One or two 1 GHz 16-bit D/A
- 4 or 8 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Dual-µSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

Block Diagram, Model 57730. Model 58730 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Module**

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The factory-installed functions include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

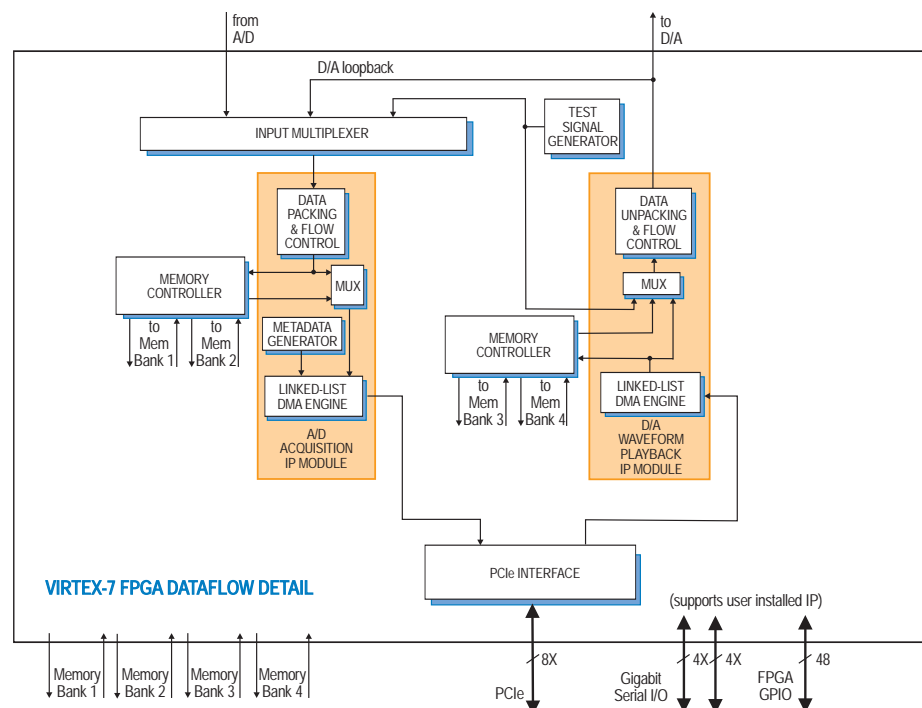

**A/D Converter Stages**

The front end accepts one or two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into one or two Texas Instruments ADS5400 1 GHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGAs for signal processing, data capture or for routing to other board resources.

**D/A Converter Stages**

These models feature one or two TI DAC5681Z 1 GHz, 16-bit D/As. The converters have an input sample rate of 1 GSPS, allowing them to accept full rate data from the FPGA. Additionally, the D/As include a 2x or 4x interpolation filter for applications that provide 1/2- or 1/4-rate input data. Analog output is through front panel SSMC connectors. ►

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Model 8264

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description

### ► Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel  $\mu$ Sync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 9192 Cobalt or Onyx Synchronizer can drive multiple  $\mu$ Sync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

### Memory Resources

The Onyx architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### Specifications

**Model 57730: 1 A/D, 1 D/A**

**Model 58730: 2 A/Ds, 2 D/As**

#### Front Panel Analog Signal Inputs (1 or 2)

**Input Type:** Transformer-coupled, front panel female SSMC connectors

#### A/D Converters (1 or 2)

**Type:** Texas Instruments ADS5400

**Sampling Rate:** 100 MHz to 1 GHz

**Resolution:** 12 bits

#### D/A Converters (1 or 2)

**Type:** Texas Instruments DAC5681Z

**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs (1 or 2)

**Output Type:** Transformer-coupled, front panel female SSMC connectors

#### Sample Clock Sources (1 or 2)

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizers (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clocks (1 or 2)

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus (1 or 2):** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O (1 or 2)

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57730; P3 and P5, Model 58730

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57730; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58730

#### Memory Banks (4 or 8)

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

Models  
57741 & 58741

1- or 2-Channel 3.6 GHz and 2- or 4-Channel 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Virtex-7 FPGAs - 6U OpenVPX

Model 58741

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One or two 1-channel mode with 3.6 GHz, 12-bit A/Ds
- Two or four 2-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDCs (Digital Downconverters)
- 4 or 8 GB of DDR3 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Models 57741 and 58741 are members of the Onyx® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71741 XMC modules mounted on a VPX carrier board.

Model 57741 is a 6U board with one Model 71741 module while the Model 58741 is a 6U board with two XMC modules rather than one.

These models include one or two 3.6 GHz, 12-bit A/D converters, four or eight banks of memory, and one or two wideband DDCs.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition IP modules and one or two wideband DDCs. In addition, IP modules for DDR3 SDRAM memories, a controller for all data clocking

and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable these models to operate as turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

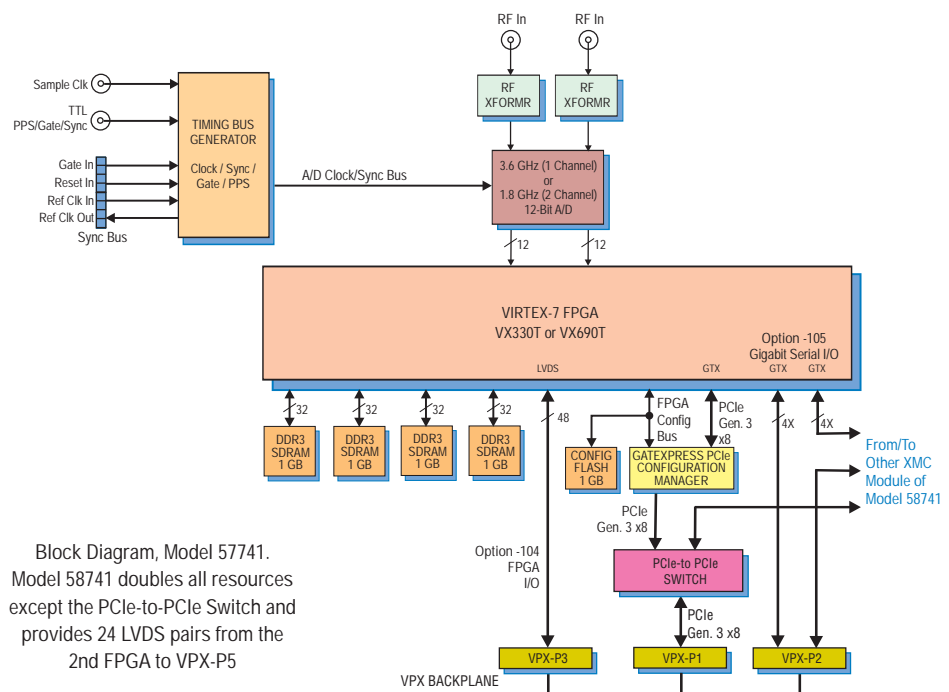

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57741; P3 and P5, Model 58741.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57741; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58741. ➤

**A/D Acquisition IP Module**

These models feature two or four A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, four banks are used to store the single-channel of input data. In dual-channel mode, two memory banks store data from input channel 1 and two memory banks store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Core**

Within each FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

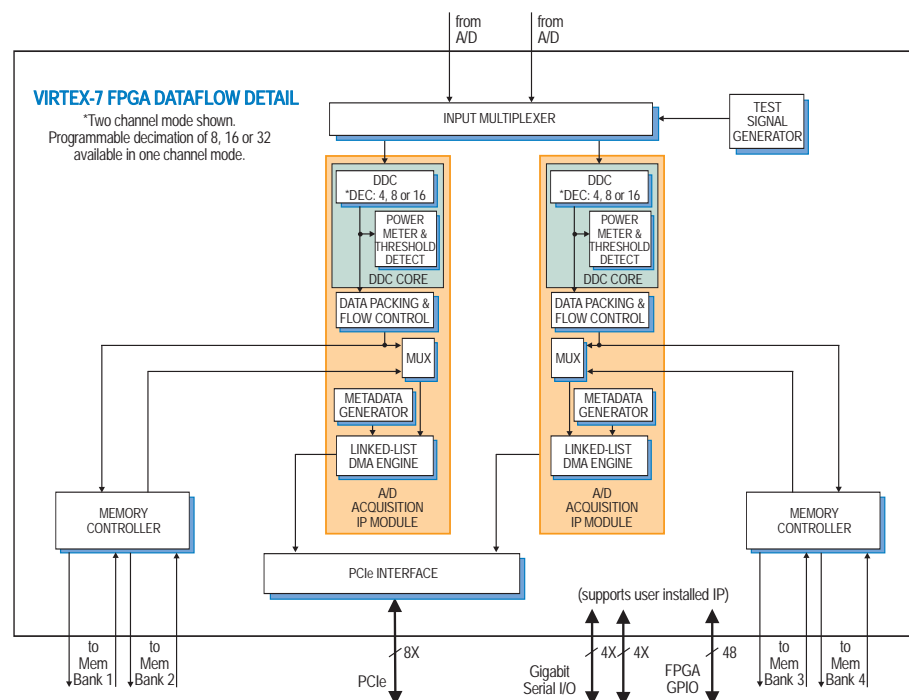

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed. ➤

## Memory Resources

The Onyx architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

## Model 8264

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
57741	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, with Wideband DDC, Virtex-7 FPGA - 6U VPX
58741	2-Ch. 3.6 GHz or 4-Ch. 1.8 GHz, 12-bit A/D, with Wideband DDC, two Virtex-7 FPGAs - 6U VPX

### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57741; P3 and P5 connectors, Model 58741
-105	Gigabit link between the FPGA and P2 connector, Model 57741; gigabit links from each FPGA to P2 connector, Model 78741

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

► The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

## A/D Converter Stages

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing these models to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

## PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two boards can be synchronized with a simple cable. For larger systems, multiple boards can be synchronized using the Model 5292 high-speed sync board to drive the sync bus.

## Specifications

**Model 57741: One A/D**

**Model 58741: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

## A/D Converters (1 or 2)

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

## Digital Downconverters (2 or 4)

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

## Sample Clock Sources (1 or 2)

Front panel SSMC connector

## Timing Bus (1 or 2)

19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

## External Trigger Input (1 or 2)

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

## Custom I/O

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57741; P3 and P5, Model 58741

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57741; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58741.

## Memory Banks (4 or 8)

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

## PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57751 & 58751

# 2- or 4-Channel 500 MHz A/D, DDC, DUC, 2-or 4-Channel 800 MHz D/A with Virtex-7 FPGA - 6U OpenVPX

Model 58751

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- 4 or 8 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

### General Information

Models 57751 and 58751 are members of the Onyx® family of high-performance 6 U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71751 XMC modules mounted on a VPX carrier board.

Model 57751 is a 6U board with one Model 71751 module while the Model 58751 is a 6U board with two XMC modules rather than one.

These models include two or four A/Ds, two or four multiband DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Onyx Architecture

The Pentek Onyx Architecture features Virtex-7 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include two or four A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for DDR3 memories, controllers for all data clocking and synchronization functions, test signal generators, and a PCIe interface complete the factory-installed functions and enable these models to operate as a complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

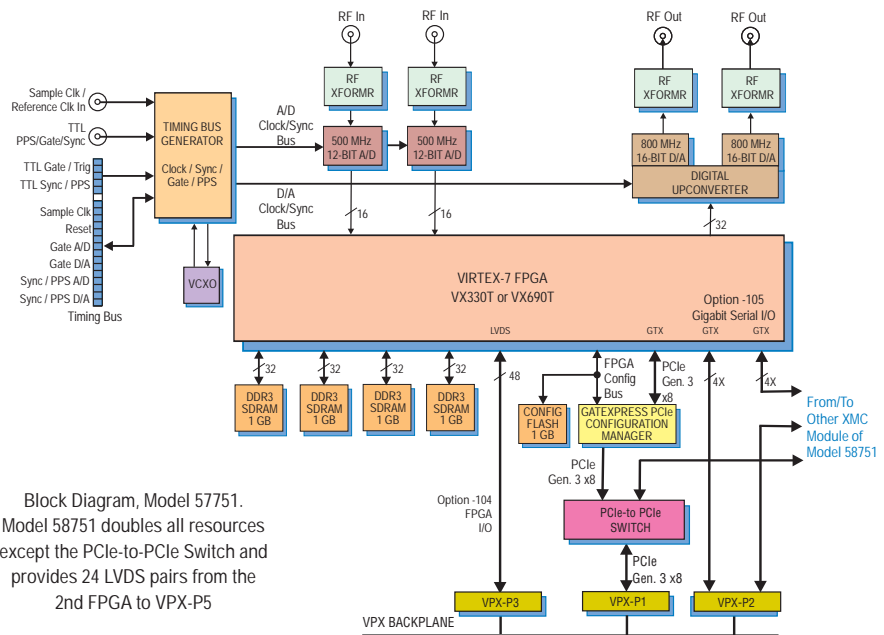

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57751; P3 and P5, Model 58751.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57751; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58751. ▶

Block Diagram, Model 57751.  
Model 58751 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP Module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation set-

ting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

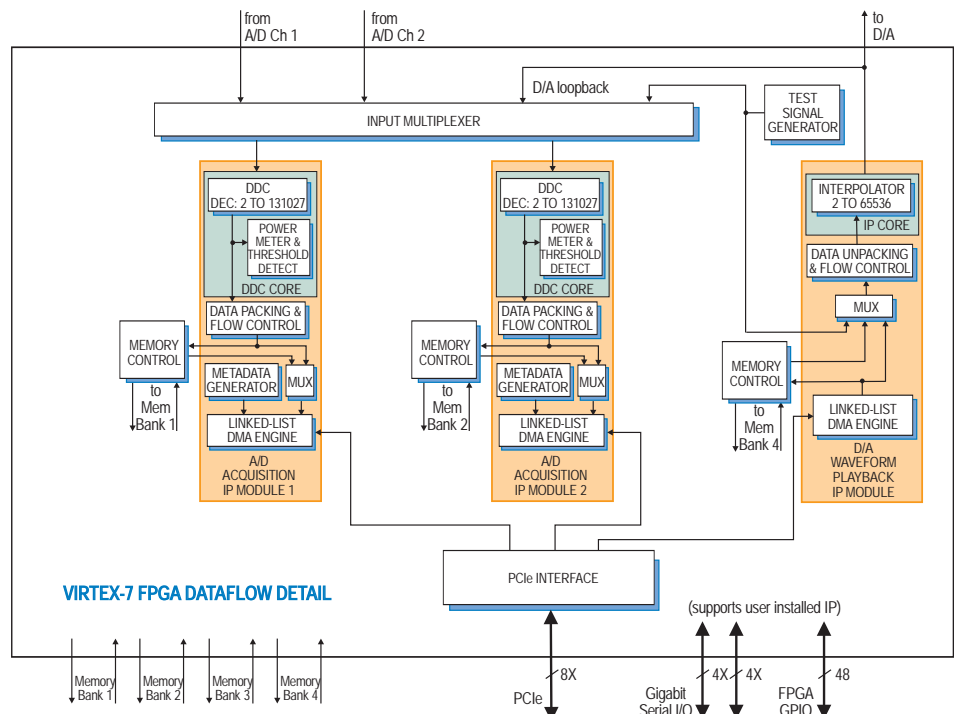

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. ➤

► In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

### A/D Converter Stages

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, Texas Instruments ADS5474 400 MHz, 14-bit A/Ds may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stages

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept the baseband real or complex data stream from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog outputs are through front-panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► **Specifications**

**Model 57751:** 2 A/Ds, 2 DDCs, 1 DUC, 2 D/As

**Model 58751:** 4 A/Ds, 4 DDCs, 2 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters (2 or 4)**

**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Total Interpolation Range (D/A and Digital combined):** 2x to 524,288x

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus: (1 or 2)** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57751; P3 and P5, Model 58751

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57751; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58751

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Models 57760 & 58760

# 4- or 8-Channel 200 MHz, 16-bit A/D with Virtex-7 FPGA - 6U OpenVPX

Model 58760

## General Information

Models 57760 and 58760 are members of the Onyx® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71760 XMC modules mounted on a VPX carrier board.

Model 57760 is a 6U board with one Model 71760 module while the Model 58760 is a 6U board with two XMC modules rather than one.

These models include four or eight A/Ds and four or eight banks of memory.

## The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchro-

nization functions, test signal generators, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop FPGA IP.

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

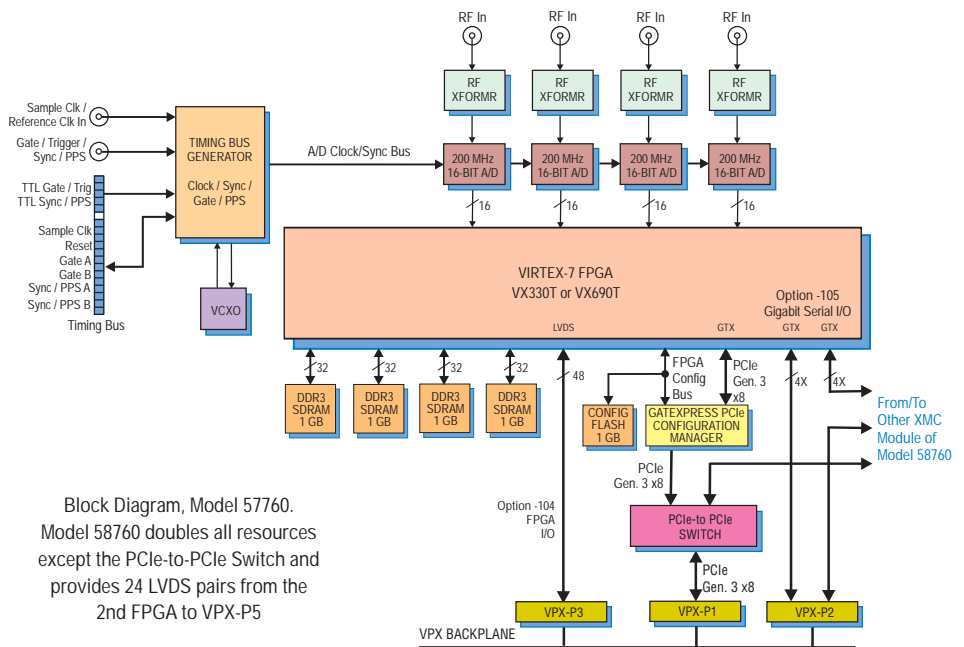

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57760; P3 and P5, Model 58760.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57760; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58760. ➤

## Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four or eight 200 MHz 16-bit A/Ds
- 4 or 8 GB of DDR3 SDRAM
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

► **GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvola-

tile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

**A/D Converter Stages**

The front end accepts four or eight full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

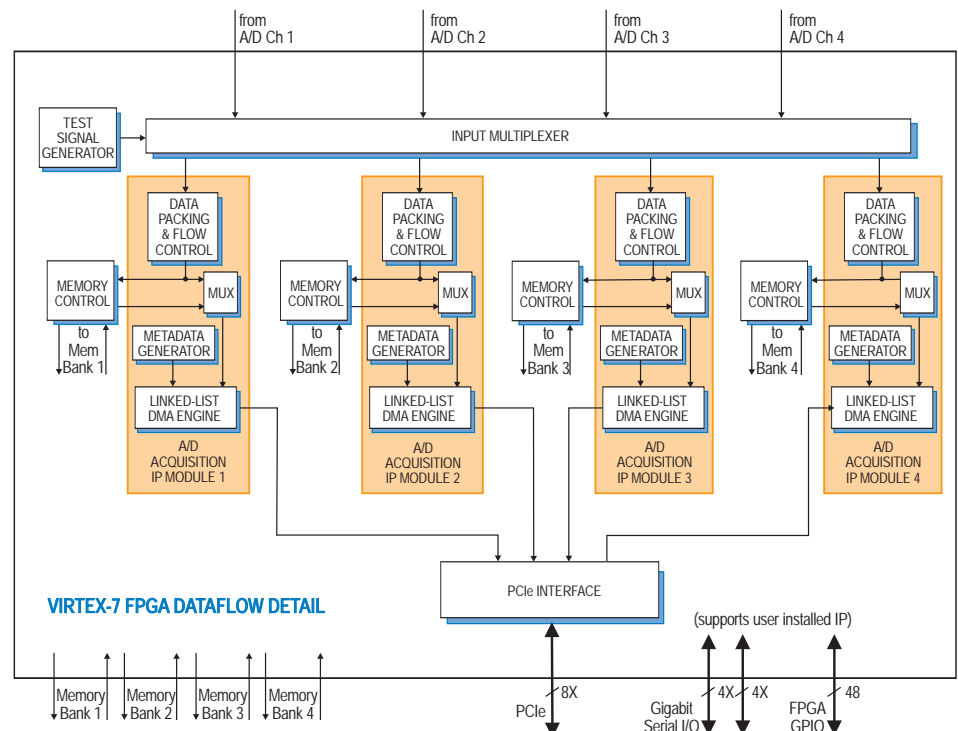

The digital outputs are delivered into the Virtex-7 FPGAs for signal processing, data capture or for routing to other board resources. ►

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of four A/Ds or the test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57760	4-Channel 200 MHz 16-bit A/D with Virtex-7 FPGA - 6U VPX
58760	8-Channel 200 MHz 16-bit A/D with two Virtex-7 FPGAs - 6U VPX

**Options:**

-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57760; P3 and P5 connectors, Model 58760
-105	Gigabit link between the FPGA and P2 connector, Model 57760; gigabit links from each FPGA to P2 connector, Model 78760

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The Onyx architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Model 57760: 4 A/Ds**

**Model 58760: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57760; P3 and P5, Model 58760

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57760; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58760.

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57761 & 58761

# 4- or 8-Channel 200 MHz A/D with DDCs and Virtex-7 FPGA - 6U OpenVPX

Model 58761

### General Information

Models 57761 and 58761 are members of the Onyx® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71761 XMC modules mounted on a VPX carrier board.

Model 57761 is a 6U board with one Model 71761 module while the Model 58761 is a 6U board with two XMC modules rather than one.

These models include four or eight A/Ds, programmable DDCs and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include four or eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, one or two test signal generators, one or two programmable beamforming IP cores, and one or two Aurora gigabit serial interfaces complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

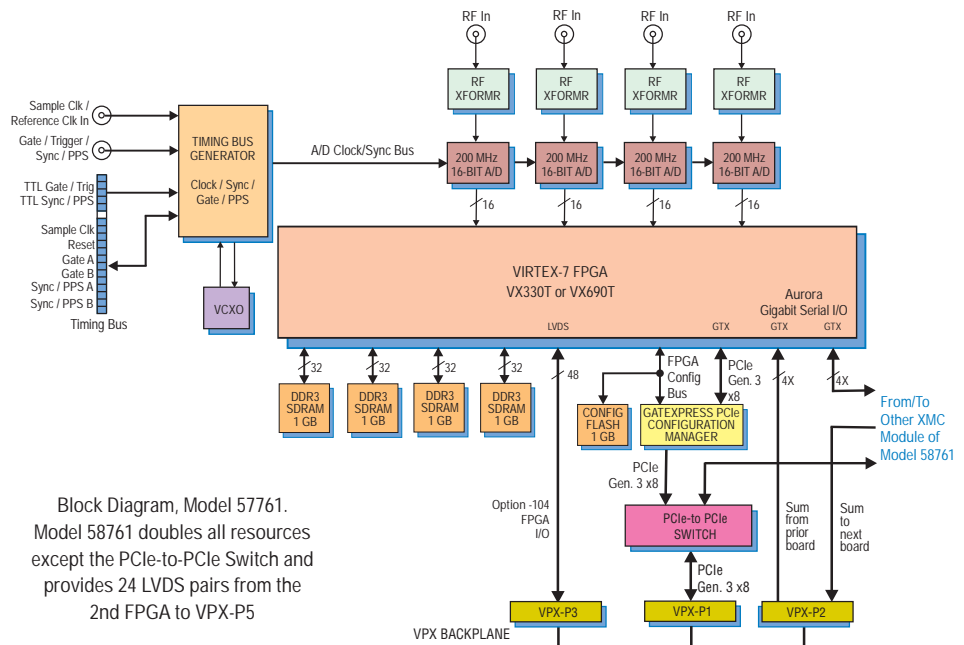

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57761; P3 and P5, Model 58761. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs
- Multiboard programmable beamformer
- 4 or 8 GB of DDR3 SDRAM
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Cores**

In addition to the DDCs, these models feature a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGAs. At power-up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGAs time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

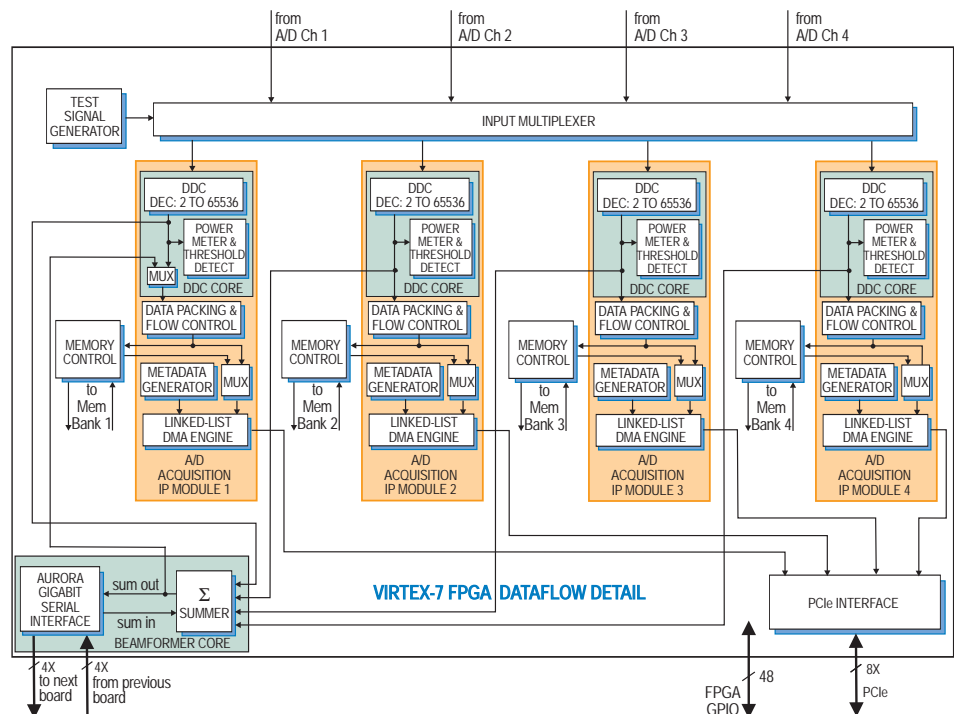

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user. In this case, it's programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image to load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

► reconfiguring the FPGAs with new IP images. The first option is to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGAs through JTAG using Xilinx iMPACT.

In all three FPGA-loading scenarios, GateXpress handles the hardware negotiation thereby simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without the need to reset the host computer so it can rediscover the board. After the reload, the host computer simply continues to see the board with the expected device ID.

### A/D Converter Stages

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports four or eight independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► **Specifications**

**Model 57761:** 4 A/Ds,

**Model 58761:** 8 A/Ds

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformers (1 or 2)**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via VPX P2 connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus: (1 or 2)** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57761; P3 and P5, Model 58761

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental:** Level L1 & L2 air-cooled;

Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57761	4-Channel 200 MHz A/D with DDCs, Virtex-7 FPGA - 6U VPX
58761	8-Channel 200 MHz A/D with DDCs, two Virtex-7 FPGAs - 6U VPX

**Option:**

-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and P3 connector, Model 57761; P3 and P5 connectors, Model 58761

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

New!

# Models 57791 & 58791

# 1 or 2 L-Band RF Tuners, 2-or 4-Channel 500 MHz A/D, Virtex-7 FPGAs - 6U VPX

Model 58791

### Features

- Accepts RF signals from 925 MHz to 2175 MHz
- One or two programmable LNAs handle L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverters provide IF or I+Q baseband signals at frequencies up to 123 MHz
- Two or four 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two or four FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 or 8 GB of DDR3 SDRAM
- Sample clock synchronization to external system reference
- PCI Express (Gen. 1, 2, & 3) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

### General Information

Models 57751 and 58751 are members of the Onyx® family of high-performance 6U VPX boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71751 XMC modules mounted on a 6U VPX carrier board.

Model 57791 is a 6U board with one Model 71791 module while the Model 58751 is a 6U board with two XMC modules rather than one.

They include one or two L-Band RF tuners, two or four A/Ds and four or eight banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include general purpose and gigabit serial connectors for application-specific I/O.

### The Onyx Architecture

The Pentek Onyx Architecture features one or two Virtex-7 FPGAs. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The factory-installed functions include two or four A/D acquisition IP modules, four or eight DDR3 memory controllers, two or four DDCs (digital downconverters), RF tuner controllers, one or two clock and synchronization generators, one or two test signal generators, and a Gen 3 PCIe interface.

These models can operate as complete turnkey solutions with no need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

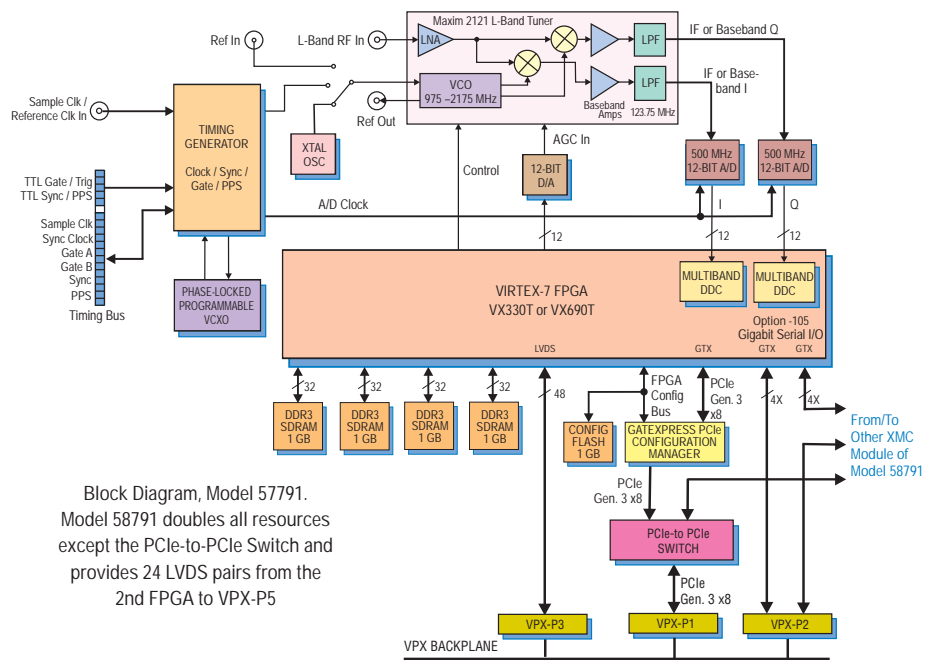

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the VPX P3 connector, Model 57791; P3 and P5, Model 58791.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57791; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58751. ▶

**A/D Acquisition IP Modules**

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

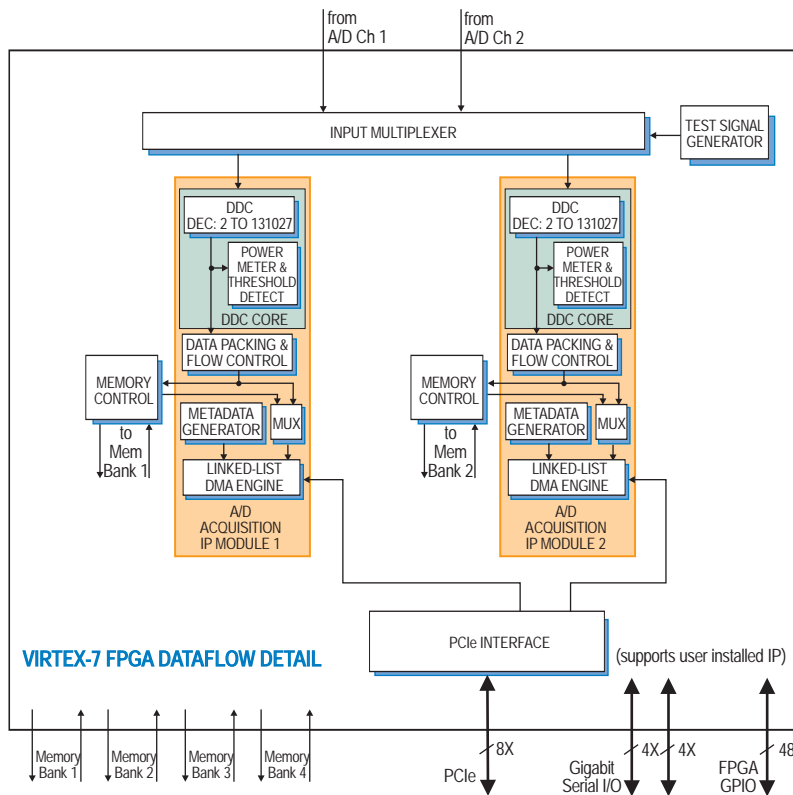

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ▶

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The analog tuner outputs are digitized by two or four Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two or four independent A/D and DDC channels are now available for digitizing and downconverting signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

One or two internal timing generators provide all timing, gating, triggering and synchronization functions required by the A/D converters. They also serve as optional sources for the L-Band tuner references.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports four or eight independent 1 GB DDR3 SDRAMs for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be used to support custom user-installed IP within the FPGA.

### PCI Express Interface

Models 57791 and 58791 include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
57791	L-Band RF Tuner with 2-Channel 500 MHz A/D with DDCs and Virtex-7 FPGA - 6U VPX
58791	Two L-Band RF Tuners with 4-Channel 500 MHz A/D with DDCs and two Virtex-7 FPGAs - 6U VPX
<b>Options:</b>	
-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-100	27 MHz crystal for MAX2121
-104	LVDS I/O between the FPGA and P3 connector, Model 57791; P3 and P5 connectors, Model 58791
-105	Gigabit link between the FPGA and P2 connector, Model 57791; gigabit links from each FPGA to P2 connector, Model 78791

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8264	VPX Development System. See 8264 Datasheet for Options

**► Specifications**

**Model 57791:** 1 L-Band Tuner, 2 A/Ds, 2 DDCs, 1 FPGA

**Model 58791:** 2 L-Band Tuners, 4 A/Ds, 4 DDCs, 2 FPGAs

**Front Panel Analog Signal Inputs (1 or 2)**

**Connector:** Front panel female SSMC

**Impedance:** 50 ohms

**L-Band Tuner (1 or 2)**

**Type:** Maxim MAX2121

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$\text{freq}_{\text{VCO}} = (\text{N.F.}) \times \text{freq}_{\text{REF}}$

where integer N = 19 to 251 and

fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel

SSMC connector or on-board 27 MHz

crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a

programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**

-50 dBm to +10 dBm

**Baseband Low Pass Filter:**

3 dB cutoff frequency: 123.75 MHz

**A/D Converters (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 10 MHz to 500 MHz

**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources (1 or 2)**

On-board timing generator/synthesizer

**A/D Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board

programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL

timing bus

**Synchronization:** VCXO can be locked

to an external 4 to 180 MHz PLL system

reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO

can be divided by 1, 2, 4, 8, or 16, for the

A/D clock

**Timing Generator External Clock Input (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm,

AC-coupled, 50 ohms, accepts 10 to 200

MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system

reference

**Timing Generator Bus (1 or 2)**

26-pin front panel connector LVPECL

bus includes, clock/sync/gate/PPS inputs

and outputs; TTL signal for gate/trigger

and sync/PPS inputs

**External Trigger Input (2 or 4)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions

include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs

between the FPGA and the VPX P3

connector, Model 57791; P3 and P5,

Model 58791

**Option -105:** Supports serial protocols

by providing a 4X gigabit link between

the FPGA and VPX P2, Model 57791; or

one 4X link from each FPGA to P2 and

an additional 4X link between the

FPGAs, Model 58791

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3\*: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

\* Gen 3 requires a compatible backplane and SBC

# Models 57131 & 58131

# 8- or 16-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGAs - 6U VPX

Model 58131

### Features

- Ideal radar and software radio interface solution
- Supports one or two Xilinx Kintex UltraScale FPGAs
- Eight or 16 250 MHz 16-bit A/Ds
- Eight or 16 multiband DDCs (digital downconverters)
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Models 57131 and 58131 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71131 XMC modules mounted on a VPX carrier board. Model 57131 is a 6U board with one Model 71131 module while the Model 58131 is a 6U board with two XMC modules rather than one.

They include eight or 16 A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGAs for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include eight or 16 A/D acquisition IP modules for simplifying data capture and transfer.

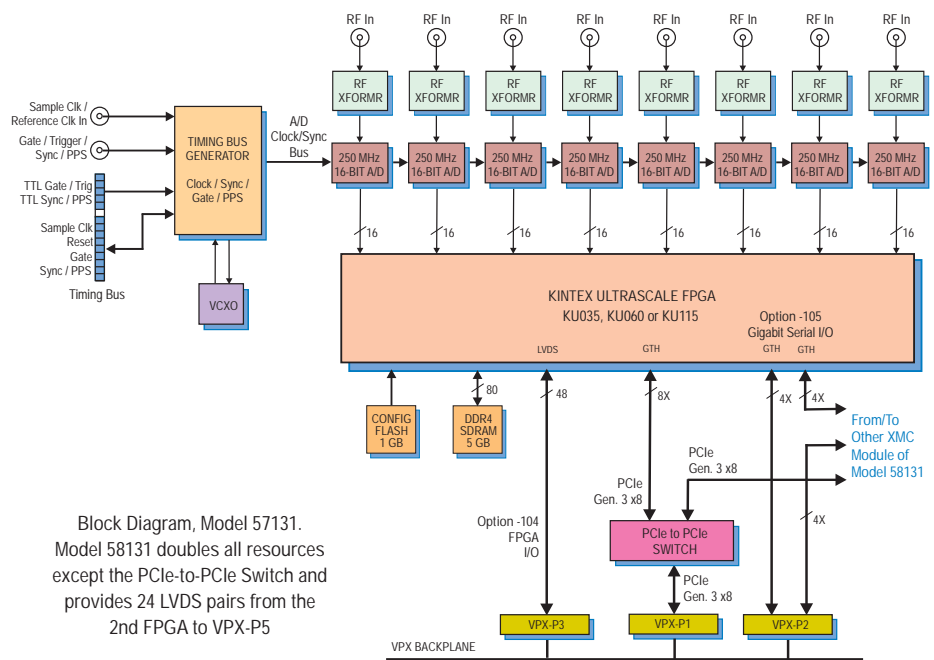

Each of the acquisition IP modules contains a powerful, multiband DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the ➤

Block Diagram, Model 57131.  
Model 58131 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature eight or 16 A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight associated A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients.

The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 and P5 connectors for custom I/O.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts eight or 16 analog HF or IF inputs on front panel MMCX connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

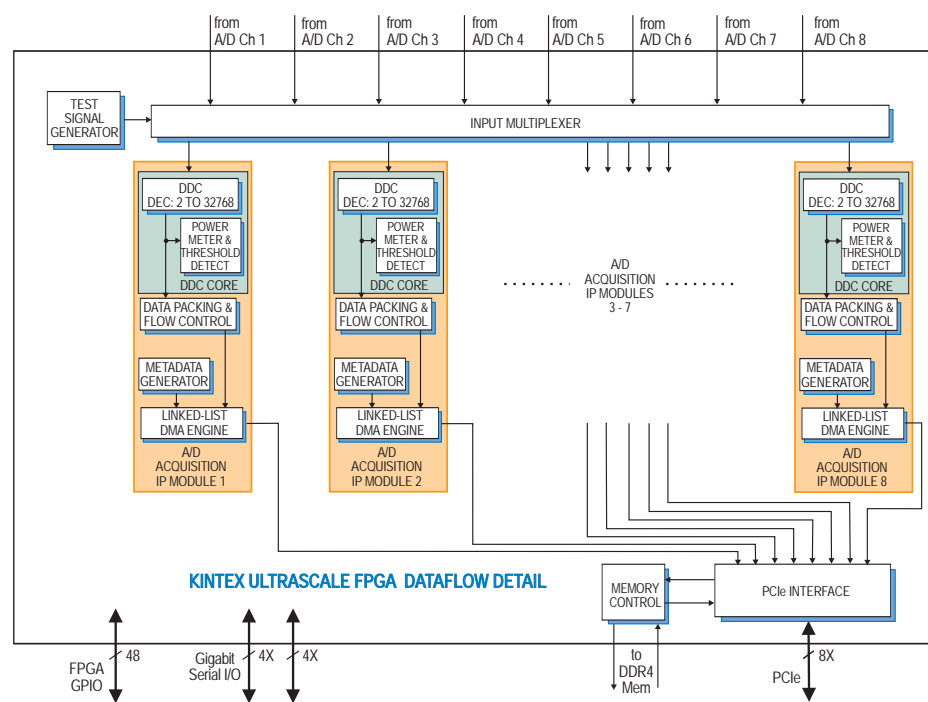

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight or four.

**Memory Resources**

The architecture supports 5 or 10 GB of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 ►

### Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

**Model 57131: 8 A/Ds;**

**Model 58131: 16 A/Ds**

#### Front Panel Analog Signal Inputs (8 or 16)

**Input Type:** Transformer-coupled, front panel female MMCX connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (8 or 16)

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

#### Digital Downconverters (8 or 16)

**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >108 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Sample Clock Sources (1 or 2)

On-board clock synthesizers

#### Clock Synthesizer (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock (1 or 2)

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### Timing Bus (1 or 2)

12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input (1 or 2)

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array (1 or 2)

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector, Model 57131; and P5 connector, Model 58131 for custom I/O

**Option -105** provides two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB Model 57131; 10 GB Model 58131

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -702: L2 (air cooled)

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

#### Option -713: L3 (conduction cooled)

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 9.187 in. x 6.717 in. (233.35 mm x 170.60 mm)

# Models 57132 & 58132

# 8- or 16-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - 6U VPX

Model 58132

### General Information

Models 57132 and 58132 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71132 XMC modules mounted on a VPX carrier board. Model 57132 is a 6U board with one Model 71132 module while the Model 58132 is a 6U board with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include eight or 16 A/D acquisition IP modules for simplifying data capture and transfer.

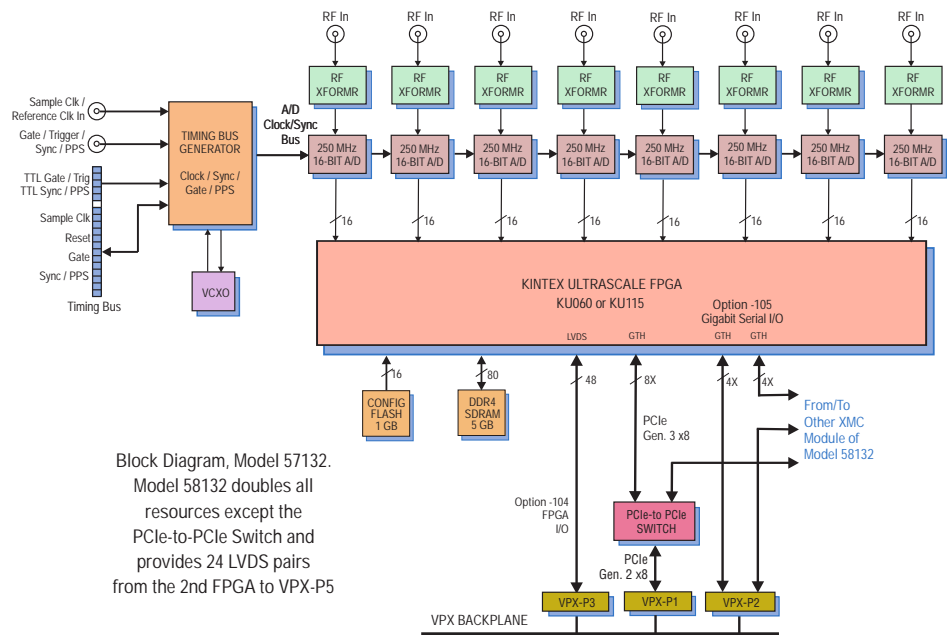

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ▶

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight or 16 250 MHz 16-bit A/Ds
- Eight or 16 wideband DDCs
- 64 or 128 multiband DDCs
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

Block Diagram, Model 57132. Model 58132 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Modules**

These models feature eight or 16 A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the A/Ds or test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filter for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**► Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57132; P3 and P5 connectors, Model 58132.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into eight or 16 TI ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

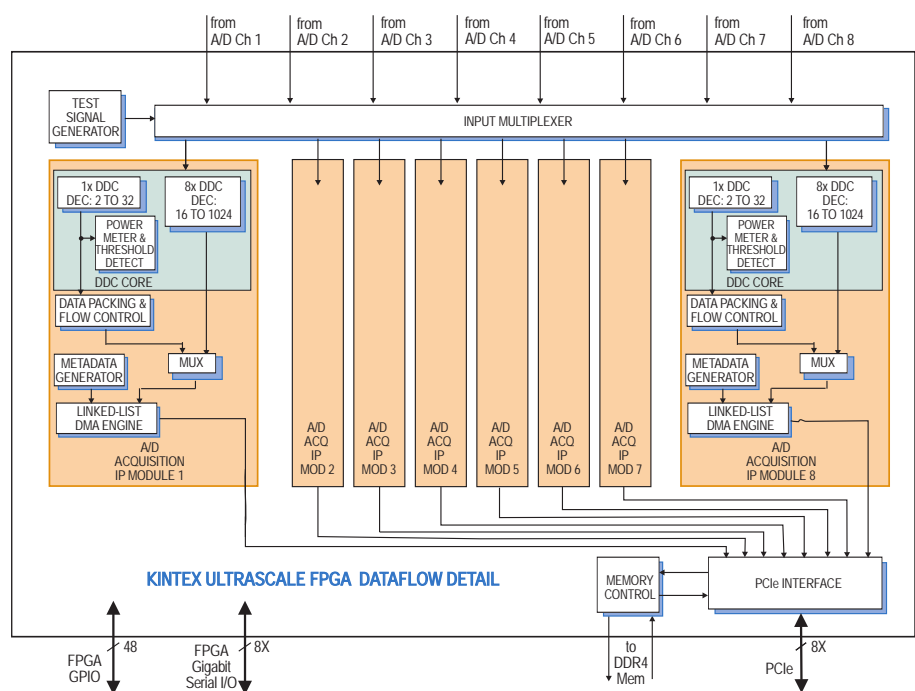

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
57132	8-Channel 250 MHz A/D with multiband DDCs and Kintex UltraScale FPGA - 6U VPX
58132	16-Channel 250 MHz A/D with multiband DDCs and two Kintex UltraScale FPGAs - 6U VPX

**Options:**

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O to VPX P3, Model 57132; P3 and P5 Model 58132
-105	Gigabit serial FPGA I/O to VPX P2
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**PCI Express Interface**

These models include industry-standard interfaces fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interfaces include multiple DMA controllers for efficient transfers to and from the boards.

**Specifications**

**Model 57132: 8 A/Ds; Model 58132: 16 A/Ds**  
**Front Panel Analog Signal Inputs (8 or 16)**

- Input Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +8 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (8 or 16)**

- Type:** Texas Instruments ADS5485
- Sampling Rate:** 10 MHz to 200 MHz
- Resolution:** 16 bits

**Wideband Digital Downconverters (8 or 16)**

- Decimation Range:** 2x to 32x
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$
- LO SFDR:** >120 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Multiband Digital Downconverters (64 or 128)**

- Decimation Range:** 16x to 1024x in steps of 8
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel
- LO SFDR:** >120 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57132; P3 and P5 connectors, Model 58132, for custom I/O

**Option -105** provides one 8X gigabit link between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2 banks)**

- Type:** DDR4 SDRAM
- Size:** 5 GB or 10 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

- Operating Temp:** -20° to 65° C
- Storage Temp:** -40° to 100° C
- Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

- Operating Temp:** -40° to 70° C
- Storage Temp:** -50° to 100° C
- Relative Humidity:** 0 to 95%, non-condensing

**Size:** board 9.187 in x 6.717 in (233.35 mm x 170.60 mm)

New

# Models 57141 & 58141

# 1 or 2-Ch. 6.4 GHz, or 2 or 4-Ch. 3.2 GHz A/D, 2 or 4-Ch. 6.4 GHz D/A, 1 or 2 Kintex UltraScale FPGAs - 6U VPX

Model 58141

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One or two-channel mode with 6.4 GHz, 12-bit A/Ds
- Two-or four-channel mode with 3.2 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- Two or four-Channel 6.4 GHz, 14-bit D/As
- Programmable DUCs (Digital Upconverters)
- 5 GB of DDR4 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Models 57141 and 58141 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71141 XMC modules mounted on a VPX carrier board. Model 57141 is a 6U board with one Model 71141 module while the Model 58141 is a 6U board with two XMC modules rather than one.

They include two or four A/Ds, complete multiboard clock and sync sections, large DDR4 memories, two or four DDCs, two or four DUCs and two or four D/As. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGAs for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

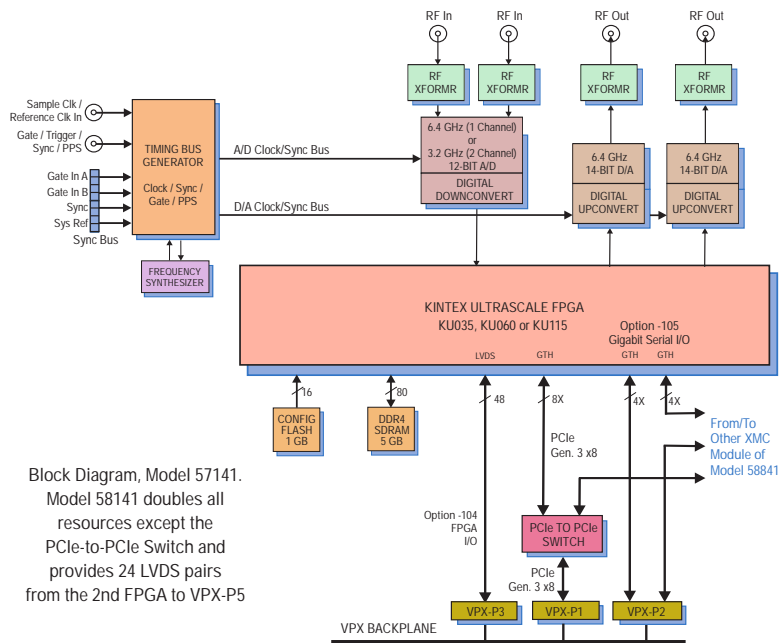

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include two or four A/D acquisition and two or four D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, controllers for all data clocking and synchronization functions, one or two test signal generators and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

Block Diagram, Model 57141. Model 58141 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

**A/D Acquisition IP Module**

These models feature two or four A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP modules have associated 5 or 10 GB of DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

These models support factory-installed functions which include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57141; P3 and P5 connectors, Model 58141.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D's built-in digital downconverters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and

provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real or complex baseband input signals. It delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes, the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The architecture supports 5 or 10 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core(s) within the FPGA can take advantage of the memory for custom applications.

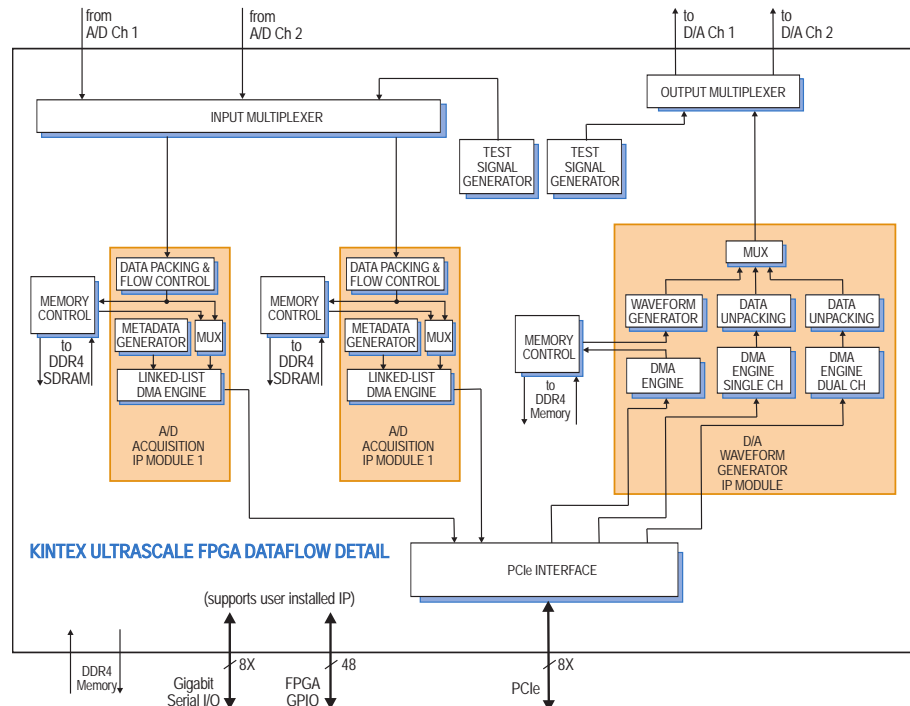

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

These models accept a sample clock via front panel SSMC connectors. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple boards to be synchronized, ideal ►

### Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

► for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. The Model 5792 high-speed sync board can be used to drive the sync bus to synchronize multichannel systems.

### Specifications

**Model 57141 One A/D**

**Model 58141 Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode: 6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 7.9 GHz; dual-channel mode: 8.1 GHz

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source (1 or 2)**

Front panel SSMC connector

**Timing Bus (1 or 2)**

19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57141; P3 and P5 connectors, Model 58141.

**Option -105** provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**Memory (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** 5 or 10 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U Board 9.187 in x 6.717 in (233.3 mm x 170.6 mm)

### Ordering Information

# Models 57821 & 58821

# 3- or 6-Channel 200 MHz A/D, DDCs, DUC, 2- or 4-Channel 800 MHz D/A, 1 or 2 Kintex UltraScale FPGAs - 6U VPX

Model 58821

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Models 57821 and 58821 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71821 XMC modules mounted on a VPX carrier board. Model 57821 is a 6U board with one Model 71821 module while the Model 58821 is a 6U board with two XMC modules rather than one.

They include three or six A/Ds, complete multiboard clock and sync sections, large DDR4 memory, three or six DDCs, one or two DUCs and two or four D/As. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGAs for custom digital I/O.

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The factory-installed functions for these models include three or six A/D acquisition and one or two waveform playback IP modules for simplifying data capture and playback, and data transfer between the board and a host computer.

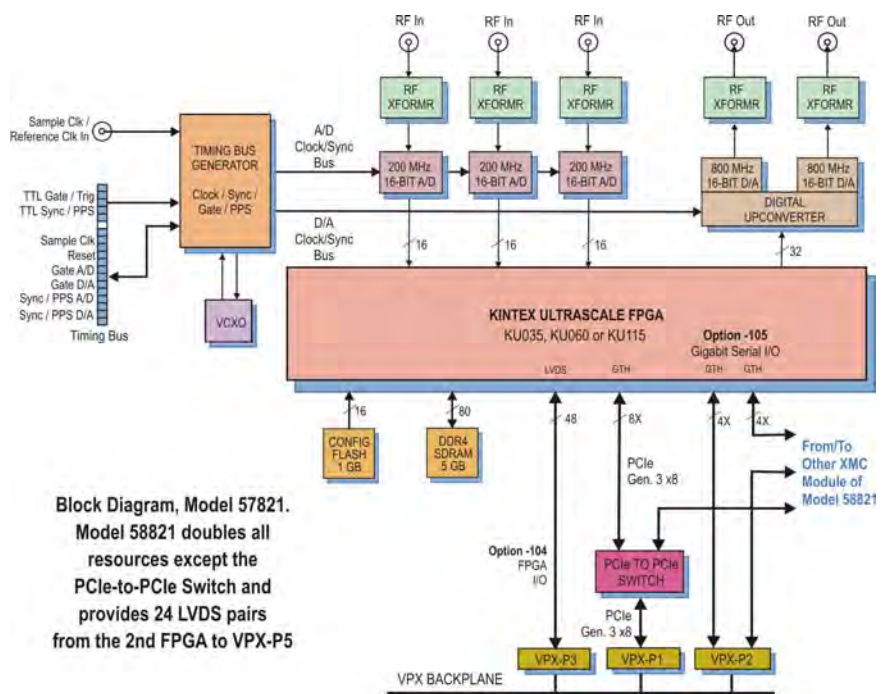

Additional IP includes: three or six powerful, programmable DDC IP cores; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; programmable interpolators, and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from three A/Ds, or the test signal generators.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition rate etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57821; P3 and P5 connectors, Model 58821.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

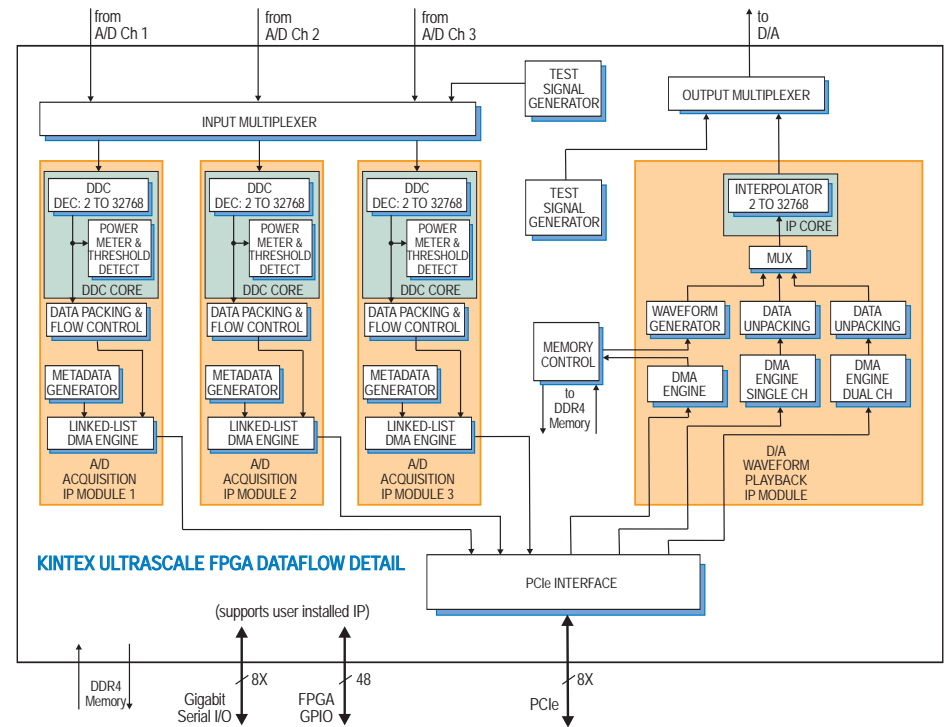

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide

different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Model 57821:** 3 A/Ds

**Model 58821:** 6 A/Ds

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**

**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (1 or 2)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolator Core (1 or 2)**

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus: (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57821; P3 and P5 connectors, Model 58821

**Option -105** provides two 4X gigabit serial links between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U Board 9.187 in x 6.717 in (233.3 mm x 170.6 mm)

New!

# Models 57841 & 58841

# 1- or 2-Ch. 3.6 GHz and 2- or 4-Ch. 1.8 GHz, 12-bit A/Ds, with Wideband DDCs, Kintex UltraScale FPGAs - 6U VPX

Model 58841

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with one or two 3.6 GHz, 12-bit A/Ds
- Two-channel mode with two or four 1.8 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- 5 or 10 GB of DDR4 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Models 57841 and 58841 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71841 XMC modules mounted on a VPX carrier board. Model 57841 is a 6U board with one Model 71841 module while the Model 58841 is a 6U board with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade

architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include one or two A/D acquisition IP modules.

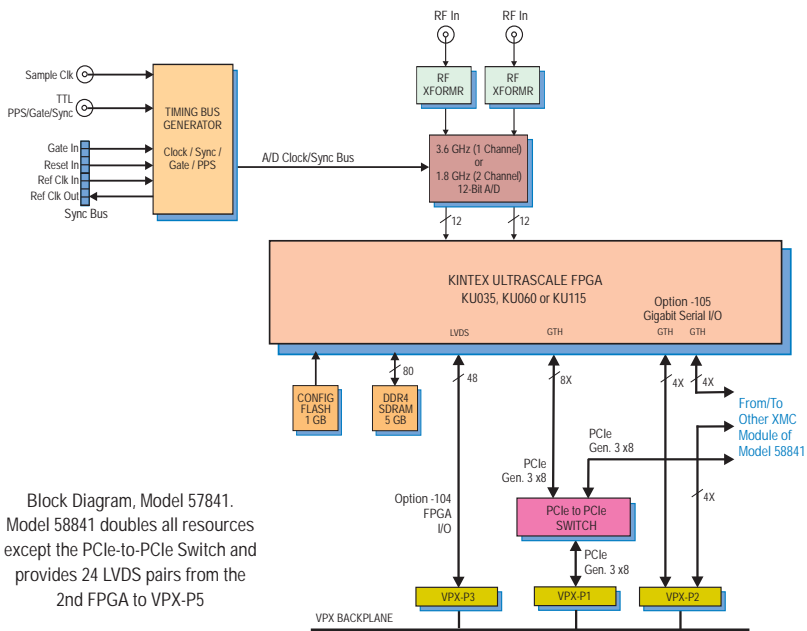

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, ➤

Block Diagram, Model 57841. Model 58841 doubles all resources except the PCIe-to-PCIe Switch and provides 24 LVDS pairs from the 2nd FPGA to VPX-P5

### A/D Acquisition IP Modules

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or the test signal generators. The IP modules have associated a 5 or 10 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of the SDRAM is used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory is supported with a DMA engine for moving A/D data through the PCI-X interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode: In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 and P5 connectors for custom I/O.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

### A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

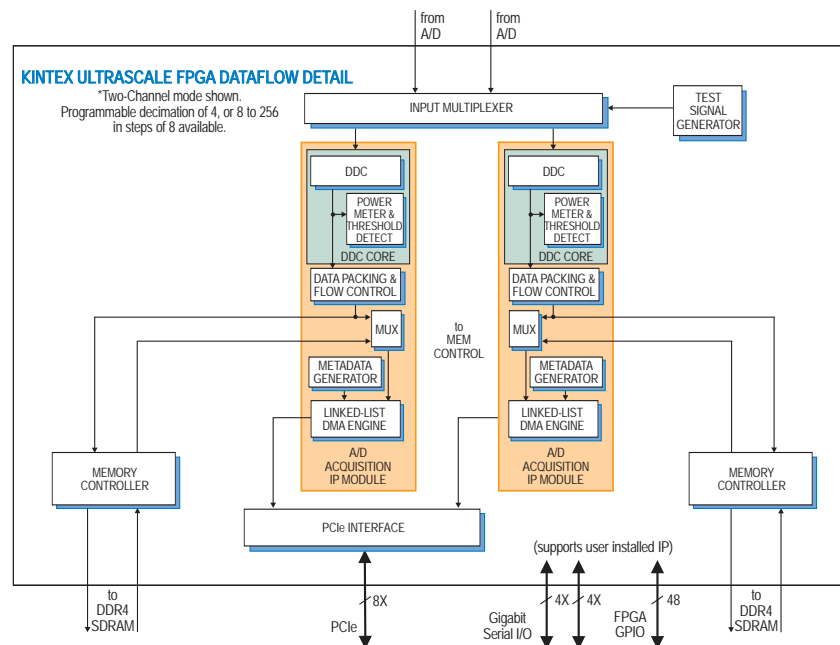

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other board resources.

### Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two units can be synchronized with a simple cable. For larger systems, multiple units can be synchronized using the Model 7192 high-speed sync module to drive the sync bus. ►

### Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### Ordering Information

Model	Description
57841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - 6U VPX
58841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - 6U VPX

#### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
-104	LVDS FPGA I/O to VPX P2, Model 57861; P2 and P5 Model 58861
-105	Gigabit serial FPGA I/O to VPX P1
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

*Contact Pentek for complete specifications of rugged and conduction-cooled versions*

### ► Memory Resources

The architecture supports 5 or 10 GB of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

These models include industry-standard interfaces fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interfaces include multiple DMA controllers for efficient transfers to and from the boards.

### Specifications

**Model 57861: One A/D**

**Model 58861: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode:

500 MHz to 3.6 GHz; dual-channel

mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode:

1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

**Digital Downconverters (2 or 4)**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source: (1 or 2)**

Front panel SSMC connectors

**Timing Bus: (1 or 2)**

19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector, Model 57861; and P5 connector, Model 58861 for custom I/O

**Option -105** provides two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB Model 57841; 10 GB Model 58841

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# Models 57851 & 58851

# 2- or 4-Channel 500 MHz A/D, DDC, DUC, 2- or 4-Channel 800 MHz D/A and Kintex UltraScale FPGAs - 6U VPX

Model 58851

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- One or two DUC (digital upconverter)
- Two or four 800 MHz 16-bit D/As
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

### General Information

Models 57851 and 58851 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71851 XMC modules mounted on a VPX carrier board. Model 57851 is a 6U board with one Model 71851 module while the Model 58851 is a 6U board with two XMC modules rather than one.

They include two or four A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two or four DDCs, one or two DUC, and two or four D/As. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

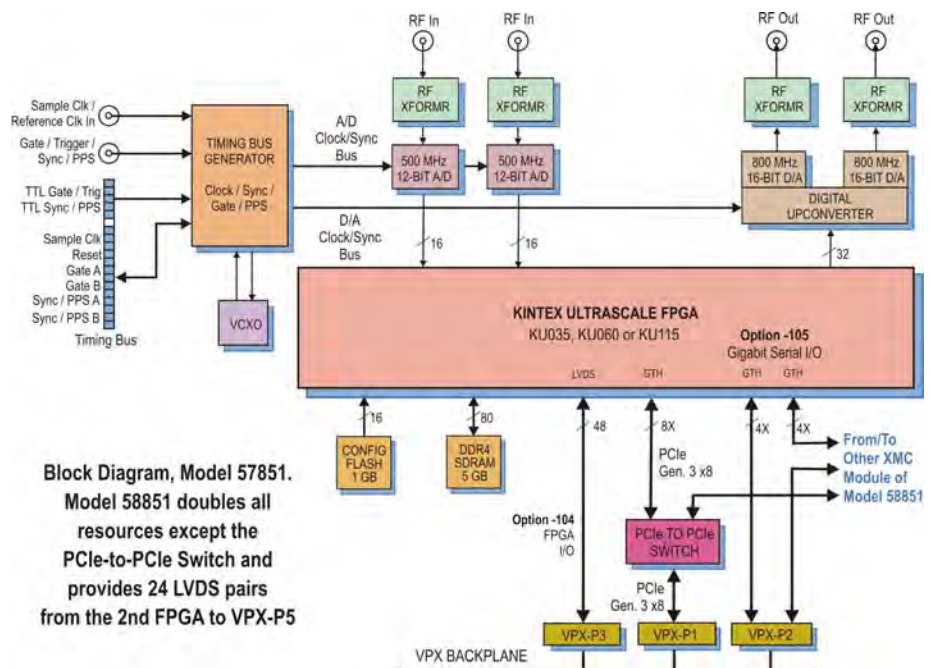

The factory-installed functions of these models include two or four A/D acquisition and two or four waveform playback IP modules for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: two or four powerful, programmable DDC IP cores; IP modules for DDR4 SDRAM memory; controllers for data clocking and synchronization functions; test signal generators; programmable interpolators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions thereby saving the time of IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

These models feature two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Modules**

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. They allow users to easily play back to the dual or quad D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57851; P3 and P5 connectors, Model 58851.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

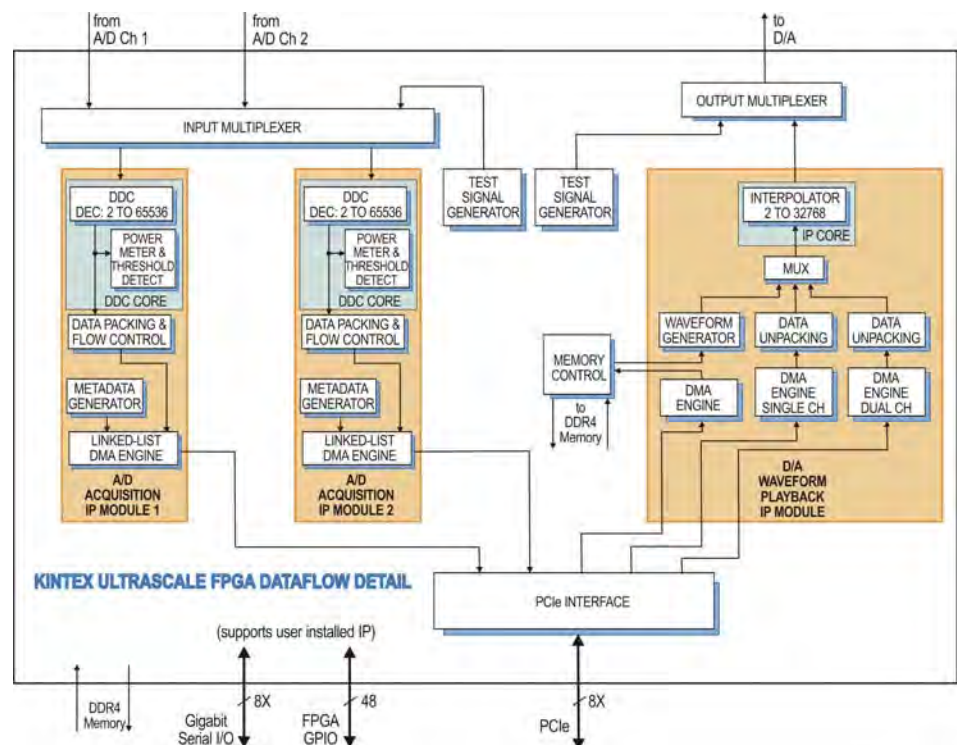

Optionally, the Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports 5 or 10 GB of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller cores within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (**Model 8264**), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
57851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 6U VPX
58851	4-Channel 500 MHz A/D with DDCs, DUC with 4-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 6U VPX

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.

with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolator Core (1 or 2)**

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

**Total Interpolation Range (D/A and interpolator core combined): 2x to 262,144x**

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus: (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57851; P3 and P5 connectors, Model 58851; for custom I/O

**Option -105:** provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U Board 9.187 in x 6.717 in (233.35 mm x 170.61 mm)

# Models 57861 & 58861

# 4- or 8-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U VPX

Model 58861

### General Information

Models 57861 and 58861 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek’s new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71841 XMC modules mounted on a VPX carrier board. Model 57841 is a 6U board with one Model 71841 module while the Model 58841 is a 6U board with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The factory-installed functions include four or eight A/D acquisition IP modules for simplifying data capture and transfer.

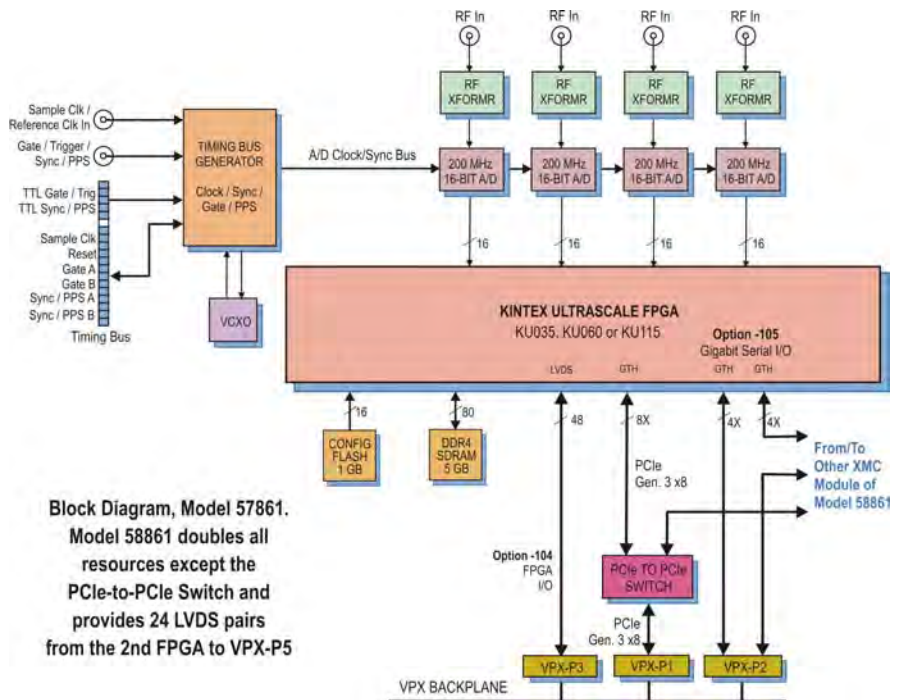

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board’s entire FPGA design as a block diagram that can be edited in Xilinx’s Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the A/Ds or test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57861; P3 and P5 connectors, Model 58861.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

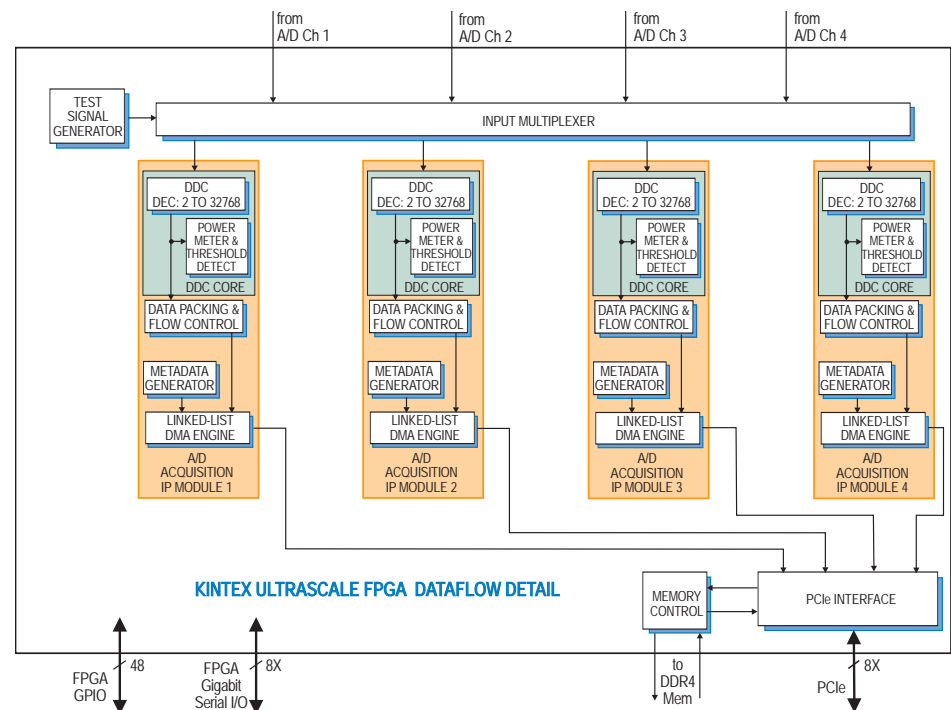

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
57861	4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U VPX
58861	8-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGAs - 6U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
-104	LVDS FPGA I/O to VPX P3, Model 57861; P3 and P5 Model 58861
-105	Gigabit serial FPGA I/O to VPX P2
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

*Contact Pentek for complete specifications of rugged and conduction-cooled versions*

**► PCI Express Interface**

These models include industry-standard interfaces fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interfaces include multiple DMA controllers for efficient transfers to and from the boards.

**Specifications**

**Model 57861: 4 A/Ds**

**Model 58861: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Quantity:** Four channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57861; P3 and P5 connectors, Model 58861, for custom I/O

**Option -105** provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2 banks)**

**Type:** DDR4 SDRAM  
**Size:** 5 GB or 10 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Board 9.187 in x 6.717 in (233.35 mm x 170.60 mm)

# Models 57862 & 58862

# 4 or 8-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGAs - 6U VPX

Model 58862

## General Information

Models 57862 and 58862 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71862 XMC modules mounted on a VPX carrier board. Model 57862 is a 6U board with one Model 71862 module while the Model 58862 is a 6U board with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include four or eight A/D acquisition IP modules for simplifying data capture and transfer.

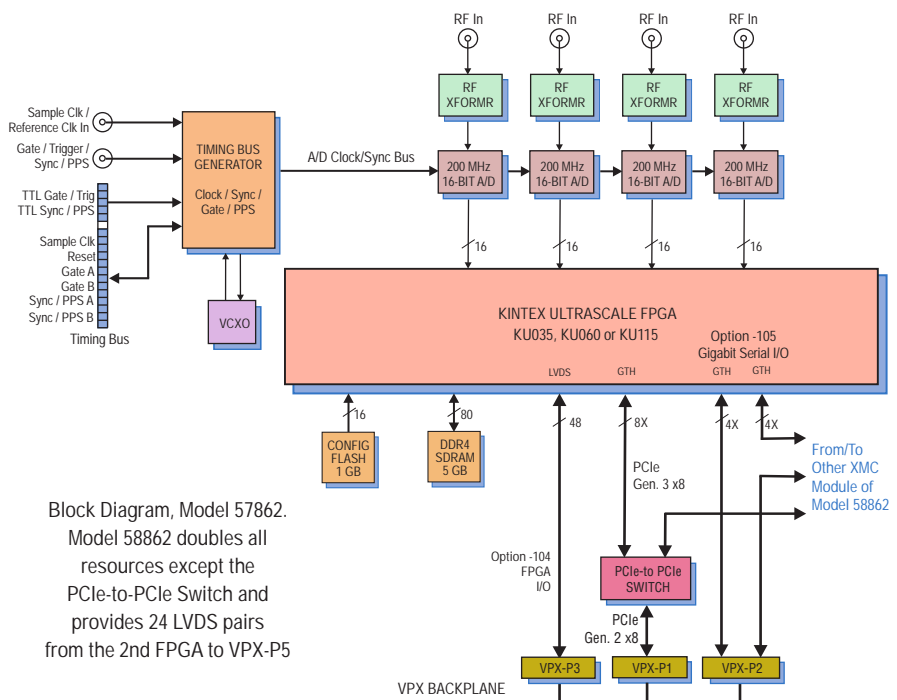

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the A/Ds or test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filter for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### ► Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57862; P3 and P5 connectors, Model 58862.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal-processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

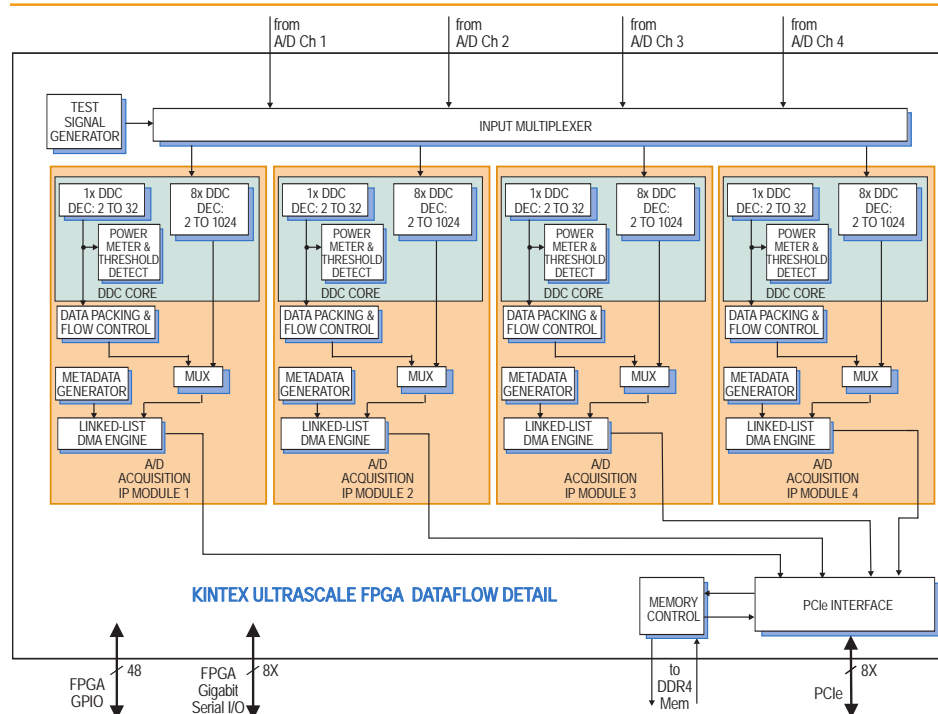

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

► DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**PCI Express Interface**

These models include industry-standard interfaces fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interfaces include multiple DMA controllers for efficient transfers to and from the boards.

**Specifications**

**Model 57862: 4 A/Ds; Model 58862: 8 A/Ds**  
**Front Panel Analog Signal Inputs (4 or 8)**

- Input Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +8 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

- Type:** Texas Instruments ADS5485
- Sampling Rate:** 10 MHz to 200 MHz
- Resolution:** 16 bits

**Wideband Digital Downconverters (4 or 8)**

- Decimation Range:** 2x to 32x
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$
- LO SFDR:** >120 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Multiband Digital Downconverters (4 or 8)**

- Decimation Range:** 2x to 1024x
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel
- LO SFDR:** >120 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

- Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus
- Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz
- Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

# Models 57800 & 58800

## Kintex UltraScale FPGA Coprocessor- 6U VPX

Model 58800

### General Information

Models 57800 and 58800 are members of the Jade™ family of high-performance 6U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71800 XMC modules mounted on a VPX carrier board. Model 57800 is a 6U board with one Model 71800 module while the Model 58800 is a 6U board with two XMC modules rather than one.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 57800 and Model 58800 include optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally

matched to the board's interfaces. The factory-installed functions in these models include one or two test signal generators, one or two metadata generators, one or two DDR4 SDRAM controllers, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57800; P3 and P5 connectors, Model 58800.

Option -105 provides two 4X gigabit links between the FPGA and the VPX P2 connector to support serial protocols. ➤

### Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**► Front-Panel Digital I/O Interface**

These models include one or two 80-pin front panel connectors that provide 38 or 76 LVDS pairs connected to one or both of the FPGAs. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path.

**Specifications**

**Front Panel Digital I/O (1 or 2)**

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 or 76 pairs
- Signal Type:** LVDS

**Field Programmable Gate Array (1 or 2)**

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O (1 or 2)**

- Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P3 connector, Model 57800; P3 and P5 connectors, Model 58800
- Option -105** provides two 4X gigabit serial links between the FPGA and the VPX P2 connector to support serial protocols

**Memory (1 or 2)**

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

- Standard: L0 (air cooled)**
  - Operating Temp:** 0° to 50° C
  - Storage Temp:** -20° to 90° C
  - Relative Humidity:** 0 to 95%, non-condensing
- Option -702: L2 (air cooled)**
  - Operating Temp:** -20° to 65° C
  - Storage Temp:** -40° to 100° C
  - Relative Humidity:** 0 to 95%, non-condensing
- Option -713: L3 (conduction cooled)**
  - Operating Temp:** -40° to 70° C
  - Storage Temp:** -50° to 100° C
  - Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U Board 9.187 in x 6.717 in (233.3 mm x 170.6 mm)

## Model 8264

# 6U OpenVPX Development System for Cobalt and Onyx Boards

### Features

- 9U 19-inch rackmount, 9-slot, 16-inch deep chassis which houses 6U VPX boards
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box ready-to-run examples

### General Information

The Model 8264 is a fully-integrated, 6U VPX development system for Pentek Cobalt® and Onyx® software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8264 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

### ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8264. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

### System Implementation

Built on a professional 9U rackmount workstation, the 8264 is equipped with the latest Intel i7 processor, DDR3 SDRAM and a high-performance single-board computer. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt and Onyx analog and digital interfaces. The 8264 can be configured with 64-bit Windows or Linux operating systems.

The 8264 uses a 19" 9U rackmount chassis that is 16" deep. Nine VPX slots provide ample space for an SBC, a switch card and multiple Pentek boards. Enhanced forced-air ventilation assures adequate cooling for all boards and dual 500-W power supplies guarantee more than adequate power for all installed boards. Mounting provisions for two 3.5 in. drives with front-accessible trays allow for easy removable storage. Front-panel access to USB, display, Ethernet and RS-232 ports simplifies development; an optional rear transition module supplements the front-panel connections with SATA, audio, a second video interface, and additional USB ports.

### Configuration

All 8264 systems come with software and hardware installed and tested. Up to seven Pentek boards in the 8264 can be supported. Please contact Pentek to configure a system that matches your specific requirements.

### Options

Available options include high-end multi-core CPUs and choice of Windows or Linux.

### Specifications

**Operating System:** 64-bit Windows 7

Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB

**Dimensions:** 6U Chassis, 19" W x 16" D x 10.5" H

**Weight:** 50 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

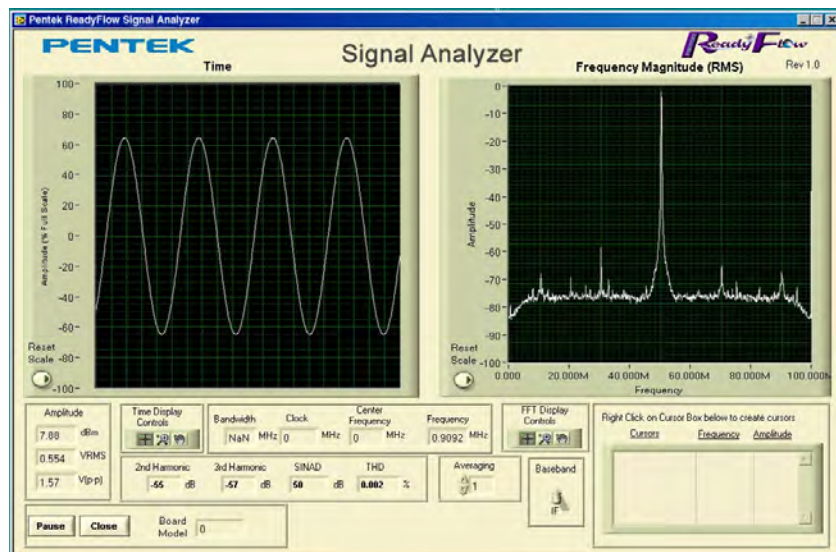

### Ordering Information

Model	Description

# Model 5973

# 3U OpenVPX Virtex-7 Processor and FMC Carrier

### Features

- VITA-57.1 FMC site offers access to a wide range of possible I/O
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1, 2 and 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 5973 is a high-performance 3U OpenVPX board based on the Xilinx Virtex-7 FPGA. As a stand-alone processor board, it provides an ideal development and deployment platform for demanding signal-processing applications.

The 5973 includes a VITA-57.1 FMC site providing access to a wide range of I/O options. When combined with any of Pentek's analog interface FMCs, it becomes a complete multichannel data conversion and processing subsystem suitable for connection to IF, HF or RF ports of a communications or radar system.

The 5973 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on an MTP connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5973s mounted in the same chassis or even over extended distances between them.

### Board Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the main board and the FMC, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

The architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

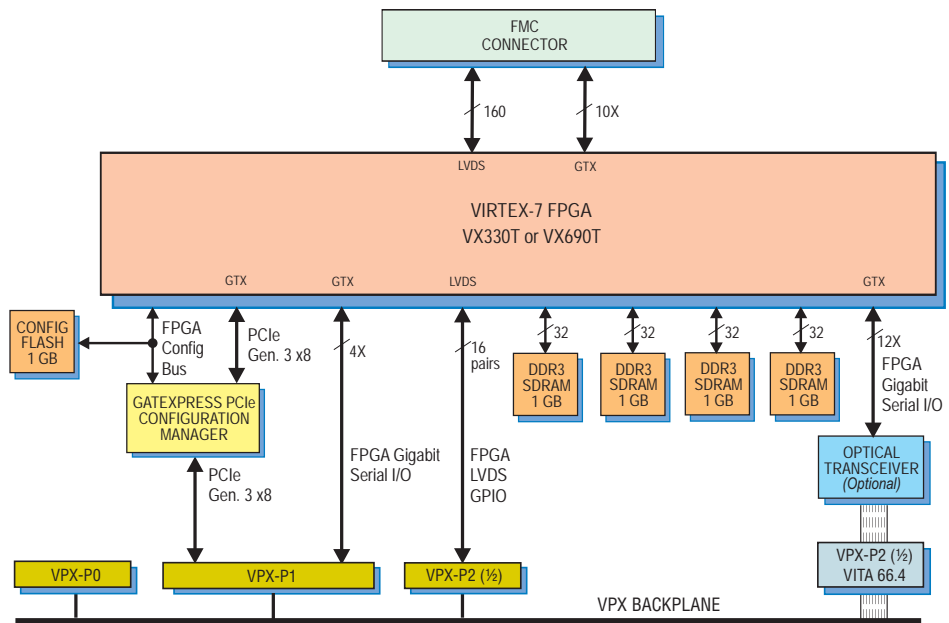

When integrated with a Pentek FMC, the 5973 is delivered with factory-installed applications ideally matched to the board's analog or digital interfaces. These can include A/D acquisition and D/A waveform playback engines for simplifying data capture and playback.

Data tagging and metadata packet generation, in conjunction with powerful linked-list DMA engines, provide a streamlined interface for moving data on and off the board and identifying data packets with channel, timing and sample count information.

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973 and its installed FMC to operate as a complete turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ➤

### Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### FMC Product Combinations

If you wish to purchase this FMC Carrier in combination with an A/D FMC module, please see:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-110	VITA-66.4 12X optical interface

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

### Xilinx Virtex-7 FPGA

The 5973 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Sixteen pairs of LVDS connections are optionally provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols.

The 5973 supports the emerging VITA-66.4 standard, that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

### GateXpress for FPGA Configuration

The 5973 architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most SBCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### Specifications

**I/O Module Interface:** VITA-57.1, High Pin Count FMC site

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled,

Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Model 5983

# 3U OpenVPX Kintex UltraScale Processor and FMC Carrier

### Features

- VITA-57.4 HSPC FMC+ site offers access to a wide range of possible I/O
- Supports Xilinx Kintex UltraScale FPGAs
- 9 GB of DDR4 SDRAM
- On-board GPS receiver
- PCI Express (Gen. 1, 2 and 3) interface up to x8
- User-configurable gigabit serial interface
- LVDS connections to the Kintex UltraScale FPGA for custom I/O
- Optional optical Interface for backplane gigabit serial interboard communication
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4, VITA-57.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

The JadeFX™ Model 5983 is a high-performance 3U OpenVPX board based on the Xilinx Kintex UltraScale FPGA. As a stand-alone processor board, it provides an ideal development and deployment platform for demanding signal-processing applications.

The 5983 includes a VITA-57.4 FMC site providing access to a wide range of I/O options. When combined with any of Pentek’s analog interface Flexor® FMCs to create a FlexorSet, it becomes a complete multichannel data conversion and processing subsystem suitable for connection to IF, HF or RF ports of a communications or radar system.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

### Board Architecture

Based on the proven design of the Pentek Jade family of Kintex UltraScale products, the JadeFX 5983 retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the main board and the FMC, enabling factory-installed functions that include data

multiplexing, channel selection, data packing, gating, triggering and memory control.

The architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

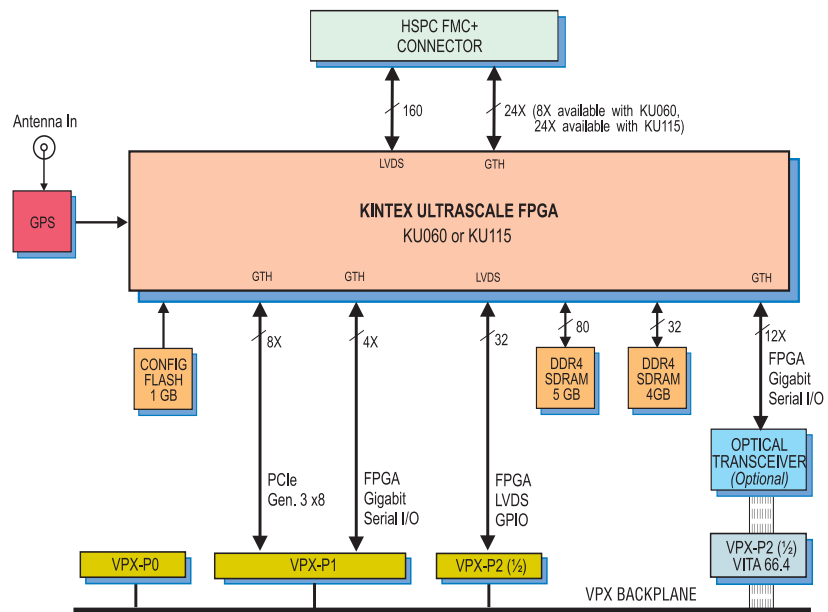

When integrated with a Pentek FMC, the 5983 is delivered with factory-installed applications ideally matched to the board’s analog or digital interfaces. These can include A/D acquisition and D/A waveform generation engines for simplifying data capture and playback.

Data tagging and metadata packet generation, in conjunction with powerful linked-list DMA engines, provide a streamlined interface for moving data on and off the board and identifying data packets with channel timing and sample-count information.

IP modules for DDR4 SDRAM memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983 and its installed FMC to operate as a complete turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board’s entire FPGA design as a block diagram that can be edited in Xilinx’s Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx, OnyxFx and JadeFX 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Xilinx Kintex UltraScale FPGA**

The 5983 can be optionally populated with one of two Kintex UltraScale FPGAs to match the specific requirements of the processing task. Supported FPGAs are KU060 or KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost KU060 can be installed.

Sixteen pairs of LVDS connections are optionally provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols.

The 5983 supports the VITA-66.4 standard, that provides up to 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

**GPS**

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

**Specifications**

**I/O Module Interface:** VITA-57.4, High Serial Pin-Count FMC site

**Field Programmable Gate Array Standard:** Xilinx Kintex UltraScale XCKU060-2

**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

**Serial :** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR4 SDRAM

**Size:** Two banks, one 4 GB and one 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -763: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

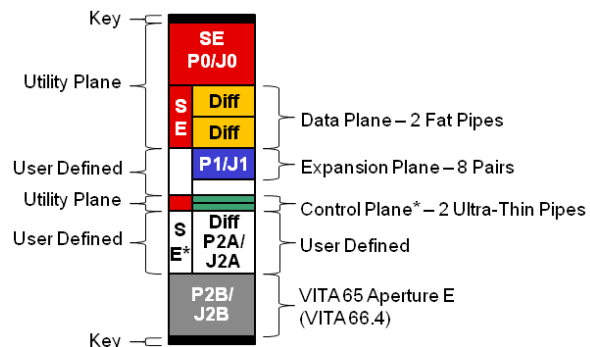

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:** The Model 5983 is compatible with the following module profile, as defined by the VITA 65 OpenVPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

New!

# Model 7070

# PCI Express Virtex-7 Processor and FMC Carrier - x8 PCIe

Model 7070 shown with Model 3312 multichannel A/D & D/A FMC module

## General Information

The Flexor® Model 7070 is a high-performance PCIe board based on the Xilinx Virtex-7 FPGA. As a stand-alone processor board, it provides an ideal development and deployment platform for demanding signal processing applications.

The 7070 includes a VITA-57.1 FMC site providing access to a wide range of I/O options. When combined with any of Pentek's analog interface FMCs, it becomes a complete multichannel data conversion and processing subsystem suitable for connection to IF, HF or RF ports of a communications or radar system.

The 7070 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on an MTP connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 7070s mounted in the same chassis or even over extended distances between them.

## Board Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 retains all of the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the main board and the FMC module, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control.

The architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

When integrated with a Pentek FMC, the 7070 is delivered with factory-installed applications ideally matched to the board's analog or digital interfaces. These can include A/D acquisition and D/A waveform playback engines for simplifying data capture and playback.

Data tagging and metadata packet generation, in conjunction with powerful linked-list DMA engines, provide a streamlined interface for moving data on and off the board and identifying data packets with channel, timing and sample-count information.

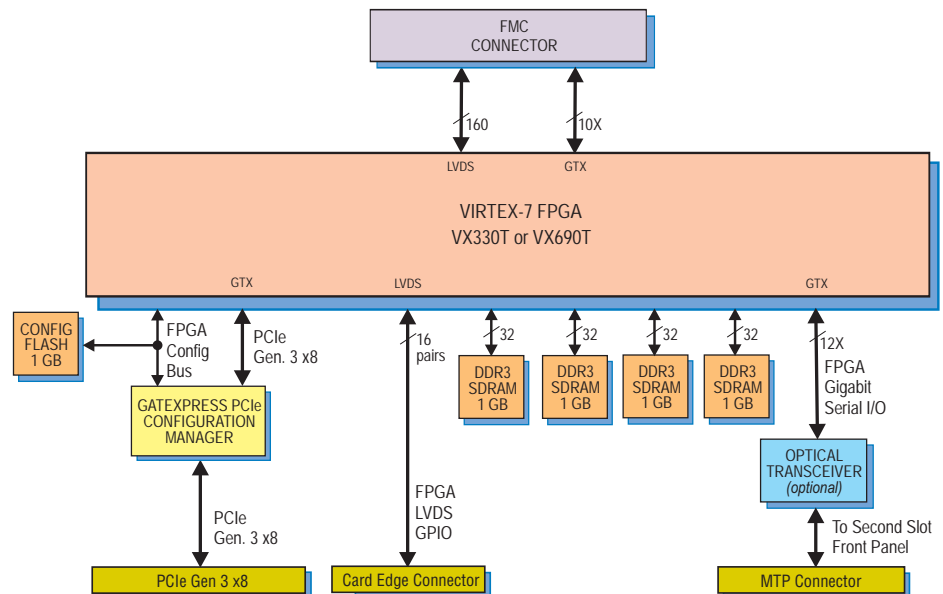

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070 and installed FMC to operate as a complete turnkey solution without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ▶

## Features

- VITA-57.1 FMC site offers access to a wide range of possible I/O
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- 4 GB of DDR3 SDRAM
- PCI Express (Gen. 1, 2 and 3) interface up to x8
- Optional user-configurable 12X optical gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Commercial and extended-temperature versions available

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## FMC Product Combinations

If you wish to purchase this FMC Carrier in combination with an A/D FMC module, please see:

## Xilinx Virtex-7 FPGA

The 7070 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Sixteen pairs of LVDS connections are optionally provided between the FPGA and a card edge connector for custom I/O. For applications requiring custom gigabit links, up to 12 high-speed, full-duplex FPGA GTX lanes driven via an optical transceiver support serial protocols. A 12-lane MTP optical connector is presented on a PCIe slot panel that can be installed in an empty, adjacent PCIe slot.

When configured with a VX330T FPGA, four duplex lanes are available.

## GateXpress for FPGA Configuration

The 7070 architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most SBCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## Specifications

**I/O Module Interface:** VITA-57.1, High Pin Count FMC site

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom FPGA I/O

**Parallel, Option -104:** 16 pairs of LVDS connections between the FPGA and a card-edge connector.

**Optical (Option -110):** User-configurable 12X (VX690T) or 4X (VX 330T) optical gigabit serial interface, MTP connector installed in an empty adjacent slot

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air cooled,

**Size:** Half-length PCIe card

Flexor

ReadyFlow Board Support Package

GateFlow

NAVIGATOR Design Suite

Features

- Four 250 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Pentek FMC carriers
- Ruggedized and conduction-cooled versions available

General Information

The Flexor® Model 3312 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 250 MHz, 16-bit A/Ds, programmable clocking, and multiboard synchronization for support of larger high-channel count systems.

When combined with a Pentek 3U VPX or a PCIe FMC carrier, the 3312 is available as a FlexorSet, a complete turnkey data acquisition solution. For applications that require custom processing, FlexorSets are ideal for IP development and deployment.

Pentek also offers the option -990 reference design with software and IP support when installed on the Xilinx VC707 Evaluation Kit board.

A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

Performance of the Model 3312

The true performance of the 3312 can be best unlocked when used with the Pentek FMC carriers as a FlexorSet. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a metadata packet creator.

A/D Acquisition IP Modules

With the 3312 installed on either the 5973 or the 7070 carrier, the board-set features four A/D acquisition modules for easily capturing and moving data. Each module can receive data from any of the four A/Ds, a test signal generator or from the D/A waveform generator IP module in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

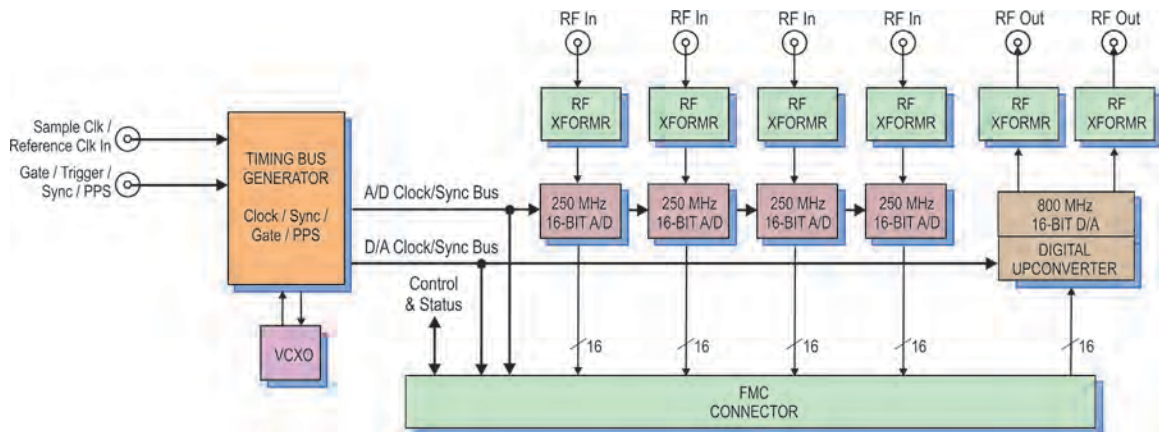

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's task of identifying and executing on the data.

When used with the 5973 or the 7070, Pentek's ReadyFlow® BSP provides control of all the 3312's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows or Linux operating systems.

D/A Waveform Generator IP Module

With the 5973 or the 7070, the 3312 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As wave-forms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. ➤

## FMC Interface

The Model 3312 complies with the VITA 57 High-Pin-Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3312 and the FMC carrier.

## SPARK Development Systems

SPARK systems are fully-integrated saving engineers and system integrators the time and expense associated with building and testing a development system. SPARK systems ensure the optimum performance of Pentek boards and are available in 3U VPX ([Model 8267](#)) and in a PC environment ([Model 8266](#)).

Contact Pentek for availability of rugged and conduction-cooled versions and other support options

► Up to 64 individual link entries can be chained together to create complex waveforms with minimum programming.

## Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal allowing multiple modules to be synchronized thereby creating larger multi-board systems.

## Board Support Packages

Pentek's BSPs provide control of the 3312's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a powerful, quick-start platform to create custom applications. BSPs are compatible with Windows and Linux operating systems. ReadyFlow BSP is used with OnyxFX Virtex-7 FPGA carriers and Navigator BSP is used for all new development going forward including the JadeFX Kintex Ultrascale carriers.

## Extendable IP Design

For applications that require specialized functions, users can install their own

custom IP for data processing. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the development kit to completely replace the Pentek IP with their own.

GateFlow is used with OnyxFX Virtex-7 FPGA carriers and Navigator FDK is used for all new FPGA development going forward including the JadeFX Kintex UltraScale carriers.

## Model 3312 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front panel external clock

**Synchronization:** VCXO can be phase-locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D or D/A clocks

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-Pin-Count FMC

# FlexorSet Model 5973-312

# 4-Ch. 250 MHz 16-bit A/D, 2-Ch. 800 MHz 16-bit D/A with DUC - 3U VPX

Model 5973-312

### Features

- Includes Xilinx Virtex-7 FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 250 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 5973 is a member of the OnyxFX® family of high-performance 3U VPX baseboards with a Xilinx Virtex-7 FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5973-312 FlexorSet™ combines the Model 5973 and the Model 3312 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four 250 MHz 16-bit A/Ds, one digital upconverter, two 800 MHz 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 5973-312 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

When delivered as an assembled board set, the 5973-312 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains IP for DDR3 SDRAM memories.

The 5973-312 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

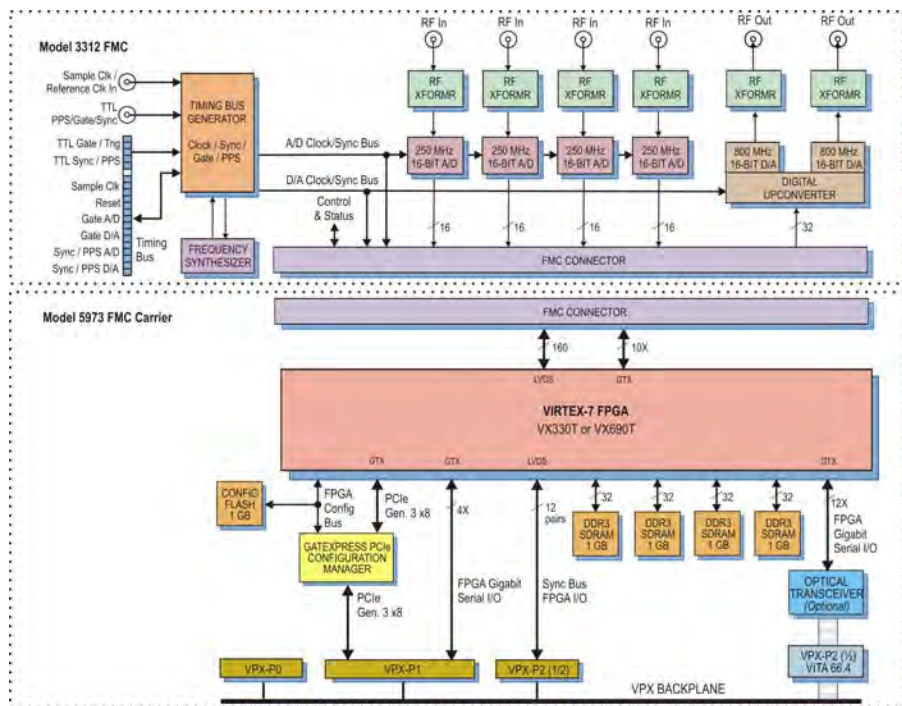

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-312 to operate as a turnkey solution without the need to develop any FPGA IP.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ▶

**A/D Acquisition IP Modules**

The 5973-312 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Generator IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The 5973-312 factory-installed functions include a sophisticated D/A Waveform Generator IP module. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► Xilinx Virtex-7 FPGA**

The 5973-312 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols. Sixteen pairs of LVDS connections between the FPGA and the VPX P2 connector for synchronization and custom I/O.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where

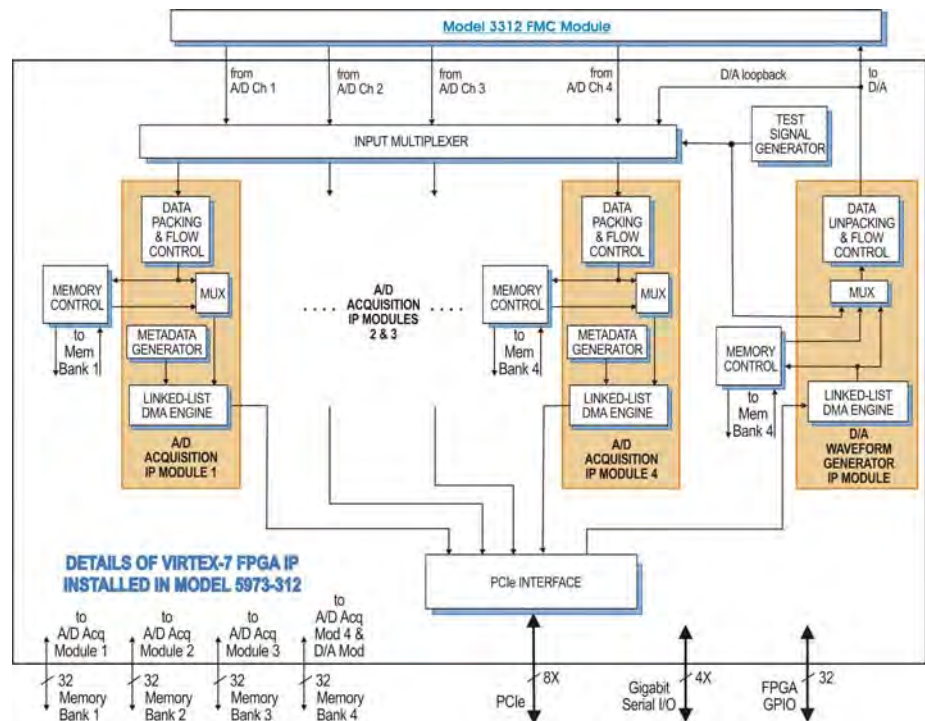

the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT. ►

### PCI Express Interface

The Model 5973-312 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 5973-312 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

versions*

► In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz  
**A/D Converters**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for synchronization custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# FlexorSet Model 5983-313

# 4-Ch. 250 MHz 16-bit A/D with DDCs, 2-Ch. 800 MHz 16-bit D/A with DUC and Extended Interpolation - 3U VPX

Model 5983-313

## Features

- VITA-57.4 HSPC FMC+ site offers access to a wide range of possible I/O
- Supports Xilinx Kintex UltraScale FPGA
- Four 250 MHz 16-bit A/Ds
- Four multiband DDCs
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Extended Interpolation
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- LVDS connections to the Kintex UltraScale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX base-boards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-313 FlexorSet™ combines the Model 5983 and the Model 3313 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs and is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling

factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5983-313 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer. Each of the four acquisition IP modules contains a powerful DDC core.

The 5983-313 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-313 to operate as a turnkey solution without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included. Developers can ➤

**A/D Acquisition IP Modules**

The 5983-313 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Generator IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The 5983-313 factory-installed functions include a sophisticated D/A Waveform Generator IP module. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be program-med from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power

meters present average power measurements for each DDC core output in easy-to-read registers.

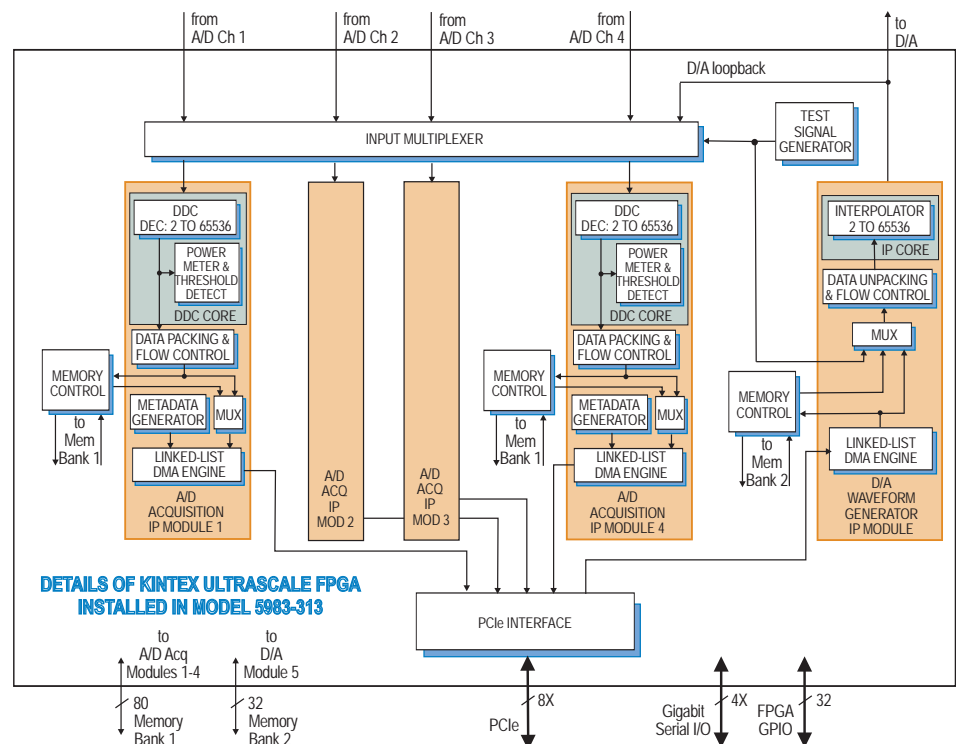

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

► integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

**Xilinx Kintex UltraScale FPGA**

The 5983-313 can be optionally populated with one of two Kintex UltraScale FPGAs to match the specific requirements of the processing task. Supported FPGAs are KU060 or KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost KU060 can be installed.

Sixteen pairs of LVDS connections are optionally provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols. ►

► The 5983-313 supports the VITA-66.4 standard, that provides up to 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

### GPS

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

In addition, the FPGA-based interpolator provides a range of 2x to 65536x in two stages of 2x to 256x. Including the DAC5688 interpolation, the overall available interpolation range equals 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to

provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### PCI Express Interface

The Model 5983-313 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 5983-313 architecture supports two independent DDR3 SDRAM memory banks. The banks are four and five gigabytes each and are part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

#### 4-Channel Digital Downconverter

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit user-programmable coefficients, 24-bit output

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution ►

**SPARK Development Systems**

The Model 8267 is a fully-integrated development system for Pentek 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
5983-313	4-Channel 250 MHz 16-bit A/D, with DDCs, 2-Channel 800 MHz 16-bit D/A with DUC, Extended Interpolation and Kintex Ultra-Scale FPGA - 3U VPX

**Options:**

-087	XCKU115-2 FPGA
-110	VITA-66.4 12X optical interface
-180	GPS Support
-702	Air cooled, Level L2
-763	Conduction-cooled, Level L3

**► Specifications, Continued**

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Total Interpolation Range**

D/A and digital combined: 2x to 524,288x

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel connector  
**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU060-2

**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

**Serial:** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR4 SDRAM

**Size:** Two banks, one 4 GB and one 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -763: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

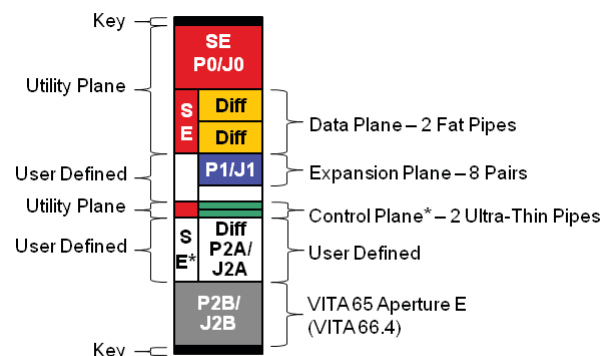

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:** The Model 5983-313 is compatible with the following module profile, as defined by the VITA 65 Open-VPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

\* not connected on board

# FlexorSet Model 7070-312

## 4-Ch. 250 MHz 16-bit A/D, 2-Ch. 800 MHz 16-bit D/A - x8 PCIe

Model 7070-312

### General Information

Model 7070-312 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3312 FMC is factory-installed on the 5973 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four 250 MHz, 16-bit A/Ds, one digital upconverter, two 800 MHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 7070-312 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-312 includes factory-installed

applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 7070-312 features a sophisticated D/A waveform playback IP module. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

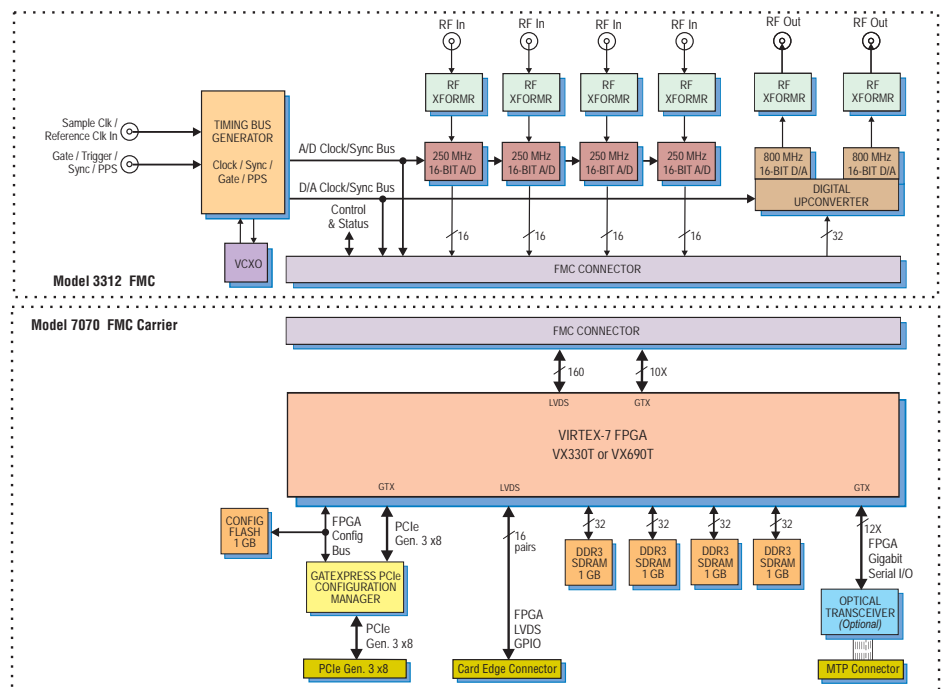

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-312 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 250 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 7070-312 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The 7070-312 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► Xilinx Virtex-7 FPGA**

The 7070-312 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O.

Option -110: For applications requiring optical gigabit links, up to 12 high-speed, full-duplex FPGA GTX lanes driven via an optical transceiver support serial protocols. A 12-lane MTP optical connector is presented on the PCIe slot panel.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

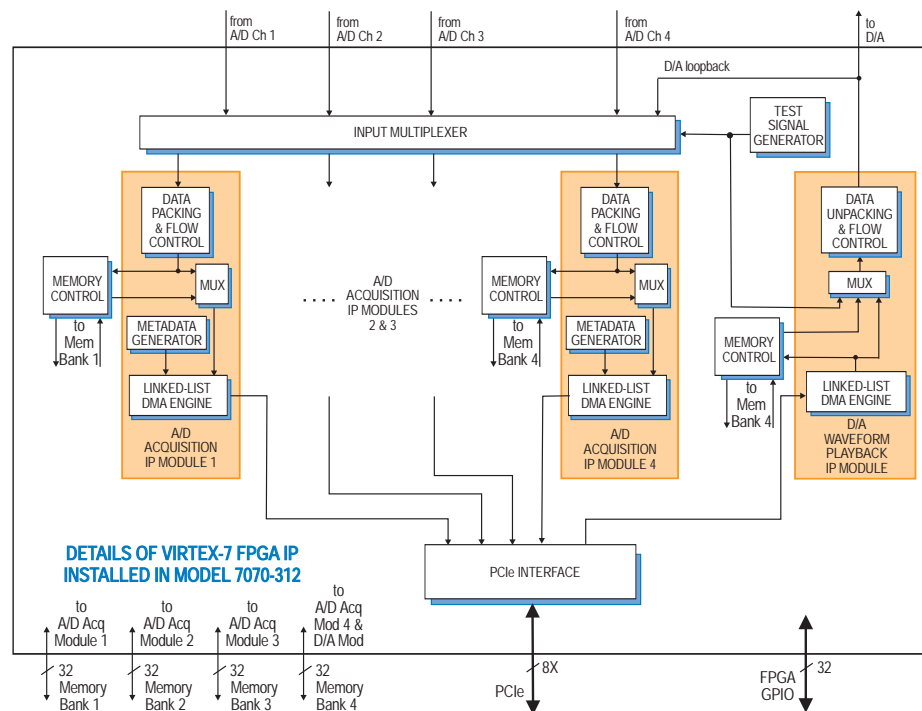

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the ►

### PCI Express Interface

The Model 7070-312 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 7070-312 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
7070-312	4-Channel 250 MHz A/D, 2-Channel 800 MHz 16-bit D/A with Virtex-7 FPGA - x8 PCIe

#### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to card-edge connector
-110	12x gigabit serial optical I/O with XC7VX690T FPGA, 4x w. XC7VX330T

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz  
**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Option -076:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O  
**Optical (Option -110):** 12x gigabit serial optical I/O with XC7VX690T FPGA, 4x with XC7VX330T

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;  
**Environmental:** Level L1 & L2 air-cooled  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

## Model 3312

# 4-Ch. 250 MHz, 16-bit A/D with DDCs, 2-Ch. 800 MHz, 16-bit D/A with DUC and Extended Interpolation - FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-313](#)
  - [FlexorSet Model 7070-313](#)
- Four 250 MHz 16-bit A/Ds
- Four multiband DDCs
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U VPX or Model 7070 PCIe Virtex-7 FMC carriers
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 3312 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 250 MHz, 16-bit A/Ds, two 800 MHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channelcount systems.

The 3312 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-313 3U VPX or the FlexorSet 7070-313 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Performance of the Model 3312

The true performance of the 3312 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a D/A waveform playback IP module.

### A/D Acquisition IP Modules

With the 3312 installed on either the 5973 or the 7070 carrier, the board-set features four A/D acquisition IP modules for easily capturing and moving data. Each module can receive data from any of the four A/

Ds, a test signal generator or from the D/A waveform playback IP module in loop-back mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

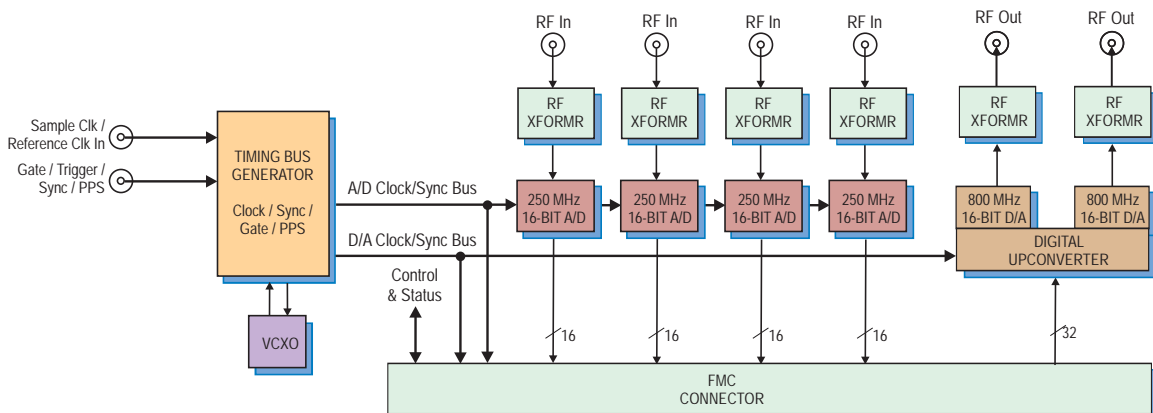

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's task of identifying and executing on the data.

### D/A Waveform Playback IP Module

With the 5973 or the 7070 carrier, the 3312 features a sophisticated D/A waveform playback IP module. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with minimum programming. ➤

## Model 3312

# 4-Ch. 250 MHz, 16-bit A/D, 2-Ch. 800 MHz, 16-bit D/A with DUC - FMC

### Features

- Four 250 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U OpenVPX or Model 7070 PCIe Virtex-7 FMC carriers as FlexorSets
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 3312 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 250 MHz, 16-bit A/Ds, two 800 MHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channel-count systems.

The 3312 is available as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-312 3U VPX or the FlexorSet 7070-312 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

Pentek also offers the option -990 reference design with software and IP support for the 3312 when installed on the Xilinx VC707 Evaluation Kit board.

### A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Performance of the Model 3312

The true performance of the 3312 can be best unlocked when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a D/A waveform recorder IP module.

### A/D Acquisition IP Modules

With the 3312 installed on either the 5973 or the 7070 carrier, the board-set features

four A/D acquisition IP modules for easily capturing and moving data. Each module can receive data from any of the four A/Ds, a test signal generator or from the D/A waveform generator IP module in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

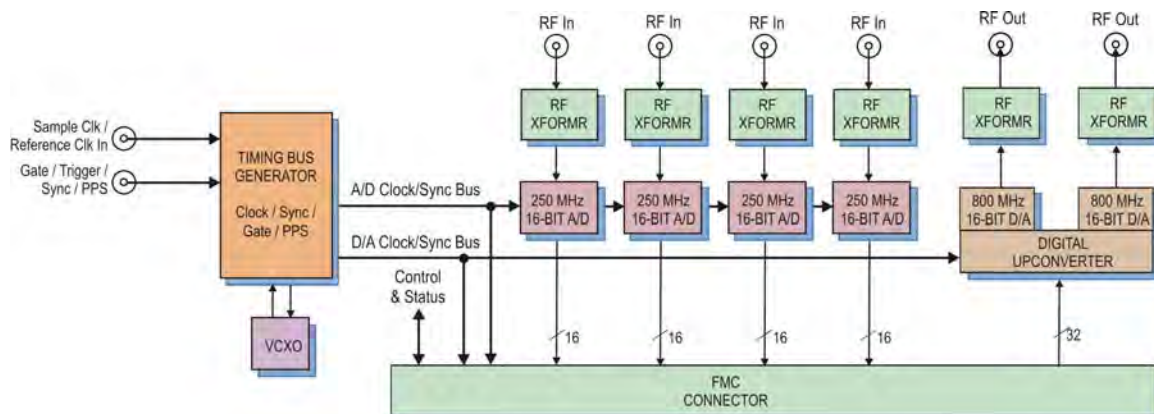

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's task of identifying and executing on the data.

### D/A Waveform Generator IP Module

With the 5973 or the 7070, the 3312 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from generator trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with minimum programming. ➤

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

## Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal allowing multiple modules to be synchronized thereby creating larger multi-board systems.

## ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3312's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows or Linux operating systems.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/3312 or 7070/3312 IP modules as documented source code. Using Xilinx Vivado tools, developers can integrate their own IP with

the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

## FMC Interface

The Model 3312 complies with the VITA 57 High-Pin-Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3312 and the FMC carrier.

## Model 3312 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front panel external clock

**Synchronization:** VCXO can be phase-locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D or D/A clocks

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-Pin Count FMC

New!

# FlexorSet Model 5973-313

# 4-Ch. 250 MHz 16-bit A/D with DDCs, 2-Ch. 800 MHz 16-bit D/A with DUC and Extended Interpolation - 3U VPX

Model 5973-313

### Features

- Includes Xilinx Virtex-7 FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 250 MHz 16-bit A/Ds
- Four multiband DDCs
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Extended Interpolation
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 5973 is a member of the OnyxFX® family of high-performance 3U VPX baseboards with a Xilinx Virtex-7 FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5973-313 FlexorSet™ combines the Model 5973 and the Model 3312 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs and is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

The Model 5973-313 includes four 250 MHz, 16-bit A/Ds, one digital upconverter, two 800 MHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, it includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5973-313 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful DDC core.

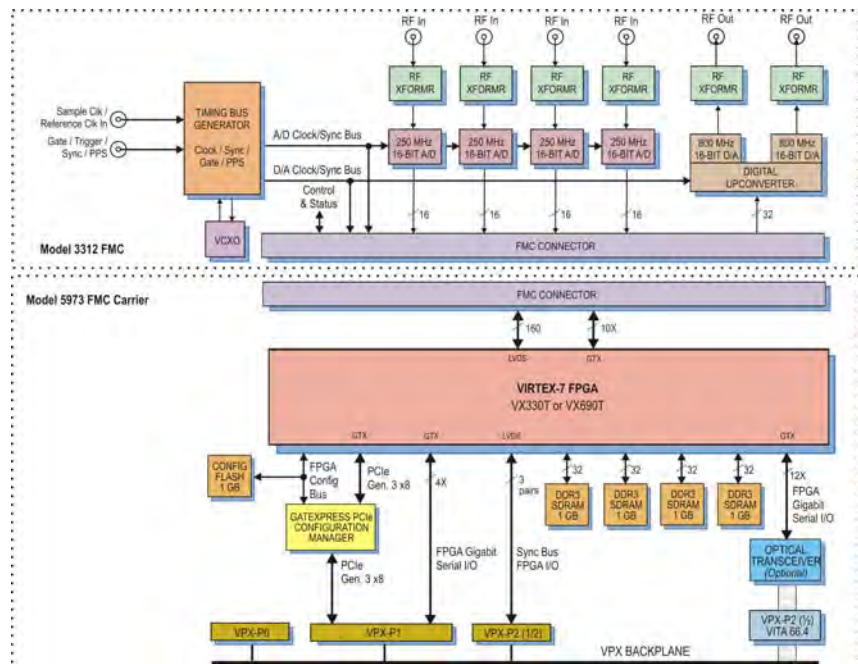

The 5973-313 features a sophisticated D/A waveform recorder IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-313 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ▶

**A/D Acquisition IP Modules**

The 5973-313 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Generator IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The 5973-313 factory-installed functions include a sophisticated D/A Waveform Generator IP module. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K

samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

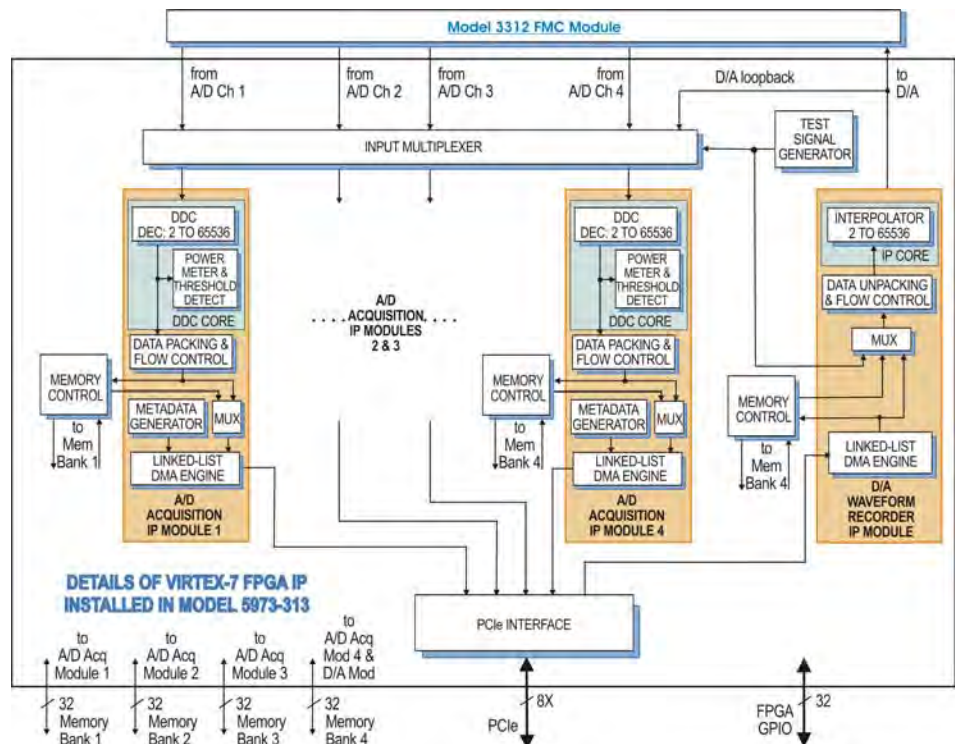

**► Xilinx Virtex-7 FPGA**

The 5973-313 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols.

Option -104 provides 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface. ►

### ► GateXpress for FPGA Configuration

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT. In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

In addition, the FPGA-based interpolator provides a range of 2x to 65536x in two stages of 2x to 256x. Including the DAC5688 interpolation, the overall available interpolation range equals 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules. ►

### SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### Ordering Information

Model	Description
5973-313	4-Channel 250 MHz 16-bit A/D, with DDCs, 2-Channel 800 MHz 16-bit D/A with DUC, Extended Interpolation and Virtex-7 FPGA - 3U VPX

#### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-110	VITA-66.4 12X optical I/O with XC7VX690T FPGA, 4X w. XC7VX330T

Contact Pentek for availability of rugged and conduction-cooled versions

### ► PCI Express Interface

The Model 5973-313 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 5973-313 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

#### 4-Channel Digital Downconverter

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit user-programmable coefficients, 24-bit output

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Total Interpolation Range

D/A and digital combined: 2x to 524,288x

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

### Custom FPGA I/O

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

New!

# FlexorSet Model 5983-313

# 4-Ch. 250 MHz 16-bit A/D with DDCs, 2-Ch. 800 MHz 16-bit D/A with DUC and Extended Interpolation - 3U VPX

Model 5983-313

## Features

- VITA-57.4 HSPC FMC+ site offers access to a wide range of possible I/O
- Supports Xilinx Kintex UltraScale FPGA
- Four 250 MHz 16-bit A/Ds
- Four multiband DDCs
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Extended Interpolation
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- LVDS connections to the Kintex UltraScale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX base-boards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-313 FlexorSet™ combines the Model 5983 and the Model 3313 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs and is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling

factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5983-313 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer. Each of the four acquisition IP modules contains a powerful DDC core.

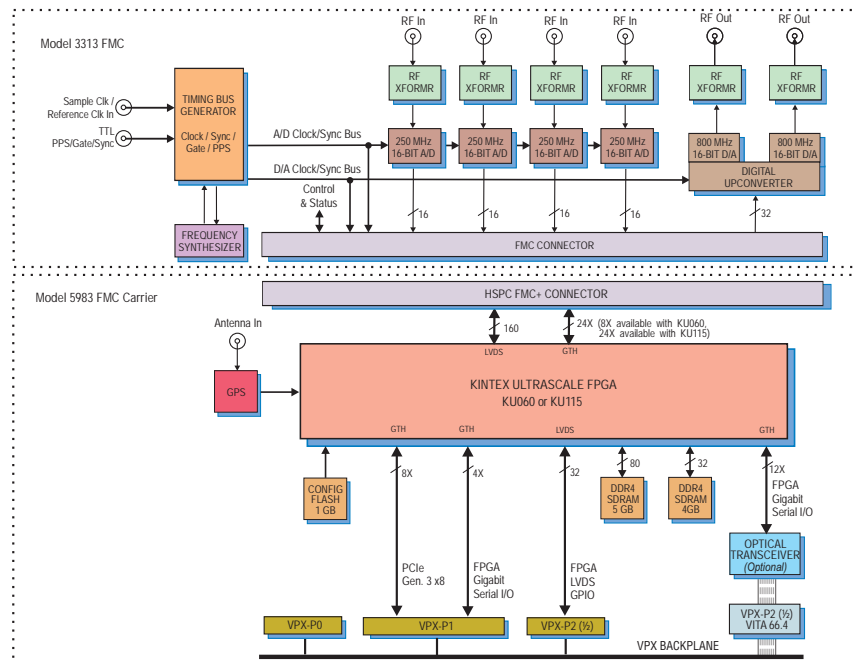

The 5983-313 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-313 to operate as a turnkey solution without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included. Developers can ➤

**A/D Acquisition IP Modules**

The 5983-313 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Generator IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The 5983-313 factory-installed functions include a sophisticated D/A Waveform Generator IP module. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be program-med from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power

meters present average power measurements for each DDC core output in easy-to-read registers.

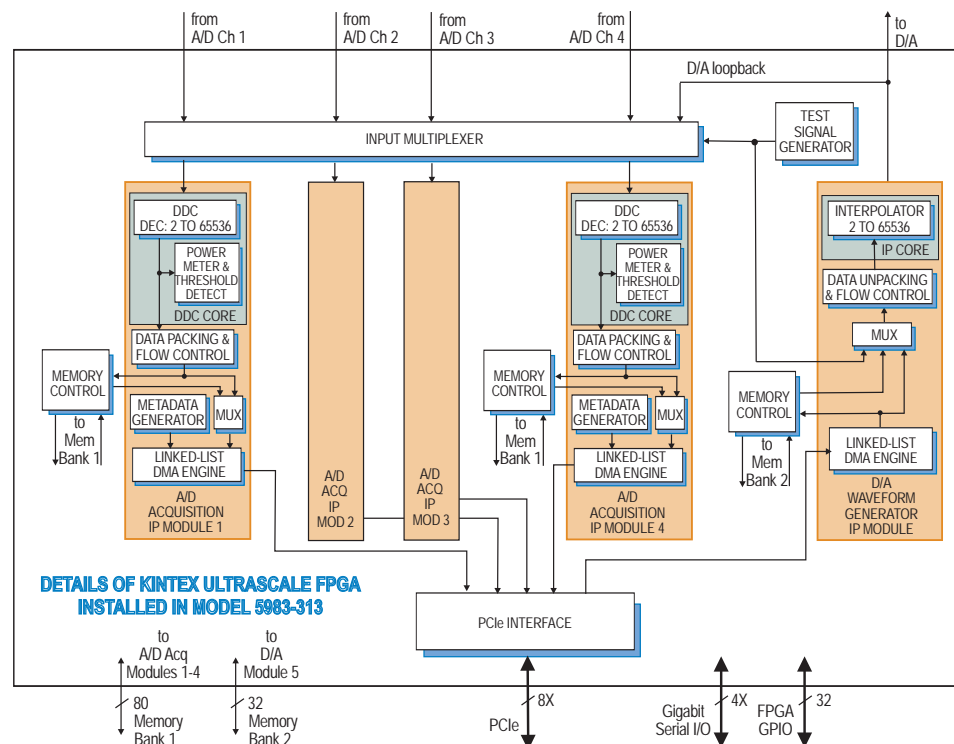

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

► integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

**Xilinx Kintex UltraScale FPGA**

The 5983-313 can be optionally populated with one of two Kintex UltraScale FPGAs to match the specific requirements of the processing task. Supported FPGAs are KU060 or KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost KU060 can be installed.

Sixteen pairs of LVDS connections are optionally provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols. ►

► The 5983-313 supports the VITA-66.4 standard, that provides up to 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

### GPS

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sampling frequency. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

In addition, the FPGA-based interpolator provides a range of 2x to 65536x in two stages of 2x to 256x. Including the DAC5688 interpolation, the overall available interpolation range equals 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to

provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### PCI Express Interface

The Model 5983-313 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 5983-313 architecture supports two independent DDR3 SDRAM memory banks. The banks are four and five gigabytes each and are part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

#### 4-Channel Digital Downconverter

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit user-programmable coefficients, 24-bit output

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution ►

# FlexorSet Model 7070-313

## 4-Ch. 250 MHz 16-bit A/D with DDCs, 2-Ch. 800 MHz 16-bit D/A with DUC and Extended Interpolation - x8 PCIe

Model 7070-313

### General Information

Model 7070-313 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3312 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board-set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs and is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

The Model 7070-313 includes four 250 MHz, 16-bit A/Ds, one digital upconverter, two 800 MHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, it includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-313 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful DDC core.

The 7070-313 features a sophisticated D/A waveform playback IP module. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

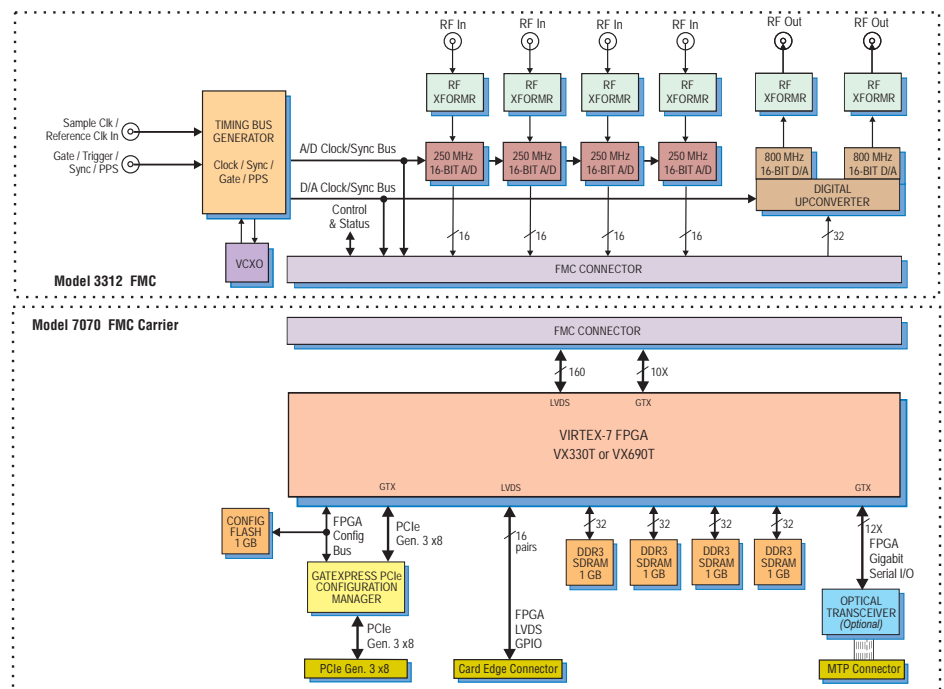

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-313 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 250 MHz 16-bit A/Ds
- Four multiband DDCs
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Extended Interpolation
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 7070-313 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The 7070-313 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average

power measurements for each DDC core output in easy-to-read registers.

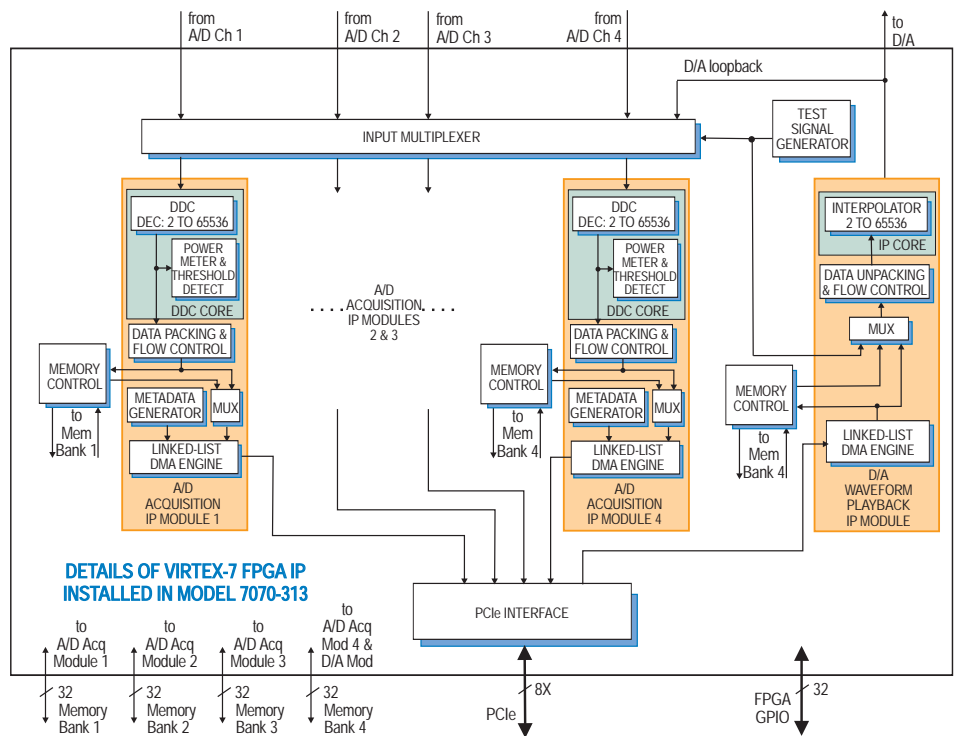

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

**► Xilinx Virtex-7 FPGA**

The 7070-313 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface. ►

### ► GateXpress for FPGA Configuration

The Flexor architecture includes GateXpress<sup>®</sup>, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT. In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

In addition, the FPGA-based interpolator provides a range of 2x to 65536x in two stages of 2x to 256x. Including the DAC5688 interpolation, the overall available interpolation range equals 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules. ►

► **PCI Express Interface**

The Model 7070-313 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Memory Resources**

The 7070-313 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

**4-Channel Digital Downconverter**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit user-programmable coefficients, 24-bit output  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Total Interpolation Range**

D/A and digital combined: 2x to 524,288x

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel connector  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz  
**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Option -076:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O  
**Optical (Option -110):** 12x gigabit serial optical I/O with XC7VX690T FPGA, 4x with XC7VX330T

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;  
**Environmental:** Level L1 & L2 air-cooled  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
5973-313	4-Channel 250 MHz 16-bit A/D, with DDCs, 2-Channel 800 MHz 16-bit D/A with DUC, Extended Interpolation and Virtex-7 FPGA -x8 PCIe
<b>Options:</b>	
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O between the FPGA and a card-edge connector for custom I/O
-110	VITA-66.4 12X optical I/O with XC7VX690T FPGA, 4X w. XC7VX330T

New!

Features

- Eight 250 MHz, 16-bit A/Ds
- On-board timing bus generator with multiboard synchronization
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Pentek FMC carriers
- Ruggedized and conduction-cooled versions available

General Information

The Flexor® Model 3316 is a multi-channel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes eight 250 MHz, 16-bit A/Ds, programmable clocking, and multiboard synchronization for support of larger high-channel count systems.

When combined with a Pentek 3U VPX or a PCIe FMC carrier, the 3316 is available as a FlexorSet, a complete turnkey data acquisition solution. For applications that require custom processing, FlexorSets are ideal for IP development and deployment.

Pentek also offers the option -990 reference design with software and IP support when installed on the Xilinx VC707 Evaluation Kit board.

A/D Converters

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

Performance of the Model 3316

The true performance of the 3316 can be best unlocked when used with the Pentek FMC carriers as a FlexorSet. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a metadata packet creator.

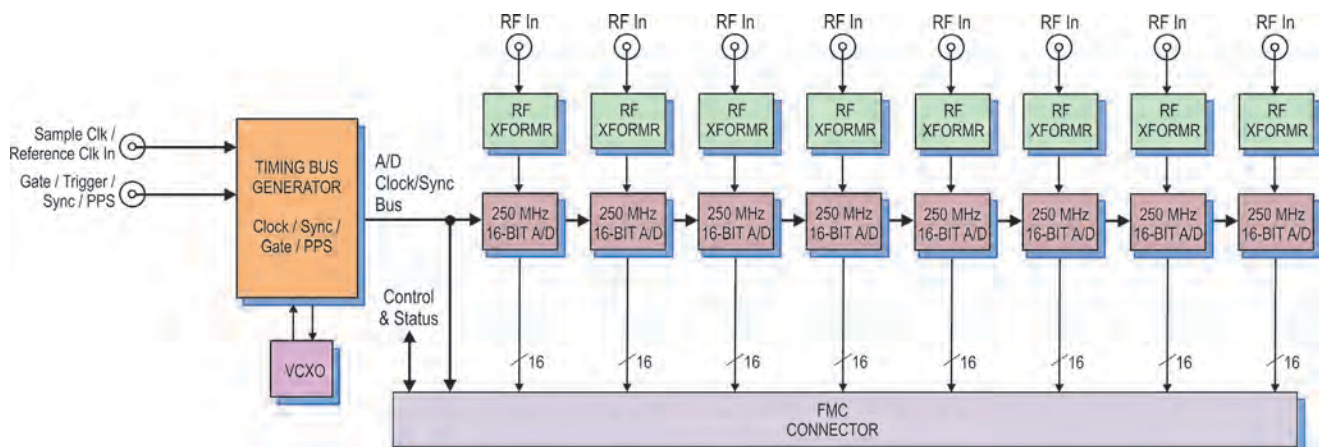

A/D Acquisition IP Modules

With the 3316 installed on a Pentek FMC carrier, the FlexorSet features eight A/D Acquisition IP modules for easily capturing and moving data. Each module can receive data from any of the eight A/Ds, or a test signal generator.

Each IP module can have an associated memory bank on the Pentek FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's task of identifying and executing on the data. ➤

### SPARK Development Systems

SPARK systems are fully-integrated saving engineers and system integrators the time and expense associated with building and testing a development system. SPARK systems ensure the optimum performance of Pentek boards and are available in 3U VPX ([Model 8267](#)) and in a PC environment ([Model 8266](#)).

### Ordering Information

<a href="#">7070-316</a>	8-Channel 250 MHz A/D with Virtex-7 FPGA- x8
<a href="#">7070-317</a>	8-Channel 250 MHz A/D, Virtex-7 FPGA with 8 multiband DDCs and interpolator -x8

*Contact Pentek for availability of rugged and conduction-cooled versions and other support options*

► When used with the 5973 or the 7070, Pentek's ReadyFlow® BSP provides control of all the 3316's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows or Linux operating systems.

### Board Support Packages

Pentek's BSPs provide control of all the 3316's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a powerful, quick-start platform to create custom applications. BSPs are compatible with Windows and Linux operating systems. ReadyFlow BSP is used with OnyxFX Virtex-7 FPGA carriers and Navigator BSP is used for all new development going forward including the JadeFX Kintex UltraScale carriers.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the development kit to completely replace the Pentek IP with their own.

GateFlow is used with OnyxFX Virtex-7 FPGA carriers and Navigator FDK is used for all new FPGA development going forward including the JadeFX Kintex UltraScale carriers.

### FMC Interface

The Model 3316 complies with the VITA 57 High-Pin-Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3316 and the FMC carrier.

### Model 3316 Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Sample Clock Source:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front-panel external clock

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16

#### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-Pin-Count FMC

# FlexorSet Model 5973-316

## 8-Channel 250 MHz A/D with Virtex-7 FPGA - 3U VPX

Model 5973-316

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Eight 250 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical interface for backplane gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 5973-316 is a member of the Flexor® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3316 FMC is factory-installed on the 5973 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes eight A/Ds and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 5973-316 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5973-316 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include eight

A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains IP modules for DDR3 SDRAM memories. A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-316 to operate as a turnkey solution without the need to develop any FPGA IP.

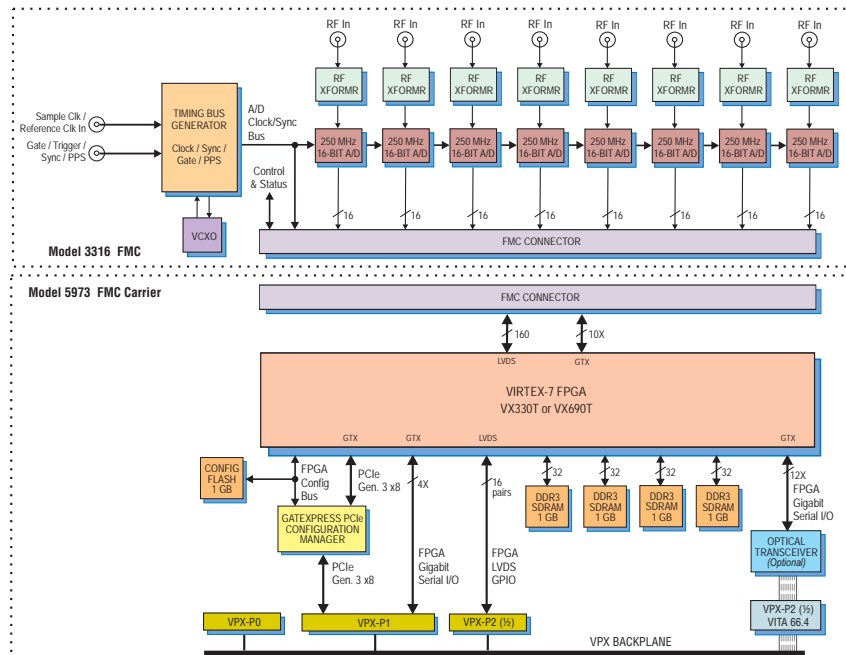

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The 5973-316 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols. ➤

► Option -104 provides 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit backplane communications between boards independent of the PCIe interface.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board’s configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board’s PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from

FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

**A/D Converter Stage**

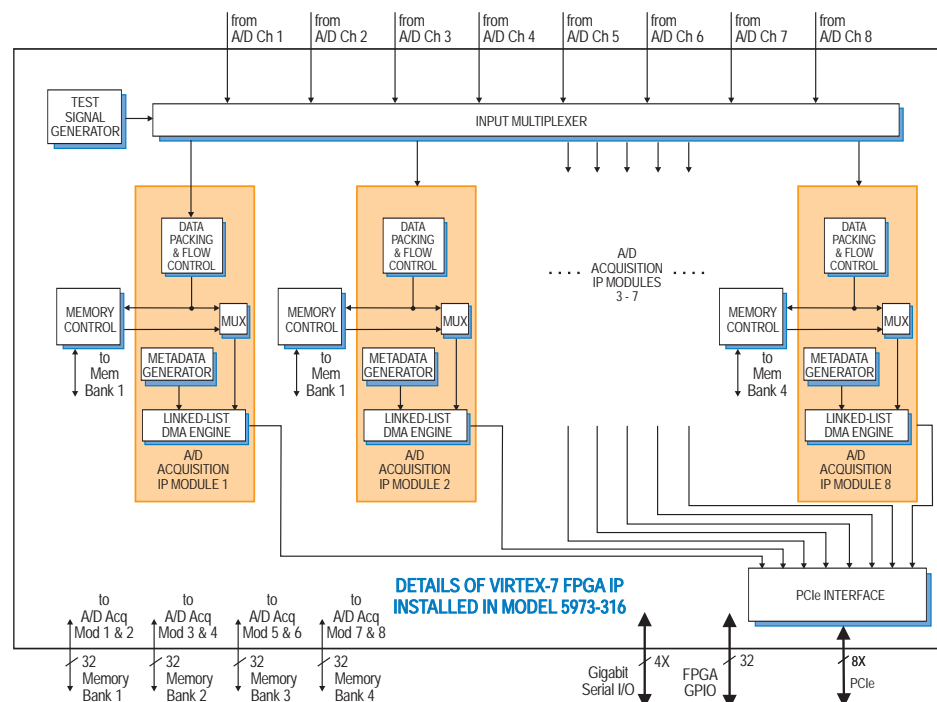

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters. ►

**A/D Acquisition IP Modules**

The 5973-316 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
5973-316	8-Channel 250 MHz A/D with Virtex-7 FPGA - 3U VPX

**Options:**

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-110	VITA-66.4 12X optical interface

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

**► Memory Resources**

The 5973-316 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

**PCI Express Interface**

The Model 5973-316 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled,

Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# FlexorSet Model 5983-317

# 8-Channel 250 MHz A/D with DDCs, Kintex UltraScale FPGA - 3U VPX

Model 5983-317

## Features

- VITA-57.4 HSPC FMC+ site offers access to a wide range of possible I/O
- Supports Xilinx Kintex UltraScale FPGA
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs
- 4 GB and 5 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- LVDS connections to the Kintex UltraScale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX base-boards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-317 FlexorSet™ combines the Model 5983 and the Model 3317 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to

all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5983-317 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-317 to operate as a turnkey solution without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the back-plane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit back-plane communications between boards independent of the PCIe interface. ➤

**A/D Acquisition IP Modules**

The 5983-317 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from its corresponding A/D or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be

programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8 K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

**➤ A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

**Memory Resources**

The 5983-317 architecture supports two independent DDR3 SDRAM memory banks. These banks are 4 GB and 5 G deep and are an integral part of the board’s DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 5983-317 includes an industry-standard interface fully compliant with PCI e Gen. 1, 2 and 3 bus specifications. PCIe links up to x8, are supported. ➤

**SPARK Development Systems**

The Model 8267 is a fully-integrated development system for Pentek 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

**GPS**

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Eight channels

**Decimation Range:** 2x to 32,768x in three stages of 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stop-band attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU060-2

**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

**Serial:** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR4 SDRAM

**Size:** Two banks, one 4 GB and one 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -763: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:** The Model 5983-317 is compatible with the following module profile, as defined by the VITA 65 OpenVPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

\* not connected on board

# FlexorSet Model 7070-316

## 8-Channel 250 MHz A/D with Virtex-7 FPGA - x8 PCIe

Model 7070-316

### General Information

Model 7070-316 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3316 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes eight A/Ds and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 7070-316 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-316 includes factory-installed applications ideally matched to the board's

analog interfaces. The functions include eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains IP modules for DDR3 SDRAM memories. A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-316 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

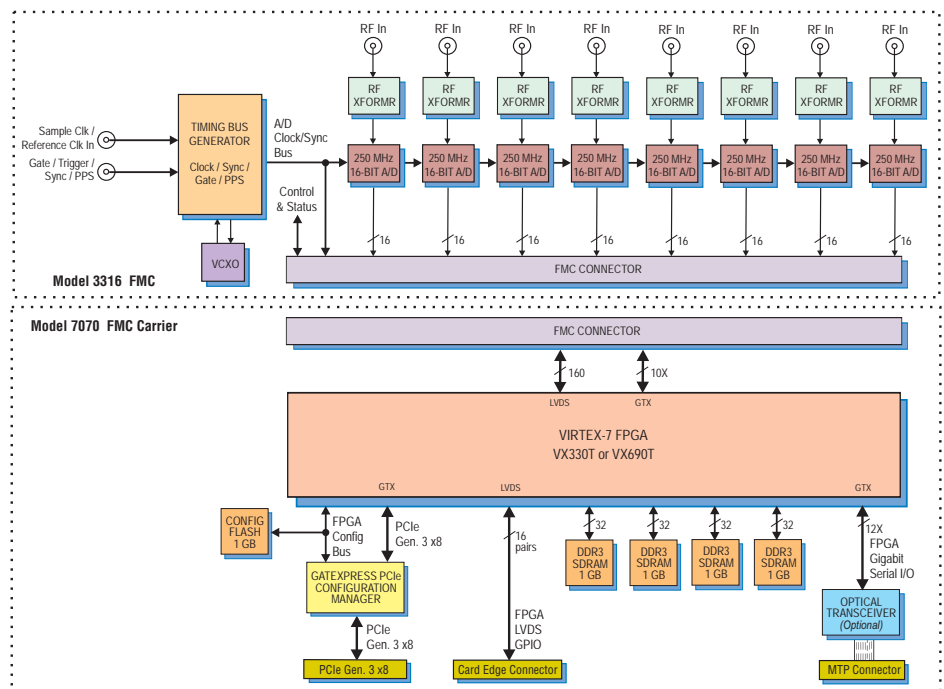

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The 7070-316 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed. ▶

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Eight 250 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

► Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O.

Option -110: For applications requiring optical gigabit links, up to 12 high-speed, full-duplex FPGA GTX lanes driven via an optical transceiver support serial protocols. A 12-lane MTP optical connector is presented on the PCIe slot panel.

### GateXpress for FPGA Configuration

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user

selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

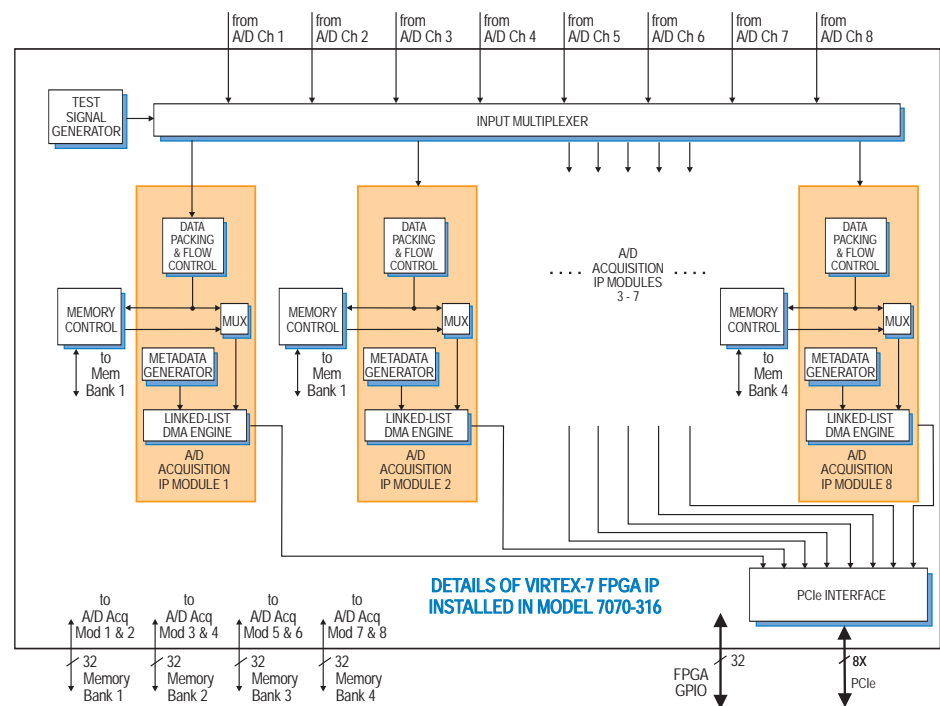

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters. ►

### A/D Acquisition IP Modules

The 7070-316 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► **Memory Resources**

The 7070-316 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

**PCI Express Interface**

The Model 7070-316 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
7070-316	8-Channel 250 MHz A/D with Virtex-7 FPGA - x8 PCIe

**Options:**

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to card-edge connector
-110	12x gigabit serial optical I/O with XC7VX690T FPGA, 4x w. XC7VX330T

Model	Description
8266	PC Development System See 8266 Datasheet for Options

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the card-edge connector for custom I/O

**Optical (Option -110):** 12x gigabit serial optical I/O with XC7VX690T FPGA, 4x with XC7VX330T

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## Model 3317

## 8-Channel 250 MHz, 16-bit A/D with DDCs - FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-317](#)
  - [FlexorSet Model 7070-317](#)
- Eight 250 MHz, 16-bit A/Ds
- Eight multiband DDCs
- On-board timing bus generator with multiboard synchronization
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U VPX or Model 7070 PCIe Virtex-7 FMC carrier
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 3317 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes eight 250 MHz, 16-bit A/Ds, programmable clocking, and multiboard synchronization for support of larger high-channel count systems.

The 3317 is sold as a complete turnkey data acquisition solution as the FlexorSet™ 5973-317 3U VPX or the FlexorSet 7070-317 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

The 3317 is identical to the 3316 but with different FPGA functionality since it includes DDCs (digital downconverters) when attached to a 5973 or a 7070 FMC carrier.

### A/D Converters

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Performance of the Model 3317

The true performance of the 3317 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable DDCs, programmable linked-list DMA engines, and a metadata packet creator.

### A/D Acquisition IP Modules

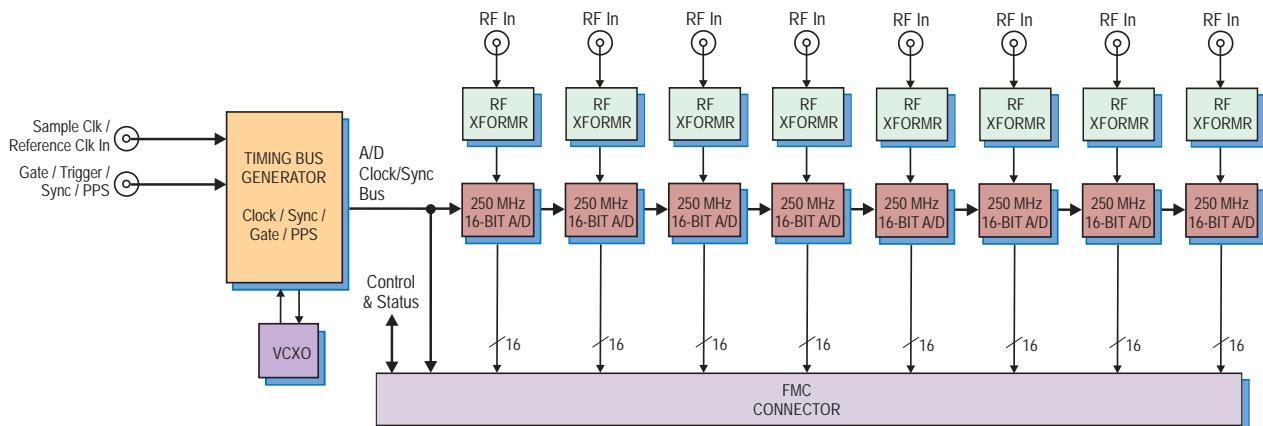

With the 3317 installed on either the 5973 or the 7070 FMC carrier, the board-set features eight A/D Acquisition IP modules for easily capturing and moving data. Each module can receive data from any of the eight A/Ds, or a test signal generator.

Each IP module can have an associated memory bank on the Pentek FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's task of identifying and executing on the data.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the FlexorSet to operate as a turnkey solution without the need to develop any FPGA IP. ▶

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple modules to be synchronized to create larger multiboard systems.

## ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3317's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973-317 (3U VPX) or 7070-317 (x8 PCIe) IP modules as documented source code. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973-317/7070-317 IP with their own.

## FMC Interface

The Model 3317 complies with the VITA 57 High Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3317 and the FMC carrier.

## Model 3317 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Sample Clock Source:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front-panel external clock

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-Pin Count FMC

# FlexorSet Model 5973-317

## 8-Channel 250 MHz A/D with DDCs, Virtex-7 FPGA - 3U VPX

### Features

- Supports Xilinx Virtex-7 VXT FPGA
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical interface for backplane gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 5973-317 is a member of the Flexor® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3316 FMC is factory-installed on the 5973 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The Model 5973-317 includes eight A/Ds and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, it includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5973-317 includes factory-installed applications ideally matched to the board's

analog interfaces. The functions include eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-317 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

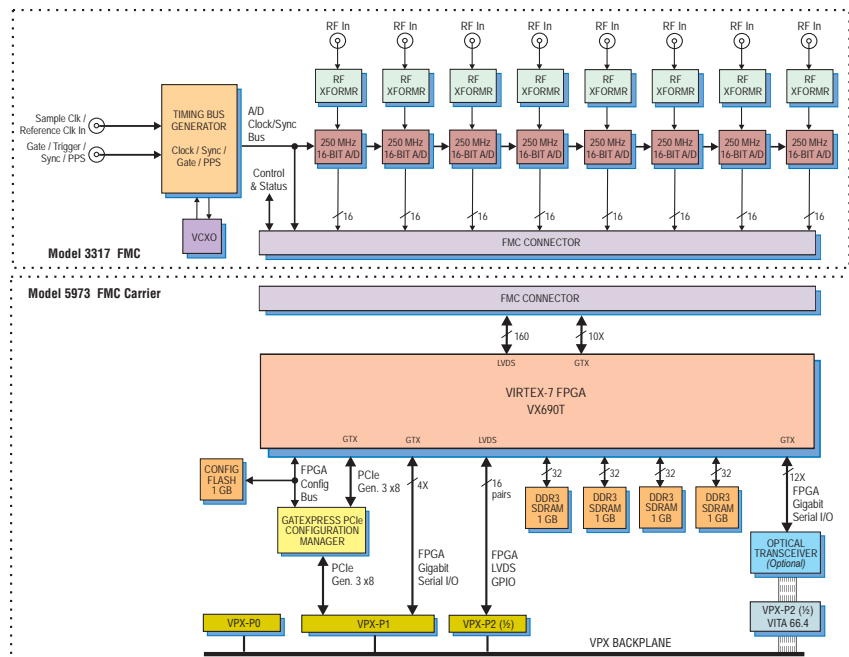

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The 5973-317 is populated with a VX690T FPGA. It features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols.

Option -104 provides 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

► Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the back-plane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit back-plane communications between boards independent of the PCIe interface.

**A/D Acquisition IP Modules**

The 5973-317 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

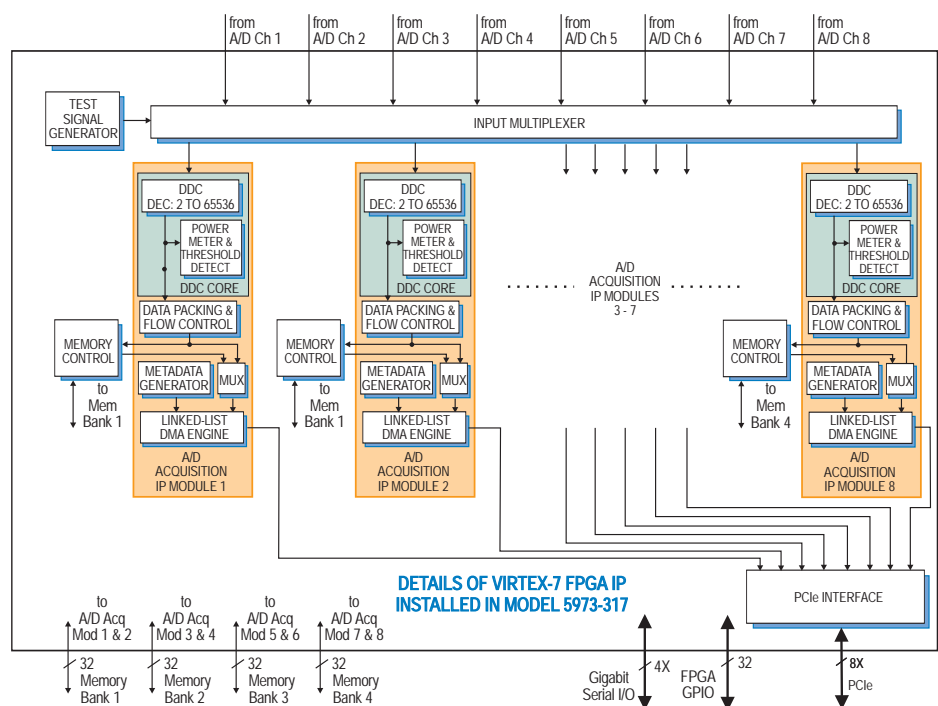

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board’s configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board’s PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. ►

### Memory Resources

The 5973-317 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### PCI Express Interface

The Model 5973-317 includes an industry-standard interface fully compliant with PCI e Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
5973-317	8-Channel 250 MHz A/D with DDCs and Virtex-7 FPGA - 3U VPX

#### Options:

-104	LVDS FPGA I/O to VPX P2
-110	VITA-66.4 12X optical interface

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

► In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Sample Clock Sources:** On-board clock synthesizer  
**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O  
**Optical (Option -110):** VITA-66.4, 12X duplex lanes

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;  
**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# FlexorSet Model 5983-317

# 8-Channel 250 MHz A/D with DDCs, Kintex UltraScale FPGA - 3U VPX

Model 5983-317

## Features

- VITA-57.4 HSPC FMC+ site offers access to a wide range of possible I/O
- Supports Xilinx Kintex UltraScale FPGA
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs
- 4 GB and 5 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for backplane gigabit serial interboard communication
- LVDS connections to the Kintex UltraScale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX base-boards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-317 FlexorSet™ combines the Model 5983 and the Model 3317 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to

all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

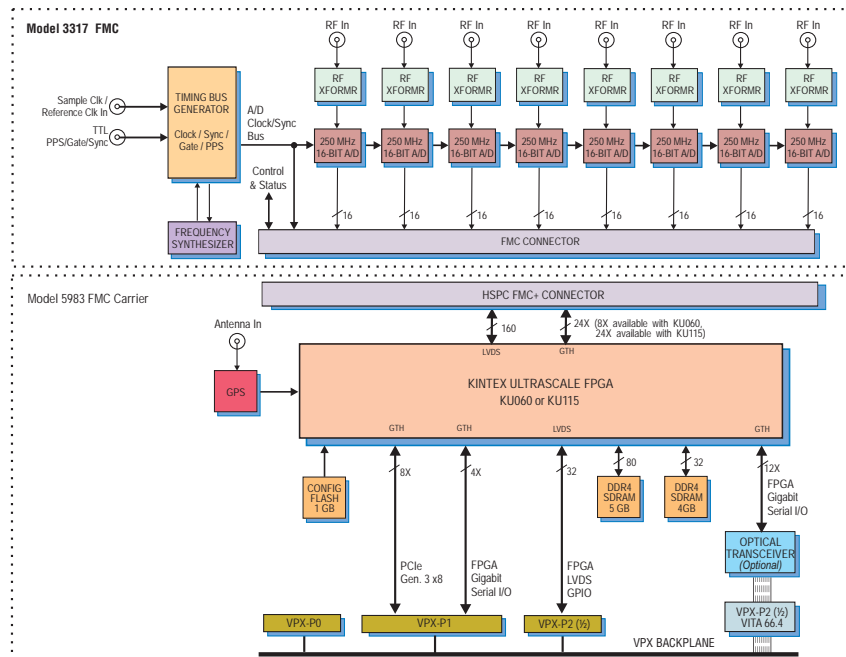

When delivered as an assembled board set, the 5983-317 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-317 to operate as a turnkey solution without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the back-plane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit back-plane communications between boards independent of the PCIe interface. ➤

**A/D Acquisition IP Modules**

The 5983-317 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from its corresponding A/D or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be

programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8 K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

**➤ A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

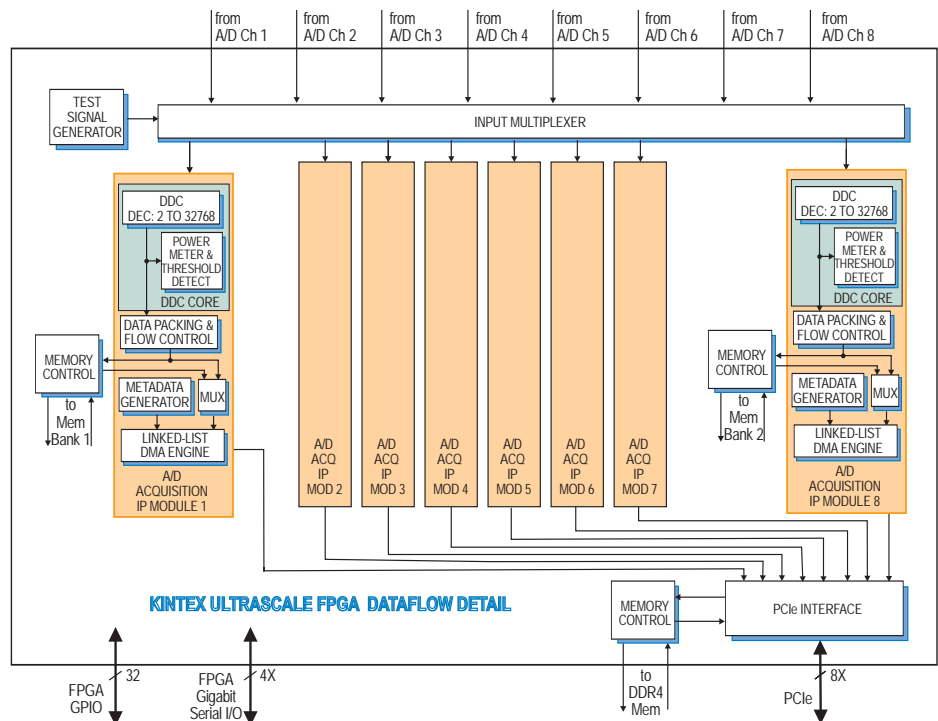

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

**Memory Resources**

The 5983-317 architecture supports two independent DDR3 SDRAM memory banks. These banks are 4 GB and 5 G deep and are an integral part of the board’s DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 5983-317 includes an industry-standard interface fully compliant with PCI e Gen. 1, 2 and 3 bus specifications. PCIe links up to x8, are supported. ➤

**SPARK Development Systems**

The Model 8267 is a fully-integrated development system for Pentek 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
5983-317	8-Channel 250 MHz A/D with DDCs and Kintex Ultra Scale FPGA - 3U VPX

**Options:**

-087	XCKU115-2 FPGA
-110	VITA-66.4 12X optical interface
-180	GPS Support
-702	Air cooled, Level L2
-763	Conduction-cooled, Level L3

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

**GPS**

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Eight channels

**Decimation Range:** 2x to 32,768x in three stages of 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stop-band attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU060-2

**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

**Serial:** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR4 SDRAM

**Size:** Two banks, one 4 GB and one 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -763: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

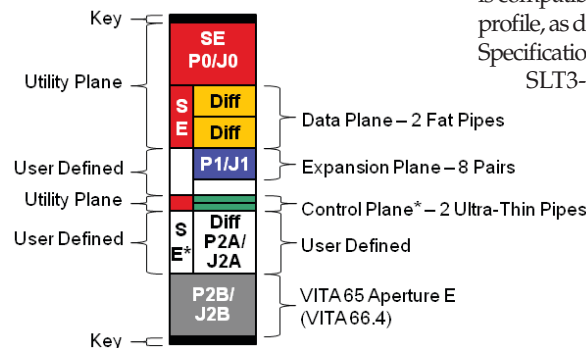

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:** The Model 5983-317 is compatible with the following module profile, as defined by the VITA 65 OpenVPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

New!

# FlexorSet Model 7070-317

## 8-Channel 250 MHz A/D with DDCs, Virtex-7 FPGA - x8 PCIe

Model 7070-317

### General Information

Model 7070-317 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3316 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes eight A/Ds and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 7070-317 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-317 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-317 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

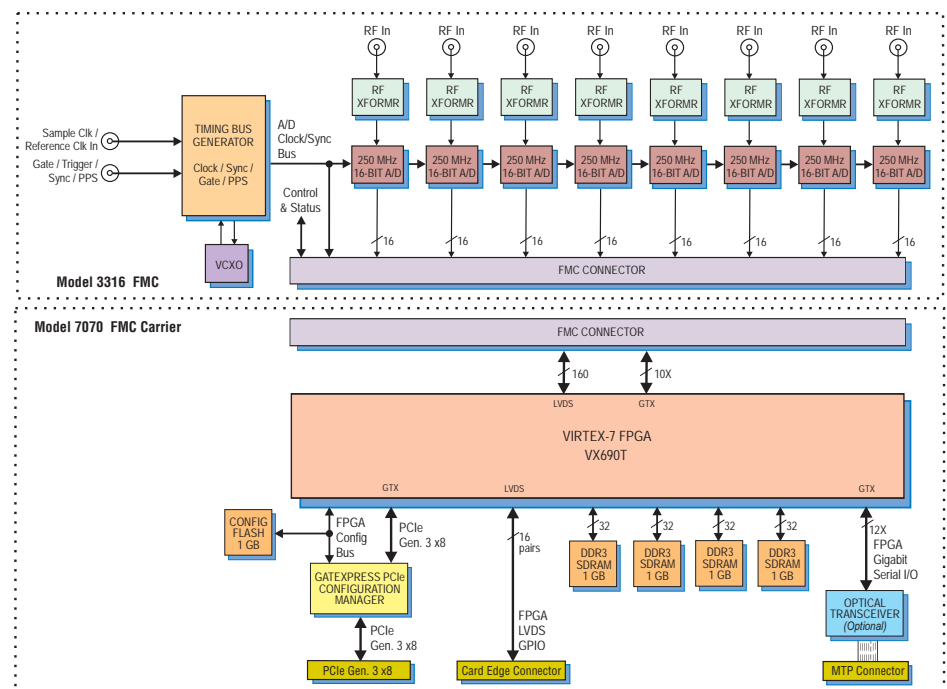

### Xilinx Virtex-7 FPGA

The 7070-317 is populated with a VX690T FPGA. It features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception.

Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGA
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

► Option -110: For applications requiring optical gigabit links, up to 12 high-speed, full-duplex FPGA GTX lanes driven via an optical transceiver support serial protocols. A 12-lane MTP optical connector is presented on the PCIe slot panel.

**A/D Acquisition IP Modules**

The 7070-317 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

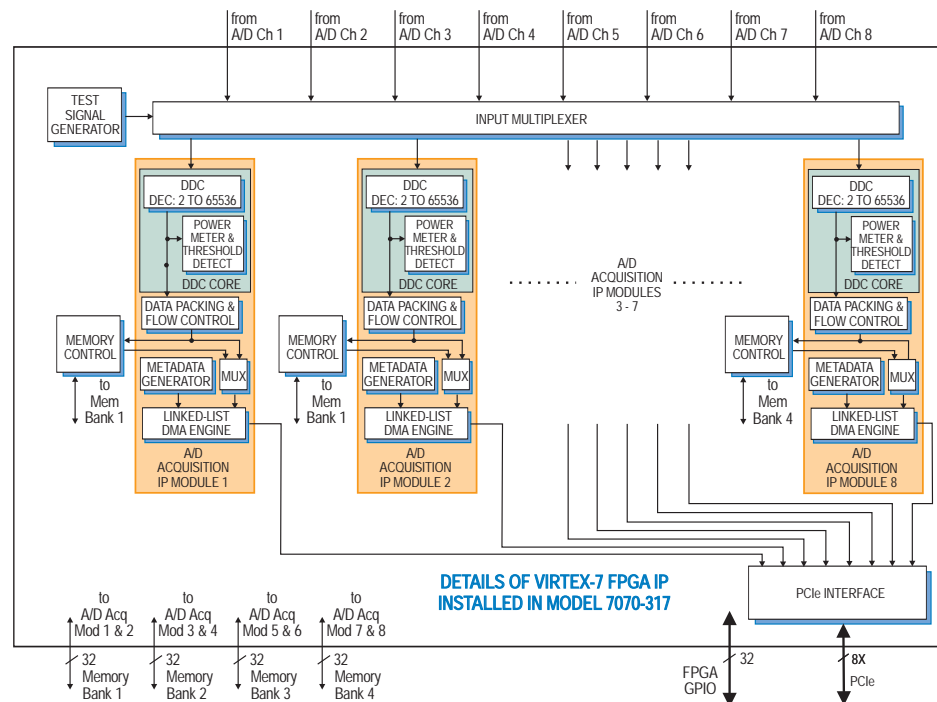

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. ►

### Memory Resources

The 7070-317 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### PCI Express Interface

The Model 7070-317 includes an industry-standard interface fully compliant with PCI e Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
7070-317	8-Channel 250 MHz A/D with DDCs and Virtex-7 FPGA - x8 PCIe
<b>Options:</b>	
-104	LVDS FPGA I/O to card-edge connector
-110	12x gigabit serial optical I/O with XC7VX690T FPGA, 4x w. XC7VX330T

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. Included are a clock, sync and gate or trigger signals. An on-board clock generator can receive an external sample clock from the front-panel coaxial connector. This clock can be used directly by the A/D section or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple boards to be synchronized to create larger multiboard systems.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC46TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Eight channels

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O

**Optical (Option -110):** 12x gigabit serial optical I/O with XC7VX690T FPGA, 4x with XC7VX330T

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled,

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## Model 3320

## 2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A - FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-320](#)
  - [FlexorSet Model 7070-320](#)
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 3.0 GHz\* A/Ds
- Two 2.8 GHz\* D/As
- Two digital downconverters
- Two digital upconverters
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor™ Model 3320 is a multichannel, high-speed data converter FMC. It is suitable for connection to RF or IF ports of a communications or radar system. It includes two 3.0 GHz A/Ds, two 2.8 GHz D/As, programmable clocking and multiboard synchronization for support of larger high-channel-count systems.

The 3320 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-320 3U VPX or the FlexorSet 7070-320 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### Performance of the Model 3320

The true performance of the 3320 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and D/A waveform playback IP modules.

Designed to allow users to optimize data conversion rates and modes for specific application requirements, the FlexorSet provides preconfigured conversion profiles. Users can use these profiles which include: digital downconverter and digital upconverter modes, conversion resolution and A/D and D/A sample rates, or program their own profiles. In addition to supporting PCIe Gen. 3 as a native interface, the FlexorSet includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### A/D and Digital Downconverter Stage

The front end accepts two analog RF or IF inputs on front-panel connectors with

transformer-coupling into a Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on the last page for supported modes.

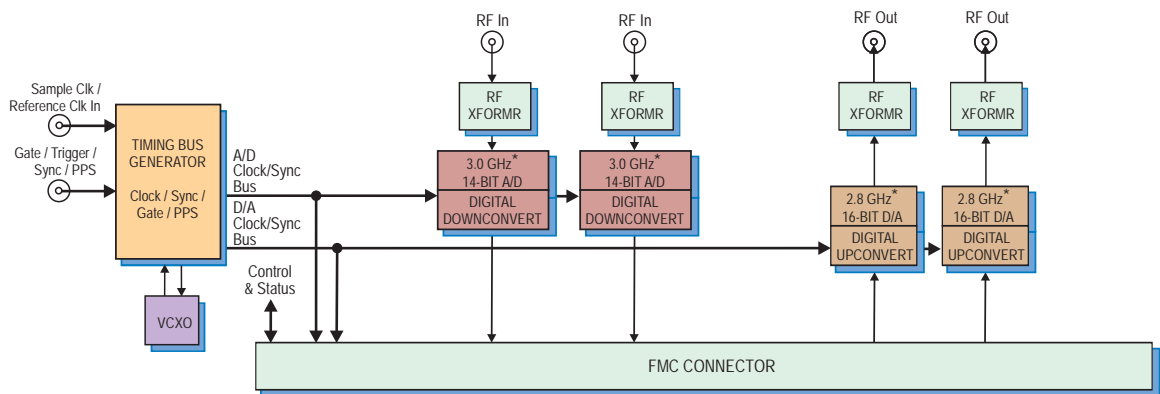

### A/D Acquisition IP Modules

With the 3320 installed on either the 5973 or the 7070 carrier, the board-set features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the two D/A waveform playback IP modules in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's job of identifying and executing on the data. ➤

\* See last page for configuration profiles

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Model 8267

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt, Onyx and Flexor VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### ► Digital Upconverter and D/A Stage

Two Texas Instruments DAC39J84 D/As accept two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide interpolation factors from 1x to 16x.

### D/A Waveform Playback IP Modules

A Texas Instruments DAC39J84 D/A accepts two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide programmable interpolation.

### Clocking and Synchronization

The 3320 architecture includes a timing bus generator, responsible for providing clocking to the data converters, FPGA and all synchronization circuits. When paired with the 5973 or the 7070, the FlexorSet's built-in functions include setup and support of the timing generator to produce the pre-defined data conversion profiles. This simplifies operation by allowing users to easily change profiles through software.

The timing bus generator has a built-in frequency synthesizer that allows the board to operate without the need for an external sample clock. If users prefer, an external clock can be accepted on a front panel coax connector. In addition, the connector can be programmed to accept a 10 MHz system reference, locking the on-board clock to the reference that enables synchronization across multiple boards.

A front panel LVTTTL Gate/Trigger/Sync connector is also included on the board. Users can program the connector's function to operate in one of three modes to match the application requirements.

### ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3320's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/320 or 7070/320 modules as documented source code. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

### FMC Interface

The Model 3320 complies with the VITA 57 High-Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3320 and the FMC carrier. ►

## ► Model 3320 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Mini-Circuits TC1-1-13M

**Full Scale Input:** +6.6 dBm into 50 ohms

**3 dB Passband:** 4.5 to 3000 MHz

### A/D Converters

**Type:** Texas Instruments ADC32RF45

**Sampling Rate and Resolution:** See table below

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Coil Craft WBC4-14L

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 1.5 MHz to 1200 MHz

### D/A Converters

**Type:** Texas Instruments DAC39J84

**Sampling Rate and Resolution:** See table below

**Sample Clock Sources:** Timing bus generator provides A/D and D/A clocks

### Timing Bus Generator

**Clock Source:** Selectable from on-board frequency synthesizer or front panel external clock

**Synchronization:** Frequency synthesizer can be locked to an external 10 MHz PLL system reference

### External Clock

**Type:** Front panel SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms

### External Trigger Input

**Type:** Front panel SSMC connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## Ordering Information

Model	Description
5973-320	2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A with Virtex-7 FPGA - 3U VPX

# FlexorSet Model 5973-320

## 2-Ch. 3.0 GHz A/D, 2-Ch. 2.8 GHz D/A wth Virtex-7 - 3U VPX

### General Information

Model 5973-320 is a member of the Flexor® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3320 FMC is factory-installed on the 5973 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the RF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

Designed to allow users to optimize data conversion rates and modes for specific application requirements, the FlexorSet provides preconfigured conversion profiles. Users can use these profiles which include: digital downconverter and digital upconverter modes, conversion resolution and A/D and D/A sample rates, or program their own profiles. In addition to supporting PCIe Gen. 3 as a native interface, the Model 5973-320 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

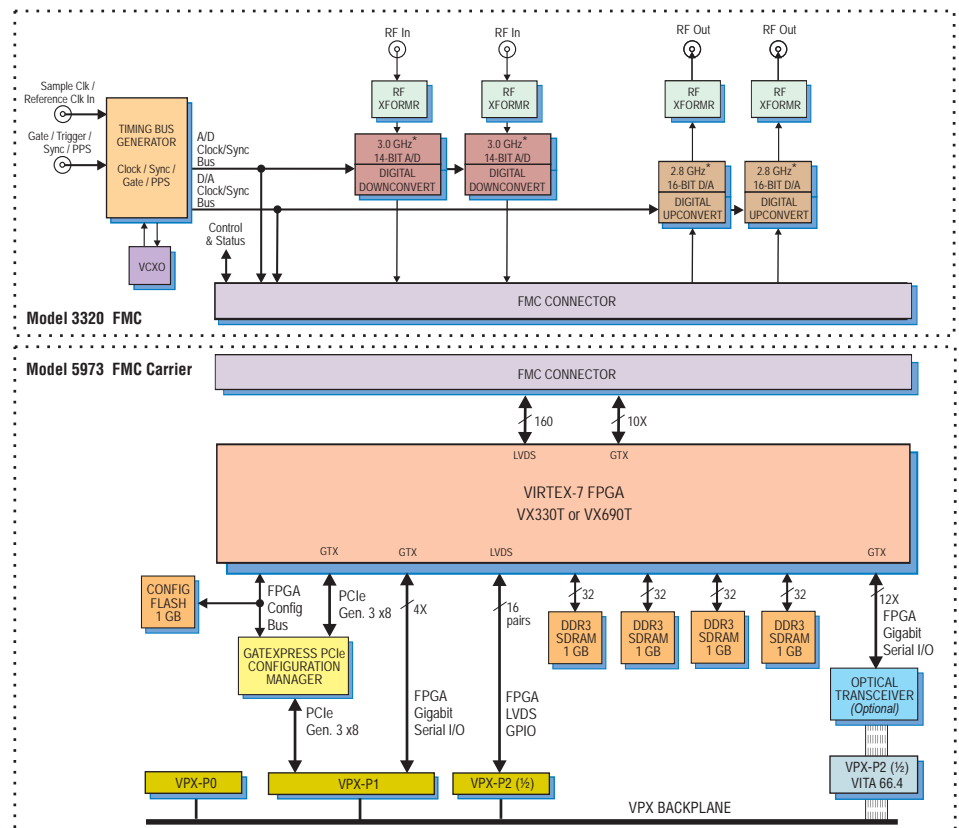

When delivered as an assembled board set, the 5973-320 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include two A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 5973-320 features two sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 3.0 GHz\* A/Ds
- Two 2.8 GHz\* D/As
- Two digital downconverters
- Two digital upconverters
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

\* See last page for configuration profiles

**A/D Acquisition IP Modules**

The 5973-320 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the two A/Ds, a test signal generator or from the two D/A Waveform Playback IP modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The 5973-320 factory-installed functions include two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily playback waveforms stored in either on-board or off-board host memory to the two D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

► In each playback module, up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-320 to operate as a turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The 5973-320 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols.

Option -104 provides 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

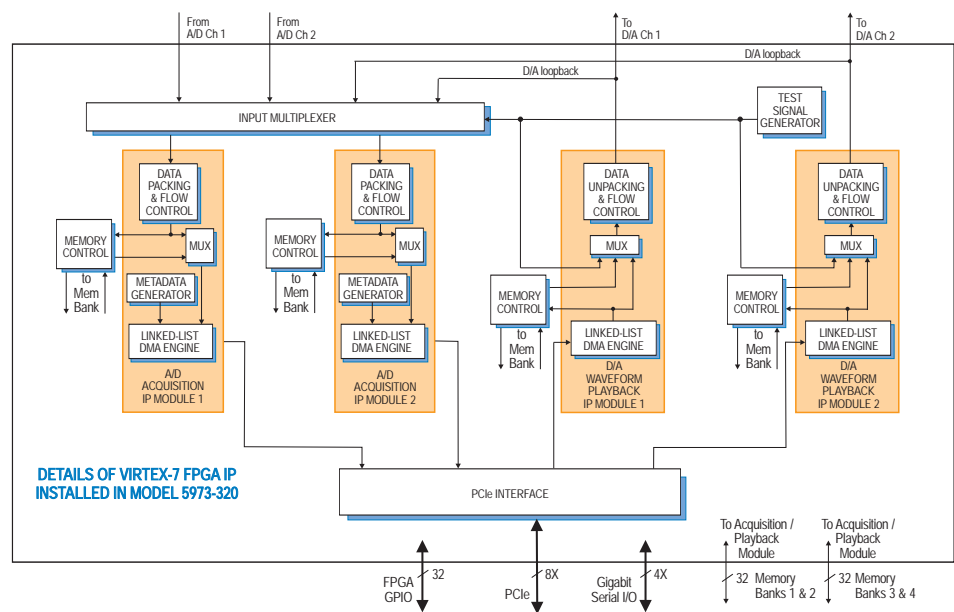

Option -110 supports the VITA-66.4 standard that provides up to 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit communications between boards independent of the PCIe interface.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command. ►

### Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### Memory Resources

The 5973-320 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's waveform playback capabilities, providing local storage for user waveforms.

### PCI Express Interface

The Model 5973-320 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### A/D Converter and Digital Downconverter Stage

The front end accepts two analog RF or IF inputs on front-panel connectors with transformer-coupling into a Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on next page for supported modes.

### Digital Upconverter and D/A Stage

A Texas Instruments DAC39J84 D/A accepts two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide programmable interpolation.

### Clocking and Synchronization

The 3320 architecture includes a timing bus generator, responsible for providing clocking to the data converters, FPGA and all synchronization circuits. When paired with the 7070, the FlexorSet's built-in functions include setup and support of the timing generator to produce the predefined data conversion profiles. This simplifies operation by allowing users to easily change profiles through software.

The timing bus generator has a built in frequency synthesizer that allows the board to operate without the need of an external sample clock. If users prefer, an external clock can be accepted on a front panel coax connector. In addition, the connector can be programmed to accept a 10 MHz system reference, locking the on-board clock to the reference that enables synchronization across multiple boards.

A front panel LVTTTL Gate/Trigger/Sync connector is also included on the board. Users can program the connector's function to operate in one of three modes to match the application requirements. ►

► **Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel SSMC connectors  
**Transformer Type:** Mini-Circuits TC1-1-13M  
**Full Scale Input:** +6.6 dBm into 50 ohms  
**3 dB Passband:** 4.5 to 3000 MHz

**A/D Converters**

**Type:** Texas Instruments ADC32RF45  
**Sampling Rate and Resolution:** See table below

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel SSMC connectors  
**Transformer Type:** Coil Craft WBC4-14L  
**Full-Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 1.5 MHz to 1200 MHz

**D/A Converters**

**Type:** Texas Instruments DAC39J84  
**Sampling Rate and Resolution:** See table below

**Sample Clock Sources:** Timing bus generator provides A/D and D/A clocks

**Timing Bus Generator**

**Clock Source:** Selectable from on-board frequency synthesizer or front panel external clock  
**Synchronization:** Frequency synthesizer can be locked to an external 10 MHz PLL system reference

**External Clock**

**Type:** Front panel SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms

**External Trigger Input**

**Type:** Front panel SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Option -076:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.  
**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O  
**Optical (Option -110):** User configurable VITA-66.4, 12X (with VX690T) or 4X (with VX330T) duplex lanes

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;  
**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# FlexorSet Model 5983-320

# 2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A with Kintex UltraScale FPGA - 3U VPX

Model 5983-320

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX baseboards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-320 FlexorSet™ combines the Model 5983 and the Model 3317 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances between them.

FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5983-320 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include two A/D acquisition IP modules for simplifying data capture and data transfer.

The 5983-320 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

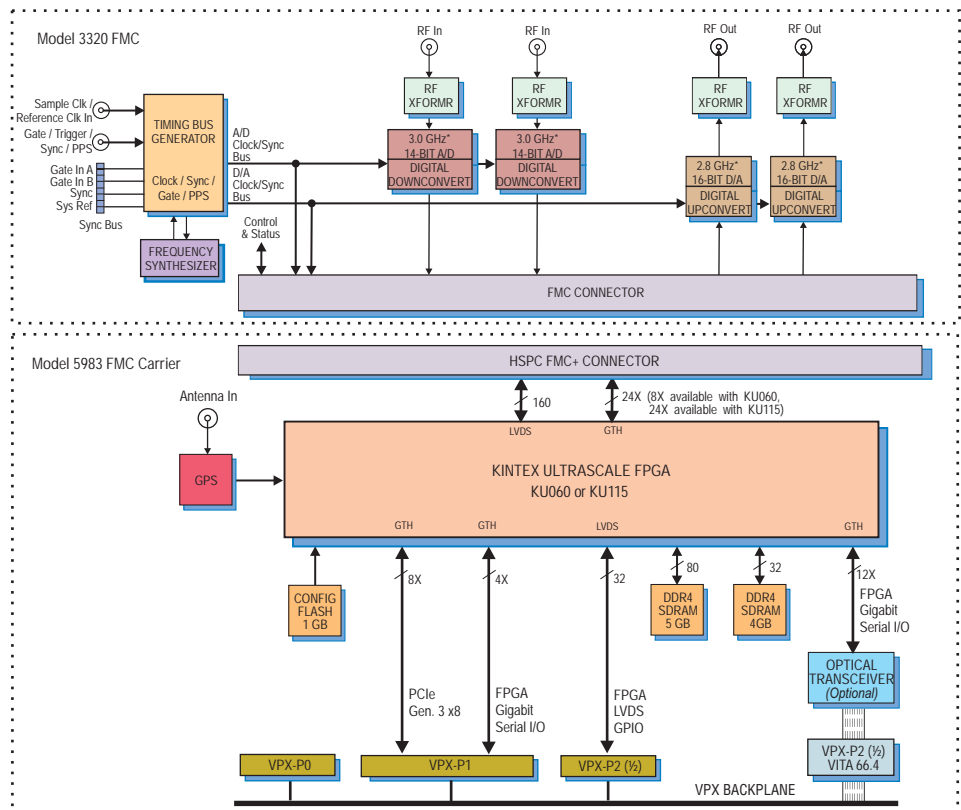

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-320 to operate as a turnkey solution without the need to develop any FPGA IP. ▶

## Features

- Supports Xilinx Kintex UltraScale FPGA
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 3.0 GHz\* A/Ds
- Two 2.8 GHz\* D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for gigabit serial interboard communication
- LVDS connections to the Kintex UltraScale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983

**A/D Acquisition IP Modules**

The 5983-320 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the two A/Ds, a test signal generator or from the two D/A Waveform Generator IP modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Generator IP Modules**

The 5983-320 factory-installed functions include two sophisticated D/A Waveform Generator IP modules. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the two D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

**► Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-320 to operate as a turnkey solution without the need to develop any FPGA IP.

**Xilinx Kintex UltraScale FPGA**

The 5983-320 can be optionally populated with one of two Kintex UltraScale FPGAs to match the specific requirements of the processing task. Supported FPGAs are KU060 or KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost KU060 can be installed.

Sixteen pairs of LVDS connections are provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols.

**Memory Resources**

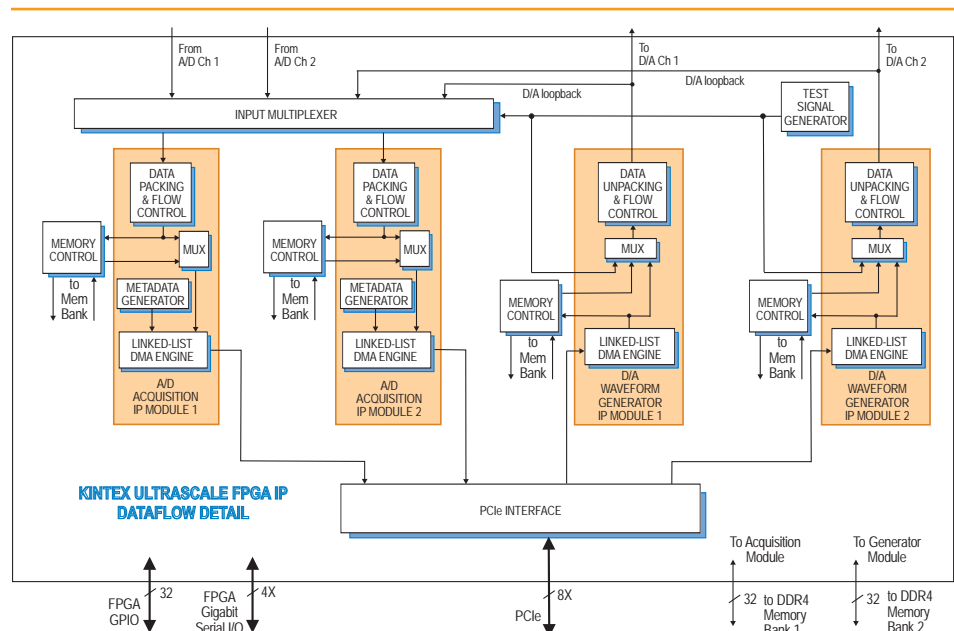

The 5983-320 architecture supports two independent DDR3 SDRAM memory banks. The banks are four and five gigabytes each and are part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 5983-320 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**A/D Converter and Digital Down-converter Stage**

The front end accepts two analog RF or IF inputs on front-panel connectors with transformer-coupling into a Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on the next page for supported modes.►

### ► GPS

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

### Digital Upconverter and D/A Stage

A Texas Instruments DAC39J84 D/A accepts two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide programmable interpolation.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Mini-Circuits TC1-1-13M

**Full Scale Input:** +6.6 dBm into 50 ohms

**3 dB Passband:** 4.5 to 3000 MHz

#### A/D Converters

**Type:** Texas Instruments ADC32RF45

**Sampling Rate and Resolution:** See the 3320 preconfigured modes table

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Coil Craft WBC4-14L

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 1.5 MHz to 1200 MHz

#### D/A Converters

**Type:** Texas Instruments DAC39J84

**Sampling Rate and Resolution:** See the 3320 preconfigured modes table

**Sample Clock Sources:** Timing bus generator provides A/D and D/A clocks

#### Timing Bus Generator

**Clock Source:** Selectable from on-board frequency synthesizer or front panel external clock

**Synchronization:** Frequency synthesizer can be locked to an external 10 MHz PLL system reference

#### External Clock

**Type:** Front panel SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms

#### External Trigger Input

**Type:** Front panel SSMC connector

**Function:** Programmable functions include: trigger, gate, sync and PPS ►

**SPARK Development Systems**

The Model 8267 is a fully-integrated development system for Pentek 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

- ▶ **Field Programmable Gate Array**  
**Standard:** Xilinx Kintex UltraScale XCKU060-2  
**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

- Serial:** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.
- Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O
- Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

- Type:** DDR4 SDRAM
- Size:** Two banks, one 4 GB and one 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

- Standard: L0 (air cooled)**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing
- Option -702: L2 (air cooled)**  
**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing
- Option -763: L3 (conduction cooled)**  
**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:**

The Model 5983-320 is compatible with the following module profile, as defined by the VITA 65 Open-VPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

**Ordering Information**

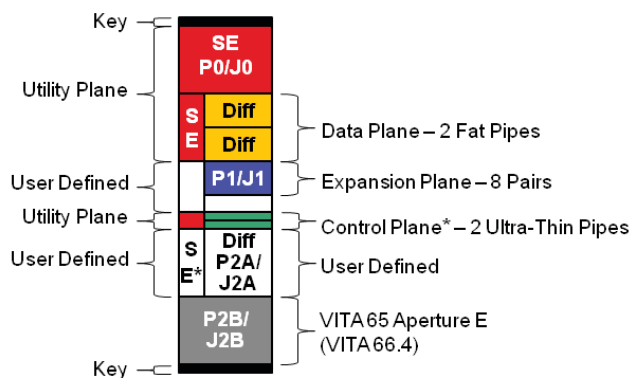

Model	Description
5983-320	2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A with Virtex-7 FPGA - 3U VPX

**Options:**

-087	XCKU115-2 FPGA
-110	VITA-66.4 12X optical interface
-180	GPS Support
-702	Air cooled, Level L2
-763	Conduction-cooled, Level L3

*Contact Pentek for availability of rugged and conduction-cooled versions*

# FlexorSet Model 7070-320

## 2-Ch. 3.0 GHz A/D, 2-Ch. 2.8 GHz D/A with Virtex-7 - x8 PCIe

Model 7070-320

### General Information

Model 7070-320 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3320 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the RF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

Designed to allow users to optimize data conversion rates and modes for specific application requirements, the FlexorSet provides preconfigured conversion profiles. Users can use these profiles which include: digital downconverter and digital upconverter modes, conversion resolution and A/D and D/A sample rates, or program their own profiles. In addition to supporting PCIe Gen. 3 as a native interface, the Model 5973-320 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

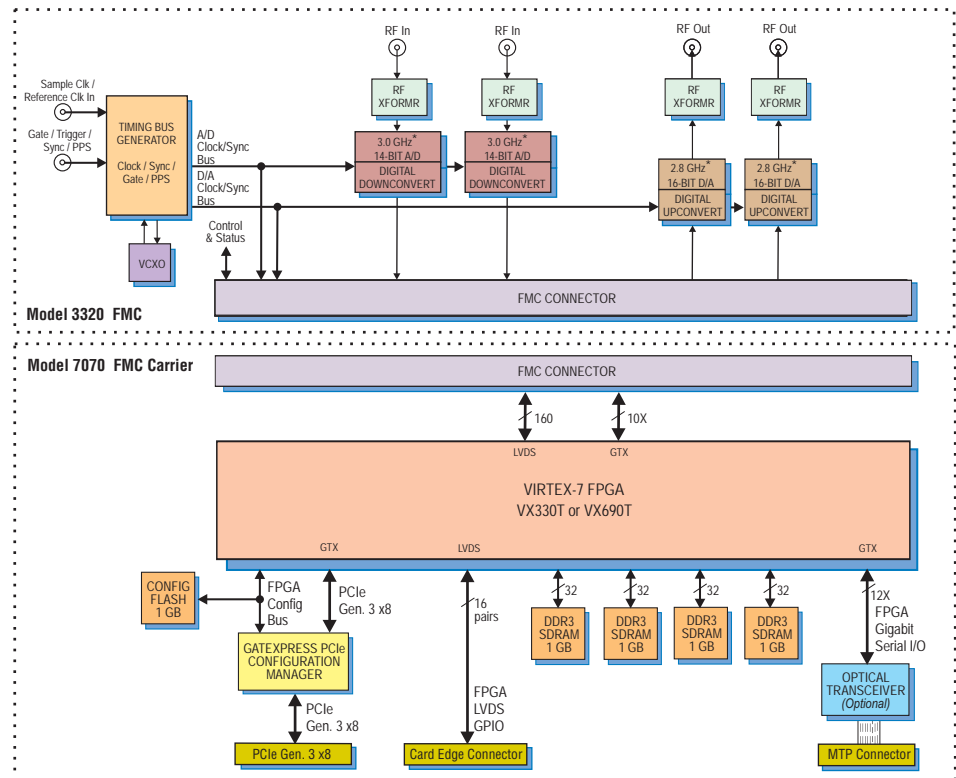

When delivered as an assembled board set, the 7070-320 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include two A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 7070-320 features two sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. ➤

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 3.0 GHz\* A/Ds
- Two 2.8 GHz\* D/As
- Two digital downconverters
- Two digital upconverters
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

\* See last page for configuration profiles

**A/D Acquisition IP Modules**

The 7070-320 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the two A/Ds, a test signal generator or from the two D/A Waveform Playback IP modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The 7070-320 factory-installed functions include two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily playback waveforms stored in either on-board or off-board host memory to the two D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

► In each playback module, up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-320 to operate as a turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The 7070-320 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O.

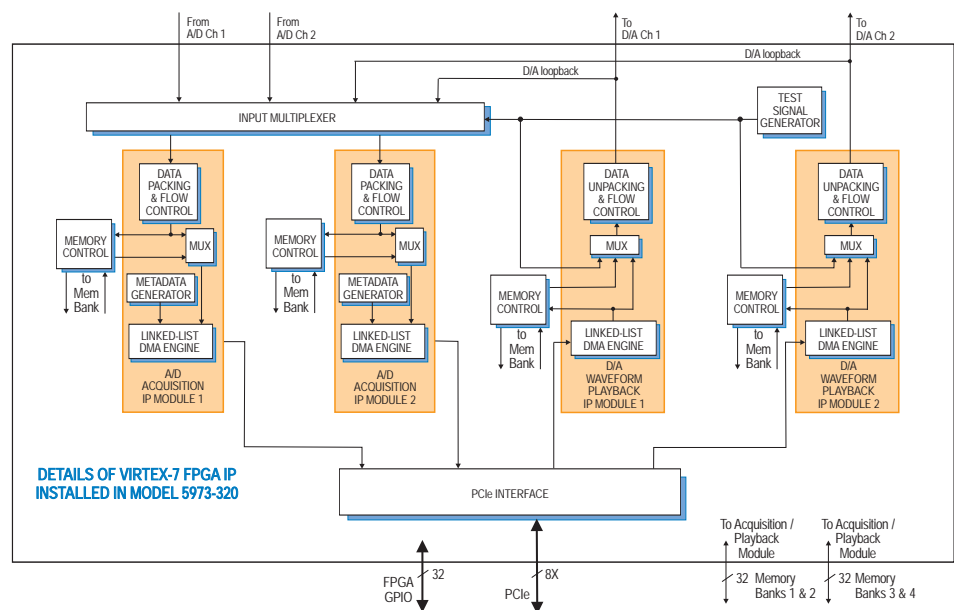

Option -110 supports the VITA-66.4 standard that provides up to 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit communications between boards independent of the PCIe interface.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command. ►

► The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### Memory Resources

The 7070-320 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's waveform playback capabilities, providing local storage for user waveforms.

### PCI Express Interface

The Model 7070-320 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### A/D Converter and Digital Downconverter Stage

The front end accepts two analog RF or IF inputs on front-panel connectors with transformer-coupling into a Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on next page for supported modes.

### Digital Upconverter and D/A Stage

A Texas Instruments DAC39J84 D/A accepts two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide programmable interpolation.

### Clocking and Synchronization

The 3320 architecture includes a timing bus generator, responsible for providing clocking to the data converters, FPGA and all synchronization circuits. When paired with the 7070, the FlexorSet's built-in functions include setup and support of the timing generator to produce the predefined data conversion profiles. This simplifies operation by allowing users to easily change profiles through software.

The timing bus generator has a built in frequency synthesizer that allows the board to operate without the need of an external sample clock. If users prefer, an external clock can be accepted on a front panel coax connector. In addition, the connector can be programmed to accept a 10 MHz system reference, locking the on-board clock to the reference that enables synchronization across multiple boards.

A front panel LVTTTL Gate/Trigger/Sync connector is also included on the board. Users can program the connector's function to operate in one of three modes to match the application requirements. ►

**► Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Mini-Circuits TC1-1-13M

**Full Scale Input:** +6.6 dBm into 50 ohms

**3 dB Passband:** 4.5 to 3000 MHz

**A/D Converters**

**Type:** Texas Instruments ADC32RF45

**Sampling Rate and Resolution:** See table below

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel SSMC connectors

**Transformer Type:** Coil Craft WBC4-14L

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 1.5 MHz to 1200 MHz

**D/A Converters**

**Type:** Texas Instruments DAC39J84

**Sampling Rate and Resolution:** See table below

**Sample Clock Sources:** Timing bus generator provides A/D and D/A clocks

**Timing Bus Generator**

**Clock Source:** Selectable from on-board frequency synthesizer or front panel external clock

**Synchronization:** Frequency synthesizer can be locked to an external 10 MHz PLL system reference

**External Clock**

**Type:** Front panel SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms

**External Trigger Input**

**Type:** Front panel SSMC connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

**Custom FPGA I/O**

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O

**Optical (Option -110):** User configurable VITA-66.4, 12X (with VX690T) or 4X (with VX330T) duplex lanes

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

**Model Description**  
7070-320 2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A with Virtex-7 FPGA - x8 PCIe

**Options:**

-076 XC7VX690T-2 FPGA  
-104 LVDS FPGA I/O to card-edge connector  
-110 VITA-66.4 12X (with VX690T), 4X (with VX330T) optical interface

## Model 3324

## 4-Ch. 500 MHz 16-bit A/D, 4-Ch. 2 GHz 16-bit D/A-FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-324](#)
  - [FlexorSet Model 7070-324](#)
- Four 500 MHz, 16-bit A/Ds
- Four digital upconverters
- Four 2 GHz, 16-bit D/As (500 MHz input data rate, 2 GHz output sample rate with interpolation)
- On-board timing bus generator with multiboard synchronization
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U OpenVPX or Model 7070 PCIe Virtex-7 FMC carrier
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor™ Model 3324 is a multichannel, high-speed data converter FMC. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 500 MHz, 16-bit A/Ds, four 2 GHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channelcount systems.

The 3324 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-324 3U VPX or the FlexorSet 7070-324 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into four 500 MHz, 16-bit A/D converters.

### Performance of the Model 3324

The true performance of the 3324 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a D/A waveform playback IP module.

### A/D Acquisition IP Modules

With the 3324 installed on either the 5973 or the 7070 carrier, the board-set features four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the four A/Ds,

a test signal generator or from the D/A waveform playback IP module in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

With the 5973 or the 7070, the 3324 features four sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back via the D/As waveforms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming. ▶

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Model 8267

The Model 8267 is a VPX development system for Pentek Cobalt, Onyx and Flexor VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Digital Upconverters and D/As

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 1.5 GHz. In both modes the D/As provide interpolation factors of 2x, 4x, 8x and 16x.

## Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple modules to be synchronized and create larger multiboard systems.

## ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3324's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/3324 or 7070/3324 modules as documented

source code. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

## FMC Interface

The Model 3324 complies with the VITA 57 High-Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3324 and the FMC carrier.

## Model 3324 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC1-1TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 250 kHz to 750 MHz

### A/D Converters

**Type:** Texas Instruments ADS54J60

**Sampling Rate:** up to 500 MHz

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### D/A Converters

**Type:** Texas Instruments DAC38J84

**Input Data Rate:** Up to 500 MHz

**Output Sample Rate:** Up to 2 GHz (with interpolation)

**Resolution:** 16 bits

**Sample Clock Source:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front-panel external clock

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D and D/A clocks

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-pin-count FMC

New!

# FlexorSet Model 5973-324

Model 5973-324

## Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 500 MHz 16-bit A/Ds
- Four digital upconverters
- Four 2 GHz 16-bit D/As (500 MHz input sample rate, 2 GHz output sample rate with interpolation)
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## 4-Ch. 500 MHz 16-bit A/D, 4-Ch. 2 GHz 16-bit D/A - 3U VPX

### General Information

Model 5973-324 is a member of the Flexor® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3324 FMC is factory-installed on the 5973 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four 500 MHz, 16-bit A/Ds, four digital upconverters, four 2 GHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 5973-324 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 5973 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier

board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

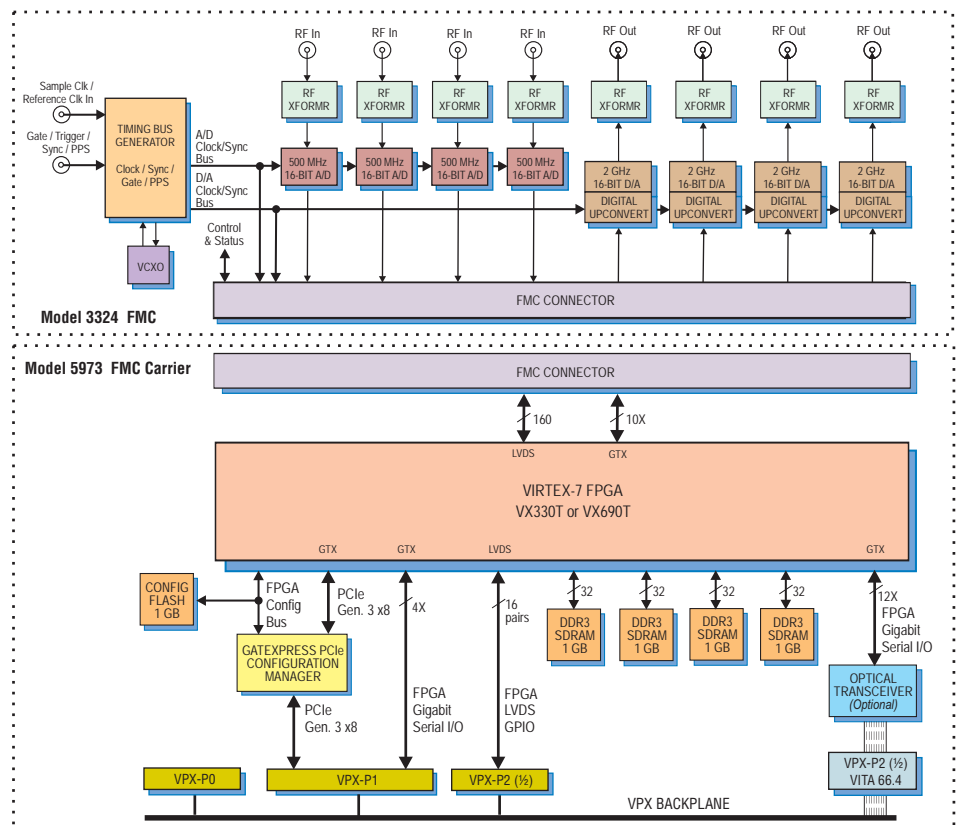

When delivered as an assembled board set, the 5973-324 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 5973-324 features four sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

In each playback module, up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5973-324 to operate as a turnkey solution without the need to develop any FPGA IP. ▶

**A/D Acquisition IP Modules**

The 5973-324 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the four D/A Waveform Playback IP modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The 5973-324 factory-installed functions include four sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back waveforms stored in either on-board or off-board host memory to the four D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

**► Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The 5973-324 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

A 4X connection between the FPGA and the VPX P1 connector supports gigabit serial protocols.

Option -104 provides 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -110 supports the VITA-66.4 standard that provides 12 optical duplex lanes to the backplane. With the installation of a serial protocol, the VITA-66.4 interface enables gigabit communications between boards independent of the PCIe interface.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe

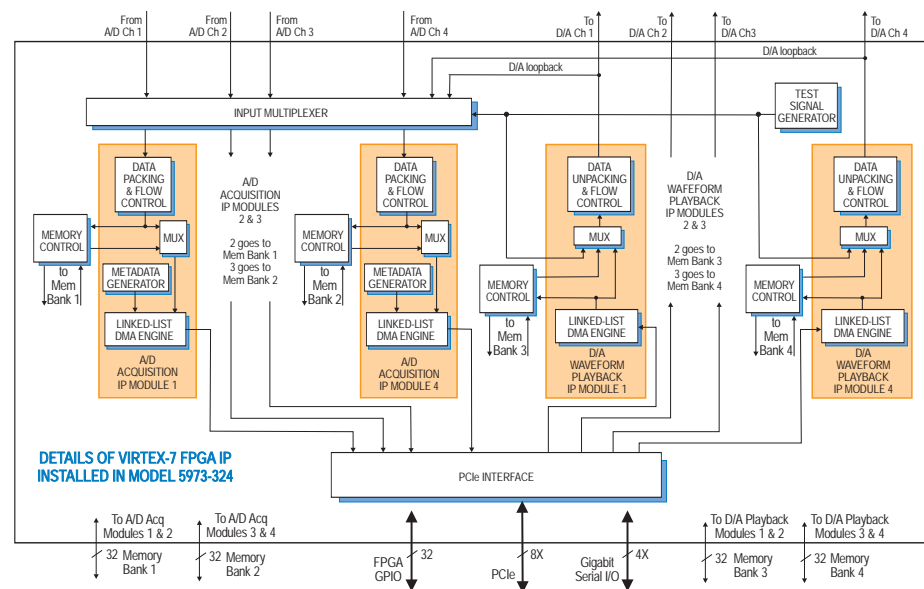

configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT. ►

### PCI Express Interface

The Model 5973-324 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 5973-324 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
5973-324	4-Channel 500 MHz 16-bit A/D, 4-Channel 2 GHz 16-bit D/A with Virtex-7 FPGA - 3U VPX

#### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-110	VITA-66.4 12X optical interface

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

► In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into 500 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2 GHz. In both modes the D/As provide interpolation factors of 2x, 4x, 8x and 16x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors  
**Transformer Type:** Coil Craft WBC1-1TLB

**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 750 MHz

#### A/D Converters

**Type:** Texas Instruments ADS54J60  
**Sampling Rate:** Up to 500 MHz  
**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full-Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converters

**Type:** Texas Instruments DAC38J84  
**Input Data Rate:** Up to 500 MHz  
**Output Sample Rate:** Up to 2 GHz (with interpolation)  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D and D/A clocks

#### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;  
**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# FlexorSet Model 5983-324

# 4-Channel 500 MHz 16-bit A/D, 4-Channel 2 GHz 16-bit D/A Kintex UltraScale FPGA - 3U VPX

Model 5983-324

## Features

- Supports Xilinx Kintex UltraScale FPGA
- Four 500 MHz 16-bit A/Ds
- Four digital upconverters
- Four 2 GHz 16-bit D/As (500 MHz input sample rate, 2 GHz output sample rate with interpolation)
- 4 and 5 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- User-configurable gigabit serial interface
- Optional optical Interface for gigabit interboard communication
- LVDS connections to the Kintex Ultrascale FPGA for custom I/O and synchronization
- Compatible with several VITA standards including: VITA-46, VITA-48, VITA-66.4 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 5983 is a member of the JadeFX™ family of high-performance 3U VPX baseboards with a Xilinx Kintex UltraScale FPGA and an available FMC I/O slot.

As an integrated solution, the Model 5983-324 FlexorSet™ combines the Model 5983 and the Model 3324 Flexor® FMC as a factory-installed set. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter with programmable DDCs (Digital Downconverters) and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

In addition to the Gen. 3 x8 PCIe interface, the 5983 architecture includes an optional built-in gigabit serial optical interface. Up to 12 high-speed duplex optical lanes are available on a VITA-66.4 connector. With the installation of a serial protocol in the FPGA, this interface enables a high-bandwidth connection between 5983s mounted in the same chassis or even over extended distances.

FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 5983-324 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include two A/D acquisition IP modules for simplifying data capture and data transfer.

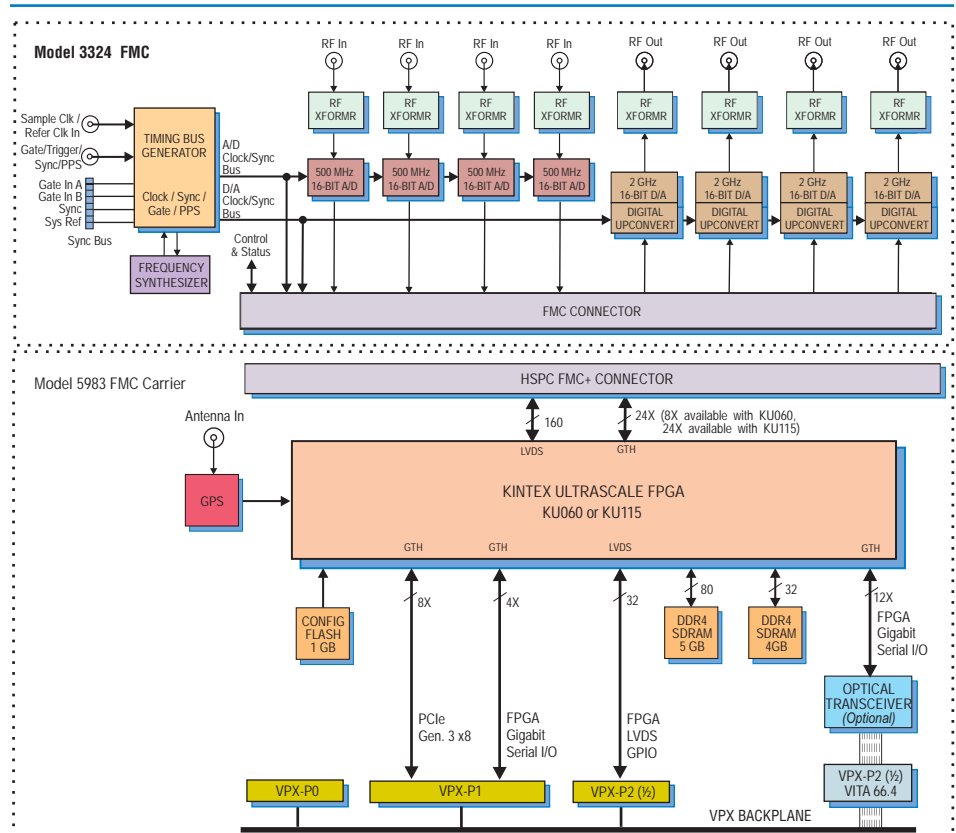

The 5983-324 features a sophisticated D/A waveform generator IP module. A linked-list controller allows users to easily record to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-324 to operate as a turnkey solution without the need to develop any FPGA IP. ▶

## The Flexor Architecture

Based on the proven design of the Pentek Jade family of Kintex products, the 5983

**A/D Acquisition IP Modules**

The 5983-324 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the four D/A Waveform Recorder IP modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Recorder IP Modules**

The 5983-324 factory-installed functions include four sophisticated D/A Waveform Recorder IP modules. A linked-list controller allows users to easily record waveforms stored in either on-board or off-board host memory to the four D/As.

Parameters including length of waveform, delay from trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

**► Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 5983-324 to operate as a turnkey solution without the need to develop any FPGA IP.

**Xilinx Kintex UltraScale FPGA**

The 5983-324 can be optionally populated with one of two Kintex UltraScale FPGAs to match the specific requirements of the processing task. Supported FPGAs are KU060 or KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost KU060 can be installed.

Sixteen pairs of LVDS connections are provided between the FPGA and the VPX P2 connector for custom I/O. For applications requiring custom gigabit links, a 4X connection is supported between the FPGA and the VPX P1 connector to support serial protocols.

**Memory Resources**

The 5983-324 architecture supports two independent DDR3 SDRAM memory banks. The banks are four and five gigabytes each and are part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 5983-324 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

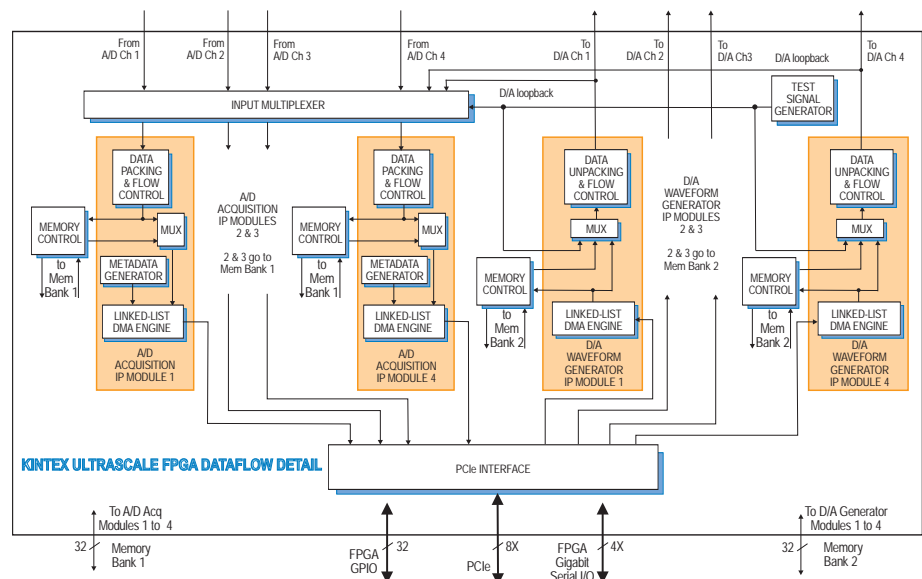

**A/D Converter and Downconverter**

The front end accepts four analog RF or IF inputs on front-panel connectors with transformer-coupling into Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on the last page for supported modes.

**Digital Upconverter and D/A**

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. ►

### ► GPS

An optional GPS receiver provides time and position information to the FPGA. This information can be used for precise data tagging.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector.

This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front-panel coaxial connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC1-1TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 750 MHz

#### A/D Converters

**Type:** Texas Instruments ADS54J60

**Sampling Rate:** Up to 500 MHz

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converters

**Type:** Texas Instruments DAC38J84

**Input Data Rate:** Up to 500 MHz

**Output Sample Rate:** Up to 2 GHz (with interpolation)

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D and D/A clocks ►

**SPARK Development Systems**

The Model 8267 is a fully-integrated development system for Pentek 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► **External Clock**

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**External Trigger Input**

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU060-2

**Optional:** Xilinx Kintex UltraScale XCKU115-2

**Custom FPGA I/O**

**Serial:** 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Parallel:** 16 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Optical (Option -110):** VITA-66.4, 12X duplex lanes

**Memory**

**Type:** DDR4 SDRAM

**Size:** Two banks, one 4 GB and one 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -763: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**OpenVPX Compatibility:** The Model 5983-324 is compatible with the following module profile, as defined by the VITA 65 Open-VPX Specification:

SLT3-PAY-2F1F2U1E-14.6.6-1

# FlexorSet Model 7070-324

## 4-Ch. 500 MHz 16-bit A/D, 4-Ch. 2 GHz 16-bit D/A - x8 PCIe

Model 7070-324

### General Information

Model 7070-324 is a member of the Flexor® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA.

As a FlexorSet™ integrated solution, the Model 3324 FMC is factory-installed on the 7070 FMC carrier. The required FPGA IP is installed and the board set is delivered ready for immediate use.

The delivered FlexorSet is a multichannel, high-speed data converter and is suitable for connection to the HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four 500 MHz, 16-bit A/Ds, four digital upconverters, four 2 GHz, 16-bit D/As, and four banks of memory. In addition to supporting PCIe Gen. 3 as a native interface, the Model 7070-324 includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### The Flexor Architecture

Based on the proven design of the Pentek Onyx family of Virtex-7 products, the 7070 FMC carrier retains all the key features of that family. As a central foundation of the board architecture, the FPGA has access to all data and control paths of both the carrier board and the FMC module, enabling factory-installed functions that include data

multiplexing, channel selection, data packing, gating, triggering and memory control.

When delivered as an assembled board set, the 7070-324 includes factory-installed applications ideally matched to the board's analog interfaces. The functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains IP modules for DDR3 SDRAM memories.

The 7070-324 features four sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory. Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

In each playback module, up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

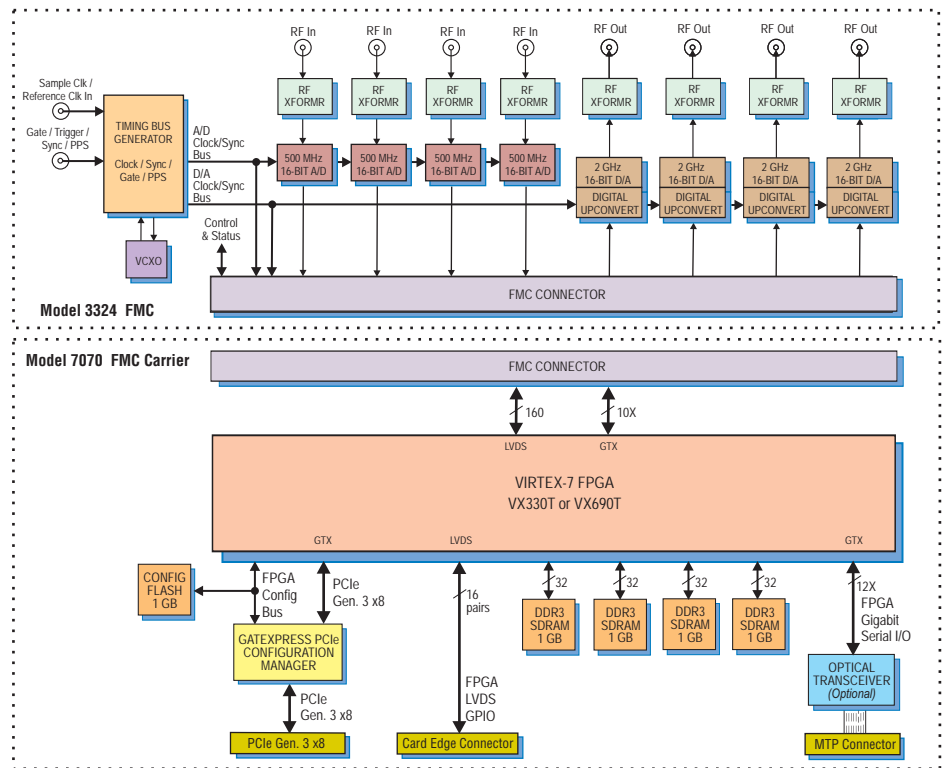

A controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 7070-324 to operate as a turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their custom ▶

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 500 MHz 16-bit A/Ds
- Four digital upconverters
- Four 2 GHz 16-bit D/As (500 MHz input data rate, 2 GHz output sample rate with interpolation)
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional optical interface for gigabit serial interboard communication
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 7070-324 features four A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from any of the four A/Ds, a test signal generator or from the D/A Waveform Playback IP Modules in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

The 7070-324 factory-installed functions include four sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily playback waveforms stored in either on-board or off-board host memory to the four D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming.

► IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The 7070-324 can be optionally populated with one of two Virtex-7 FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O.

Option -110: For applications requiring optical gigabit links, up to 12 high-speed, full-duplex FPGA GTX lanes driven via an optical transceiver support serial protocols. A 12-lane MTP optical connector is presented on the PCIe slot panel.

**GateXpress for FPGA Configuration**

The Flexor architecture includes GateXpress®, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power-up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is

especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on many systems.

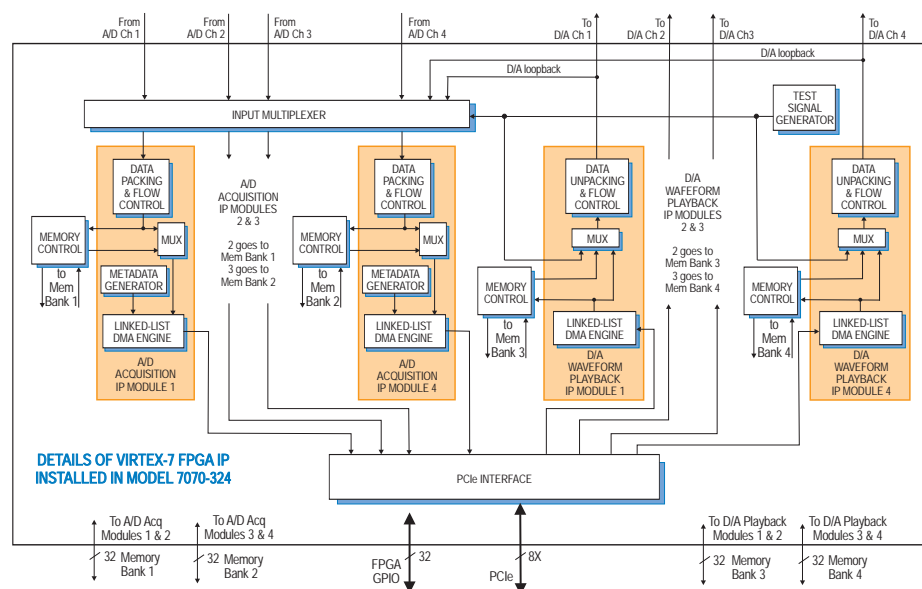

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power-up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first option to load is an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in non-volatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space ►

### PCI Express Interface

The Model 7070-324 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 7070-324 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
7070-324	4-Channel 500 MHz 16-bit A/D, 4-Channel 2 GHz 16-bit D/A with Virtex-7 FPGA - x8 PCIe

#### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to card-edge connector
-110	12x gigabit serial optical I/O with XC7VX690T FPGA, 4x w. XC7VX330T

Model	Description
8266	PC Development System See 8266 Datasheet for Options

▶ allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into 500 MHz, 16-bit A/D converters.

### Digital Upconverter and D/A Stage

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2 GHz. In both modes the D/As provide interpolation factors of 2x, 4x, 8x and 16x.

### Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO. In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal to synchronize multiple modules.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors  
**Transformer Type:** Coil Craft WBC1-1TLB  
**Full-Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 750 MHz

#### A/D Converters

**Type:** Texas Instruments ADS54J60  
**Sampling Rate:** Up to 500 MHz  
**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converters

**Type:** Texas Instruments DAC38J84

**Input Data Rate:** Up to 500 MHz

**Output Sample Rate:** Up to 2 GHz (with interpolation)

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an

A/D clock and a D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8 or 16 for the A/D and D/A clocks

#### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

#### External Trigger Input

**Type:** Front panel connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Option -076:** Xilinx Virtex-7 XC7VX690T-2

#### Custom FPGA I/O

**Parallel (Option -104):** 16 pairs of LVDS connections between the FPGA and a card-edge connector for custom I/O

**Optical (Option -110):** 12x gigabit serial optical I/O with XC7VX690T FPGA, 4x with XC7VX330T

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## Features

- 4U 19-inch rackmount PC server chassis, 21-inch deep
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box test examples

## Ordering Information

Model	Description
8266	PC Development System for PCIe Cobalt, Onyx and Flexor Boards

### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS

The addition of third-party PCIe cards may affect system performance. Please consult with us before doing so.

## General Information

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt®, Onyx® and Flexor™ PCI Express software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8266 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

## ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8266. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

## System Implementation

Built on a professional 4U rackmount workstation, the 8266 is equipped with the latest Intel processor, DDR3 SDRAM and a high-performance motherboard. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces.

The 8266 can be configured with 64-bit Windows or Linux operating systems.

The 8266 uses a 19" 4U rackmount chassis that is 21" deep. Enhanced forced-air ventilation assures adequate cooling for Pentek Cobalt, Onyx and Flexor boards.

The chassis is designed to draw cool air from the front and push warm air out the back. A 1000 W, 80+ Gold Power Supply guarantees more than enough power for additional boards.

## Configuration

Pentek uses a variety of motherboards to provide the flexibility for operation and cooling of each system. Up to four Pentek Cobalt, Onyx or Flexor boards in the 8266 can be supported. Please contact Pentek to configure a system that requires additional PCIe slots for 3rd party hardware.

## Options

Available options include high-end multi-core CPUs and choice of Windows or Linux.

## Specifications

**Operating System:** 64-bit Windows 7 Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB standard

**Dimensions:** 4U Chassis, 19" W x 21" D x 7" H

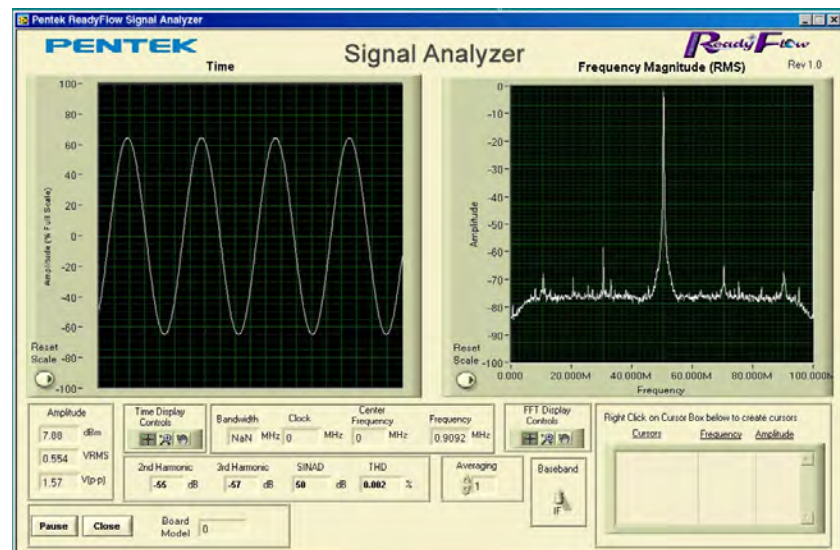

**Weight:** 35 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

# Model 8267

# 3U VPX Development System for Cobalt, Onyx and Flexor Boards

### Features

- 9-slot, 4U 19-inch rackmount, 12-inch deep chassis which houses 3U VPX boards
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box ready-to-run examples

### Ordering Information

Model	Description
8267	3U VPX Development System for Cobalt, Onyx and Flexor Boards

#### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS
-101	Upgrade to 16 GB DDR3 SDRAM

The addition of third-party VPX boards may affect system performance. Please consult with us before doing so.

### General Information

The Model 8267 is a fully-integrated, 3U VPX development system for Pentek Cobalt®, Onyx® and Flexor™ software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8267 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

### ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8267. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

### System Implementation

Built on a professional 4U rackmount workstation, the 8267 is equipped with the latest Intel i7 processor, DDR3 SDRAM and a high-performance single-board computer. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces. The 8267 can be configured with 64-bit Windows or Linux operating systems.

The 8267 uses a 19" 4U rackmount chassis that is 12" deep. Nine VPX slots provide ample space for an SBC, a switch card and multiple Pentek boards. Enhanced forced-air ventilation assures adequate cooling for all boards and dual 250-W power supplies guarantee more than adequate power for all installed boards. Mounting provisions for two 3.5 in. drives with front-accessible trays allow for easy removable storage. Front-panel access to USB, display, Ethernet and RS-232 ports simplifies development; an optional rear transition module supplements the front-panel connections with SATA, audio, a second video interface, and additional USB ports.

### Configuration

All 8267 systems come with software and hardware installed and tested. Up to seven Pentek boards in the 8267 can be supported. Please contact Pentek to configure a system that matches your specific requirements.

### Options

Available options include high-end multi-core CPUs and extended memory support.

### Specifications

**Operating System:** 64-bit Windows 7

## Reference Design for the Xilinx VC707 Evaluation Kit

### Features

- Supports the Xilinx Virtex-7 FPGA
- Complete development environment with Pentek's reference design
- Supports the Pentek Model 3312 FMC I/O Module

Pentek offers the option -990 reference design with software and IP support for the Pentek Model 3312 when installed on the Xilinx VC707 Evaluation Kit board.

The Virtex®-7 FPGA VC707 Evaluation Kit is a PCIe platform using the Virtex-7 XC7VX485T-2FFG1761C. It includes basic components of hardware, design tools, IP, and preverified reference designs.

When coupled with Pentek's option -990 reference design for the 3312, the user has a complete development environment for custom applications. The industry-standard FPGA Mezzanine Connectors (FMC) are directly compatible with the 3312.

*The Xilinx Virtex® -7 FPGA VC707 Evaluation Kit gives designers an easy starting point for evaluating and leveraging devices that deliver breakthrough performance, capacity, and power efficiency. Out of the box, this platform speeds time to market for the full-range of Virtex-7 FPGA-based applications including advanced systems for wired and wireless communications, aerospace and defense. The highly flexible kit combines fully integrated hardware, software, and IP with preverified reference designs that maximize productivity and let designers immediately focus on their unique project requirements.*

*The Flexor® Model 3312 is a multichannel, high-speed data converter FMC module. It includes four 250 MHz, 16-bit A/Ds, two 800 MHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channel-count systems.*

# Customer Information

## Placing an Order

When placing a purchase order for Pentek products, please provide the model number and product description. You may place your orders by letter, telephone, email or fax; you should confirm a verbal order by mail, email or fax.

All orders should specify a purchase order number, bill-to and ship-to address, method of shipment, and a contact name and telephone number.

U.S. orders should be made out to Pentek, Inc. and may be placed directly at our office address, or c/o our authorized sales representative in your area.

International orders may be placed with us, or with our authorized distributor in your country. They have pricing and availability information and they will be pleased to assist you.

## Prices and Price Quotations

All prices are F.O.B. factory in U.S. dollars. Shipping charges and applicable import, federal, state or local taxes, are paid by the purchaser.

We're glad to respond to your request for price quotation just contact the corporate office, or your local representative. Price and delivery quotations are valid for 30 days, unless otherwise stated.

Quantity discounts for large orders are available and will be included in our price quotation, if applicable.

## Terms

Terms are Net 30 days for accounts with established credit; until credit is established, we require prepayment, or will ship C.O.D.

## Shipping

For new orders, we normally ship UPS ground with shipping charges prepaid and added to our invoice. If you are in a hurry, we will ship UPS Red, UPS Blue, FedEx, or the carrier of your choice, as you request.

## Order Cancellation and Returns

All orders placed with Pentek are considered binding and are subject to cancellation charges. Hardware products may be returned within 30 days after receipt, subject to a restocking charge. Before returning a product, please call Customer Service to obtain a Return Material Authorization (RMA) number. Software purchases are final and we cannot allow returns.

## Warranty

Pentek warrants its products to conform to published specifications and to be free from defects in materials and workmanship for a period of one year from the date of delivery, when used under normal operating conditions and within the service conditions for which they were furnished.

The obligation of Pentek arising from a warranty claim shall be limited to repairing or, optionally, replacing without charge any product which proves to be defective within the term and scope of the warranty.

Pentek must be notified of the defect or nonconformity within the warranty period. The affected product must be returned with shipping charges and insurance prepaid. Pentek will pay shipping charges for the return of product to buyer, except for products returned from outside the USA.

## Limitations of Warranty

This warranty does not apply to products which have been repaired or altered by anyone other than Pentek or its authorized representatives.

The warranty does not extend to products that have been damaged by misuse, neglect, improper installation, unauthorized modification, or extreme environmental conditions, that fall outside of the scope of the product's environmental specifications.

Due to the normal, finite write-cycle limits of Solid State Drives (SSDs), Pentek shall not be liable for warranty coverage of SSDs caused by wear-related issues that arise as an SSD reaches its write-cycle limit.

Pentek specifically disclaims merchantability or fitness for a particular purpose. Pentek shall not be held liable for incidental or consequential damages arising from the sale, use, or installation of any Pentek product. Regardless of circumstances, Pentek's liability under this warranty shall not exceed the purchase price of the product.

## Extended Warranty

You may purchase an extended warranty on our board-level products for a fee of 1% of the list price per month of coverage, or 10% of the list price per year of coverage.

All Pentek software products (excluding 3rd-party products) include free maintenance and free upgrades for one year. Extended software maintenance is available for one, two, and three years, starting after the first year.

## Service and Repair

You must obtain a Return Material Authorization (RMA) before returning any product to Pentek for service or repair. RMA requests must be submitted online at:

[Return Material Authorization Form](#)

After the form is completed in its entirety and submitted, Pentek shall email you a receipt and start processing your request. Once your request has been approved, Pentek shall e-mail you an RMA number, shipping instructions, and a quotation if the product is out of warranty.

Carefully package the product in its original packaging, if it is still available, and ship it to Pentek prepaid (if within the US) or free domicile DDP (if outside the US). Pentek shall not be responsible for loss or damage in shipment to Pentek, so you are strongly encouraged to insure the shipment for its full replacement value.

When the work is completed, we will return the product to you along with a statement of work performed.

Customer Service phone: 201-818-5900 • fax: 201-818-5697  
• email: [custsrv@pentek.com](mailto:custsrv@pentek.com)

[Customer Information](#)

Last updated: April 2018

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x8

**General Information**

Model 71663 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 71663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

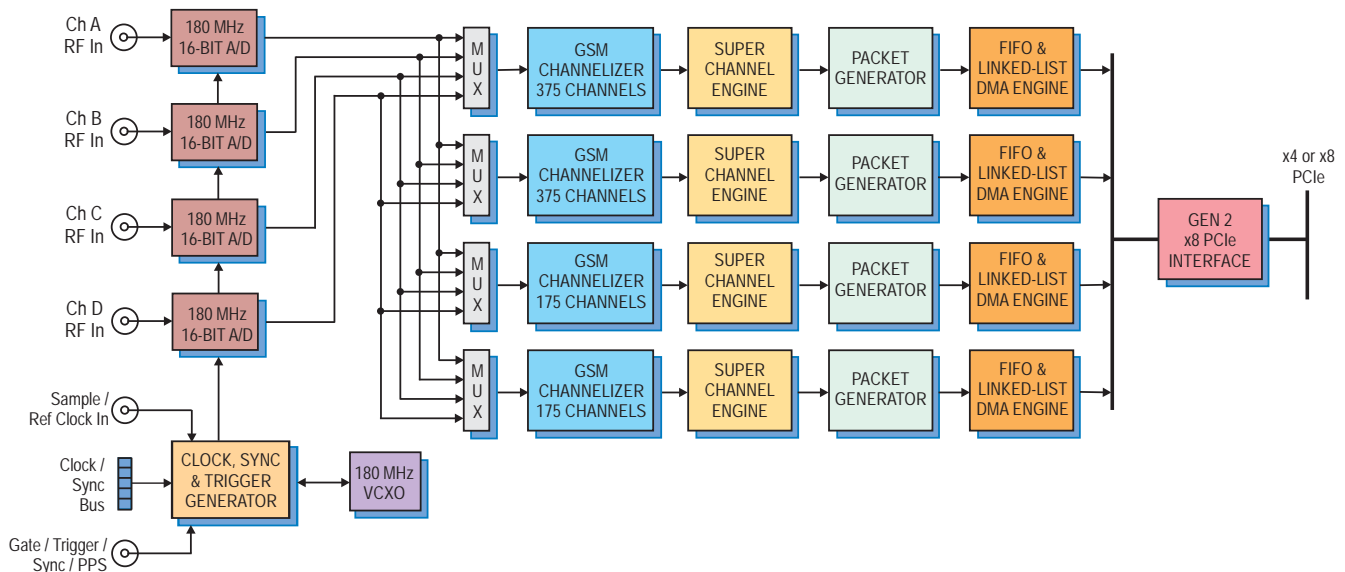

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**GSM Channelizer Cores**

The 71663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 71663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 71663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 71663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 71663 and host. ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**► Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**GSM Channel Banks**

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

**DDC Channels**

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

**DDC Channel Filter Characteristics**

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz \* 13 / 2160 = 1.0833333 MS/sec

**DDC Data Output Format:**

24 bits I + 24 bits Q

**Superchannels**

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

**Frequency Offsets for each DDC:**

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

**Superchannel Output Format:**

26 bits I + 26 bits Q

**Number of Superchannels per Bank:**

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6VSX315T

**PCI Express Interface**

**PCI Express Bus:** Gen. 2 x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Ordering Information**

Model	Description
71663	1100-Channel GSM Channelizer with Quad A/D - XMC

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x8

**General Information**

Model 78663 is a member of the Cobalt® family of high-performance PCIe boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 78663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

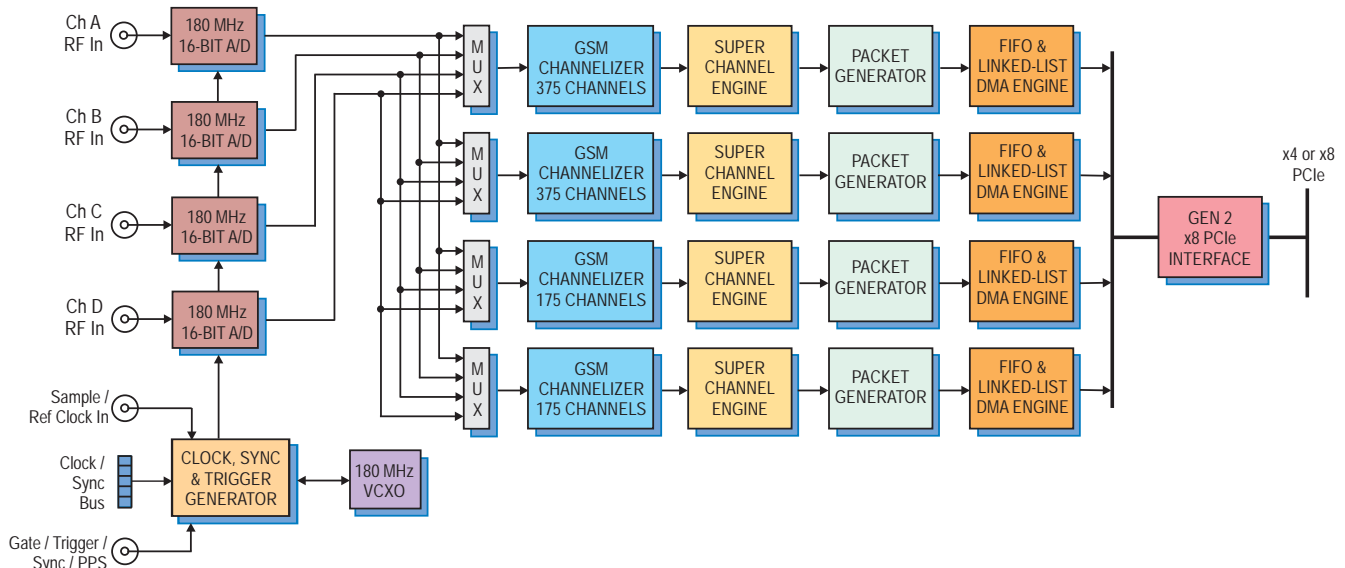

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**GSM Channelizer Cores**

The 78663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 78663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 78663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely 180 MHz\*13/2160, or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 52663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

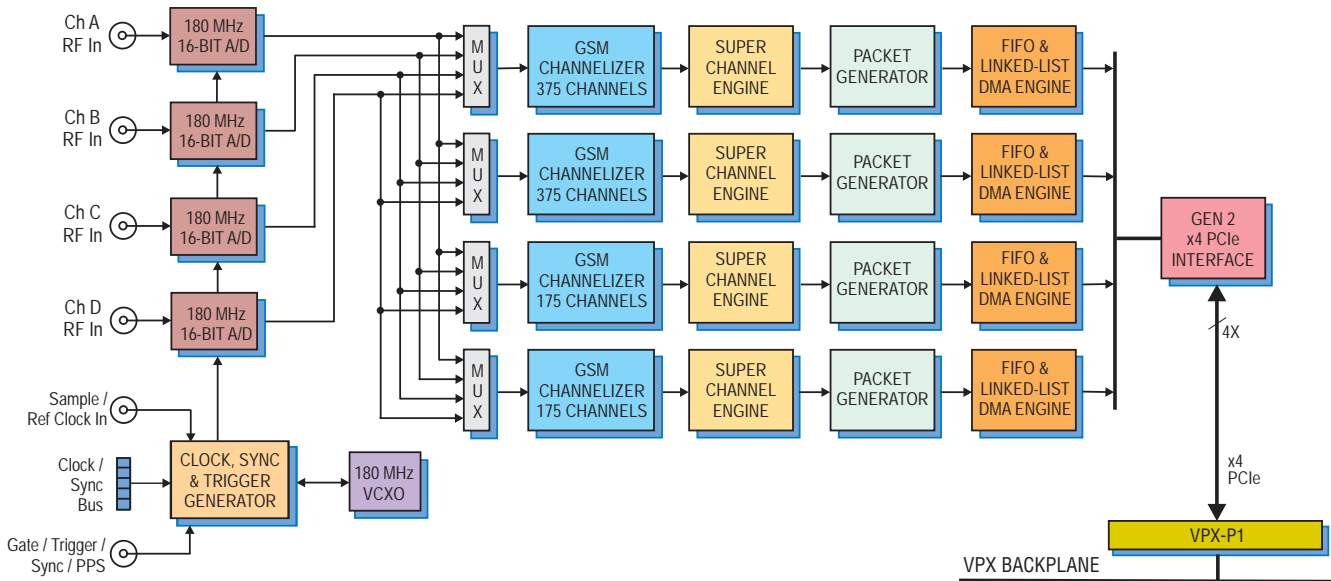

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**GSM Channelizer Cores**

The 52663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 52663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 52663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 2 GB/sec peak rate of PCIe Gen 2 x4 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is slightly above the capability of the PCIe Gen 2 x4 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 52663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x4, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 52663 and host. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### GSM Channel Banks

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

#### DDC Channels

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

#### DDC Channel Filter Characteristics:

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to 180 MHz \* 13 / 2160 = 1.0833333 MS/sec

#### DDC Data Output Format:

24 bits I + 24 bits Q

#### Superchannels

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

#### Frequency Offsets for each DDC:

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

#### Superchannel Output Format:

26 bits I + 26 bits Q

#### Number of Superchannels per Bank:

175-Channel banks: 44; 375-Channel

banks: 94

**Field Programmable Gate Array:** Xilinx

Virtex-6 XC6VSX315T

#### PCI Express Interface

**PCI Express Bus:** Gen. 2 x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

### Model 8267

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt and Onyx VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
52663	1100-Channel GSM Channelizer with Quad A/D - VPX

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

### VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

New!

# Models 57663 & 58663

# 1100- or 2200-Channel GSM Channelizer with Quad or Octal A/D - 6U OpenVPX

Model 58663

### Features

- Four or eight 180 MHz 16-bit A/Ds
- Two or four banks of 375 DDCs for upper GSM band
- Two or four banks of 175 DDCs for lower GSM band
- PCI Express (Gen. 1 & 2) interface up to x4
- LVPECL clock/sync bus for multiboard synchronization
- Ruggedized and conduction-cooled versions available

### General Information

Models 57663 and 58663 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71663 XMC modules mounted on a VPX carrier board.

Model 57663 is a 6U board with one Model 71663 module while the Model 58663 is a 6U board with two XMC modules rather than one.

This quad or octal, high-speed A/D converter with 1100 or 2200 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

### The Cobalt Architecture

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four or eight factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four or eight DMA controllers, PCIe interface, gating, and triggering.

These models are complete, full-featured subsystems, ready to use with no additional FPGA development required.

### A/D Converter Stage

The front end accepts four or eight analog IF inputs on front panel SSMC connectors

with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

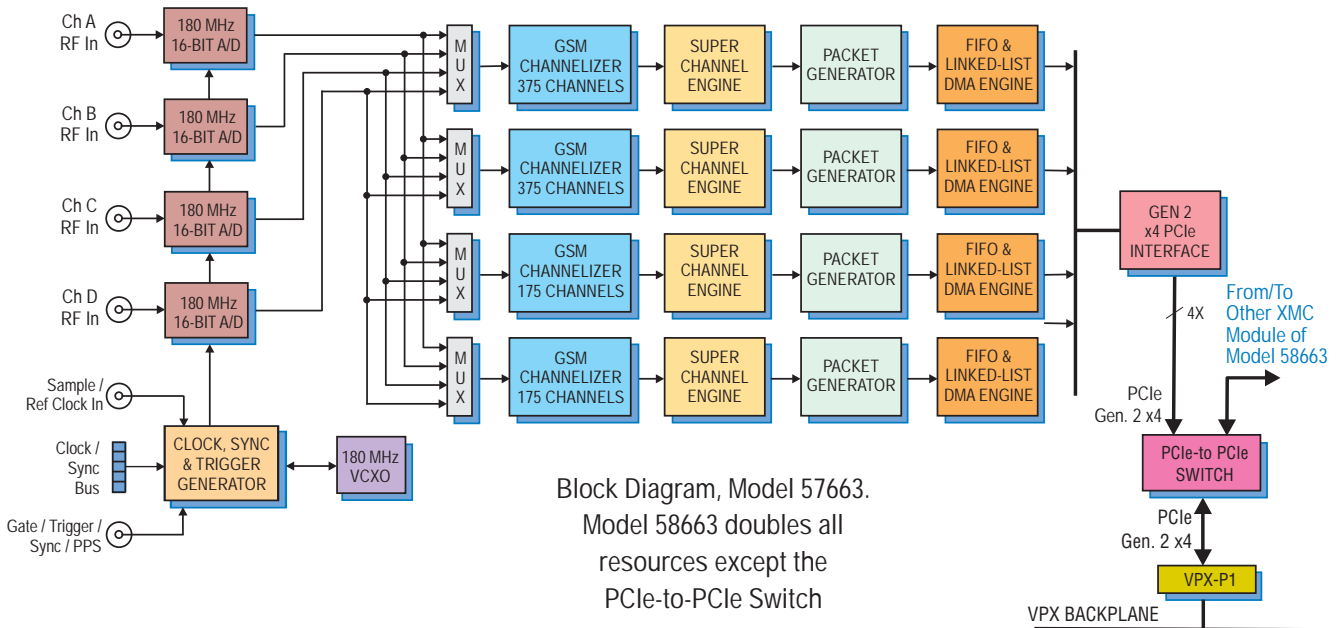

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

### Clocking and Synchronization

The internal timing bus provides all timing and synchronization required by the A/D converters. It includes clock, sync and gate or trigger signals. One or two on-board clock generators accept external 180 MHz sample clocks from the front panel SSMC connectors. The clocks can be used directly by the A/Ds or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ➤

## ► GSM Channelizer Cores

These models contain four or eight powerful GSM channelizer cores, two or four with 375 DDCs and two or four with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of four GSM channelizers.

The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to these models, the GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the four or eight A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must insure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \cdot 13/2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

## Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x over sampling, and results in a reduction of the aggregate traffic by a factor of 4 to 2.383 GB/sec.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bits I + 26-bits Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank only contains three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCI-X bus. There are four superchannel mask words, one for each bank.

## Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

## PCI Express Interface

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

The PCIe interface is also used as the programming interface for all status and control between these models and host. ►

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72663	1100-Channel GSM Channelizer with Quad A/D - 6U cPCI
73663	1100-Channel GSM Channelizer with Quad A/D - 3U cPCI
74663	2200-Channel GSM Channelizer with Octal A/D - 6U cPCI

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express Gen. 2 x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)

**General Information**

Model 56663 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 56663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

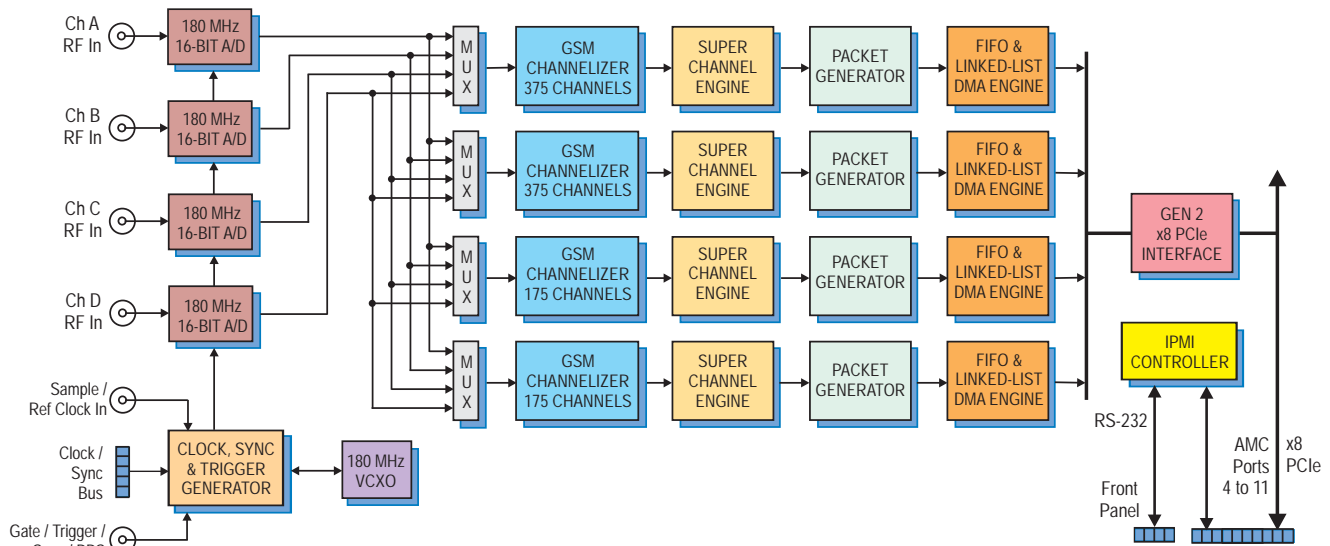

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**GSM Channelizer Cores**

The 56663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ➤

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 56663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 56663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 56663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 56663 and host.

### AMC Interface

The Model 56663 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### GSM Channel Banks

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

#### DDC Channels

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

#### DDC Channel Filter Characteristics

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz \* 13 / 2160 = 1.0833333 MS/sec

#### DDC Data Output Format:

24 bits I + 24 bits Q

#### Superchannels

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

#### Frequency Offsets for each DDC:

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

#### Superchannel Output Format:

26 bits I + 26 bits Q

#### Number of Superchannels per Bank:

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6VSX315T

#### PCI Express Interface

**PCI Express Bus:** Gen. 2 x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56663	1100-Channel GSM Channelizer with Quad A/D - AMC

Contact Pentek for availability of rugged and conduction-cooled versions

### General Information

Model 71610 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. This digital I/O module provides 32 LVDS differential inputs or outputs plus LVDS clock, data valid, and data flow control on a front panel 80-pin connector. Its built-in data capture and data generation feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to supporting PCI Express Gen. 1 as a native interface, the Model 71610 includes a general-purpose connector for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's interface. The 71610 factory-installed functions include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, a controller for all data clocking, a test signal generator, and a PCIe interface com-

plete the factory-installed functions and enable the 71610 to operate as a complete turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

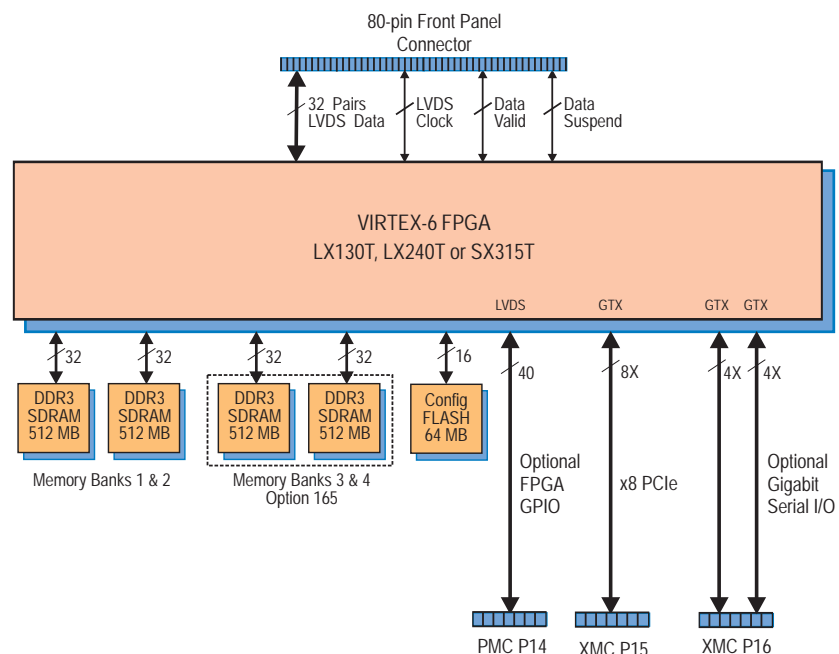

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O to the carrier board.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

### Features

- 32 bits of LVDS digital I/O
- One LVDS clock
- One LVDS data valid
- One LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAS
- DMA controller moves data to and from system memory
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

### Model Description

71610 LVDS Digital I/O with Virtex-6 FPGA - XMC

### Options:

-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options

## ► Acquisition IP Module

The module can be configured for digital input mode by setting a jumper on the board. In this case, the module accepts input data Clock and input Data Valid signals. This supports a continuous input Clock with data accepted only when the Data Valid line is true. The module can optionally generate a Data Suspend output signal indicating that the 71610 is no longer capable of accepting data. The module accepts 32 bits from the front panel connector or from an on-board test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Memory banks are supported with DMA engines for easily moving input data through the PCIe interface.

## Generation IP Module

The module can be configured for digital output mode by setting a jumper on the board. In this case, the module generates output data Clock and output Data Valid signals. This supports a continuous output Clock with data valid only when the Data Valid line is true. The module can optionally accept a Data Suspend input signal to halt data generation when the destination device is no longer capable of accepting data.

A linked-list controller allows users to generate 32-bit digital words out through the front panel LVDS connector from tables stored in either on-board or off-board host memory. Parameters including length of table, delay from software trigger, table repetition, etc. can be programmed for entry. Up to 64 individual link entries can be chained together to create complex output patterns with minimum programming.

## XMC Interface

The Model 71610 complies with the VITA 42.0 XMC specification. Each of two connectors provides multilane gigabit serial interfaces with up to a 6 GHz bit clock. With dual XMC connectors, the 71610 supports x4 or x8 PCIe on the primary P15 XMC connector. The secondary P16 XMC connector is used for dual 4X or single 8X user-installed gigabit serial interfaces, such as Aurora, PCIe and serial RapidIO.

## PCI Express Interface

The Model 71610 includes an industry-standard interface fully compliant with PCI Express Gen. 1 bus specifications. Supporting a PCIe x4 or x8 connection, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Memory Resources

The 71610 hardware architecture supports up to four independent 512 MB memory banks of DDR3 SDRAM. The board is always configured with 1 GB of memory (Banks 1 and 2).

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. For customers who need more memory to support their IP, Banks 3 and 4 can be optionally added for a total of 2 GB of DDR3 SDRAM

## Specifications

### Front Panel Input/Output

**Data Lines:** 35 LVDS differential pairs (32 pairs supported in factory-installed functions), 2.5 V compliant

**Clock:** One LVDS differential pair, 2.5 V compliant

**Data Valid:** One LVDS differential pair, 2.5 V compliant

**Data Suspend:** One LVDS differential pair, 2.5 V compliant

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

### Memory

**Standard:** Two 512 MB DDR3 SDRAM memory banks (1 and 2), 400 MHz DDR

**Option 165:** Two 512 MB DDR3 SDRAM memory banks (3 and 4), 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**General Information**

Model 78610 is a member of the Cobalt® family of high-performance PCIe boards based on the Xilinx Virtex-6 FPGA. This digital I/O board provides 32 LVDS differential inputs or outputs plus LVDS clock, data valid, and data flow control on a front panel 80-pin connector. Its built-in data capture and data generation feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

Model 52610 COTS (left) and rugged version

**Features**

- 32 bits of LVDS digital I/O
- One LVDS clock
- One LVDS data valid
- One LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAS
- DMA controller moves data to and from system memory
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53610 is a member of the Cobalt® family of high-performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This digital I/O board provides 32 LVDS differential inputs or outputs plus LVDS clock, data valid, and data flow control on a front panel 80-pin connector. Its built-in data capture and data generation feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to supporting PCI Express Gen. 1 as a native interface, the Model 53610 includes a general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s interface. The 53610 factory-installed functions include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, a controller for all data clocking, a test

signal generator, and a PCIe interface complete the factory-installed functions and enable the 53610 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

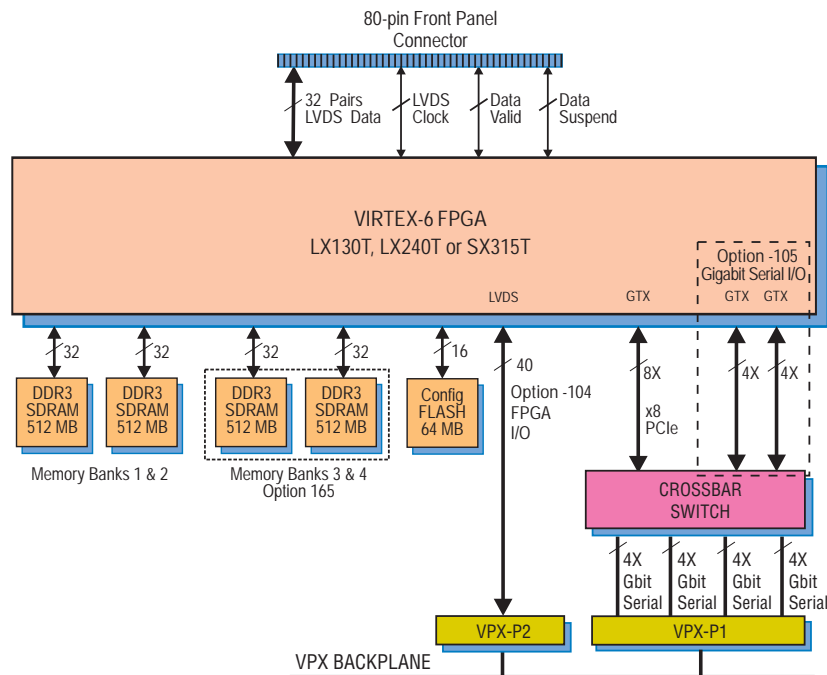

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

## Fabric-Transparent Crossbar Switch

The 53610 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

## Model 8267

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt and Onyx VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

### Model Description

53610 LVDS Digital I/O with Virtex-6 FPGA - 3U VPX

### Options:

- 062 XC6VLX240T
- 064 XC6V SX315T
- 104 LVDS FPGA I/O to VPX P2
- 105 Gigabit serial FPGA I/O to VPX P1
- 155\* Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
- 165 Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

## ► Acquisition IP Module

The board can be configured for digital input mode by the setting of a jumper. In this case, the board accepts input data Clock and input data Valid signals. This supports a continuous input Clock with data accepted only when the Data Valid line is true. The board can optionally generate a Data Suspend output signal indicating that the 53610 is no longer capable of accepting data. The board accepts 32 bits from the front panel connector or from an on-board test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Memory banks are supported with DMA engines for easily moving input data through the PCIe interface.

## Generation IP Module

The board can be configured for digital output mode by the setting of a jumper. In this case, the board generates output data Clock and output Data Valid signals. This supports a continuous output Clock with data valid only when the Data Valid line is true. The board can optionally accept a Data Suspend input signal to halt data generation when the destination device is no longer capable of accepting data.

A linked-list controller allows users to generate 32-bit digital words out through the front panel LVDS connector from tables stored in either on-board or off-board host memory. Parameters including length of table, delay from software trigger, table repetition, etc. can be programmed for entry. Up to 64 individual link entries can be chained together to create complex output patterns with minimum programming.

## PCI Express Interface

The Model 53610 includes an industry-standard interface fully compliant with PCI Express Gen. 1 bus specifications. Supporting a PCIe x4 or x8 connection, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Memory Resources

The 53610 hardware architecture supports up to four independent 512 MB memory banks of DDR3 SDRAM. The board is always configured with 1 GB of memory (Banks 1 and 2).

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. For customers who need more memory to support their

IP, Banks 3 and 4 can be optionally added for a total of 2 GB of DDR3 SDRAM

## Specifications

### Front Panel Input/Output

**Data Lines:** 35 LVDS differential pairs (32 pairs supported in factory-installed functions), 2.5 V compliant

**Clock:** One LVDS differential pair, 2.5 V compliant

**Data Valid:** One LVDS differential pair, 2.5 V compliant

**Data Suspend:** One LVDS differential pair, 2.5 V compliant

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6V SX315T

### Custom I/O

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

### Memory

**Standard:** Two 512 MB DDR3 SDRAM memory banks (1 and 2), 400 MHz DDR

**Option 165:** Two 512 MB DDR3 SDRAM memory banks (3 and 4), 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 52610 COTS (left) and rugged version

**Features**

- 32 bits of LVDS digital I/O
- One LVDS clock
- One LVDS data valid
- One LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAs
- DMA controller moves data to and from system memory
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 52610 is a member of the Cobalt® family of high-performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This digital I/O board provides 32 LVDS differential inputs or outputs plus LVDS clock, data valid, and data flow control on a front panel 80-pin connector. Its built-in data capture and data generation feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to supporting PCI Express Gen. 1 as a native interface, the Model 52610 includes a general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's interface. The 52610 factory-installed functions include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, a controller for all data clocking, a test

signal generator, and a PCIe interface complete the factory-installed functions and enable the 52610 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

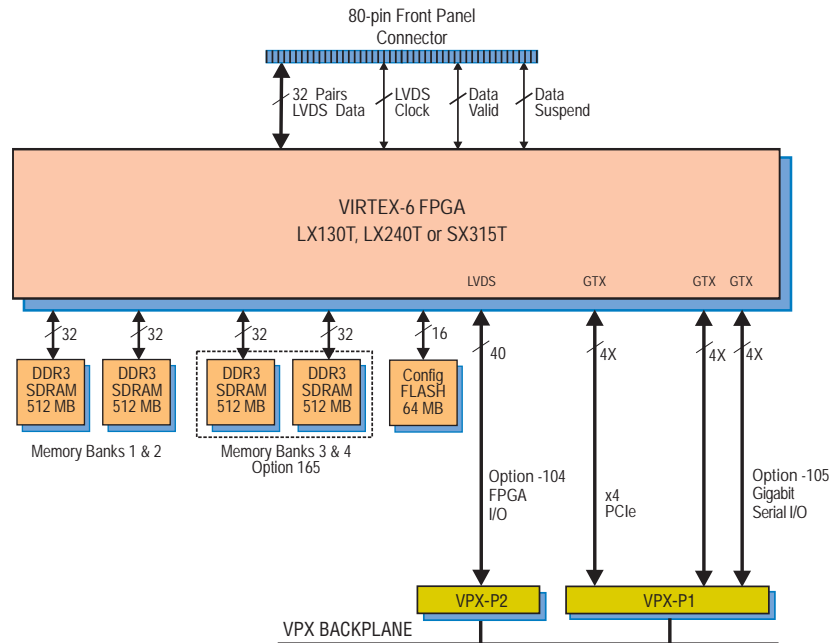

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**Model 8267**

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt and Onyx VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Models 57610 and 58610

# Single or Dual LVDS Digital I/O with Virtex-6 FPGA - 6U OpenVPX

Model 58610

## General Information

Models 57610 and 58610 are members of the Cobalt® family of high-performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71610 XMC modules mounted on a VPX carrier board.

Model 57610 is a 6U board with one Model 71610 module while the Model 58610 is a 6U board with two XMC modules rather than one.

These models include one or two general-purpose connectors for application-specific I/O.

## The Cobalt Architecture

The Pentek Cobalt Architecture features Virtex-6 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's interface. The factory-installed functions of these models include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, controllers for all data clocking, test signal generators, and a PCIe interface complete the factory-installed functions

and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

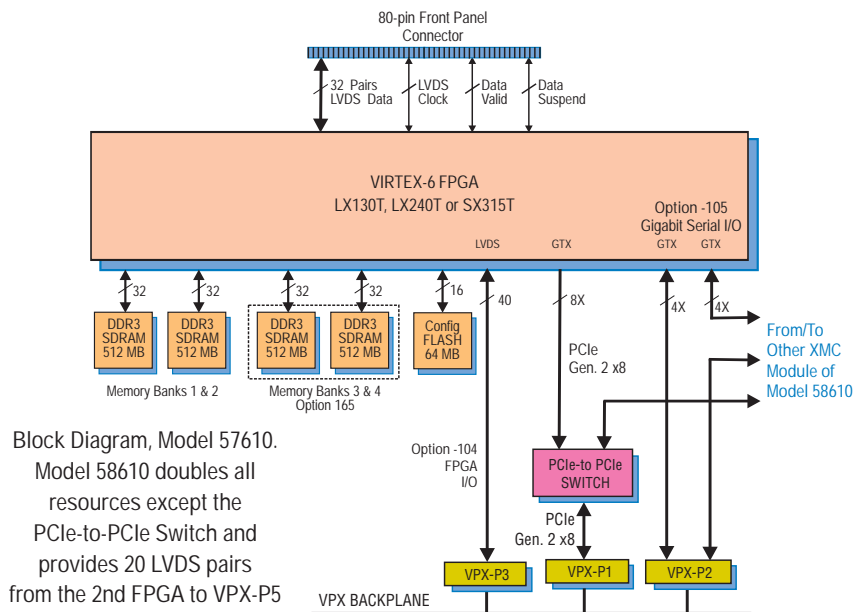

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57610; P3 and P5, Model 58610.

Option -105 supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57610; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58610. ➤

## Features

- 32 or 64 bits of LVDS digital I/O
- One or two LVDS clocks
- One or two LVDS data valid
- One or two LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAs
- One or two DMA controllers move data to and from system memory
- Up to 2 or 4 GB of DDR3
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board
- Ruggedized and conduction-cooled versions available

**Model 8264**

The Model 8264 is a fully-integrated development system for Pentek Cobalt and Onyx 6U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

**Model Description**

- 57610 Single LVDS Digital I/O with Virtex-6 FPGA - 6U VPX
- 58610 Dual LVDS Digital I/O with two Virtex-6 FPGAs - 6U VPX

**Options:**

- 062 XC6VLX240T
- 064 XC6VSX315T
- 104 LVDS I/O between the FPGA and P3 connector, Model 57610; P3 and P5 connectors, Model 58610

8264	VPX Development System. See 8264 Datasheet for Options

**► Acquisition IP Modules**

These models can be configured for digital input mode by the setting of one or two jumpers. In this case, the board accepts input data Clock and input data Valid signals. This supports a continuous input Clock with data accepted only when the Data Valid line is true. The board can optionally generate a Data Suspend output signal indicating that these models are no longer capable of accepting data. The board accepts 32 bits from the front panel connector or from an on-board test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Memory banks are supported with DMA engines for easily moving input data through the PCIe interface.

**Generation IP Modules**

These models can be configured for digital output mode by the setting of one or two jumpers. In this case, the board generates output data Clock and output Data Valid signals. This supports a continuous output Clock with data valid only when the Data Valid line is true. The board can optionally accept a Data Suspend input signal to halt data generation when the destination device is no longer capable of accepting data.

One or two linked-list controllers allow users to generate 32-bit digital words out through the front panel LVDS connector from tables stored in either on-board or off-board host memory. Parameters including length of table, delay from software trigger, table repetition, etc. can be programmed for entry. Up to 64 or 128 individual link entries can be chained together to create complex output patterns with minimum programming.

**PCI Express Interface**

These models include an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Memory Resources**

The hardware architecture supports up to four or eight independent 512 MB memory banks of DDR3 SDRAM. The board is always configured with 1 GB of memory (Banks 1 and 2).

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. For customers who need more memory to support their IP, Banks 3 and 4 can be optionally added for a total of 4 GB.

**Specifications**

**Model 57610: Single LVDS Digital I/O**

**Model 58610: Dual LVDS Digital I/O**

**Front Panel Input/Output (1 or 2)**

**Data Lines:** 35 LVDS differential pairs (32 pairs supported in factory-installed functions), 2.5 V compliant

**Clock:** One LVDS differential pair, 2.5 V compliant

**Data Valid:** One LVDS differential pair, 2.5 V compliant

**Data Suspend:** One LVDS differential pair, 2.5 V compliant

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the VPX P3 connector, Model 57610; P3 and P5, Model 58610

**Option -105:** Supports serial protocols by providing a 4X gigabit link between the FPGA and VPX P2, Model 57610; or one 4X link from each FPGA to P2 and an additional 4X link between the FPGAs, Model 58610

**Memory Banks (1 or 2)**

**Standard:** Two 512 MB DDR3 SDRAM memory banks (1 and 2), 400 MHz DDR

**Option 165:** Two 512 MB DDR3 SDRAM memory banks (3 and 4), 400 MHz DDR

**PCI Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental:** Level L1 & L2 air-cooled; Level L3 ruggedized, conduction-cooled

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 74610 Model 73610

### General Information

Models 72610, 73610 and 74610 are members of the Cobalt® family of high-performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71610 XMC modules mounted on a cPCI carrier board.

Model 72610 is a 6U cPCI board while the Model 73610 is a 3U cPCI board; both are equipped with one Model 71610 XMC. Model 74610 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two general-purpose connectors for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt Architecture features Virtex-6 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's interface. The factory-installed functions of these models include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, controllers for all data clocking, a test

signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

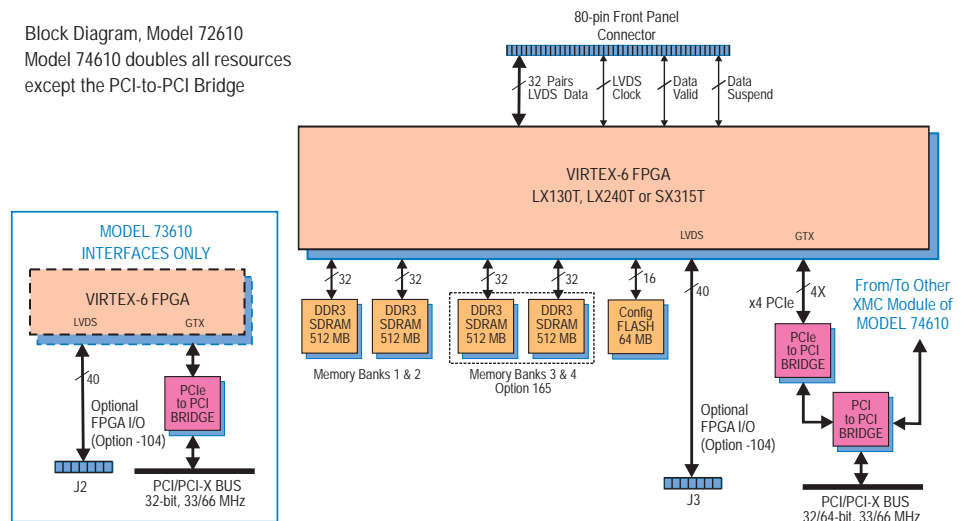

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73610; J3 connector, Model 72610; J3 and J5 connectors, Model 74610. ➤

### Features

- 32 or 64 bits of LVDS digital I/O
- One or two LVDS clocks
- One or two LVDS data valid
- One or two LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAS
- One or two DMA controllers move data to and from system memory
- Up to 2 or 4 GB of DDR3 SDRAM
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board

74610	Dual LVDS Digital I/O with Virtex-6 FPGAs - 6U cPCI

#### Options:

-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS I/O between the FPGA and J2 connector, Model 73610; J3 connector, Model 72610; J3 and J5 connectors, Model 74610
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

### General Information

Model 56610 is a member of the Cobalt® family of high-performance AMC boards based on the Xilinx Virtex-6 FPGA. This digital I/O board provides 32 LVDS differential inputs or outputs plus LVDS clock, data valid, and data flow control on a front panel 80-pin connector. Its built-in data capture and data generation feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

In addition to supporting PCI Express Gen. 1 as a native interface, the Model 56610 includes a general-purpose connector for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions for data flow and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an IP (intellectual property) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's interface. The 56610 factory-installed functions include 32-bit acquisition and generation IP modules, to support either input or output functions, respectively.

IP modules for DDR3 SDRAM memories, a controller for all data clocking, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56610 to operate as a complete turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

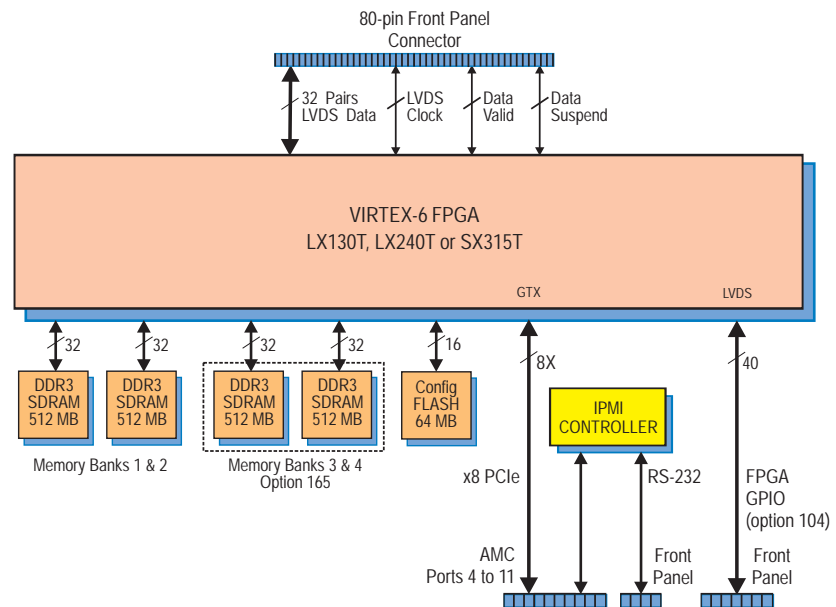

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T LX240T, or SX315T. The SXT part features up to 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

### Features

- 32 bits of LVDS digital I/O
- One LVDS clock
- One LVDS data valid
- One LVDS data suspend
- Supports LXT and SXT Virtex-6 FPGAS
- DMA controller moves data to and from system memory
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O to the carrier board

### ► Acquisition IP Module

The board can be configured for digital input mode by the setting of a jumper. In this case, the board accepts input data Clock and input data Valid signals. This supports a continuous input Clock with data accepted only when the Data Valid line is true. The board can optionally generate a Data Suspend output signal indicating that the 56610 is no longer capable of accepting data. The board accepts 32 bits from the front panel connector or from an on-board test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Memory banks are supported with DMA engines for easily moving input data through the PCIe interface.

### Generation IP Module

The board can be configured for digital output mode by the setting of a jumper. In this case, the board generates output data Clock and output Data Valid signals. This supports a continuous output Clock with data valid only when the Data Valid line is true. The board can optionally accept a Data Suspend input signal to halt data generation when the destination device is no longer capable of accepting data.

A linked-list controller allows users to generate 32-bit digital words out through the front panel LVDS connector from tables stored in either on-board or off-board host memory. Parameters including length of table, delay from software trigger, table repetition, etc. can be programmed for entry. Up to 64 individual link entries can be chained together to create complex output patterns with minimum programming.

### AMC Interface

The Model 56610 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56610 includes an industry-standard interface fully compliant with PCI Express Gen. 1 bus specifications. Supporting a PCIe x4 or x8 connection, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 56610 hardware architecture supports up to four independent 512 MB memory banks of DDR3 SDRAM. The board is always configured with 1 GB of memory (Banks 1 and 2).

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. For customers who need more memory to support their IP, Banks 3 and 4 can be optionally added for a total of 2 GB of DDR3 SDRAM

### Specifications

#### Front Panel Input/Output

**Data Lines:** 35 LVDS differential pairs (32 pairs supported in factory-installed functions), 2.5 V compliant

**Clock:** One LVDS differential pair, 2.5 V compliant

**Data Valid:** One LVDS differential pair, 2.5 V compliant

**Data Suspend:** One LVDS differential pair, 2.5 V compliant

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Standard:** Two 512 MB DDR3 SDRAM memory banks (1 and 2), 400 MHz DDR

**Option 165:** Two 512 MB DDR3 SDRAM memory banks (3 and 4), 400 MHz DDR

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Model Description

56610 LVDS Digital I/O with Virtex-6 FPGA - PCIe

### Options:

-062 XC6VLX240T

-064 XC6VSX315T

-104 LVDS FPGA I/O through 68-pin ribbon cable connector

-105 Gigabit serial FPGA I/O through two 4X top edge connectors

-155\* Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)

-165 Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

**General Information**

Model 7811 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, gigabit serial interface, it is ideal for interfacing to Serial FPDP data converter boards or as a chassis-to-chassis data link.

The 7811 is fully compatible with the VITA 17.1 Serial FPDP specification. Its built-in data transfer features make it a complete turnkey solution. For users who require application-specific functions, the 7811 serves as a flexible platform for developing and deploying custom FPGA processing IP.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data transfer and control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

IP modules for data routing and flow control, CRC support, advanced DMA engines, and a PCIe interface complete the

factory-installed functions and enable the 7811 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

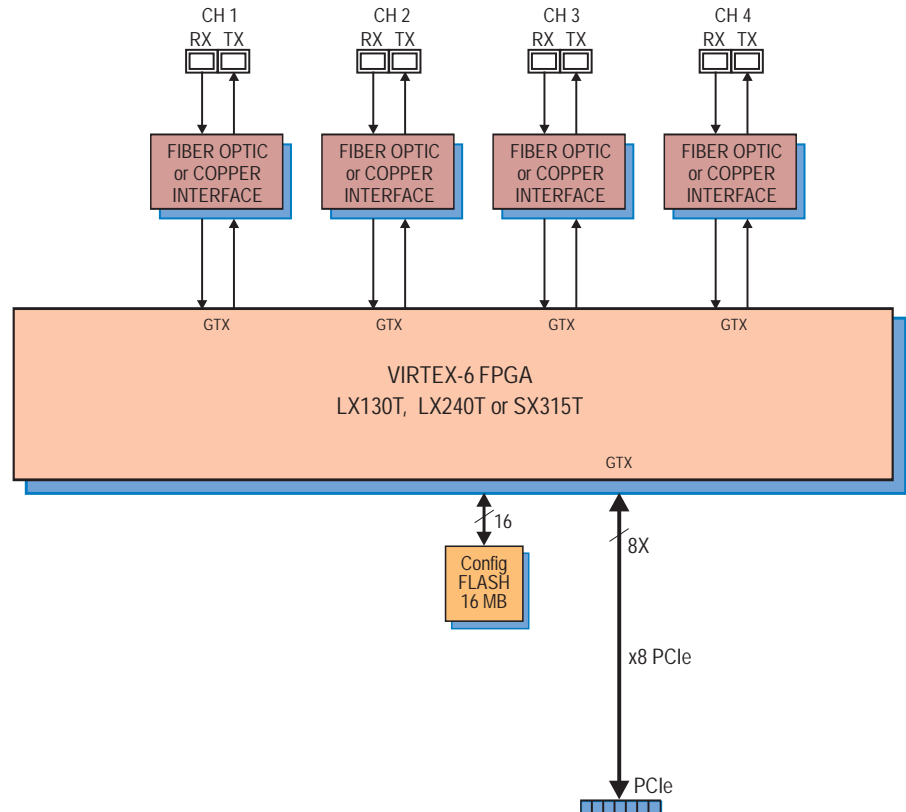

The Virtex-6 FPGA can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T or SX315T. The SX315T part features 1,344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception.

For applications not requiring large DSP resources, the lower-cost LX130T FPGA can be installed. ➤

**Features**

- Complete Serial FPDP solution
- Fully compliant with VITA 17.1 specification
- Fibre optic or copper serial interfaces
- PCI Express interface up to x8

► Serial FPDP Interface

The 7811 is fully compatible with the VITA 17.1 Serial FPDP specification. With the capability to support 1.0625, 2.125, 2.5, 3.125, and 4.25 Gbaud link rates and the option for multi-mode and single-mode optical interfaces or copper interfaces the board can work in virtually any system. Programmable modes include: flow control in both receive and transmit directions, CRC support, and copy/loop modes.

PCI Express Interface

The Model 7811 includes an industry-standard interface fully compliant with PCI Express bus specifications. Supporting PCIe links up to x8, the interface includes eight DMA controllers. Each of the four Serial FPDP channels includes dedicated DMA engines for transmit and receive for efficient transfers to and from the board.

Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Specifications

Front Panel Serial FPDP Inputs/Outputs

Number of Connectors: 4

Fiber Optic Connector Type: LC

Laser: 850 nm (standard, other options available)

Copper Connector Type: SFP+

Fiber Optic or Copper Link Rates:

1.0625, 2.125, 2.5, 3.125 or 4.25 Gbaud (copper rate depends on cable length)

Fiber Optic or Copper Data Transfer Rates: 105, 210, 247, 309 or 420 MB/sec (depending on link rate) per serial FPDP port

Field Programmable Gate Array

Standard: Xilinx Virtex-6 XC6VLX130T

Optional: Xilinx Virtex-6 XC6VLX240T

PCI-Express Interface

PCI Express Bus: Gen. 1: x4 or x8

Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: Half-length PCIe card, 4.38 in. x 7.13 in. ►

Model 53611 COTS (left) and rugged version

**General Information**

Model 53611 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, gigabit serial interface, it is ideal for interfacing to Serial FPDP data converter boards or as a chassis-to-chassis data link.

The 53611 is fully compatible with the VITA 17.1 Serial FPDP specification. Its built-in data transfer features make it a complete turnkey solution. For users who require application-specific functions, the 53611 serves as a flexible platform for developing and deploying custom FPGA processing IP.

In addition to supporting PCI Express over the 3U VPX backplane, the Model 53611 includes a general purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data transfer and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

IP modules for DDR3 SDRAM memories, controllers for data routing and flow control, CRC support, advanced DMA engines, and

a PCIe interface complete the factory-installed functions and enable the 53611 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

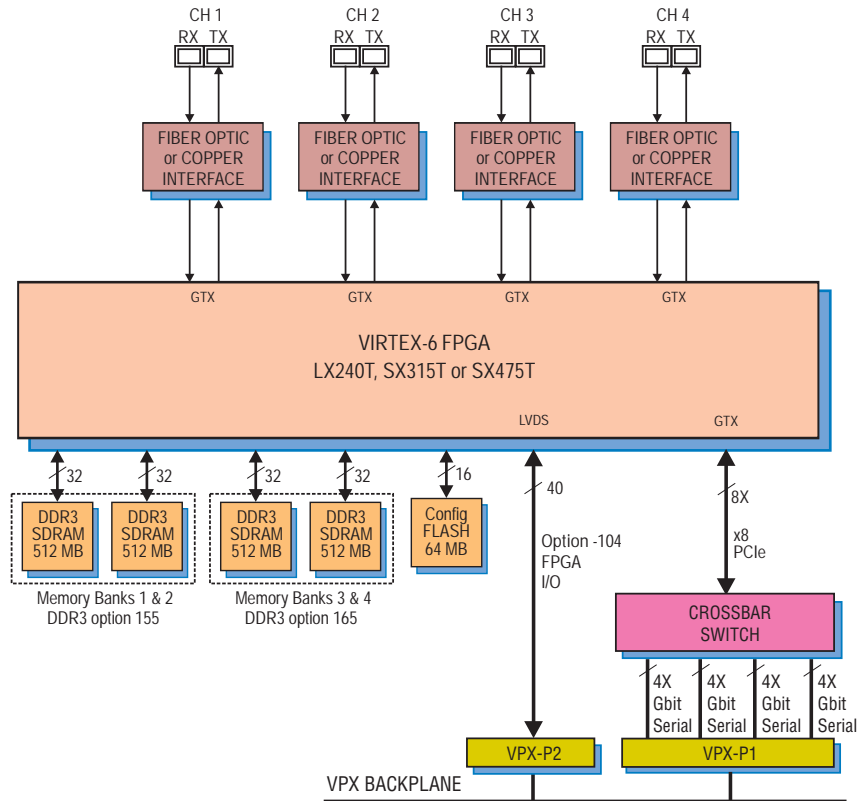

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T, SX315T, or SX475T. The SXT parts feature up to 2016 DSP48E slices and are ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**Features**

- Complete Serial FPDP solution
- Fully compliant with VITA 17.1 specification
- Fiber optic or copper serial interfaces
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface up to x8
- LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

► Serial FPDP Interface

The 53611 is fully compatible with the VITA 17.1 Serial FPDP specification. With the capability to support 1.0625, 2.125, 2.5, 3.125, and 4.25 Gbaud link rates and the option for multi-mode and single-mode optical interfaces, the board can work in virtually any system. Programmable modes include: flow control in both receive and transmit directions, CRC support, and copy/loop modes.

Memory Resources

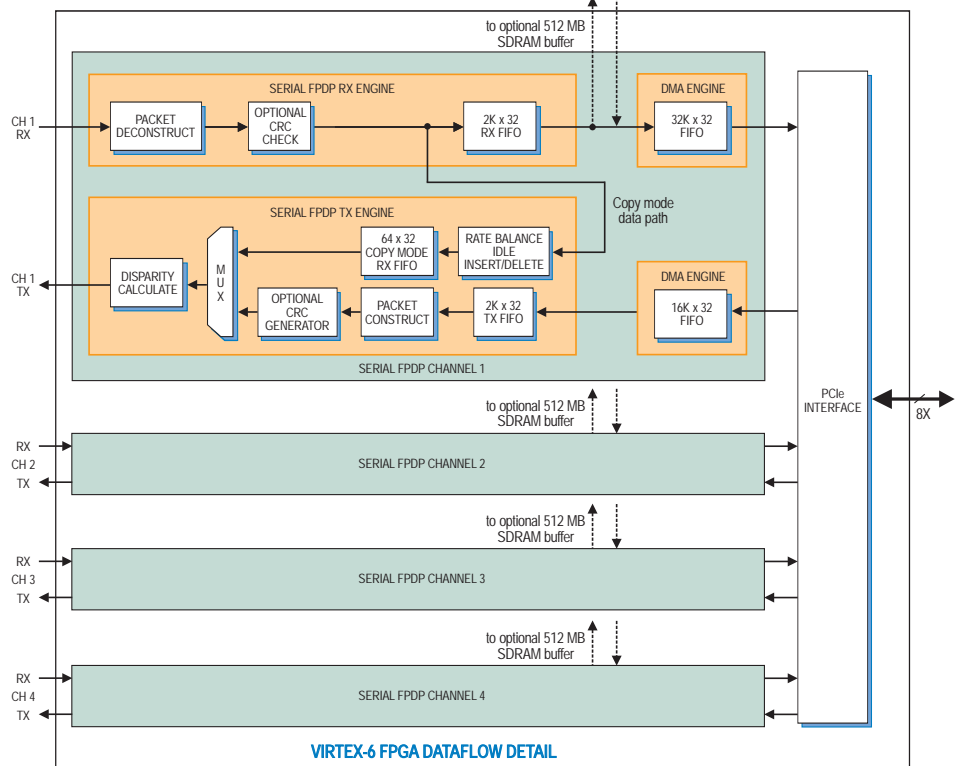

The 53611 architecture supports up to four independent memory banks of DDR3 SDRAM. Each memory is 512 MB deep and an integral part of the board’s DMA capabilities, providing FIFO memory space for creating DMA packets.

PCI Express Interface

The Model 53611 includes an industry-standard interface fully compliant with PCI Express Gen. 1 bus specifications. Supporting PCIe links up to x8, the interface includes eight DMA controllers. Each of the four Serial FPDP channels includes dedicated DMA engines for transmit and receive for efficient transfers to and from the board.

Crossbar Switch

The 53611 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Serial FPDP Inputs/Outputs**

**Number of Connectors:** 4

**Fiber Optic Connector Type:** LC

**Laser:** 850 nm (standard, other options available)

**Copper Connector Type:** Micro Twinax

**Fiber Optic or Copper Link Rates:**

1.0625, 2.125, 2.5, 3.125 or 4.25 Gbaud  
(copper rate depends on cable length)

**Fiber Optic or Copper Data Transfer**

**Rates:** 105, 210, 247, 309 or 420 MB/sec  
(depending on link rate) per serial FPDP port

**Field Programmable Gate Array:** Xilinx

Virtex-6 XC6VLX240T, XC6VSX315T, or XC6VSX475T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Models 57611 and 58611

# Quad or Octal Serial FPDP Interface with Virtex-6 FPGA - 6U OpenVPX

Model 58611

## General Information

Models 57611 and 58611 are members of the Cobalt® family of high performance 6U OpenVPX boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71611 XMC modules mounted on a VPX carrier board.

Model 57611 is a 6U board with one Model 71611 module while the Model 58611 is a 6U board with two XMC modules rather than one.

These models are fully compatible with the VITA 17.1 Serial FPDP specification. Their built-in data transfer features make them complete turnkey solutions. For users who require application-specific functions, they serve as flexible platforms for developing and deploying custom FPGA processing IP.

## The Cobalt Architecture

The Pentek Cobalt Architecture features one or two Virtex-6 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data transfer and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

IP modules for DDR3 SDRAM memories, controllers for data routing and flow control, CRC support, advanced DMA engines, and

a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

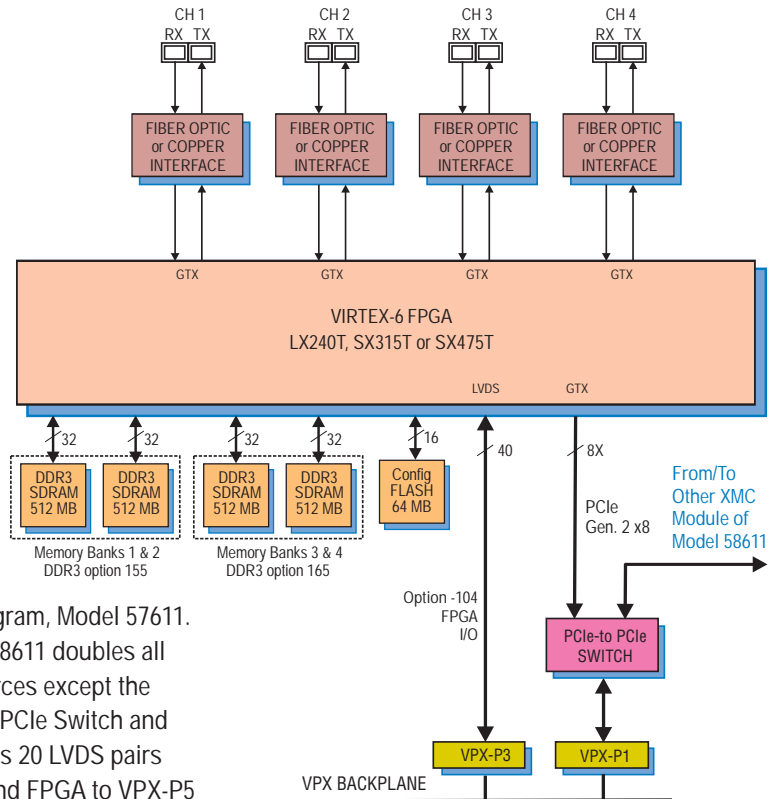

## Xilinx Virtex-6 FPGA

### General Information

Model 56611 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, gigabit serial interface, it is ideal for interfacing to Serial FPDP data converter boards or as a chassis-to-chassis data link.

The 56611 is fully compatible with the VITA 17.1 Serial FPDP specification. Its built-in data transfer features make it a complete turnkey solution. For users who require application-specific functions, the 56611 serves as a flexible platform for developing and deploying custom FPGA processing IP. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56611 includes a front panel general-purpose connector for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data transfer and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

IP modules for DDR3 SDRAM memories, controllers for data routing and flow control,

CRC support, advanced DMA engines, and a PCIe interface complete the factory-installed functions and enable the 56611 to operate as a complete turnkey solution without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

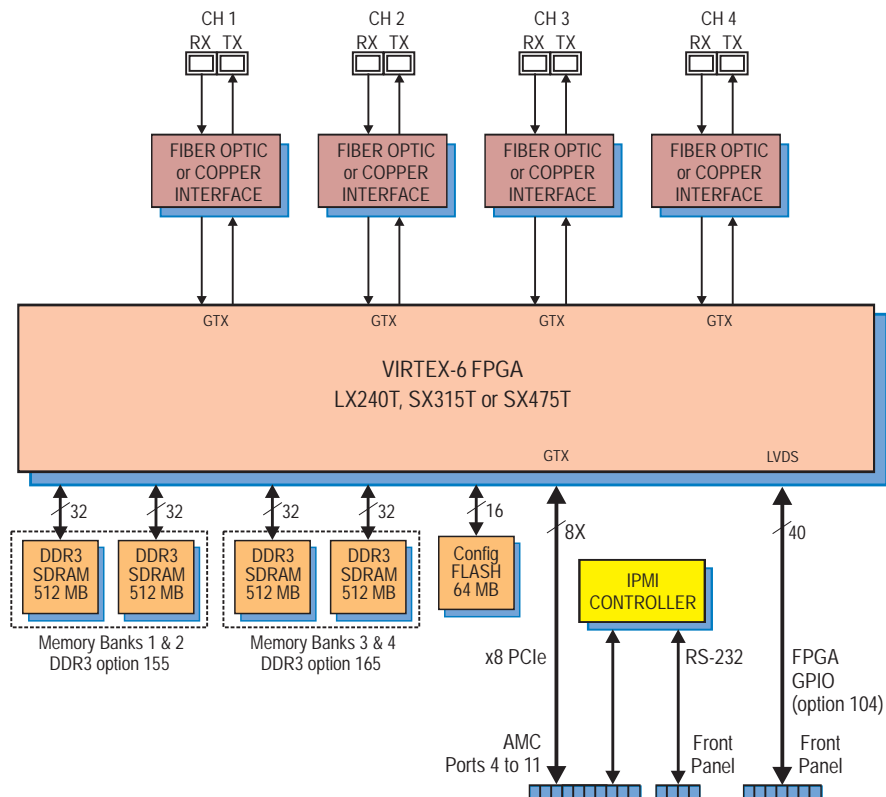

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T, SX315T, or SX475T. The SXT parts feature up to 2016 DSP48E slices and are ideal for modulation / demodulation, encoding / decoding, encryption / decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

### Features

- Complete Serial FPDP solution
- Fully compliant with VITA 17.1 specification
- Fiber optic or copper serial interfaces
- Up to 2 GB of DDR3 SDRAM
- PCI Express interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**AMC Interface**

The Model 56611 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or μTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

**Serial FPDP Interface**

The 56611 is fully compatible with the VITA 17.1 Serial FPDP specification. With the capability to support 1.0625, 2.125, 2.5, 3.125, and 4.25 Gbaud link rates and the option for multi-mode and single-mode optical interfaces, the board can work in virtually any system. Programmable modes include: flow control in both receive and transmit directions, CRC support, and copy/loop modes.

**Memory Resources**

The 56611 architecture supports up to four independent memory banks of DDR3 SDRAM. Each memory is 512 MB deep and an integral part of the module’s DMA capabilities, providing FIFO memory space for creating DMA packets.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

The Model 56611 includes an industry-standard interface fully compliant with PCI Express Gen. 1 bus specifications. Supporting PCIe links up to x8, the interface includes eight DMA controllers. Each of the four Serial FPDP channels includes dedicated DMA engines for transmit and receive for efficient transfers to and from the module.

**Specifications**

**Front Panel Serial FPDP Inputs/Outputs**

**Number of Connectors:** 4

**Fiber Optic Connector Type:** LC

**Laser:** 850 nm (standard, other options available)

**Copper Connector Type:** Micro Twinax

**Fiber Optic or Copper Link Rates:**

1.0625, 2.125, 2.5, 3.125 or 4.25 Gbaud (copper rate depends on cable length)

**Fiber Optic or Copper Data Transfer Rates:** 105, 210, 247, 309 or 420 MB/sec

(depending on link rate) per serial FPDP port

**Field Programmable Gate Array:** Xilinx

Virtex-6 XC6VLX240T, XC6VSX315T, or XC6VSX475T

**Custom I/O**

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

**Memory**

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8

**AMC Interface**

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in. ➤

New!

# Model 3312

# 4-Ch. 250 MHz, 16-bit A/D, 2-Ch. 800 MHz, 16-bit D/A - FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-312](#)
  - [FlexorSet Model 7070-312](#)
- Four 250 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U OpenVPX or Model 7070 PCIe Virtex-7 FMC carriers
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 3312 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 250 MHz, 16-bit A/Ds, two 800 MHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channelcount systems.

The 3312 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-312 3U VPX or the FlexorSet 7070-312 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into two Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Performance of the Model 3312

The true performance of the 3312 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a D/A waveform playback IP module.

### A/D Acquisition IP Modules

With the 3312 installed on either the 5973 or the 7070 carrier, the board-set features four A/D acquisition IP modules for easily capturing and moving data. Each module

can receive data from any of the four A/Ds, a test signal generator or from the D/A waveform playback IP module in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

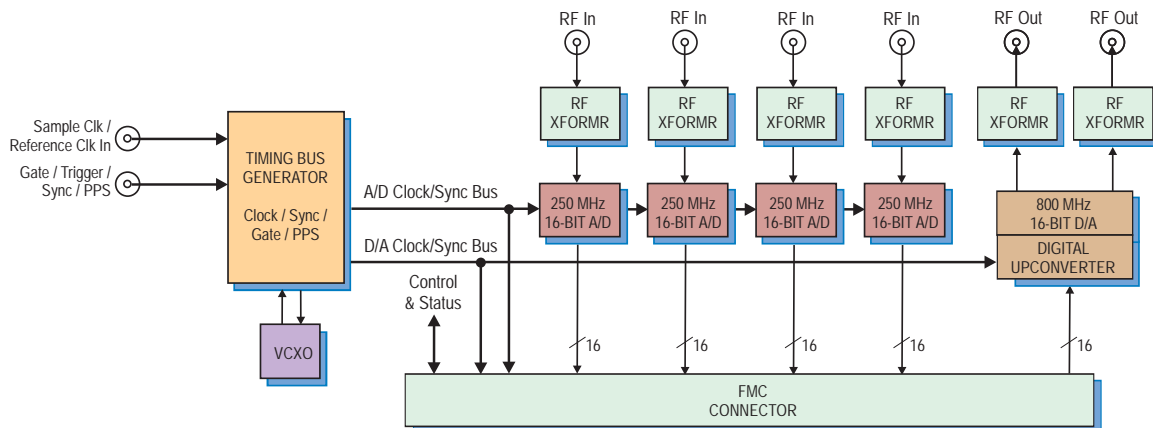

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's task of identifying and executing on the data.

### D/A Waveform Playback IP Module

With the 5973 or the 7070, the 3312 features a sophisticated D/A waveform playback IP module. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with minimum programming. ➤

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
3312	4-Channel 250 MHz, 16-bit A/D, 2-Channel 800 MHz, 16-bit D/A - FMC

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options
8267	VPX Development System See 8267 Datasheet for Options

## Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers the output to the 16-bit D/A converter. Analog outputs are through front panel connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel LVTTTL Gate/Trigger/Sync connector can receive an external timing signal allowing multiple modules to be synchronized thereby creating larger multi-board systems.

## ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3312's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/3312 or 7070/3312 IP modules as documented source code. Using Xilinx Vivado tools, developers can integrate their own IP with

the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

## FMC Interface

The Model 3312 complies with the VITA 57 High Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3312 and the FMC carrier.

## Model 3312 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connector

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: an A/D clock and a D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front panel external clock

**Synchronization:** VCXO can be phase-locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D or D/A clocks

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-Pin Count FMC

# Model 3316

# 8-Channel 250 MHz, 16-bit A/D - FMC

### Features

- Sold as the:
  - FlexorSet Model 5973-316
  - FlexorSet Model 7070-316
- Eight 250 MHz, 16-bit A/Ds
- On-board timing bus generator with multiboard synchronization
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U OpenVPX or Model 7070 PCIe Virtex-7 FMC carrier
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor® Model 3316 is a multichannel, high-speed data converter FMC module. It is suitable for connection to HF or IF ports of a communications or radar system. It includes eight 250 MHz, 16-bit A/Ds, programmable clocking, and multiboard synchronization for support of larger high-channelcount systems.

The 3316 is sold as a complete turnkey data acquisition solution as the FlexorSet™ 5973-316 3U VPX or the FlexorSet 7070-316 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### A/D Converters

The front end accepts eight analog HF or IF inputs on front-panel connectors with transformer-coupling into four Texas Instruments ADS42LB69 Dual 250 MHz, 16-bit A/D converters.

### Performance of the Model 3316

The true performance of the 3316 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a metadata packet creator.

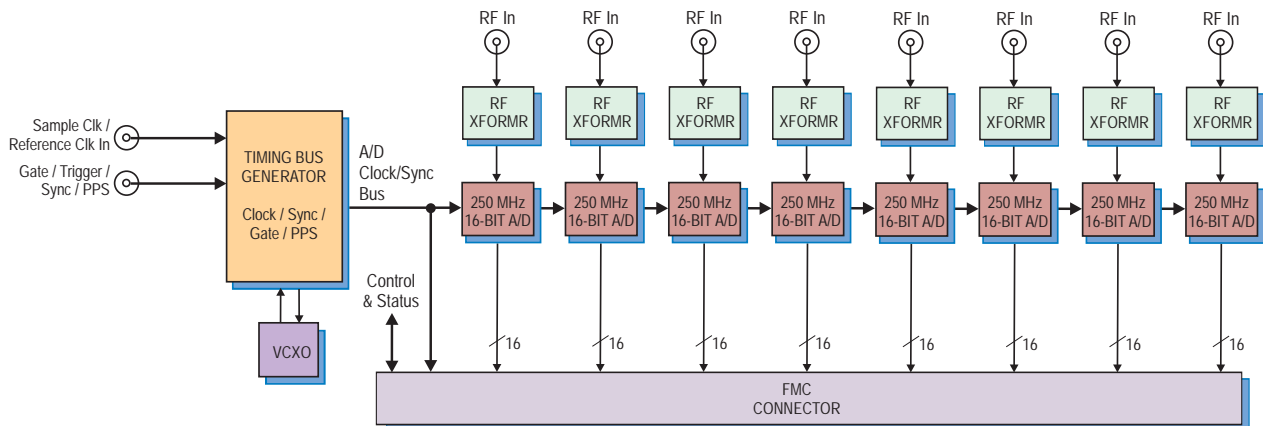

### A/D Acquisition IP Modules

With the 3316 installed on either the 5973 or the 7070 FMC carrier, the board-set features eight A/D Acquisition IP modules for easily capturing and moving data. Each module can receive data from any of the eight A/Ds, or a test signal generator.

Each IP module can have an associated memory bank on the Pentek FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's task of identifying and executing on the data. ▶

### Model 8266

## Model 3320

## 2-Channel 3.0 GHz A/D, 2-Channel 2.8 GHz D/A - FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-320](#)
  - [FlexorSet Model 7070-320](#)
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 3.0 GHz\* A/Ds
- Two 2.8 GHz\* D/As
- Two digital downconverters
- Two digital upconverters
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor™ Model 3320 is a multichannel, high-speed data converter FMC. It is suitable for connection to RF or IF ports of a communications or radar system. It includes two 3.0 GHz A/Ds, two 2.8 GHz D/As, programmable clocking and multiboard synchronization for support of larger high-channel-count systems.

The 3320 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-320 3U VPX or the FlexorSet 7070-320 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### Performance of the Model 3320

The true performance of the 3320 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and D/A waveform playback IP modules.

Designed to allow users to optimize data conversion rates and modes for specific application requirements, the FlexorSet provides preconfigured conversion profiles. Users can use these profiles which include: digital downconverter and digital upconverter modes, conversion resolution and A/D and D/A sample rates, or program their own profiles. In addition to supporting PCIe Gen. 3 as a native interface, the FlexorSet includes optional copper and optical connections to the Virtex-7 FPGA for custom I/O.

### A/D and Digital Downconverter Stage

The front end accepts two analog RF or IF inputs on front-panel connectors with

transformer-coupling into a Texas Instruments ADC32RF45 dual channel A/D. With dual built-in digital downconverters and programmable decimations, the converter serves as an ideal interface for a range of radar, signal intelligence and electronic countermeasures applications. The ADC32RF45 can operate within a range of different conversion speeds and resolutions. See the table on the last page for supported modes.

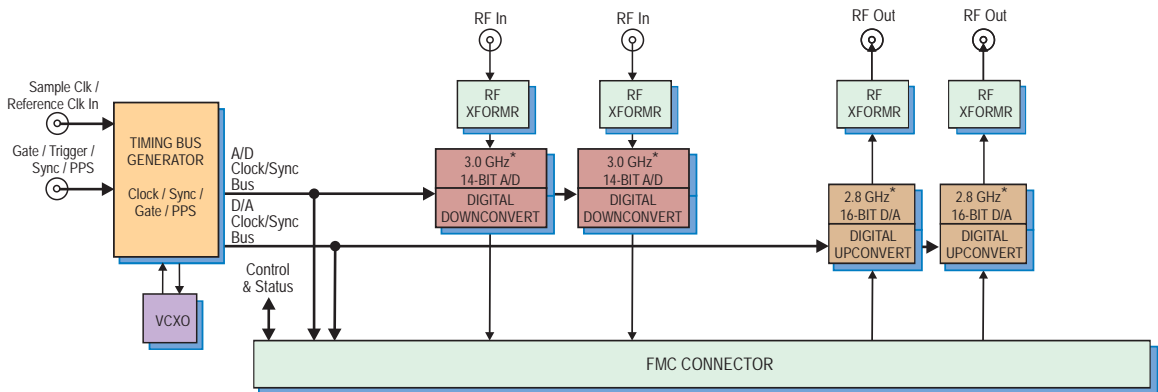

### A/D Acquisition IP Modules

With the 3320 installed on either the 5973 or the 7070 carrier, the board-set features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the two D/A waveform playback IP modules in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's job of identifying and executing on the data. ➤

\* See last page for configuration profiles

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Model 8267

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt, Onyx and Flexor VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### ► Digital Upconverter and D/A Stage

Two Texas Instruments DAC39J84 D/As accept two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide interpolation factors from 1x to 16x.

### D/A Waveform Playback IP Modules

A Texas Instruments DAC39J84 D/A accepts two baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the dual 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 2.8 GHz. In both modes the D/As provide programmable interpolation.

### Clocking and Synchronization

The 3320 architecture includes a timing bus generator, responsible for providing clocking to the data converters, FPGA and all synchronization circuits. When paired with the 5973 or the 7070, the FlexorSet's built-in functions include setup and support of the timing generator to produce the pre-defined data conversion profiles. This simplifies operation by allowing users to easily change profiles through software.

The timing bus generator has a built-in frequency synthesizer that allows the board to operate without the need for an external sample clock. If users prefer, an external clock can be accepted on a front panel coax connector. In addition, the connector can be programmed to accept a 10 MHz system reference, locking the on-board clock to the reference that enables synchronization across multiple boards.

A front panel LVTTTL Gate/Trigger/Sync connector is also included on the board. Users can program the connector's function to operate in one of three modes to match the application requirements.

### ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow® BSP provides control of all the 3320's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow® FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/320 or 7070/320 modules as documented source code. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

### FMC Interface

The Model 3320 complies with the VITA 57 High-Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3320 and the FMC carrier. ►

## ► Model 3320 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel SSMC connectors

## Model 3324

## 4-Ch. 500 MHz 16-bit A/D, 4-Ch. 2 GHz 16-bit D/A-FMC

### Features

- Sold as the:
  - [FlexorSet Model 5973-324](#)
  - [FlexorSet Model 7070-324](#)
- Four 500 MHz, 16-bit A/Ds
- Four digital upconverters
- Four 2 GHz, 16-bit D/As (500 MHz input data rate, 2 GHz output sample rate with interpolation)
- On-board timing bus generator with multiboard synchronization
- Sample clock synchronization to an external system reference
- VITA 57 FMC compatible
- Complete radar or software radio interface solution when combined with the Model 5973 3U OpenVPX or Model 7070 PCIe Virtex-7 FMC carrier
- Ruggedized and conduction-cooled versions available

### General Information

The Flexor™ Model 3324 is a multichannel, high-speed data converter FMC. It is suitable for connection to HF or IF ports of a communications or radar system. It includes four 500 MHz, 16-bit A/Ds, four 2 GHz, 16-bit D/As, programmable clocking, and multiboard synchronization for support of larger high-channelcount systems.

The 3324 is sold as a complete turnkey data acquisition and signal generation solution as the FlexorSet™ 5973-324 3U VPX or the FlexorSet 7070-324 PCIe board. For applications that require custom processing, the FlexorSets are ideal for IP development and deployment.

### A/D Converters

The front end accepts four analog HF or IF inputs on front-panel connectors with transformer-coupling into four 500 MHz, 16-bit A/D converters.

### Performance of the Model 3324

The true performance of the 3324 can be unlocked only when used with the Pentek Model 5973 or Model 7070 FMC carriers. With factory-installed IP, the board-set provides a turnkey data acquisition subsystem eliminating the need to create any FPGA IP. Installed features include flexible A/D acquisition, programmable linked-list DMA engines, and a D/A waveform playback IP module.

### A/D Acquisition IP Modules

With the 3324 installed on either the 5973 or the 7070 carrier, the board-set features four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the four A/Ds,

a test signal generator or from the D/A waveform playback IP module in loopback mode.

Each IP module can have an associated memory bank on the FMC carrier for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the FMC carrier's PCIe interface.

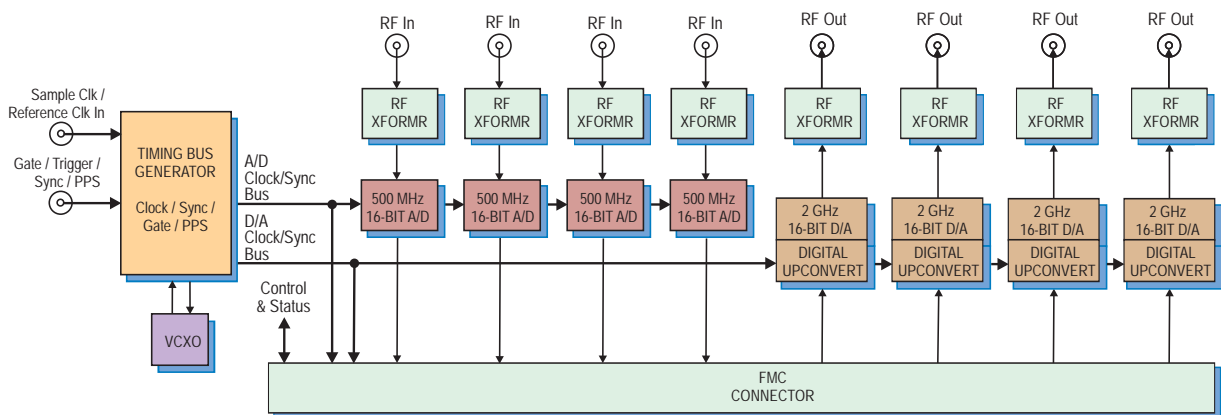

These powerful linked-list DMA engines are capable of a unique acquisition gate-driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data-length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

With the 5973 or the 7070, the 3324 features four sophisticated D/A waveform playback IP modules. A linked-list controller allows users to easily play back via the D/As waveforms stored in either on-board or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries per module can be chained together to create complex waveforms with a minimum of programming. ▶

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Model 8267

The Model 8267 is a fully-integrated VPX development system for Pentek Cobalt, Onyx and Flexor VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

3324	4-Channel 500 MHz 16-bit A/D, 4-Channel 2 GHz 16-bit D/A - FMC

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options
8267	VPX Development System See 8267 Datasheet for Options

## ► Digital Upconverters and D/As

Four D/As accept baseband real or complex data streams from the FPGA. Each stream then passes through the upconvert, interpolate and D/A stages of the converter.

When operating as DUCs (digital upconverters), the converters interpolate and translate real or complex baseband input signals to a programmable IF center frequency. The data is then delivered to the 16-bit D/A converter stages. Analog outputs are through front panel connectors.

If translation is disabled, the D/As act as interpolating 16-bit D/As with output sampling rates up to 1.5 GHz. In both modes the D/As provide interpolation factors of 2x, 4x, 8x and 16x.

## Clocking and Synchronization

Two internal timing buses provide all timing and synchronization required by the A/D and D/A converters. Each includes a clock, sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel coaxial connector. This clock can be used directly by the A/D or D/A sections or divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front coaxial panel connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel Gate/Trigger/PPS connector can receive an external timing signal allowing multiple modules to be synchronized and create larger multiboard systems.

## ReadyFlow Board Support Package

When used with the 5973 or the 7070, Pentek's ReadyFlow<sup>®</sup> BSP provides control of all the 3324's hardware and IP-based functions. Ready to run examples and a fully-sourced C library provide a quick-start and powerful platform to create custom applications. ReadyFlow is compatible with Windows and Linux operating systems.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek's GateFlow<sup>®</sup> FPGA Design Kits include all of the factory-installed Virtex-7-based 5973/3324 or 7070/3324 modules as documented

source code. Using Xilinx Vivado tools, developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek 5973/7070 IP with their own.

## FMC Interface

The Model 3324 complies with the VITA 57 High-Pin Count FMC specification. The interface provides all data, clocking, synchronization, control and status signals between the 3324 and the FMC carrier.

## Model 3324 Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC1-1TLB

**Full Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 250 kHz to 750 MHz

### A/D Converters

**Type:** Texas Instruments ADS54J60

**Sampling Rate:** up to 500 MHz

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full-Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### D/A Converters

**Type:** Texas Instruments DAC38J84

**Input Data Rate:** Up to 500 MHz

**Output Sample Rate:** Up to 2 GHz (with interpolation)

**Resolution:** 16 bits

**Sample Clock Source:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz) or front-panel external clock

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D and D/A clocks

### External Clock

**Type:** Front panel connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

### External Trigger Input

**Type:** Front panel connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Environmental:** Level L1 & L2 air-cooled, Level L3 conduction-cooled, ruggedized

**I/O Module Interface:** VITA-57.1, High-pin-count FMC

### Features

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

### General Information

The Bandit® Model 7120 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded PMC/XMC module with front-panel connectors for easy integration into RF systems, the module offers programmable gain, high dynamic range and a low noise figure.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 7120 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The 7120 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

### Quadrature Mixers

The 7120 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

### Tuning Accuracy

The 7120 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

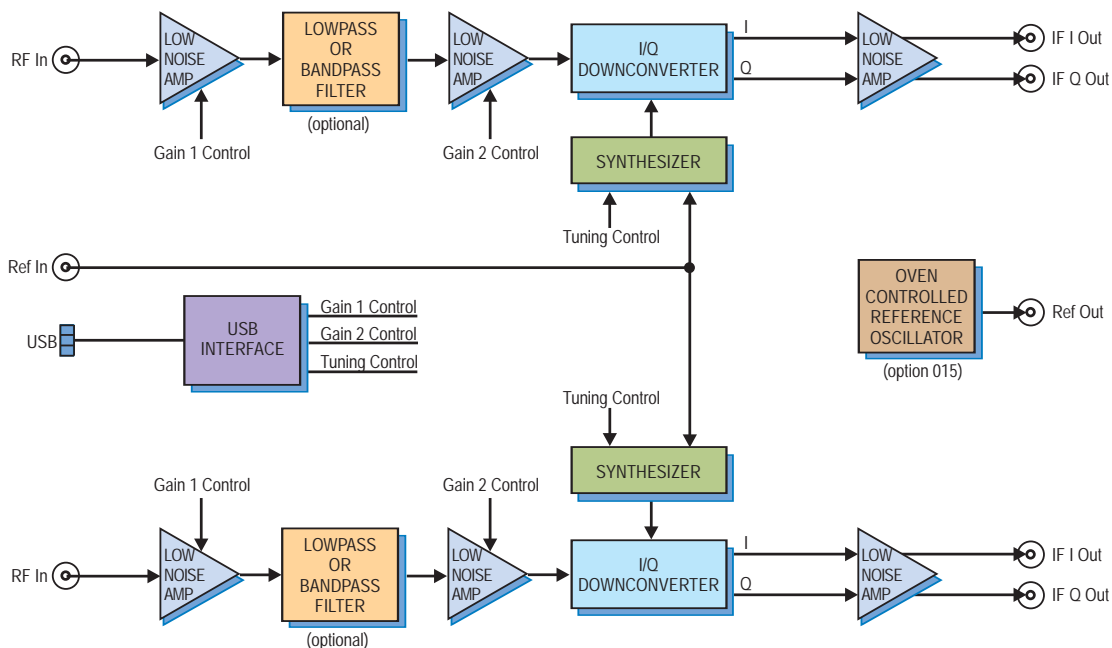

### On-board Reference Clock

In addition to accepting a 10 MHz reference signal on the front panel, the 7120 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Wideband Output

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

## ► Specifications

### RF Input

**Connector Type:** SSMC

**Input Impedance:** 50 ohms

**Input Level Range:** -60 dBm to -20 dBm

**Flatness:** ±2 dB from 400 MHz to 1 GHz,  
±3 dB from 1 GHz to 3 GHz, ±5 dB from  
3 GHz to 4 GHz

**RF Attenuator:** Programmable from 0 to  
63 dB in 0.5 dB steps

### LO Synthesizer Tuning

**Frequency range:** 400–4000 MHz,

**Resolution:** < 10 kHz

**Tuning Speed:** < 500 µsec

**Phase-Locked Loop Bandwidth:** 100 kHz

### Phase Noise

**1 kHz:** -90 dBc/Hz

**100 kHz:** -110 dBc/Hz

**1 MHz:** -130 dBc/Hz

### Noise Figure (referred to input)

**60 dB gain:** 2.6 dB

### Inband Output IP3

**20 dB gain:** +10 dBm

**60 dB gain:** +42 dBm

### Reference Input/Output

**Connector Type:** SSMC

**Input/Output Impedance:** 50 ohms

### Reference Input Signal

**Frequency:** 10 MHz

**Level:** 0 dBm, sine wave

### Reference Output Signal

**Frequency:** 10 MHz

**Level:** 0 dBm, sine wave

### OCXO Reference

**Center Frequency:** 10 MHz

**Frequency Stability vs. Change in**

**Temperature:** ±50.0 ppb

**Frequency Calibration:** ±1.0 ppm

### Aging

**Daily:** ±10 ppb/day

**First Year:** ±300 ppb

### Total Frequency Tolerance

**(20 years):** ±4.60 ppm

### Phase Noise

**1 Hz Offset:** -67 dBc/Hz

**10 Hz Offset:** -100 dBc/Hz

**100 Hz Offset:** -130 dBc/Hz

**1 KHz Offset:** -148 dBc/Hz

**10 KHz Offset:** -154 dBc/Hz

**100 KHz Offset:** -155 dBc/Hz

### IF Output

**Connector Type:** SSMC

**Output Impedance:** 50 ohms

**Center Frequency:** User definable

**Output Level:** 0 dBm, nominal

### Programming

**Functions:** RF Atten, IF Atten, Int/Ext

Reference Select, LO Synthesizer Frequency

**Interface:** USB

**Connector Type:** MicroUSB

### Power

**Voltage:** +12 VDC

**Current:** 1.5 A

**PMC/XMC Interface:** Power only on PMC

P11 (option -104) or XMC P15 (option -105)

**Size:** Standard PMC module, 2.91 in. x 5.87 in.

# Bandit Two- or Four-Channel Analog RF Wideband Downconverter - 6U OpenVPX

### General Information

These Bandit® models are two- or four-channel, high-performance, stand-alone analog RF wideband downconverters. Packaged in small, shielded 6U VPX boards with front-panel connectors for easy integration into RF systems, they offer programmable gain, high dynamic range and a low noise figure.

Model 5720 is a 6U VPX board that provides two channels, while Model 5820 is a double-density 6U VPX board that provides four channels.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, these models are ideal solutions for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The models accept RF signals on two or four front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

Model	Description
5720	Bandit Two-Channel Analog RF Wideband Downconverter - 6U VPX Single Density
5820	Bandit Four-Channel Analog RF Wideband Downconverter - 6U VPX Double Density

Option	Description
-015	Oven Controlled Reference Oscillator
-145	1.45 GHz lowpass input filter
-280	2.80 GHz lowpass input filter

Model 7420 Model 7320

**Features**

- Accept RF signals from 400 MHz to 4000 MHz
- Accept RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

**General Information**

These Bandit® models are two- or four-channel, high-performance, stand-alone analog RF wideband downconverters. Packaged in small, shielded cPCI boards with front-panel connectors for easy integration into RF systems, they offer programmable gain, high dynamic range and a low noise figure.

Model 7320 is a 3U cPCI board while Model 7220 is a 6U cPCI board; both provide two channels, while Model 7420 is a double-density 6U cPCI board that provides four channels.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, these models are ideal solutions for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

**Programmable Input Level**

The models accept RF signals on two or four front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB.

**Input Filter Options**

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

**Quadrature Mixers**

These models feature Analog Devices ADL5380 quadrature mixers. The ADL5380's

are capable of excellent accuracy with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

**Tuning Accuracy**

These models use the Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

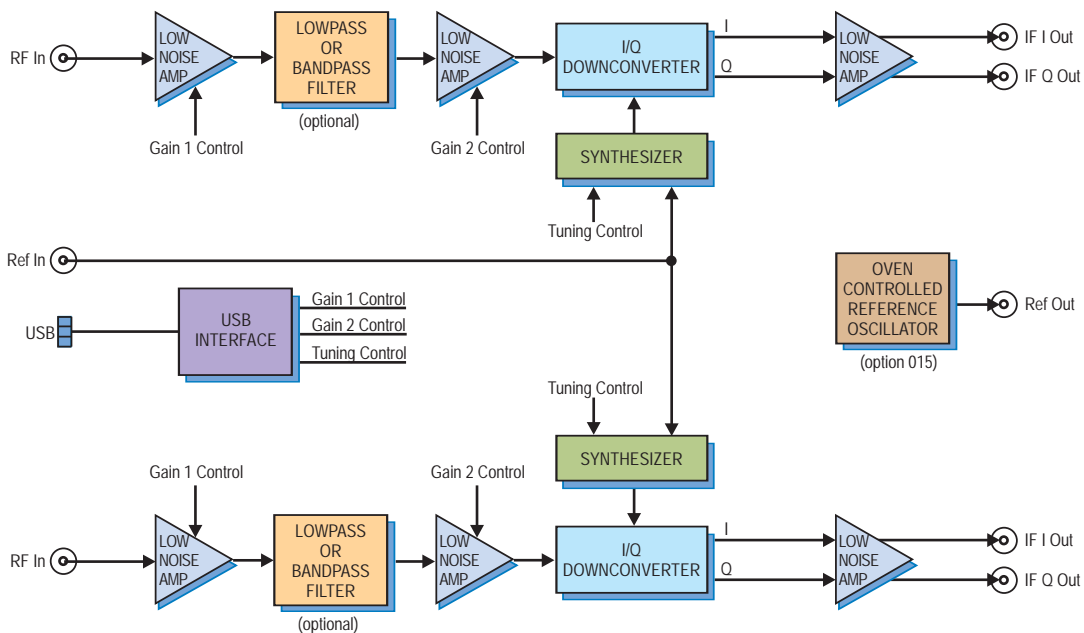

**On-board Reference Clock**

In addition to accepting a 10 MHz reference signal on the front panel, these models include on-board 10 MHz crystal oscillators which can be used as the reference to lock the internal LO frequency synthesizers.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

**Wideband Output**

Outputs are provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

7320	Bandit Two-Channel Analog RF Wideband Downconverter - 3U cPCI
7420	Bandit Four-Channel Analog RF Wideband Downconverter - 6U cPCI

Option	Description
-015	Oven Controlled Reference Oscillator
-145	1.45 GHz lowpass input filter
-280	2.80 GHz lowpass input filter

### Features

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

### General Information

The Bandit® Model 5620 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded AMC board with front-panel connectors for easy integration into RF systems, the board offers programmable gain, high dynamic range and a low noise figure.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 5620 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The 5620 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

### Quadrature Mixers

The 5620 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

### Tuning Accuracy

The 5620 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

### On-board Reference Clock

In addition to accepting a 10 MHz reference signal on the front panel, the 5620 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Wideband Output

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

Model	Description
5620	Bandit Two-Channel Analog RF Wideband Downconverter - AMC

Option	Description
-015	Oven Controlled Reference Oscillator
-145	1.45 GHz lowpass input filter
-280	2.80 GHz lowpass input filter

**Features**

- Accepts RF signals from 800 MHz to 3.000 GHz in seven different models
- Accepts RF input levels from -60 to -20 dBm
- 225 MHz IF output with 80 MHz output bandwidth
- Internal OCXO or external 10 MHz frequency reference

**General Information**

The Bandit® Model 8111 provides a series of high-performance, stand-alone analog RF slot downconverter modules. Packaged in a small, shielded enclosure with connectors for easy integration into RF systems, the modules offer programmable gain, high dynamic range and a low noise figure. With input options to cover specific frequency bands of the RF spectrum, and an IF output optimized for A/D converters, the 8111 is an ideal solution for amplifying and down-converting antenna signals for communications, radar and signal intelligence systems.

**Programmable Input Level**

The 8111 accepts RF signals on a front panel SMA connector. An LNA (Low Noise-figure Amplifier) is provided along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

**Preselector Options**

Seven different input-frequency band options are offered, each tunable across a 400 MHz band, with an overlap of 100 MHz between adjacent bands. As a group, these seven options accommodate RF input signals from 800 MHz to 3.000 GHz as follows:

Option	Frequency Band
001	800-1200 MHz
002	1100-1500 MHz
003	1400-1800 MHz
004	1700-2100 MHz
005	2000-2400 MHz
006	2300-2700 MHz
007	2600-3000 MHz

**Tuning Accuracy**

The 8111 uses a low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy, its frequency is programmable across the 400 MHz band with a tuning resolution of 1 MHz. Alternatively, for applications demanding custom local oscillator characteristics, an external LO input signal can be accepted on a front panel connector and used instead of the on-board frequency synthesizer.

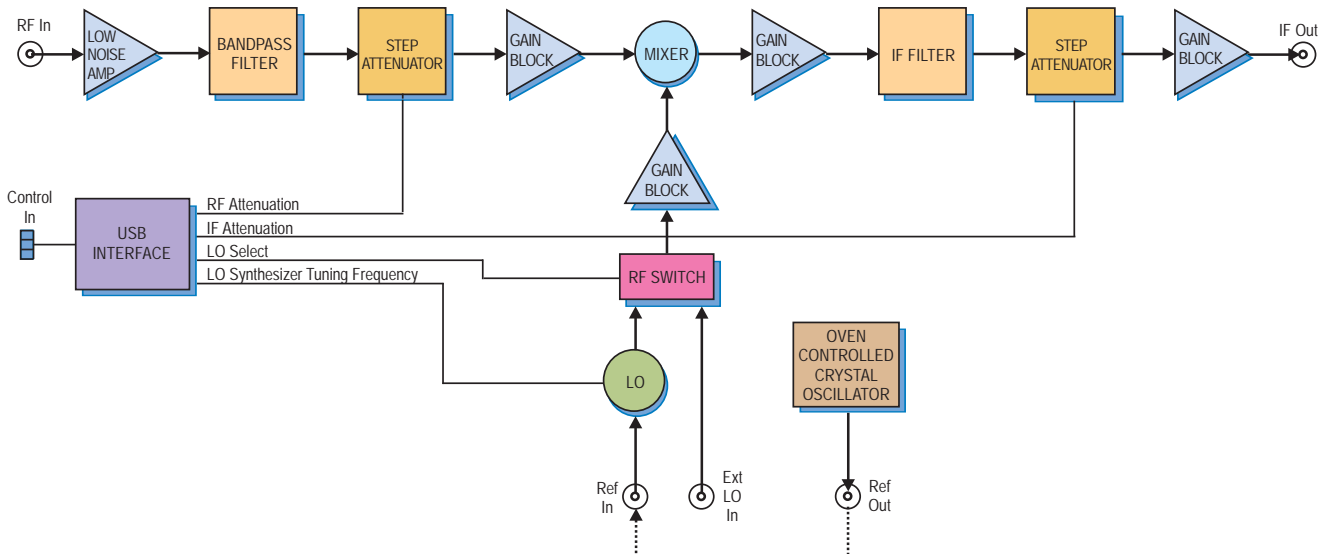

**On-board Reference Clock**

In addition to accepting a reference signal on the front panel, the 8111 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

**IF Output**

An 80 MHz-wide IF output is provided at a 225 MHz center frequency . This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

## Model 8264

# 6U OpenVPX Development System for Cobalt and Onyx Boards

### Features

- 9U 19-inch rackmount, 9-slot, 16-inch deep chassis which houses 6U VPX boards
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box ready-to-run examples

### General Information

The Model 8264 is a fully-integrated, 6U VPX development system for Pentek Cobalt® and Onyx® software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8264 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

### ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8264. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

### System Implementation

Built on a professional 9U rackmount workstation, the 8264 is equipped with the latest Intel i7 processor, DDR3 SDRAM and a high-performance single-board computer. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt and Onyx analog and digital interfaces. The 8264 can be configured with 64-bit Windows or Linux operating systems.

The 8264 uses a 19" 9U rackmount chassis that is 16" deep. Nine VPX slots provide ample space for an SBC, a switch card and multiple Pentek boards. Enhanced forced-air ventilation assures adequate cooling for all boards and dual 500-W power supplies guarantee more than adequate power for all installed boards. Mounting provisions for two 3.5 in. drives with front-accessible trays allow for easy removable storage. Front-panel access to USB, display, Ethernet and RS-232 ports simplifies development; an optional rear transition module supplements the front-panel connections with SATA, audio, a second video interface, and additional USB ports.

### Configuration

All 8264 systems come with software and hardware installed and tested. Up to seven Pentek boards in the 8264 can be supported. Please contact Pentek to configure a system that matches your specific requirements.

### Options

Available options include high-end multi-core CPUs and choice of Windows or Linux.

### Specifications

**Operating System:** 64-bit Windows 7

Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB

**Dimensions:** 6U Chassis, 19" W x 16" D x 10.5" H

**Weight:** 50 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

### Ordering Information

Model	Description
8264	6U VPX Development System for Cobalt and Onyx Boards

#### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS

The addition of third-party VPX boards may affect system performance. Please consult with us before doing so.

**Features**

- 4U 19-inch rackmount PC server chassis, 21-inch deep
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 8 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box test examples

**General Information**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt®, Onyx® and Flexor™ PCI Express software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8266 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

**ReadyFlow Software**

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8266. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek’s Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

**System Implementation**

Built on a professional 4U rackmount workstation, the 8266 is equipped with the latest Intel processor, DDR3 SDRAM and a high-performance motherboard. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces.

The 8266 can be configured with 64-bit Windows or Linux operating systems.

The 8266 uses a 19” 4U rackmount chassis that is 21” deep. Enhanced forced-air ventilation assures adequate cooling for Pentek Cobalt, Onyx and Flexor boards.

The chassis is designed to draw cool air from the front and push warm air out the back. A 1000 W, 80+ Gold Power Supply guarantees more than enough power for additional boards.

**Configuration**

Pentek uses a variety of motherboards to provide the flexibility for operation and cooling of each system. Up to four Pentek Cobalt, Onyx or Flexor boards in the 8266 can be supported. Please contact Pentek to configure a system that requires additional PCIe slots for 3rd party hardware.

**Options**

Options for high-end multicore CPUs and extended memory support applications that require additional horsepower are available.

**Specifications**

- Operating System:** 64-bit Windows 7 Professional or Linux
- Processor:** Intel Core i7 processor
- Clock Speed:** 3.6 GHz
- SDRAM:** 8 GB
- Dimensions:** 4U Chassis, 19" W x 21" D x 7" H
- Weight:** 35 lb, approx.
- Operating Temp:** 0° to +50° C
- Storage Temp:** -40° to +85° C
- Relative Humidity:** 5 to 95%, non-condensing
- Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

# Customer Information

## Placing an Order

When placing a purchase order for Pentek products, please provide the model number and product description. You may place your orders by letter, telephone, email or fax; you should confirm a verbal order by mail, email or fax.

All orders should specify a purchase order number, bill-to and ship-to address, method of shipment, and a contact name and telephone number.

U.S. orders should be made out to Pentek, Inc. and may be placed directly at our office address, or c/o our authorized sales representative in your area.

International orders may be placed with us, or with our authorized distributor in your country. They have pricing and availability information and they will be pleased to assist you.

## Prices and Price Quotations

All prices are F.O.B. factory in U.S. dollars. Shipping charges and applicable import, federal, state or local taxes, are paid by the purchaser.

We're glad to respond to your request for price quotation just contact the corporate office, or your local representative. Price and delivery quotations are valid for 30 days, unless otherwise stated.

Quantity discounts for large orders are available and will be included in our price quotation, if applicable.

## Terms

Terms are Net 30 days for accounts with established credit; until credit is established, we require prepayment, or will ship C.O.D.

## Shipping

For new orders, we normally ship UPS ground with shipping charges prepaid and added to our invoice. If you are in a hurry, we will ship UPS Red, UPS Blue, FedEx, or the carrier of your choice, as you request.

## Order Cancellation and Returns

All orders placed with Pentek are considered binding and are subject to cancellation charges. Hardware products may be returned within 30 days after receipt, subject to a restocking charge. Before returning a product, please call Customer Service to obtain a Return Material Authorization (RMA) number. Software purchases are final and we cannot allow returns.

## Warranty

Pentek warrants its products to conform to published specifications and to be free from defects in materials and workmanship for a period of one year from the date of delivery, when used under normal operating conditions and within the service conditions for which they were furnished.

The obligation of Pentek arising from a warranty claim shall be limited to repairing or, optionally, replacing without charge any product which proves to be defective within the term and scope of the warranty.

Pentek must be notified of the defect or nonconformity within the warranty period. The affected product must be returned with shipping charges and insurance prepaid. Pentek will pay shipping charges for the return of product to buyer, except for products returned from outside the USA.

## Limitations of Warranty

This warranty does not apply to products which have been repaired or altered by anyone other than Pentek or its authorized representatives.

The warranty does not extend to products that have been damaged by misuse, neglect, improper installation, unauthorized modification, or extreme environmental conditions, that fall outside of the scope of the product's environmental specifications.

Due to the normal, finite write-cycle limits of Solid State Drives (SSDs), Pentek shall not be liable for warranty coverage of SSDs caused by wear-related issues that arise as an SSD reaches its write-cycle limit.

Pentek specifically disclaims merchantability or fitness for a particular purpose. Pentek shall not be held liable for incidental or consequential damages arising from the sale, use, or installation of any Pentek product. Regardless of circumstances, Pentek's liability under this warranty shall not exceed the purchase price of the product.

## Extended Warranty

You may purchase an extended warranty on our board-level products for a fee of 1% of the list price per month of coverage, or 10% of the list price per year of coverage.

All Pentek software products (excluding 3rd-party products) include free maintenance and free upgrades for one year. Extended software maintenance is available for one, two, and three years, starting after the first year.

## Service and Repair

You must obtain a Return Material Authorization (RMA) before returning any product to Pentek for service or repair. RMA requests must be submitted online at:

[Return Material Authorization Form](#)

After the form is completed in its entirety and submitted, Pentek shall email you a receipt and start processing your request. Once your request has been approved, Pentek shall e-mail you an RMA number, shipping instructions, and a quotation if the product is out of warranty.

Carefully package the product in its original packaging, if it is still available, and ship it to Pentek prepaid (if within the US) or free domicile DDP (if outside the US). Pentek shall not be responsible for loss or damage in shipment to Pentek, so you are strongly encouraged to insure the shipment for its full replacement value.

When the work is completed, we will return the product to you along with a statement of work performed.

Customer Service phone: 201-818-5900 • fax: 201-818-5697  
• email: [custsrv@pentek.com](mailto:custsrv@pentek.com)

# Talon High-Speed Recording Systems: Flexible and Deployable Solutions

## Systems Include:

- High-performance Windows® workstation
- High-performance Intel® Processor
- Pentek SystemFlow® recording software with graphical user interface
- SystemFlow analysis tools such as virtual oscilloscope and spectrum analyzer
- Supported RAID levels of up to 0, 1, 5, 6, 10 and 50
- Time and position stamping support
- Detailed technical documentation

## Systems Benefits:

- Complete turnkey systems
- Rack-mountable and portable form factors
- C-callable API for integration of recorder into application
- Aggregate recording rates of up to 5.0 GB/sec
- Recording to non-proprietary NTFS file system for easy and immediate data access
- Ideal for communications, radar, wireless, SIGINT, telecom and satcom
- They are easy to use right out-of-the-box
- Can be controlled over the Ethernet or over the Internet

## High-Speed Recording Systems

Talon® High-Speed Recording Systems eliminate the time and risk associated with new technology system development. With increasing pressure in both the defense and commercial arenas to get to the market first, today's system engineers are looking for more complete off-the-shelf system offerings.

Out of the box, these systems arrive complete with a full-featured virtual operator control panel ready for immediate data recording and/or playback operation.

Because they consist of modular COTS board-level products and the flexible Pentek SystemFlow software, they are easily scalable to larger multichannel data acquisition and recording applications requiring aggregate recording rates of up to 5.0 GB/sec.

## Ready-to-Run Recording Systems

Depending on model, the Pentek offerings are fully integrated systems featuring a range of A/D and D/A resources or digital I/O with high-speed disk arrays.

Since these systems are built on a Windows workstation, users can easily install post-processing and analysis tools to operate on the recorded data.

Pentek systems provide a flexible architecture that can be easily customized to meet user needs. Multiple RAID levels of up to 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy.

## Systems for All Recording Needs

Pentek's High-Speed Recording Systems are available as Lab Systems, Portable Systems, Rugged, and Extreme Systems.

**RTV and RTS Lab Systems** are housed in a 19-in. rack-mountable chassis in a PC server configuration. They are designed for commercial applications in a lab or office environment.

RTS Lab System

**RTR Portable Systems** are available in a small briefcase-sized enclosure with an integral LCD display and keyboard. They, too, provide a PC server configuration and are designed for commercial or harsh environment field applications where size and weight is of paramount importance.

RTR Portable System

**RTR Rugged Rackmount Systems** are housed in a 19-in. rugged rack-mountable chassis. They are built to survive shock and vibration and they target operation in harsh environments and remote locations that may be unsuitable for humans.

RTR Rugged Rackmount System

**RTX Extreme Systems** are available in either a rackmount chassis designed to military specs, or a ½ ATR chassis.

They are designed to operate under extreme environmental conditions using forced-air or conduction-cooling to draw heat from system components.

RTX Rackmount System.

½ ATR System

*RTV Recording Systems are excellent value for under \$20,000*

*RTS Recording Systems are designed for commercial applications*

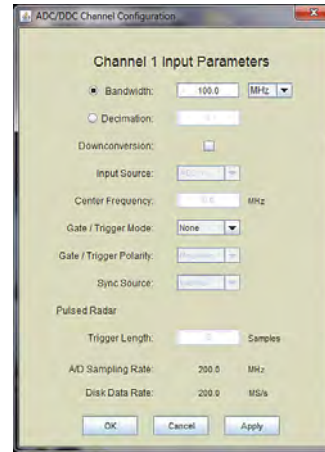

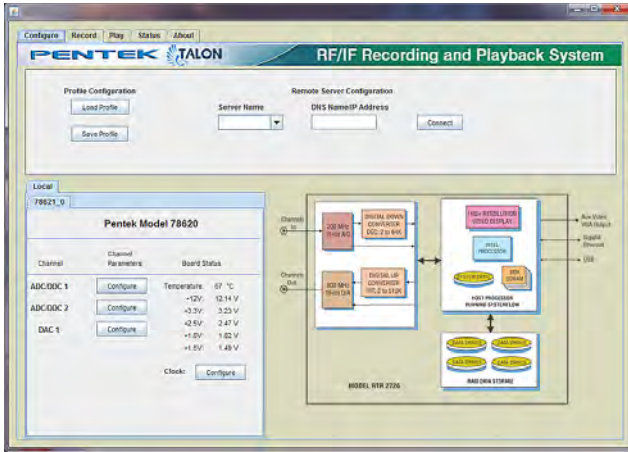

*RTR Recording Systems are designed for harsh environments*

*RTX Recording Systems are designed for extreme environments*

# SystemFlow Graphical User Interface

## SystemFlow Recorder Interface

The SystemFlow GUI displays a block diagram of the system and provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels.

## SystemFlow Hardware Configuration Interface

The SystemFlow Configure screen provides a simple and intuitive means for setting up the system parameters. The configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

## SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field.

# Recording and Playback Dataflow

## Recording Dataflow

Shown in this diagram is the dataflow during a typical recording session. The Pentek Transceiver Board contains a 2-channel 200 MHz A/D for digitizing two input analog channels. The digitized outputs are downconverted by the two DDCs (Digital Downconverters) and moved on to the PC system memory via the PCI Express inter-

face. Both the DDCs and the PCIe interface are implemented in the board's FPGA. Data then moves from the system memory to the Recording System RAID Controller and is then recorded to disk via the SATA interface. DMA controllers conduct all data transfers, bypassing the CPU for guaranteed real-time operation.

## Playback Dataflow

During a playback session, data stored on disk moves through the SATA interface of the Playback System RAID Controller. From there, data is passed to the PC system memory through the PCIe interface and then to the Pentek Transceiver board through its PCIe interface, all via hardware DMA controllers for real-time operation.

This board also contains DUCs (Digital Upconverters) which upconvert the data to the original IF frequency bands. Two 800 MHz D/As convert the data to analog form and provide signals that are identical to the analog signals that were originally recorded.

These can be further analyzed with any Windows-compatible analysis software.

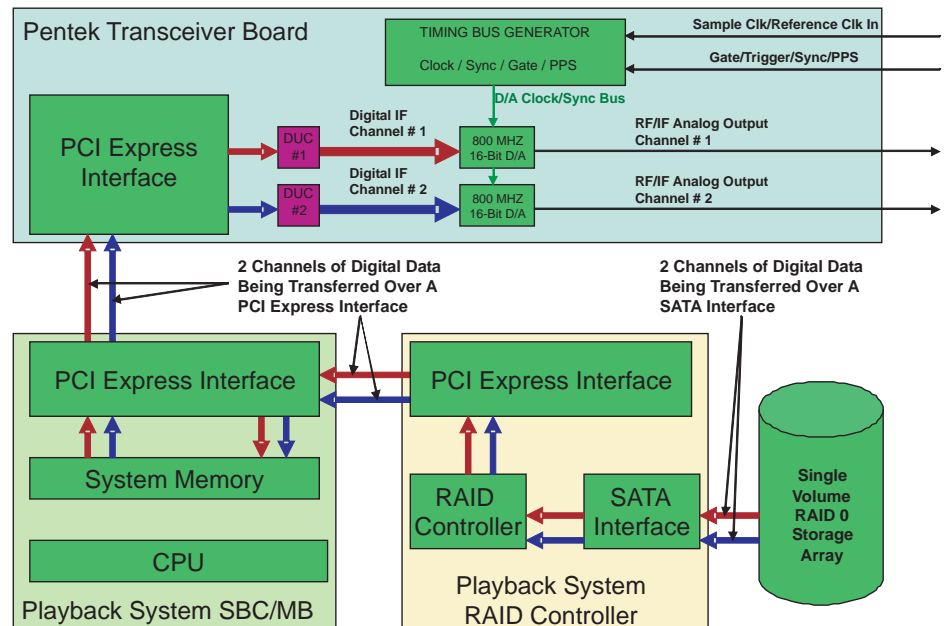

Figure 1. Rackmount RTX chassis is designed to meet or exceed Mil Specs.

Figure 2. Chassis View showing one QuickPac canister partially withdrawn.

Figure 3. Dimensional drawings of the rackmount enclosure.

## Extreme Rackmount Recorders

Pentek's Talon® RTX Rackmount series recorders are designed to provide a combination of high performance and large storage capacity in a military-specified rackmount chassis. Designed for field operation, the RTX Rackmount series provides up to 30 TB of SSD storage with aggregate recording rates up to 5 GB/sec.

## Military Specifications

All Talon RTX rackmount recorders are designed to meet military specifications for temperature, altitude, shock, vibration, radiated emissions, conducted emissions, ESD, sand and dust.

The following list contains these military specifications.

- **Vibration:** MIL-STD-810F, method 514.5
- **Shock:** MIL-STD-810F, method 516.5
- **EMI/EMC:** MIL-STD-461E, CE101, CE102, CS101 CS114, RE101, RE102, RS101, RS103
- **ESD:** MIL-STD-1686A
- **Sand & Dust:** MIL-STD-810F, method 510

## Chassis Design

All Talon RTX rackmount chassis are specially designed using heavy-duty wrought aluminum extrusions to provide superior torsional strength. Extrusions are partially overlapped for superior EMC. The chassis is 4U in height, with a depth of only 22". A fully-loaded chassis weighs as little as 45 lb.

Rear-panel I/O includes bulk-head mounted SMA connectors, a 4-pin 38999 power connector as well as motherboard I/O. Rear-panels are modular and customizable allowing the end-user to specify the desired connectors.

The Operating System drive can be internally hard-mounted or can be made removable. Additionally an internally-mounted optical DVD writer is optional. All drives, OS, DVD and data drives are protected from dust with EMI filters.

Figure 4. The rear panel includes all analog signal connections and can be customized to suit the application requirements.

## QuickPac Canisters

In order to provide field engineers the ability to quickly remove and replace storage drives in the field, Pentek has developed the QuickPac™ canisters for use in the Talon RTX rackmount chassis. These canisters hold eight SSDs, providing up to 7.68 TB of storage capacity in each canister. Up to four QuickPac canisters can be installed in a Talon RTX rackmount chassis, providing a total storage capacity of 30 TB.

Fastened by four thumbscrews, QuickPac canisters can easily be swapped in the field, allowing users to replace those filled with data with new, empty ones with very little down time. QuickPac canisters can be transported to the lab for offload or analysis, using one of Pentek's Talon offload or playback systems.

Figure 5. Front and rear view of the QuickPac canister showing the eight SSDs inside.

## Floating Inner Chassis

In order to withstand conditions of high vibration and shock, the RTX rackmount chassis is designed to isolate all critical system components by placing them on a floating inner chassis.

This inner chassis is suspended using multiaxis mounts that attenuate externally-transmitted shock and vibration energy. This allows the system to perform flawlessly in aircraft, ships, ground vehicles, UAVs or any other areas of high shock or vibration.

Figure 6. The inner chassis floats with respect to the outer enclosure to improve isolation from shock and vibration.

**Cooling and Filtering**

Every RTX recorder includes a high-powered forced air-cooling system, to allow the proper transfer of heat from hot system components out the back of the chassis. Cool air is pulled from the front of the system through the QuickPac drive packs and forced over the hottest system components to ensure optimal cooling.

High-powered fans can be controlled via system software to allow the system to

run quietly with lower cooling levels or at maximum air flow levels. This can be adjusted to match the user’s application.

Every RTX recorder includes filtering necessary to protect the system as well as the surrounding operating environment. EMI filters are placed on the front and rear of the chassis, to protect the surrounding environment from radiated emissions. A removable front panel filter protects the system against dust and sand.

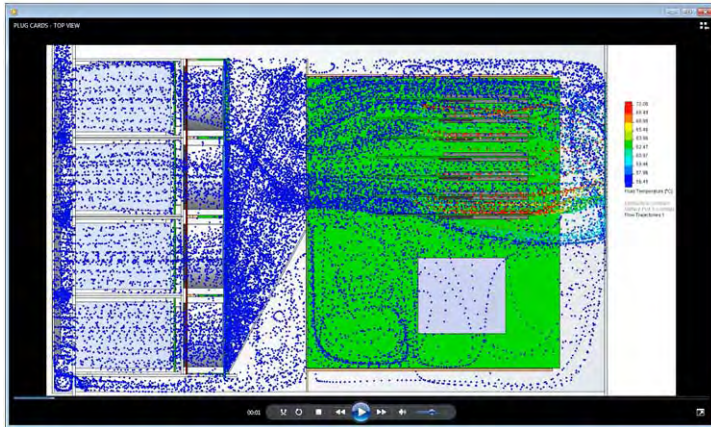

Figure 7. Airflow map shows the extensive ventilation provided to all components inside the RTX rackmount recorder.

**Modular Power Supply**

Every Talon RTX rackmount Recorder includes a 600 Watt, 85 – 264 V, 47– 400 Hz AC power supply. The power supply has an inline EMI filter to protect against conducted emissions and is isolated from the other electronics in the system, via an isolated chassis compartment. The 400 Hz rating allows every RTX rackmount recorder to operate in aircraft and other environments where smaller, 400 Hz generators are used. For applications that require DC power, 24 V and 28 V DC power supplies are available to replace the AC power supply.

**Talon Solutions Chart**

The chart below compares Pentek’s different Talon Recording System solutions. As seen here, the RTX Rackmount series

provide high performance and large storage capacity in a rugged package that meets high-level military specifications.

Talon Chassis Type	RTS-COTS Rackmount	RTR Portable	RTR Rackmount	RTX Rackmount	RTX 1/2 ATR
Dimensions (H”xW”xL”)	7x19x26	13.4x16.9x9.5	7x19x21/26	7x19x22	8.1x7.1x16.5
Weight (lb)	60–85	30–35	45–85	45–60	30–35
Cooling	Forced-air	Forced-air	Forced-air	Forced-air	Conduction
Storage Drive Type	HDD	SSD	SSD	SSD	SSD
Max. Storage Capacity (TB)	60	7.6	38.4	30.7	3.8
Max. Record Rate (MB/sec)	1600	1600	5000	5000	500
Drive Removal	Individual (with trays)	Individual (no trays)	Individual (with trays)	QuickPac Canisters	Internal (needs disassembly)
Operating Temperature (deg C)	5 to 45	0 to 50	-10 to 55	-20 to 55	-40 to 71
Operating Altitude (ft)	10,000	10,000	10,000	15,000	65,000
Shock	–	15 g	15 g	MIL-STD-810F Method 516.5	MIL-STD-810F Method 516.5
Vibration	–	1.4 g 20–500 Hz	1.4 g 20–500 Hz	MIL-STD-810F Method 514.5	MIL-STD-810F Method 514.5
EMI/EMC	–	–	–	MIL-STD-461E CE101, CE102, CS101 CS114, RE101, RE102 RS101, RS103	MIL-STD-461E CE101, CE102, CS101 RE101, RE102, RS101
ESD	–	–	–	MIL-STD-1686A	–
Sand and Dust	–	–	–	MIL-STD-810F Method 510	MIL-STD-810F Method 510

Appendix A - System Specifications Summary

Parameter	Condition	Specification
Temperature	Operating	-20 <sup>0</sup> C to +55 <sup>0</sup> C
	Non-operating	-40 <sup>0</sup> C to +70 <sup>0</sup> C
Altitude	Operating	0 to 15,000 ft
	Non-operating	0 to 40,000 ft
Humidity	Operating	0-95%, non-condensing
Fungus	Operating	No fungus nutrient material shall be used
Shock	Operating	MIL-STD-810F, Method 516.5, Procedure I (functional shock), 20 g half sine, 12 msec in each axis
Vibration	Operating	MIL-STD-810F, Method 514.5, Procedure I
Airborne Noise	Operating	60 dBA max at 1 meter from the equipment
Structure-borne Noise	Operating	Maximum structure-borne noise per MIL-STD-704-2 is no greater than 60 dB one-third octave L <sub>a</sub> , (Type III)
Blowing Dust	Operating	The unit shall resume specified performance after exposed to settling-dust conditions defined in MIL-STD-810F, Method 510, Procedure II - See Note 1
Inclination Angles	Operating	The unit shall maintain specified performance when subjected to: <ul style="list-style-type: none"> <li>● A static pitch angle of ±5<sup>0</sup></li> <li>● A list angle of 15<sup>0</sup></li> <li>● A roll angle of 45<sup>0</sup></li> </ul>

Note 1: Standard maintenance includes cleaning of the dust filter(s) as required.

Appendix B - Emissions Specifications Summary

- CE101: Conducted Emissions, Power Leads, 30 Hz to 10 kHz
- CE102: Conducted Emissions, Power Leads, 10 kHz to 10 MHz
- CS101: Conducted Susceptibility, Power Leads, 30 Hz to 50 kHz
- CS114: Conducted Susceptibility, Bulk Cable Injection, 10 kHz to 400 MHz
- CS116: Conducted Susceptibility, Damped Sinusoidal Transients, Cable and Power Leads, 10 kHz to 100 MHz
- RE101: Radiated Emissions, Magnetic Field, 30 Hz to 100 kHz
- RE102: Radiated Emissions, Electric Field, 10 kHz to 18 GHz
- RS101: Radiated Susceptibility, Magnetic Field, 30 Hz to 100 kHz
- RS103: Radiated Susceptibility, Electric Field, 10 kHz to 40 GHz

Specifications are subject to change without notice

**Features**

- Single-channel multiband recording and playback system.
- 4U 19-inch industrial rackmount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i3 processor
- 200 MHz max. 16-bit A/D sampling for recording
- 800 MHz max. 16-bit D/A sampling for playback
- 80 MHz recording and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Real-time aggregate recording rates up to 400 MB/sec
- 4 TB of data storage to NTFS RAID disk array
- SystemFlow® recording software with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- DDC decimation and DUC interpolation range from 2 to 65,536
- Optional GPS time and position stamping

**General Information**

The Talon® RTV 2601 is a turnkey multi-band recording and playback system used for recording and reproducing signals with bandwidths up to 80 MHz. The RTV 2601 uses a 16-bit, 200 MHz A/D converter to provide real-time sustained recording rates to disk of up to 400 MB/sec. The A/D is complemented with a 16-bit 800 MHz D/A that provides the ability to reproduce signals captured in the field.

The RTV 2601 comes in a 4U 19 in. rackmount package that is 22.75 in. deep. Signal I/O is provided in the rear of the unit, while the hot-swappable data drives are available at the front. Air is pulled through the system from front to back allowing it to operate at ambient temperatures from 5 to 35 deg C.

The RTV 2601 includes a programmable digital downconverter so users can configure the system to capture signals with frequencies as low as 300 kHz and as high as 700 MHz. Corresponding signal bandwidths range from a few kilohertz to 80 MHz. A digital upconverter and D/A produce an analog output matching the recorded IF signal frequency.

The system includes a built-in sample clock synthesizer programmable to any desired frequency from 10 MHz to 200 MHz. This clock synthesizer can be locked to an external 10 MHz reference clock and has excellent phase noise characteristics. Alternately, the user can supply an external sample

clock to drive the A/D and D/A converters. The RTV 2601 also supports external triggering, allowing users to trigger a recording or playback on an external signal.

As an option, a GPS or IRIG receiver card can be supplied with the system providing accurate time stamping of recorded data. Additionally, the GPS receiver delivers GPS position information that can be recorded along with the analog input signal.

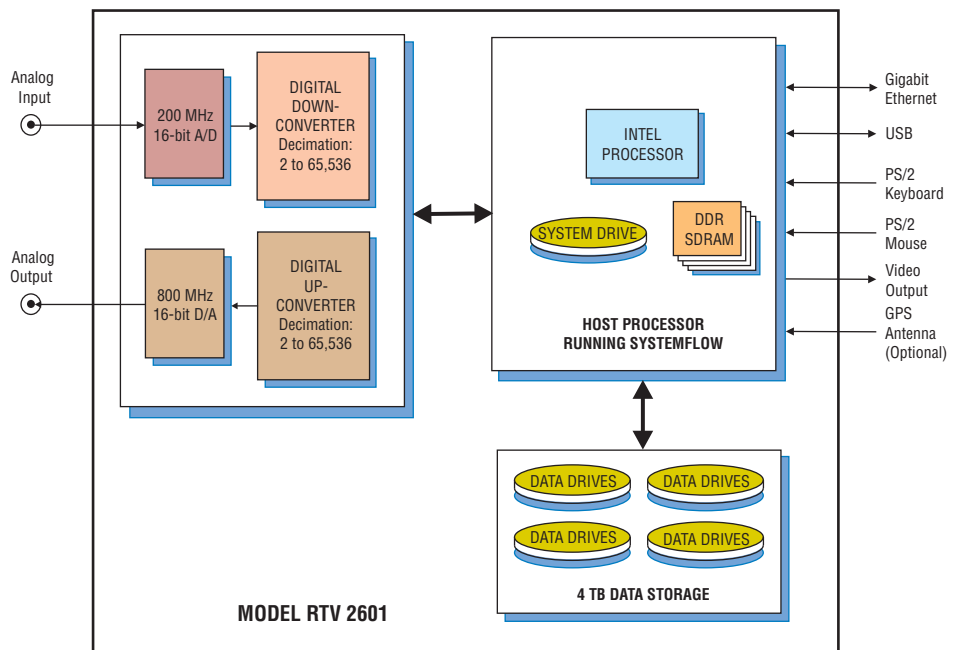

**SystemFlow Software and API**

The RTV 2601 includes the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder.

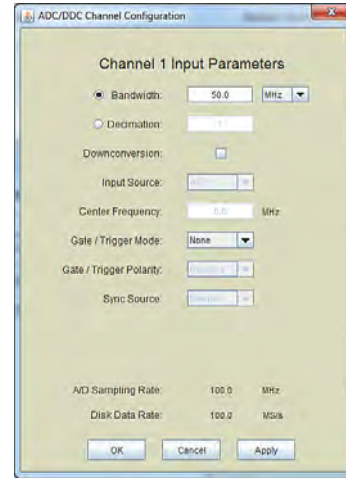

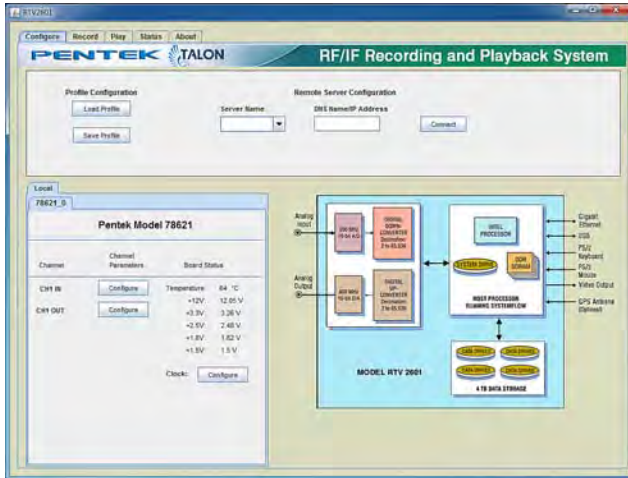

Custom configurations can be stored as profiles and later loaded when needed, so users can select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, for monitoring the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

In addition to the GUI, the RTV 2601 provides a C-callable API, which allows the user to integrate the recorder control into any application. A simple set of commands that provide configuration and control come with source code and examples to allow for an exceptionally fast integration. ➤

► SystemFlow Graphical User Interface

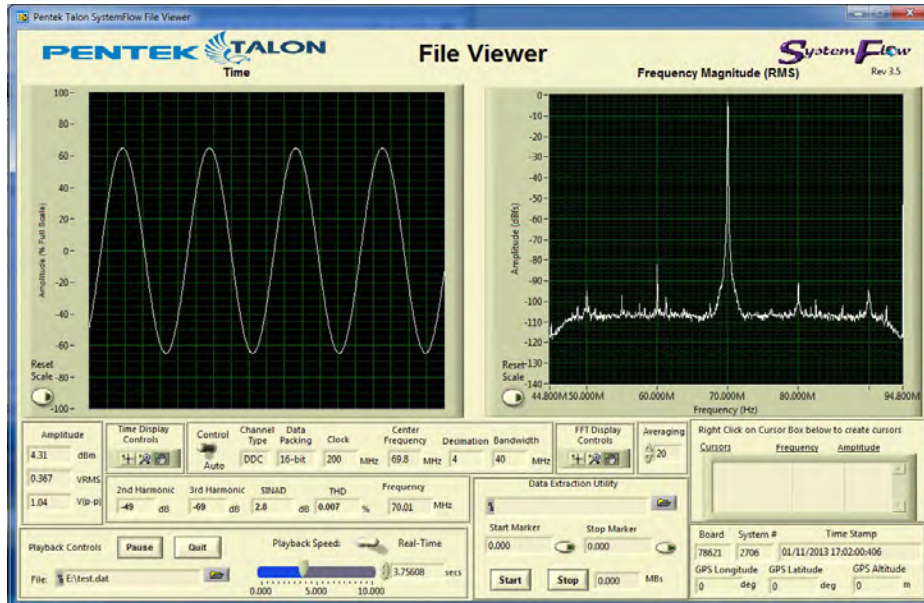

SystemFlow Recorder Interface

The RTV 2601 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTV 2601 Configure screens provide a simple and intuitive means for setting up the system parameters. The configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► System Architecture

Built on a Windows 7 Professional workstation, the RTV 2601 allows the user to install post-processing and analysis tools to operate on the recorded data. The recorder stores data in the native NTFS file system, providing immediate access to any installed Windows application. Alternately, the NTFS drive can be accessed remotely over the built-in gigabit Ethernet link from a remote Windows or Linux machine.

Recorded data can be off-loaded via the rear-panel gigabit Ethernet port, two front-panel USB 3.0 ports, two rear-panel USB 3.0 ports or four rear-panel USB 2.0 ports. A built-in DVD +/- R/RW drive allows the user to burn recorded data to disk. Hot-swappable front-panel drives can be easily removed and replaced with empty drives to provide additional data storage.

## Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i3 processor

**Clock Speed:** 2.0 GHz or higher

**SDRAM:** 8 GB

### RAID

**Storage:** 4 TB

**Number of Drives:** Six, removable, front panel access

**Optical Drive:** DVD +/- R/RW, front panel access

**USB Ports:** Front panel: 2x USB 3.0; rear panel: 2x USB 3.0, 4x USB 2.0

**Ethernet:** Single 1GbE, rear panel

**Supported RAID Levels:** 0

### Analog Recording Input

#### Analog Signal Inputs

**Input Type:** Transformer-coupled, rear-panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate ( $f_s$ ):** 10 MHz to 200 MHz

**Resolution:** 16 bits

**A/D Record Bandwidth:**  $f_s/2 =$  Nyquist bandwidth

**Anti-Aliasing Filter:** External, user-supplied

### Digital Downconverter

**Type:** Virtex-6 FPGA, Pentek DDC IP Core

**Decimation(D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 * f_s / D$

### Analog Recording Output

**Output Type:** Transformer-coupled, rear-panel female SSMC connector

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Digital Upconverter and D/As

**Interpolation:** 2 to 65,536

**Input Data Rate:** 250 MHz max.

**Bandwidth:** matches digital downconverter

**Output IF:** DC to 400 MHz

**Output Signal:** Analog, real or quadrature

**Output Sampling Rate:** 800 MHz max. with 2, 4 or 8 interpolation

**Resolution:** 16 bits

**Clock Sources:** Selectable from onboard programmable VCXO or external

### External Clocks

**Function:** Synthesizer reference clock (10 MHz typical) or A/D or D/A sample clock

**Type:** Rear-panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 800 MHz

### Physical and Environmental

**Size:** 19" W x 22.75" D x 7" H

**Weight:** 50 lbs

**Operating Temp:** +5° to +35° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Model RTV 2601 Options Information

### General Options

**Option -261** GPS time & position stamping

**Option -264** IRIG-B time stamping

*Specifications are subject to change without notice*

## Features

- Complete multiband recording and playback system
- 4U 19-inch industrial rack-mount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 200 MHz max. 16-bit A/D sampling for recording, up to eight channels
- 800 MHz 16-bit D/A sampling for playback, up to eight channels
- 80 MHz recording and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Real-time aggregate recording rates of up to 1.6 GB/sec
- Up to 100 terabytes storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- DDC decimation and DUC interpolation range from 2 to 65,536
- Optional GPS time and position stamping

Contact factory for options, number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTS 2706 is a turnkey, multi-band recording and playback system for recording and reproducing high-bandwidth signals. The RTS 2706 uses 16-bit, 200 MHz A/D converters and provides sustained recording rates up to 1.6 GB/sec in four-channel configuration.

The RTS 2706 uses Pentek's high-powered Virtex-6-based Cobalt® modules, that provide flexibility in channel count, with optional digital downconversion capabilities. Optional 16-bit, 1.25 GHz D/A converters with digital upconversion allow real-time reproduction of recorded signals.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates and DUC interpolations are among the GUI-selectable system parameters, providing a fully-programmable system capable of recording and reproducing a wide range of signals.

Optional GPS time and position stamping allows the user to record this critical signal information.

## SystemFlow Software

The RTS 2706 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

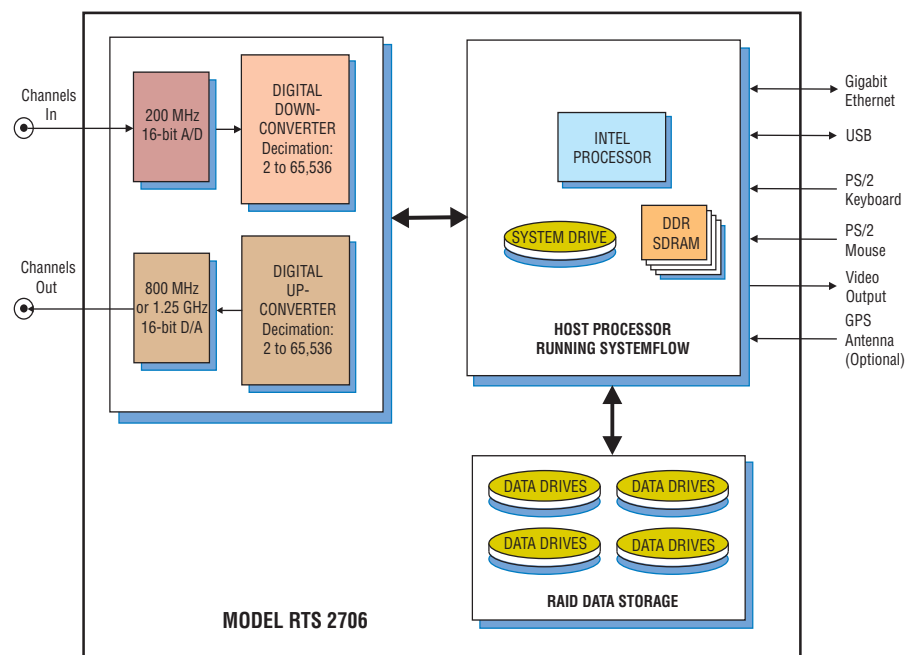

Built on a Windows 7 Professional workstation, the RTS 2706 allows the user to install post processing and analysis tools to operate on the recorded data. The RTS 2706 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports, six USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Flexible Architecture

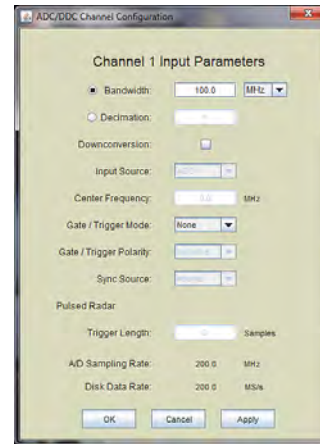

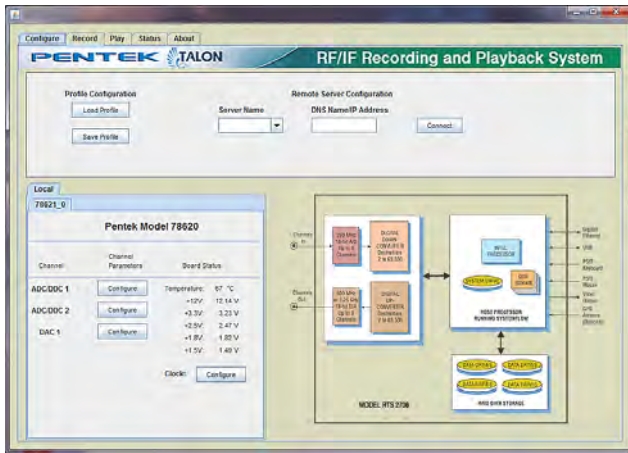

The RTS 2706 is configured in a 4U 19" rack-mountable chassis, with hot-swappable data drives, front panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. The hot-swappable HDDs provide storage capacities of up to 100 TB in a single 6U chassis. ➤

► SystemFlow Graphical User Interface

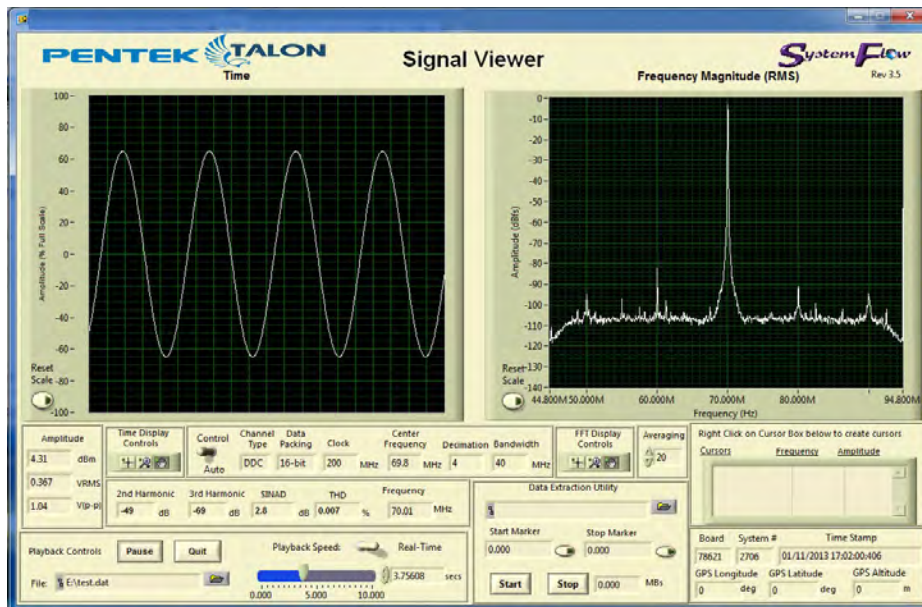

SystemFlow Recorder Interface

The RTS 2706 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTS 2706 Configure screens provide a simple and intuitive means for setting up the system parameters. The configuration screen shown here, provides entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 2.0 GHz or higher

**SDRAM:** 6 GB

### RAID

**Storage:** 2–100 TB

**Supported RAID Levels:** 0, 1, 5, 6, 10 and 50

### Analog Recording Inputs/ Outputs

#### Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate ( $f_s$ ):** 10 MHz to 200 MHz

**Resolution:** 16 bits

**A/D Record Bandwidth:**  $f_s/2$  = Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

#### Digital Downconverter

**Type:** Virtex-6 FPGA, Pentek DDC IP Core

**Decimation Range (D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$  (80 MHz max)

#### Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### Digital Upconverter and D/As

**Type:** TI DAC5688 and Pentek-installed interpolation IP core

**Interpolation:** 2 to 65,536

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz

**Output Signal:** Analog, real or quadrature

**Output Sampling Rate:** 800 MHz max. with 2, 4 or 8 interpolation

**Resolution:** 16 bits

**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

#### External Clocks

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

**Multi-Recorder Sync/Gate Bus:** 26-pin connector, dual clock/sync/gate input/output LVDS buses; one sync/gate input TTL signal

#### Physical and Environmental

**Size:** 19" W x 26" D x 7" H

**Weight:** 60-85 lb

**Operating Temp:** +5° to +45° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Model RTS 2706 Ordering Information and Options

### Channel Configurations

<b>Option -201</b>	1-channel recording
<b>Option -202</b>	2-channel recording
<b>Option -203</b>	3-channel recording
<b>Option -204</b>	4-channel recording
<b>Option -208</b>	8-channel recording
<b>Option -221</b>	1-channel playback
<b>Option -222</b>	2-channel playback
<b>Option -224</b>	4-Channel playback
<b>Option -228</b>	8-Channel playback

### Storage Options

<b>Option -406</b>	2.0 TB HDD storage capacity
<b>Option -411</b>	4.0 TB HDD storage capacity
<b>Option -416</b>	8.0 TB HDD storage capacity
<b>Option -421</b>	16.0 TB HDD storage capacity
<b>Option -423</b>	20.0 TB HDD storage capacity
<b>Option -439</b>	30.0 TB HDD storage capacity
<b>Option -450</b>	45.0 TB HDD storage capacity
<b>Option -460</b>	60.0 TB HDD storage capacity
<b>Option -480</b>	100.0 TB HDD storage capacity

**Note:** Options -450 and -460 require a 5U Chassis; Option -480 requires a 6U chassis

### General Options (append to all options)

<b>Option -261</b>	GPS time & position stamping
<b>Option -264</b>	IRIG-B time stamping

**Features**

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.9" W x 9.5" D x 13.4" H
- Lightweight: approximately 30 pounds
- Rugged aluminum alloy chassis
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Recording and playback of IF signals up to 700 MHz
- 80 MHz record and playback signal bandwidths
- 200 MHz 16-bit A/Ds
- 800 MHz 16-bit D/As
- SFDR > 80 dBFS
- Real-time aggregate recording rates up to 2.4 GB/sec
- Up to of 7.6 TB storage with hot-swappable SSD drives
- NTFS file format
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Ideal for communications, radar, wireless, SIGINT, telecom and satcom
- Optional GPS time and position stamping
- Complete high-performance Windows® workstation

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

**General Information**

The Talon® RTR 2726 is a turnkey, multi-band recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2726 provides aggregate recording rates of up to 2.4 GB/sec and is ideal for the user who requires both portability and solid performance in a compact recording system.

The RTR 2726 is supplied in a small footprint portable package measuring only 16.9" W x 9.5" D x 13.4" H and weighing just 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel® Core™ i7 processor a high-resolution 17" LCD monitor, and a high-performance SATA RAID controller.

At the heart of the RTR 2726 are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters, DDCs (Digital Downconverters), DUCs (Digital Upconverters), and complementary FPGA IP cores. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

Optional GPS time and position stamping allows the user to record this critical signal information.

**SystemFlow Software**

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

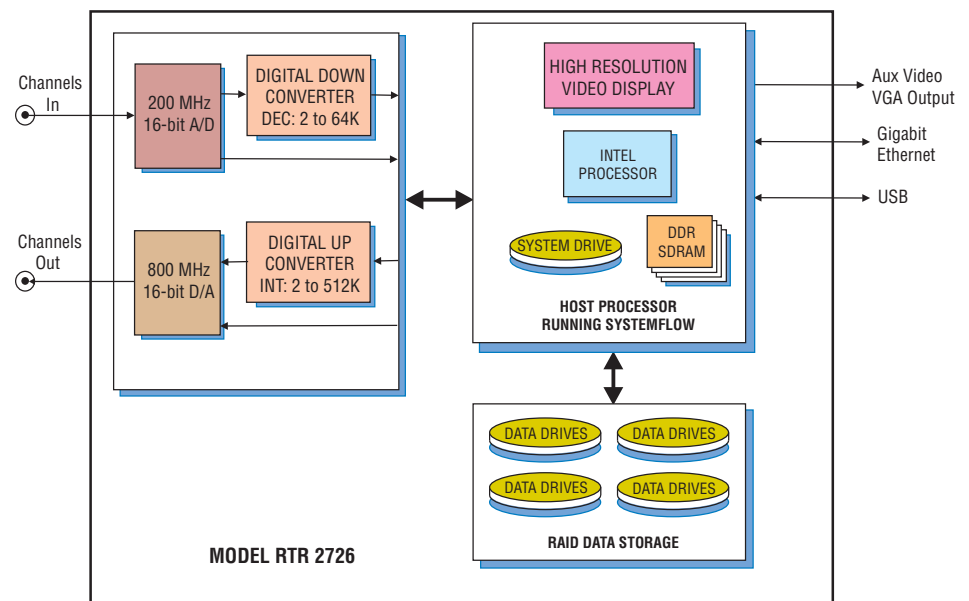

Built on a Windows 7 Professional workstation, the RTR 2726 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2726 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded through two 1 Gb Ethernet ports, eight USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

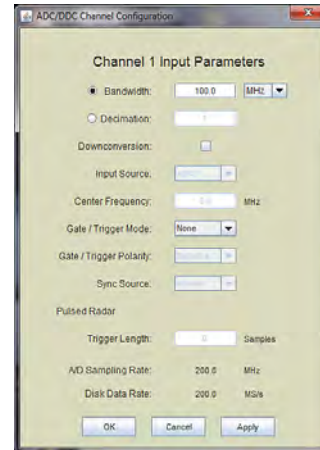

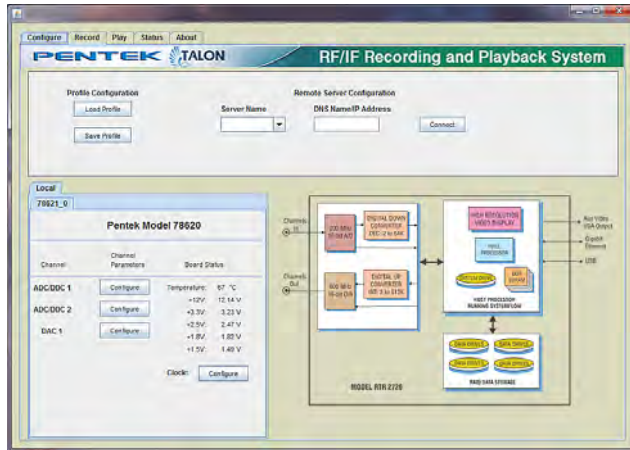

**Rugged & Flexible Architecture**

The RTR 2726 is configured in a portable, lightweight chassis with hot-swap SSDs, front panel USB ports and I/O connections on the side panel. It is built on an extremely rugged, 100% aluminum alloy unit, reinforced with shock absorbing rubber corners and an impact-resistant protective glass. Using shock- and vibration-resistant SSDs, the RTR 2726 is designed to reliably operate as a portable field instrument.

The hot-swappable SSDs provide storage capacities of up to 7.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0,1,5 and 6, provide a choice for the required level of redundancy. ▶

## Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows 7 Professional  
**Processor:** Intel Core i7 processor  
**Clock Speed:** 2.0 GHz or higher  
**Operating System Drive:** 128 GB SSD  
**SDRAM:** 6 GB  
**Monitor:** Built-in 17" high-resolution LCD  
 1440 x 900 pixels, 200 nits

### RAID

**Total Storage:** 1.9, 3.8 or 7.6 TB  
**Supported RAID Levels:** 0, 1, 5 and 6  
**Drive Bays:** Hot-swap, removable, rear panel  
**USB 2.0 Ports:** Eight (8) left side, two (2) front panel  
**USB 3.0 Ports:** Two (2) left side  
**1 Gb Ethernet Port:** One (1) left side  
**eSATA 3 Ports:** Two (2) left side  
**Aux Video Output:** 15-pin VGA left side

### Analog Recording Inputs

#### Analog Signal Inputs

**Quantity:** 1, 2, 3, or 4  
**Input Type:** Transformer-coupled, female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate ( $f_s$ ):** 10 MHz to 200 MHz  
**Resolution:** 16 bits  
**A/D Record Bandwidth:**  $f_s/2$  = Nyquist bandwidth  
**Anti-Aliasing Filters:** External, user-supplied

#### Digital Downconverter

**Type:** Virtex-6 FPGA, Pentek DDC IP Core  
**Decimation (D):** 2 to 65,536  
**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits  
**DDC Usable Bandwidth:**  $0.8 * f_s / D$   
**Bandwidth Range:** 2.5 kHz to 80 MHz at  $f_s = 200$  MHz

### Analog Playback Outputs

#### Analog Signal Outputs

**Quantity:** 1 or 2  
**Output Type:** Transformer-coupled, female SSMC connectors  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### Digital Upconverter, Interpolator and D/As

**D/A Resolution:** 16 bits  
**Output Signal:** Analog, real or quadrature  
**Type:** TI DAC5688 and Pentek-installed IP core interpolator  
**IP Core Interpolation:** 2 to 65,536  
**DAC5688 Interpolation:** 2, 4 or 8  
**Overall Interpolation:** 2 to 524,288  
**Input Data Rate to DAC5688:** 250 MS/sec max.  
**Output Sampling Rate:** 800 MHz max  
**Output IF:** DC to 400 MHz  
**Bandwidth Range:** Matches recording bandwidths  
**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

#### External Clocks

**Type:** Female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

### Physical and Environmental

**Dimensions:** 16.9" W x 9.5" D x 13.4" H  
**Weight:** 30 lb, approximately  
**Power:** 90 to 265 VAC, 50 - 60 Hz  
**Operating Temp:** 0° to +50° C  
**Storage Temp:** -40° to +85° C  
**Relative Humidity:** 5 to 95%, non-condensing  
**Operating Shock:** 15 g max. (11 msec, half sine wave)  
**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz: 1.4 g peak acceleration  
**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

# Model RTR 2726A

# 200 MS/sec RF/IF Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 200 MHz 16-bit A/Ds
- 800 MHz 16-bit D/As
- 80 MHz record and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- Real-time sustained recording rates up to 3.2 GB/sec
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2726A is a turnkey, multiband recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2726A provides sustained recording rates of up to 3.2 GB/sec in a four-channel system and is ideal for the user who requires both portability and solid performance in a compact recording system.

The RTR 2726A is supplied in a small footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17" LCD monitor, and up to 30.7 TB of SSD storage.

At the heart of the RTR 2726A are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters, DDCs (Digital Downconverters), DUCs (Digital Upconverters), and complementary FPGA IP cores. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

Optional GPS time and position stamping allows the user to record this critical signal information.

### SystemFlow Software

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

The GUI provides a very simple interface for system setup. This includes pull-down selections for a handful of parameters, a checkbox to enable/disable the DDC and a data-entry field for the sample rate. Once set up, the GUI provides the ability to save profiles that can be reloaded at the click of a button.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2726A allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2726A records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk using the 8X double-layer DVD±R/RW drive.

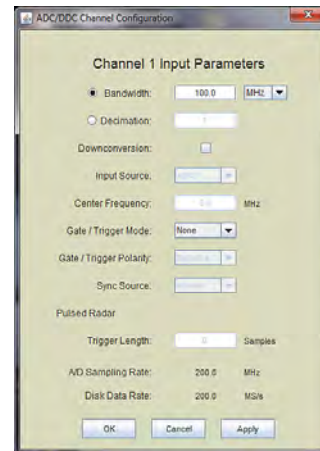

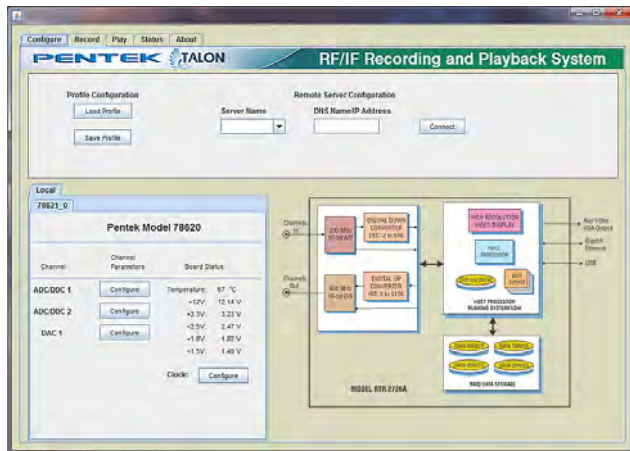

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

### Rugged Chassis with SSD Storage

The RTR 2726A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy. ➤

► SystemView Graphical User Interface

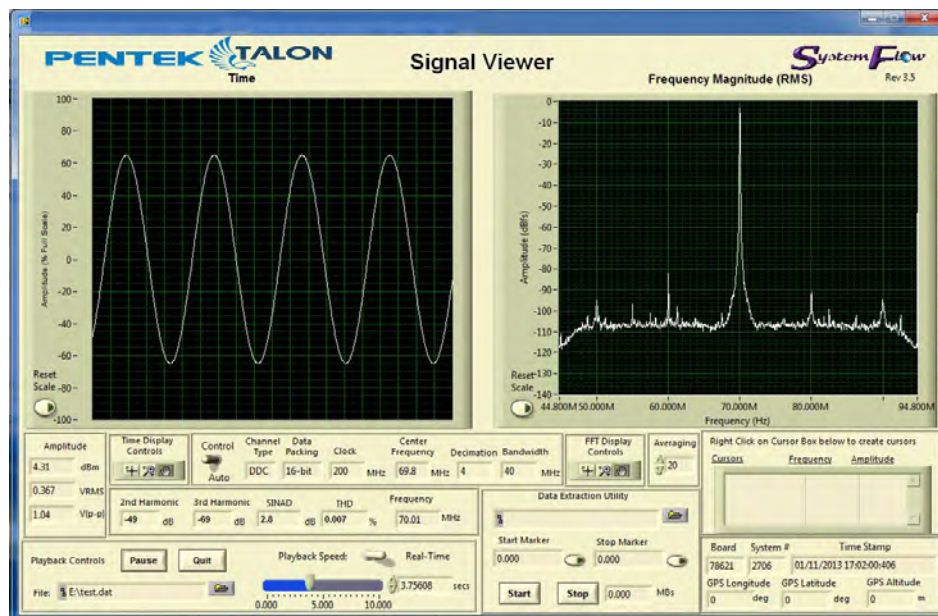

SystemFlow Recorder Interface

The RTR 2726A GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, playback a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2726A's Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. **Type:** Female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

**Optional DC Power supply**

**Voltage:** 10 to 36 VDC  
**Input Current:** 42 to 26 A (39 A at 24 VDC)  
**Inrush Current:** 100 A at 24 VDC  
**Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C  
**Efficiency:** >80% typical at 24 V full load  
**Power Good Signal:** On delay 100 to 500 msec  
**OverPower Protection:** 110% to 160%  
**Remote Control:** On/Off  
**Safety:** Meets UL, TUV, CB specifications

**Physical and Environmental**

**Size:** 16.0" W x 6.9" D x 13.0" H  
**Weight:** 30 lb max.  
**Operating Temp:** 0° to +50° C  
**Storage Temp:** -40° to +85° C  
**Relative Humidity:** 5 to 95%, non-condensing  
**Operating Shock:** 30 g max. (11 msec, half-sine wave)  
**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
 20 to 500 Hz: 1.4 g peak acceleration  
**Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS  
**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Features

- Designed to operate under conditions of shock and vibration
- 4U 19-inch rugged rackmount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 200 MHz max. 16-bit A/D sampling for recording, up to eight channels
- 80 MHz recording and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Real-time aggregate recording rates of up to 3.2 GB/sec
- Removable SSD drives
- Up to 46 terabytes of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- DDC decimation and DUC interpolation range from 2 to 65,536
- Optional GPS time and position stamping

Contact factory for options, number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2746 is a turnkey, multi-band record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTR 2746 is intended for military, airborne and UAV applications requiring a rugged system. With scalable A/Ds, D/As and SSD (Solid-State Drive) storage, the RTR 2746 can be configured to stream data to and from disk at rates as high as 3.2 GB/sec.

The RTR 2746 uses Pentek's high-powered Virtex-6-based Cobalt® boards, that provide flexibility in channel count with optional digital downconversion capabilities. Optional 16-bit, 1.25 GHz D/A converters with digital upconversion allow real-time reproduction of recorded signals.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates, and DUC interpolations are among the GUI-selectable system parameters, providing a fully programmable system capable of recording and reproducing a wide range of signals.

Optional GPS time and position stamping allows the user to record this critical signal information.

## SystemFlow Software

The RTR 2746 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2746 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2746 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded through two rear-access gigabit Ethernet ports or two USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Rugged and Flexible Architecture

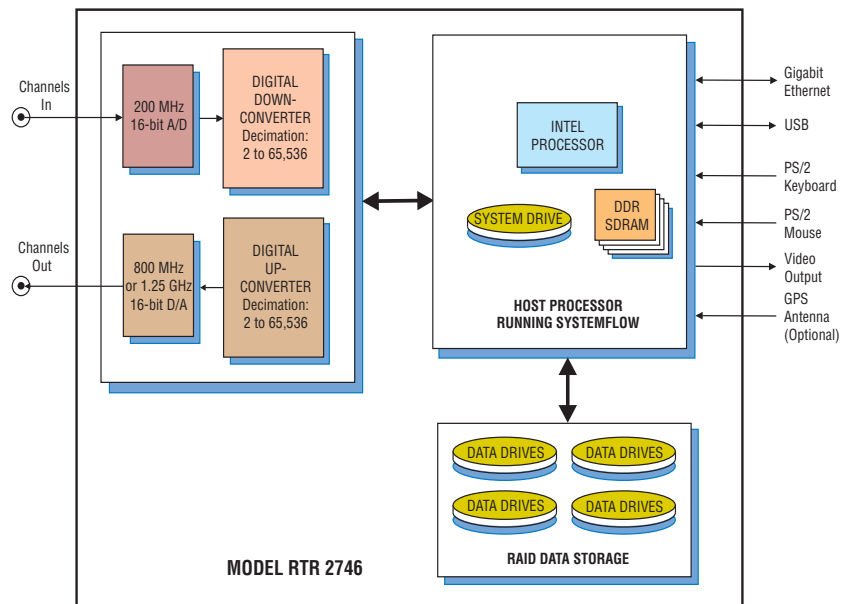

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2746 performs well in ground, shipborne and airborne environments. The hot-swappable SSDs provide storage capacity of up to 46 TB. The drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

The RTR 2746 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

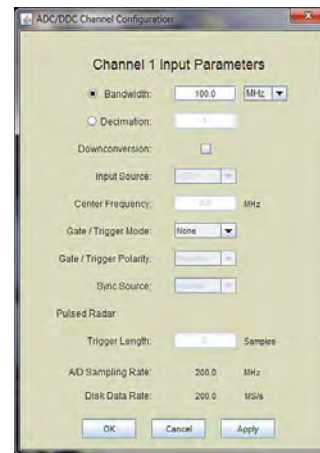

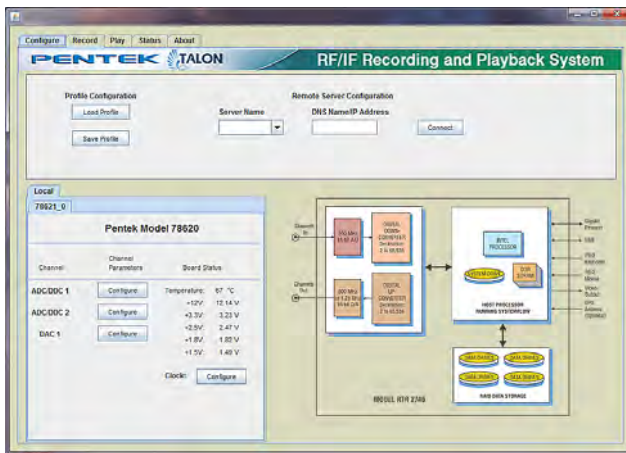

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. ➤

► SystemFlow Graphical User Interface

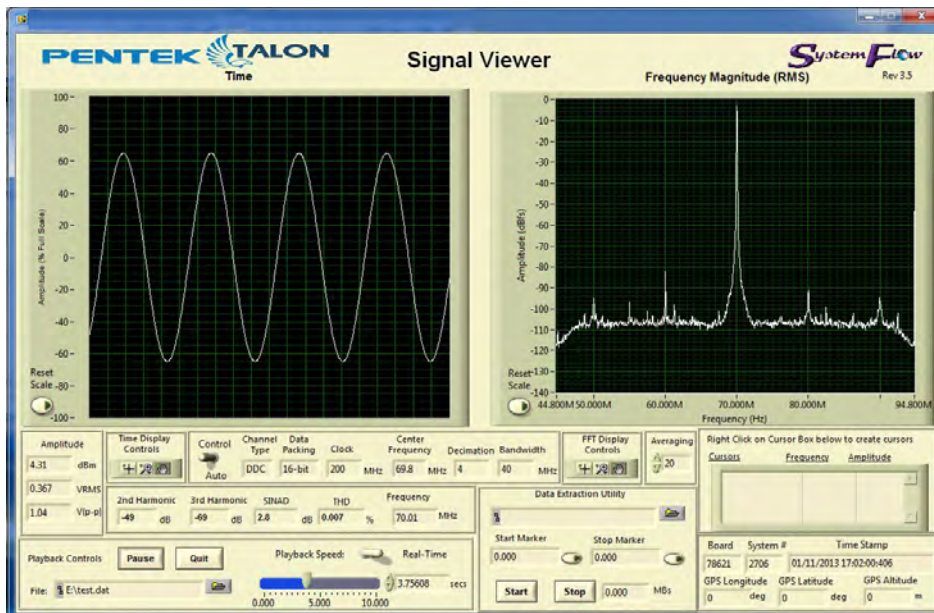

SystemFlow Recorder Interface

The RTR 2746 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2746 Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 2.0 GHz or higher

**SDRAM:** 6 GB

#### RAID

**Storage:** 3.8, 7.6, 15.3, 30.7 or 46.0 TB

**Supported Levels:** 0, 1, 5, 6, 10 and 50

### Analog Recording Inputs

#### Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**A/D Record Bandwidth:**  $f_s/2$  = Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

#### Digital Downconverter

**Type:** Virtex-6 FPGA Pentek DDC IP Core

**Decimation (D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 \cdot f_s/D$

### Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### Digital Upconverter and D/As

**Type:** TI DAC5688 and Pentek-installed interpolation IP core

**Interpolation:** 2 to 65,536

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz

**Output Signal:** Analog, real or quadrature

**Output Sampling Rate:** 800 MHz max. with 2, 4 or 8 interpolation

**Resolution:** 16 bits

**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

#### External Clocks

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

**Multi-Recorder Sync/Gate Bus:** 26-pin connector, dual clock/sync/gate input/output LVDS buses; one sync/gate input TTL signal

### Physical and Environmental

#### Dimensions

**4U Short Chassis:** 19" W x 21" D x 7" H

**Weight:** 50 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz,  
500 W max.

Optional GPS time and position stamping allows the user to record this critical signal information.

**SystemFlow Software**

The RTX 2766 includes the SystemFlow® Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTX 2766 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTX 2766 records data to the native NTFS file system, providing immediate access to the recorded data.

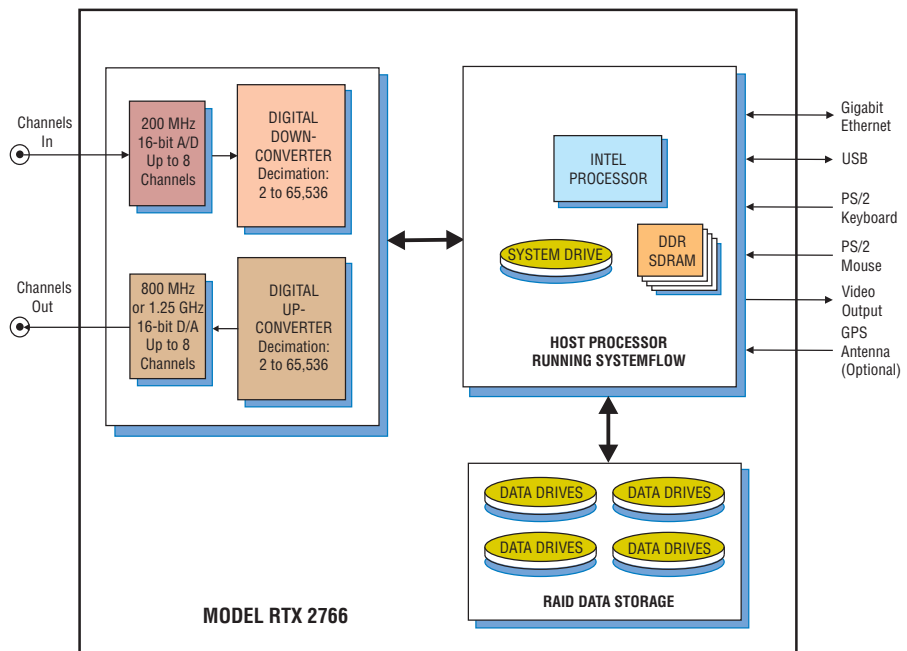

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

**Rugged Mil-Spec Chassis**

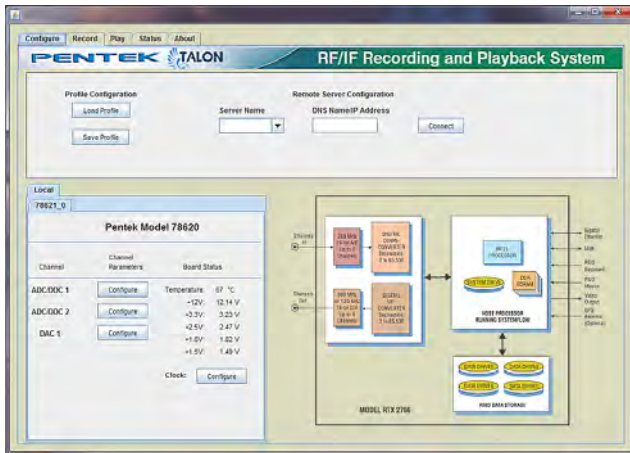

The Talon RTX 2766 uses a shock- and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

**Decimation(D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

#### Sample and Reference Clocks

**External Sample Clock:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms 10 to 200 MHz, common to all A/Ds

**VCXO Sample Clock:** Programmable, 10 to 200 MHz, phase-locked to 10MHz reference, common to all A/Ds

**Reference Clock:** Sine wave, 0 to +10 dBm, A-C coupled, 50 ohms, 10 MHz, used for phase-locking the VCXO

**Connector Type:** Rear panel female SMA connector for external sample or reference clock input

#### External Trigger

**Number:** One common trigger for all input channels

**Input Level:** LVTTTL with selectable rising or falling edge ►

► **Connector Type:** Rear panel female SMA connector

### Analog Playback Output Channels

#### Analog Signal Outputs

**Output Type:** Rear-panel female SSMC connectors

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converters

**Type:** Texas Instruments DAC5688 or DAC3484, depending on option set

**Output Sampling Rate:** Up to 800 MHz or 1.25 GHz

**Resolution:** 16 bits

**Input Sample Data Rate:** 250 or 312.5 MHz

**Output IF:** Up to 400 MHz or 625 MHz

#### Digital Upconverters

**Type:** Virtex-6 FPGA, Pentek interpolation IP core

**Overall Interpolation:** 2 to 65,536 including D/A

#### Sample and Reference Clocks

**External Sample Clock:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms 800 MHz or 1.25 GHz, common to all D/As

**VCXO Sample Clock:** Programmable, up to 1.25 GHz, phase-locked to 10MHz reference, common to all D/As

**Reference Clock:** Sine wave, 0 to +10 dBm, A-C coupled, 50 ohms, 10 MHz, used for phase-locking the VCXO

**Connector Type:** Rear panel female SMA connector for external sample or reference clock input

#### External Trigger

**Number:** One common trigger for all output channels

**Input Level:** LVTTTL with selectable rising or falling edge

**Connector Type:** Rear panel female SMA connector

### Physical and Environmental

**Dimensions:** 19" W x 22" D x 7" H

**Weight:** 50 lb, approx.

**Operating Temp:** -20° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 10% to 95%, non-condensing

**Operating Shock:** Designed to MIL-STD 810F, method 514.5, procedures I and VI

**Operating Vibration:** Designed to MIL-STD 810F, method 514.5, procedure I

**EMI/EMC:** Designed to MIL-STD 461E, CE101, CE102, CS101, CS113, RE101, RE102, RS101, RS103

**Input Power:** 85 to 264 VAC, 47– 400 Hz, 600 W max.

## Features

- Multiband recording and playback system
- ½ ATR 3U VPX chassis
- Designed to MIL-STD-704F, 810F and 461F
- Windows® 7 Professional workstation with high performance Intel® Core™ i7 processor
- 200 MHz 16-bit A/Ds for recording up to four channels
- 800 MHz 16-bit D/A for playback of one channel
- 80 MHz recording and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Real-time sustained recording rates of up to 500 MB/sec
- 1.92 TB of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5 and 6
- SystemFlow® GUI with signal viewer analysis tool which includes a virtual oscilloscope and spectrum analyzer
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters

Contact factory for options, for number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTX 2786 is a turnkey, RF/IF signal recorder designed to operate under extreme environmental conditions. Housed in a ½ ATR chassis, the RTX 2786 leverages Pentek's 3U VPX SDR modules to provide a rugged recording system with up to four 16-bit, 200 MHz A/D converters with built-in digital downconversion capabilities.

Optionally, the RTX 2786 provides one 800 MHz, 16-bit D/A converter with a digital upconverter for signal playback or waveform generation. As shown in the block diagram below, the maximum number of record channels with this option is three.

The RTX2786 can record and play back analog signals with bandwidths ranging from a few kHz up to 80 MHz, either as baseband signals or as IF signals with center frequencies tunable across a 700 MHz range.

The RTX 2786 uses conduction cooling to draw heat from the system components allowing it to operate in reduced air environments. It includes 1.92 TB of solid-state data storage, that allows it to operate with no degradation under conditions of extreme shock and vibration. The system is hermetically sealed and provides five D38999 connectors for power and I/O. Four SMA connectors are used for analog I/O.

The recorder includes a graphical user interface for quick and simple out-of-the-box operation. It also includes a user API (Application Programming Interface) to easily integrate the system into the user's application.

## SystemFlow Software

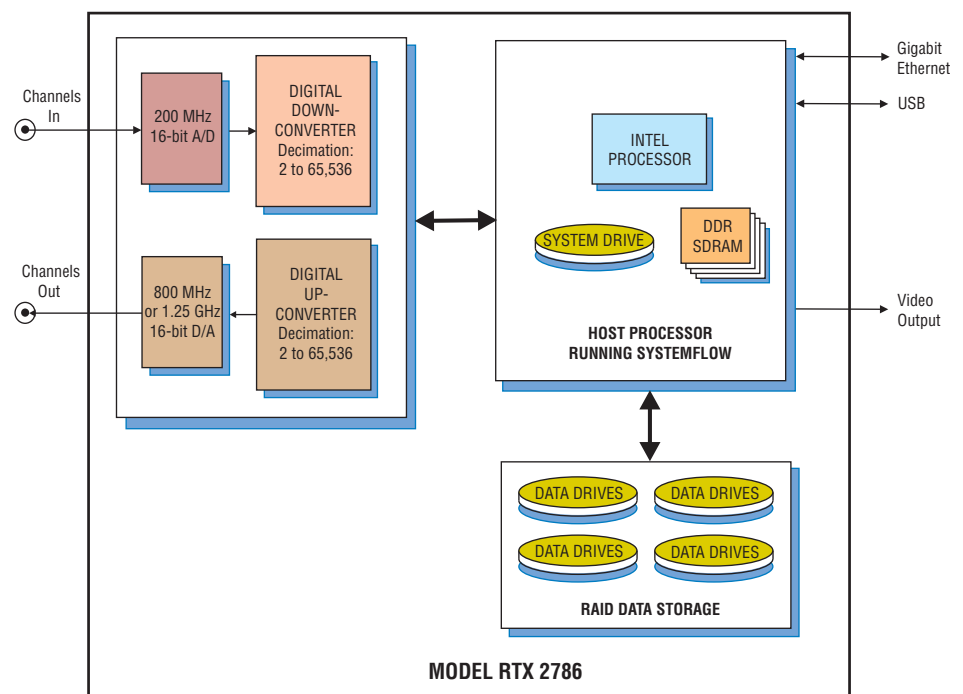

The RTX 2786 includes Pentek's SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

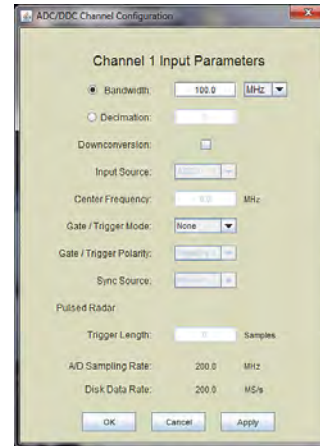

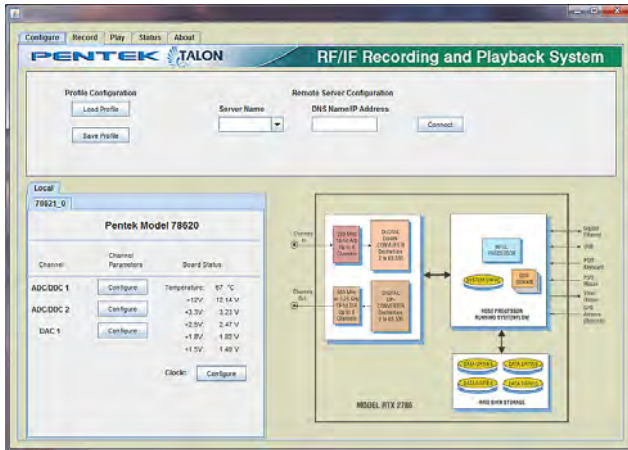

The user API allows users to integrate the recorder as a subsystem of a larger system. The API is provided as a C-callable library and allows for the recorder to be controlled over Ethernet, thus providing the ability to remotely control the recorder from a custom interface.

Built on a Windows 7 Professional workstation, the RTX 2786 allows the user to install post-processing and analysis tools on the system itself to operate on the recorded data. The RTX 2786 records data to the Windows' native NTFS file system, providing immediate access to all recorded data. Data can be off-loaded via dual gigabit Ethernet ports or four USB 2.0 ports.

Four built-in solid-state drives provide reliable, high-speed storage with a total capacity of 1.92 TB. ➤

### Digital Downconverter

**Type:** Virtex-6 FPGA, Pentek DDC IP Core

**Decimation(D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 \cdot f_s/D$

### Analog Signal Output

**Output Type:** Transformer-coupled

**Connectors:** Bulkhead SMA female

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Digital Upconverter and D/As

**Type:** TI DAC5688 and FPGA interpolation IP core

**Overall Interpolation:** 2x to 524,288x in two stages of 2x to 256x and one stage of 2x, 4x, or 8x

**Output Bandwidth:** 200 MHz maximum

**Output IF Center Frequency:** Up to 400 MHz

**Output Sampling Rate:** 800 MHz maximum

**Resolution:** 16 bits

### Sample Clock Selections:

On-board programmable VCXO

External 10 MHz reference for phase-locking VCXO

External direct sample clock

### External Clock Input

**Connector:** Bulkhead female SMA connector

**Clock Input Type:** 10 MHz reference to lock VCXO or direct input sample clock

**Clock Signal:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

### Physical and Environmental

**Size:** 7.1" W x 16.5" D x 8.1" H

**Weight:** 40 lb

**Environmentals:** MIL-STD-810F

**EMC:** MIL-STD-461F - CE101, CE102, CS101, RE101, RE102, and RS101

**Operating Temperature:** -40°C to +55°C

**Cooling Options:** Conduction, to cold plate

Conduction, to forced air side wall heat exchangers, four variable-speed rear fans

**Power Requirements:** 24 to 32 VDC, per MIL-STD-704F with 50 msec transient holdup

## Model RTX 2786 Order Information and Options

### Recording/Playback Options

<b>Option -201</b>	One-channel recording and one-channel playback
<b>Option -202</b>	Two-channel recording and one-channel playback
<b>Option -203</b>	Three-channel recording and one channel playback
<b>Option -204</b>	Four-channel recording and no playback

## Model RTR 2750

## 250 MS/sec RF/IF Rugged Rackmount Recorder

### Features

- Sixteen 250 MHz 16-bit A/Ds
- Sixteen independently-configurable DDC decimations ranging from 2 to 32768
- Sixteen independently-configurable DDC tuning frequencies
- Capable of recording RF frequencies to 700 MHz
- Capable of recording signals with bandwidths to 100 MHz
- 8 GB/s real-time aggregate recording rate
- 4U 19-inch rugged rackmount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- Front panel removable-SSD drives
- Up to 61 terabytes of storage to NTFS RAID disk array
- Multiple RAID levels of 0, 1, 5 and 6
- SystemFlow® GUI with signal viewer analysis tool
- Optional GPS time and position stamping

Contact factory for options, number and type of analog channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2750 is a turnkey recording system that provides phase-coherent recording of 16 independent input channels. Each input channel includes a 250 MHz 16-bit A/D and an FPGA-based digital down-converter with programmable decimations from 2-32768, thereby providing the ability to capture RF signals with bandwidths up to 100 MHz.

With options for AC- or DC-coupled input channels, RF signals up to 700 MHz in frequency can be sampled and streamed to disk in real-time at sustained aggregate recording rates up to 8 GB/sec in a 4U rackmount solution.

Designed to operate under conditions of vibration and extended operating temperatures, the RTR 2750 is ideal for military, airborne and field applications that require a rugged system. The hot-swappable solid state storage drives provide the highest level of performance under harsh conditions and allow for quick removal of mission-critical data.

A/D sampling rates, DDC decimations and trigger settings are among the selectable system parameters, providing a system that is simple to configure and operate.

An optional GPS time and position stamping facility allows the user to time-stamp each acquisition as well as track the location of a system in motion.

### SystemFlow Software

The Talon RTR 2750 includes Pentek's SystemFlow® Recording Software. SystemFlow features a Windows-based GUI that provides a simple means to configure and control the system. User configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured setups with a single click.

SystemFlow also includes signal viewing and analysis tools that allow the user to

monitor signals prior to, during, and after a recording session. These tools include a virtual oscilloscope, a virtual spectrum analyzer and a spectrogram display.

For users who wish to create a custom user interface or to integrate the Talon recording system into a larger application, a C-callable API is also provided as part of SystemFlow. Source code and examples are supplied to allow for a quick and simple integration effort.

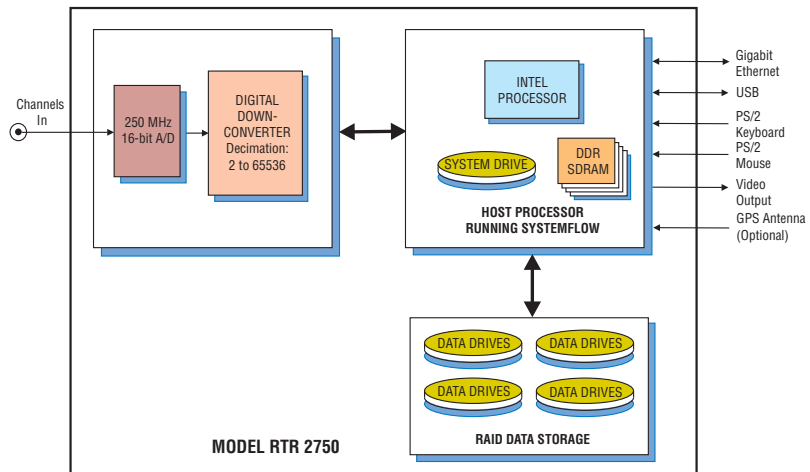

Built on a Windows 7 Professional workstation, the RTR 2750 allows the user to install post-processing and analysis tools directly onto the recording system. The RTR 2750 records data to the native NTFS file system, providing immediate access to the recorded data; no file conversion is required.

Data can be off-loaded through rear-access gigabit Ethernet ports or USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive. Dual 10 or 40 gigabit Ethernet cards can be added to the system to provide an even faster offload facility.

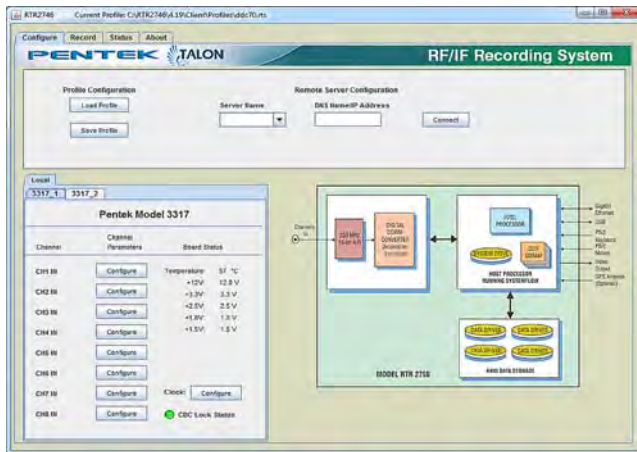

### Rugged and Flexible Architecture

The RTR 2750 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

The RTR 2750 includes as many as 32 hot-swappable SSDs to provide flexible storage capacities up to 61 TB. The 2.5-inch SSDs can be easily removed or exchanged during a mission to retrieve recorded data. Multiple RAID levels, including 0, 1, 5, and 6 provide a choice for the required level of redundancy. ▶

► SystemFlow Graphical User Interface

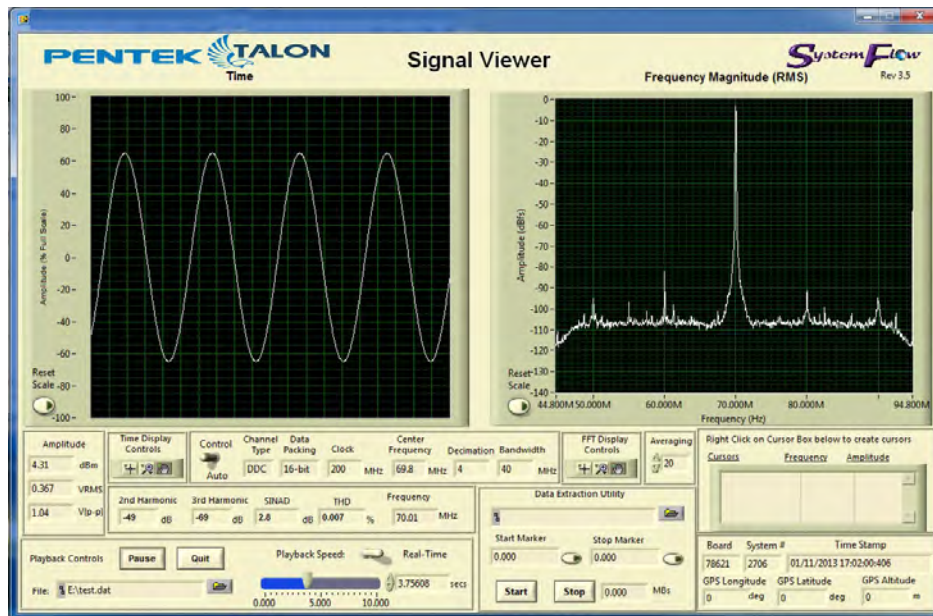

SystemFlow Recorder Interface

The RTR 2750 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2750 Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**SDRAM:** 16 GB

#### RAID

**Storage:** 15.3, 30.7 or 61.4 TB

**Supported Levels:** 0, 1, 5 and 6

### Analog Recording Inputs

#### Analog Signal Inputs

**Connector Type:** Rear-panel female MMCX connectors

**Input Type:** Transformer-coupled, optional DC-coupled

**Full-Scale Input:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Anti-Aliasing Filters:** External, user-supplied

#### A/D Converters

**Type:** Texas Instruments ADS42LB69

**Sampling Rate ( $f_s$ ):** User selectable, 10 MHz to 250 MHz

**Resolution:** 16 bits

**SNR:** 73.2 dBFS

**SFDR:** 87 dBc (HD2 and HD3)

100 dBc (Non HD2 and HD3)

#### Digital Downconverters

**Type:** Virtex-7 FPGA Pentek DDC IP Core

**Decimation (D):** User selectable 2 to 32768

**IF Center Frequency Tuning:** User selectable, 32-bit resolution

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$ , factory-supplied DDC coefficient tables

### Clock and Trigger

#### A/D Clock

**Clock Sources:** Selectable from onboard programmable VCXO or external clocks

#### External Clocks

**Connector Type:** Rear panel female MMCX connector

**Input Type:** Transformer-coupled

**Full-scale Input:** 0 to +10 dBm

#### Trigger

**Connector Type:** Rear panel female MMCX connector

**Input Type:** LVTTTL

### Physical and Environmental

#### Dimensions

**4U Short Chassis:** 19" W x 21" D x 7" H

**Weight:** 50 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz,  
500 W max.

## Model RTR 2750 Ordering Information and Options

### Storage Options

**Option -420** 15.3 TB SSD total storage, 960 GB per channel

**Option -430** 30.7 TB SSD total storage, 1.92 TB per channel

**Option -461** 61.4 TB SSD total storage, 3.84 TB per channel

### General Options (append to all options)

**Option -261** GPS time & position stamping

**Option -264** IRIG-B time stamping

**Option -004** D-C coupled inputs

**Contact Pentek for compatible Option combinations**  
**Storage Options may change, contact Pentek for the latest information**

*Specifications are subject to change without notice*

## Features

- Complete multiband recording and playback system
- 4U 19-inch industrial rack-mount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/As
- 80 MHz record and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Real-time aggregate recording rates of up to 1.6 GB/sec
- Up to 100 terabytes storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- DDC decimation and DUC interpolation range from 2 to 65,536
- Optional GPS time and position stamping

Contact factory for options, number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTS 2707 is a turnkey, multi-band recording and playback system for recording and reproducing high-bandwidth signals. The RTS 2707 uses 12-bit, 500 MHz A/D converters and provides aggregate recording rates up to 1.6 GB/sec.

The RTS 2707 uses Pentek's high-powered Virtex-6-based Cobalt® modules, that provide flexibility in channel count, with optional digital downconversion capabilities. Optional 16-bit, 800 MHz D/A converters with digital upconversion allow real-time reproduction of recorded signals.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates and DUC interpolations are among the GUI-selectable system parameters, providing a fully-programmable system capable of recording and reproducing a wide range of signals.

Optional GPS time and position stamping allows the user to record this critical signal information.

## SystemFlow Software

The RTS 2707 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTS 2706 allows the user to install post processing and analysis tools to operate on the recorded data. The RTS 2706 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via gigabit Ethernet ports or USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

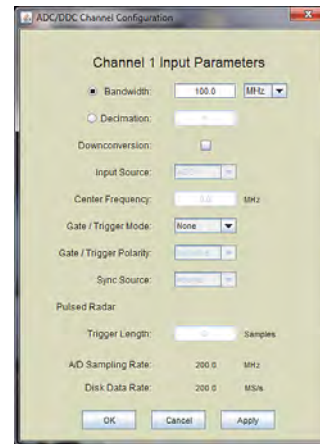

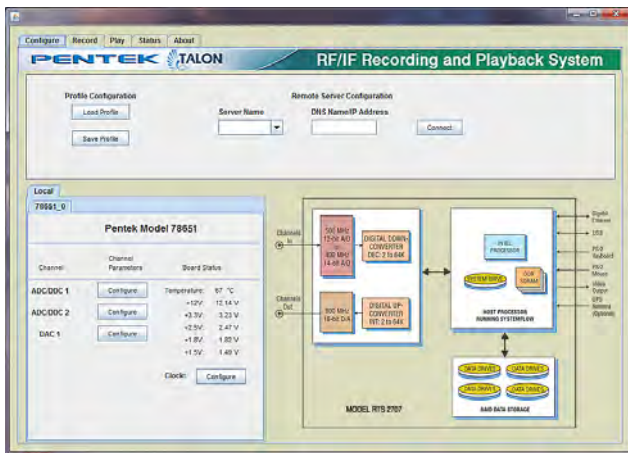

## Flexible Architecture

The RTS 2707 is configured in a 4U 19" rack-mountable chassis, with hot-swappable data drives, front panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. The hot-swappable HDDs provide storage capacities of up to 100 TB in a single 6U chassis. ➤

► SystemFlow Graphical User Interface

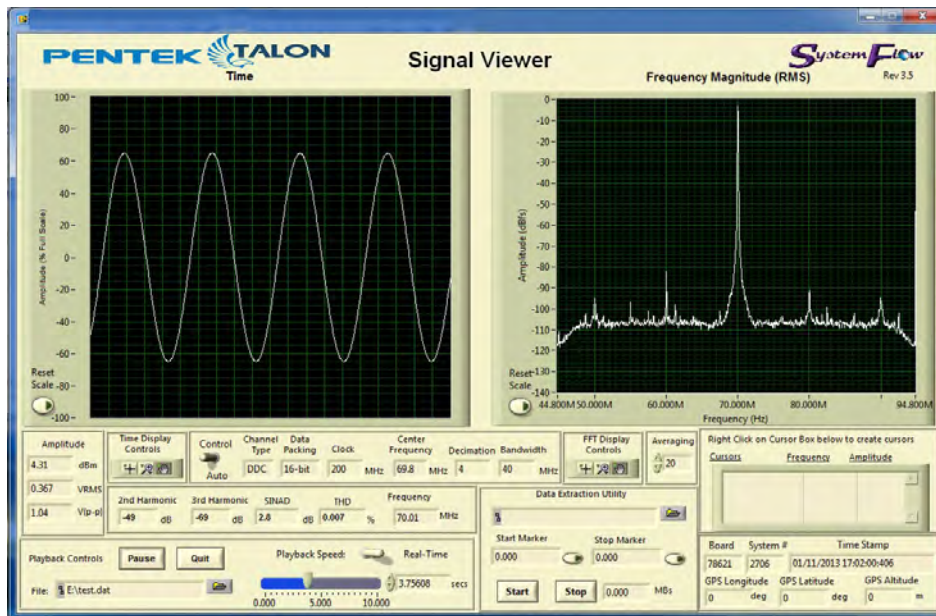

SystemFlow Recorder Interface

The RTS 2707 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTS 2707 Configure screens provide a simple and intuitive means for setting up the system parameters. The input channel configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.9" W x 9.5" D x 13.4" H
- Lightweight: approximately 30 pounds
- Rugged aluminum alloy chassis
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/A
- 200 MHz recording and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- SFDR > 70 dBFS
- Real-time aggregate recording rates up to 2.4 GB/sec
- Up to of 7.6 TB storage with hot-swappable SSD drives
- NTFS file format
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Ideal for communications, radar, wireless, SIGINT, telecom and satcom
- Optional GPS time and position stamping
- Complete high-performance Windows® workstation

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

**General Information**

The Talon® RTR 2727 is a turnkey, multi-band recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2727 provides aggregate recording rates of up to 2.4 GB/sec in a two-channel system and is ideal for the user who requires both portability and solid performance in a compact recording system.

The RTR 2727 is supplied in a small footprint portable package measuring only 16.9" W x 9.5" D x 13.4" H and weighing just 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel® Core™ i7 processor a high-resolution 17" LCD monitor, and a high-performance SATA RAID controller.

At the heart of the RTR 2727 are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters, DDCs (Digital Downconverters), DUCs (Digital Upconverters), and complementary FPGA IP cores. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

Optional GPS time and position stamping allows the user to record this critical signal information.

**SystemFlow Software**

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2727 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2727 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded through two 1 Gb Ethernet ports, eight USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

**Rugged & Flexible Architecture**

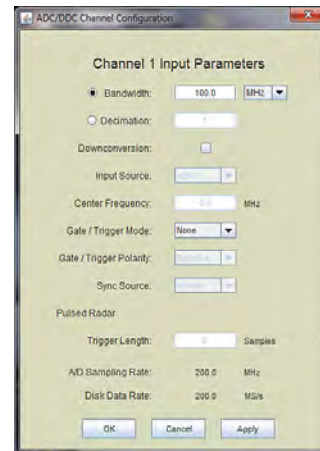

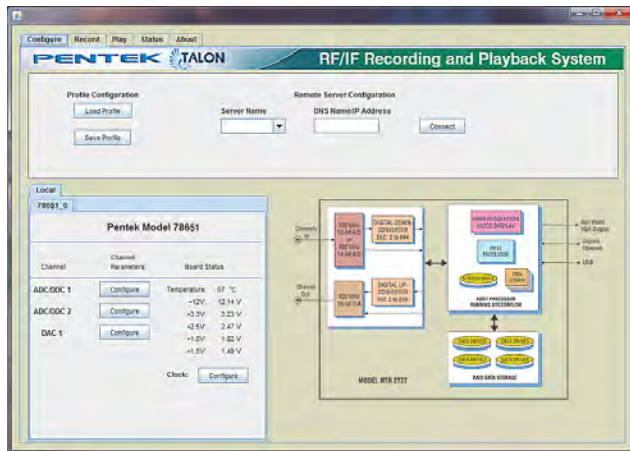

The RTR 2727 is configured in a portable, lightweight chassis with hot-swap SSDs, front panel USB ports and I/O connections on the side panel. It is built on an extremely rugged, 100% aluminum alloy unit, reinforced with shock absorbing rubber corners and an impact-resistant protective glass. Using shock- and vibration-resistant SSDs, the RTR 2727 is designed to operate reliably as a portable field instrument.

The hot-swappable SSDs provide storage capacities of up to 7.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0,1,5, and 6 provide a choice for the required level of redundancy. ➤

► SystemView Graphical User Interface

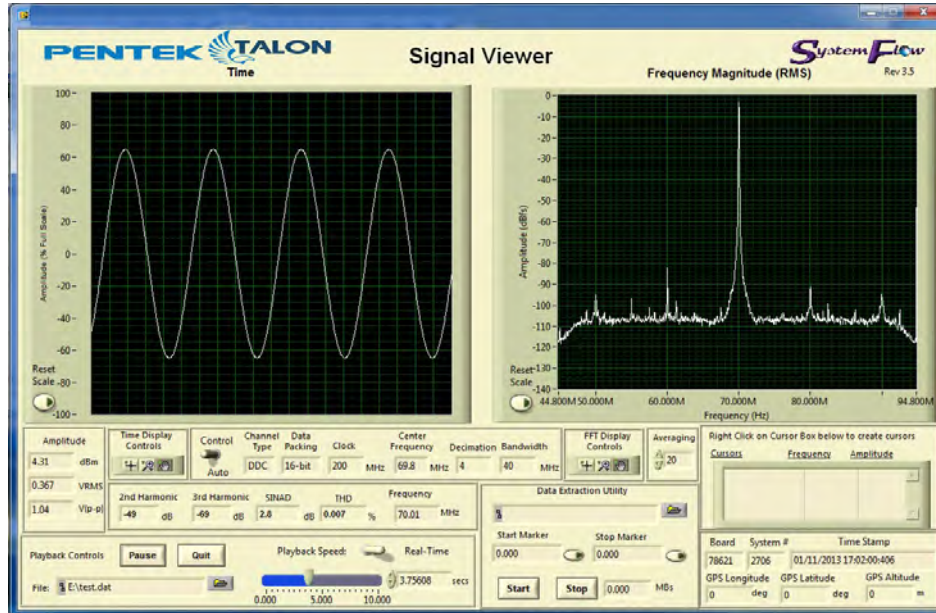

SystemFlow Recorder Interface

The RTR 2727 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, playback a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2727's Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## Specifications

### PC Workstation (standard configuration)

**Operating System:** 64-bit Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 2.0 GHz or higher

**Operating System Drive:** 128 GB SSD

**SDRAM:** 8 GB

**Monitor:** Built-in 17" high-resolution LCD  
1440 x 900 pixels, 200 nits

### RAID

**Total Storage:** 1.9, 3.8 or 7.6 TB

**Supported RAID Levels:** 0, 1, 5, and 6

**Drive Bays:** Hot-swap, removable, rear panel

**USB 2.0 Ports:** Eight on left side, two on front panel

**USB 3.0 Ports:** Two on left side

**1 Gb Ethernet Port:** Two on left side

**eSATA 3 Ports:** Two on left side

**Aux Video Output:** 15-pin VGA on left side

### Analog Recording Inputs

#### Analog Signal Inputs

**Quantity:** 1 or 2

**Input Type:** Transformer-coupled, female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5463 or ADS5474 (Option -014)

**Sampling Rate ( $f_s$ ):** 20 MHz to 500 MHz or 20 MHz to 400 MHz (Option -014)

**Resolution:** 12 bits or 14 bits (Option -014)

**A/D Record Bandwidth:**  $f_s/2 =$  Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

#### Digital Downconverter

**Type:** Virtex-6 FPGA Pentek DDC IP Core

**Decimation (D):** 2 to 65,536

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

**Bandwidth Range:** 5 kHz to 160 MHz at  $f_s = 400$  MHz

### Analog Playback Output

#### Analog Signal Outputs

**Quantity:** 1

**Output Type:** Transformer-coupled, female SSMC connectors

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### Digital Upconverter and D/A

**Output Signal:** Analog, real or quadrature

**Type:** TI DAC5688 and Pentek-installed interpolation IP core

**Interpolation:** 2 to 65,536

**Input Data Rate to DAC5688:** 250 MS/sec max.

**Output Sampling Rate:** 800 MHz, max.

**Output IF:** 250 MHz, max.

**D/A Resolution:** 16 bits

**Bandwidth Range:** Matches recording bandwidths

**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

#### External Clock

**Type:** Female SSMC connector, sine wave, 0 to +12 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz divider input clock or PLL system reference

#### Internal Clock

**Type:** Programmable VCXO from 10 to 810 MHz

### Physical and Environmental

**Dimensions:** 16.9" W x 9.5" D x 13.4" H

**Weight:** 30 lb, approximately

**Power:** 90 to 265 VAC, 50 - 60 Hz

**Operating Temp:** 5° to +45° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

# Model RTR 2727A

# 500 MS/sec RF/IF Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/A
- 200 MHz recording and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- Real-time aggregate recording rates up to 4.0 GB/sec
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2727A is a turnkey, multi-band recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2727A provides aggregate recording rates of up to 4.0 GB/sec in a two-channel system and is ideal for the user who requires both portability and solid performance in a compact recording system.

The RTR 2727A is supplied in a small footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17" LCD monitor, and up to 61.4 TB of SSD storage.

At the heart of the RTR 2727A are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters, DDCs (Digital Downconverters), DUCs (Digital Upconverters), and complementary FPGA IP cores. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

Optional GPS time and position stamping allows the user to record this critical signal information.

### SystemFlow Software

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

The GUI provides a very simple interface for system setup. This includes pull-down selections for a handful of parameters, a checkbox to enable/disable the DDC and a data-entry field for the sample rate. Once set up, the GUI provides the ability to save profiles that can be reloaded at the click of a button.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and spectrum analyzer.

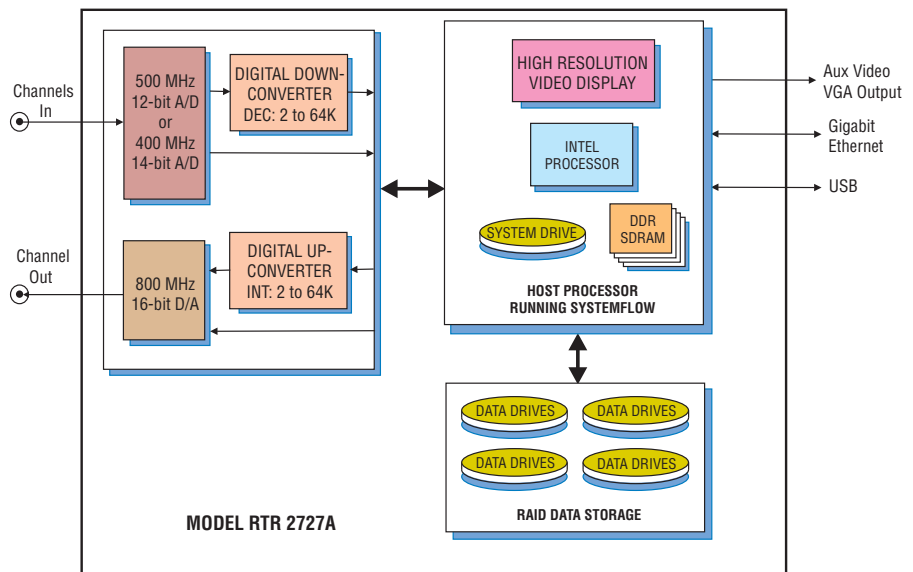

Built on a Windows 7 Professional workstation, the RTR 2727A allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2727A records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double-layer DVD±R/RW drive.

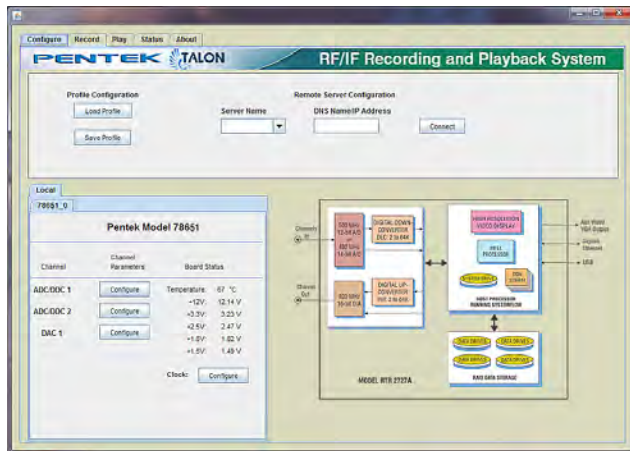

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

### Rugged Chassis with SSD Storage

The RTR 2727A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 1, 5, and 6, provide a choice for the required level of redundancy. ▶

► SystemView Graphical User Interface

SystemFlow Recorder Interface

The RTR 2727A GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, playback a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2727A's Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** 64-bit Windows workstation

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**Operating System Drive:** 128 GB SSD

**SDRAM:** 8 GB

**Monitor:** Built-in 17.3" high-resolution LCD,  
1920 x 1080 pixels, 16:9 aspect ratio, anti-glare surface  
Brightness: 300 cd/m<sup>2</sup>; Contrast ratio: 400:1 typical

### RAID

**Total Storage:** 3.8 – 60.4 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, side panel

**USB 2.0 Ports:** Four on left side, two on front panel

**USB 3.0 Ports:** Two on left side

**1 Gb Ethernet Ports:** Two on left side

**Aux Video Output:** 15-pin VGA on left side

### Analog Signal Inputs

**Connectors:** 1 or 2, transformer-coupled, female SSMC

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5463 or ADS5474 (Option -014)

**Sampling Rate ( $f_s$ ):** 20 MHz to 500 MHz or 20 MHz to 400 MHz (Option -014)

**Resolution:** 12 bits or 14 bits (Option -014)

**A/D Record Bandwidth:**  $f_s/2 =$  Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

### Digital Downconverter

**Type:** Virtex-6 FPGA Pentek DDC IP Core

**Decimation (D):** 2 to 65,536

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

### Analog Signal Output

**Connector:** Transformer-coupled, female SSMC

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Digital Upconverter and D/A

**Output Signal:** Analog, real or quadrature

**Type:** TI DAC5688 and Pentek-installed interpolation IP core

**Interpolation:** 2 to 65,536

**Input Data Rate to DAC5688:** 250 MS/sec max.

**Output Sampling Rate:** 800 MHz, max.

**Output IF:** 250 MHz, max.

**D/A Resolution:** 16 bits

**Bandwidth Range:** Matches recording bandwidths

**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

### External Clock

**Type:** Female SSMC connector, sine wave, 0 to +12 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz divider input clock or PLL system reference

### Internal Clock

**Type:** Programmable VCXO from 10 to 810 MHz

### Optional DC Power supply

**Voltage:** 10 to 36 VDC

**Input Current:** 42 to 26 A (39 A at 24 VDC)

**Inrush Current:** 100 A at 24 VDC

**Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C

**Efficiency:** >80% typical at 24 V full load

**Power Good Signal:** On delay 100 to 500 msec

**OverPower Protection:** 110% to 160%

**Remote Control:** On/Off

**Safety:** Meets UL, TUV, CB specifications

### Physical and Environmental

**Size:** 16.0" W x 6.9" D x 13.0" H

**Weight:** 30 lb max.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 30 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
20 to 500 Hz: 1.4 g peak acceleration

**Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

**Features**

- Designed to operate under conditions of shock and vibration
- 4U 19-inch rugged rackmount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/As
- 200 MHz record and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- Real-time aggregate recording rates of up to 4.0 GB/sec
- Up to 46 terabytes of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- NTFS file format
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

Contact factory for options, number and type of analog channels, recording rates, and disk capacity.

**General Information**

The Talon® RTR 2747 is a turnkey, multi-band record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTR 2747 is intended for military, airborne and UAV applications requiring a rugged system. With scalable A/Ds, D/As and SSD (Solid-State Drive) storage, the RTR 2747 can be configured to stream data to and from disk at aggregate rates as high as 4.0 GB/sec.

The RTR 2747 uses Pentek's high-powered Virtex-6-based Cobalt® boards, that provide flexibility in channel count with optional digital downconversion and upconversion capabilities.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates, and DUC interpolations are among the selectable system parameters, that provide a fully programmable system capable of recording and reproducing a wide range of signals.

Optional GPS time and position stamping allows the user to record this critical signal information.

**SystemFlow Software**

The RTR 2747 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2747 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2747 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded through two rear-access gigabit Ethernet ports or two USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

**Rugged and Flexible Architecture**

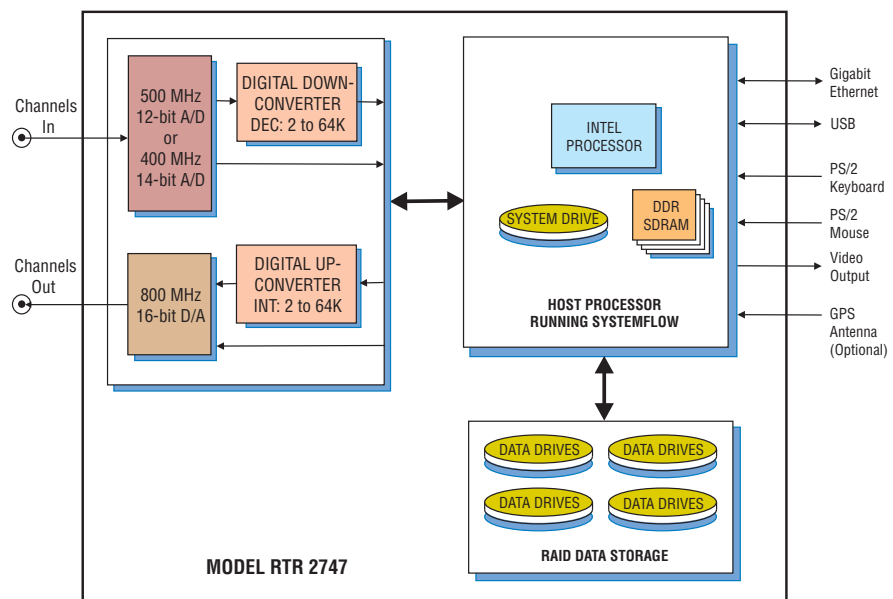

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2747 performs well in ground, shipborne and airborne environments. The hot-swappable SSDs provide storage capacity of up to 46 TB. The drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

The RTR 2747 is configured in a 4U 19" rack-mountable chassis, with hot-swappable data drives, front panel USB ports and I/O connectors on the rear panel.

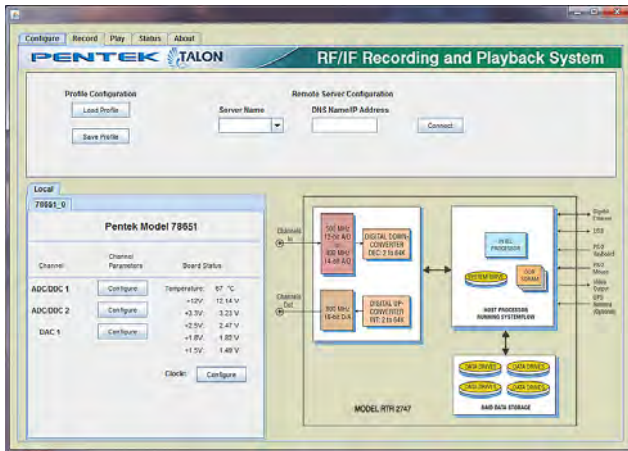

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. ➤

► SystemFlow Graphical User Interface

SystemFlow Recorder Interface

The RTR 2747 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2747 Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## Features

- Designed to meet MIL-STD-810 shock and vibration
- Designed to meet EMC/EMI per MIL-STD-461 EMC
- 4U 19-inch rugged rackmount PC server chassis, 22" deep
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/As
- Real-time aggregate recording rates of up to 4.0 GB/sec
- 200 MHz max. record and playback signal bandwidths
- Capable of record/playback of IF frequencies to 700 MHz
- Up to four front-panel removable QuickPac SSD drive canisters with eight drives each
- Up to 30 terabytes of storage to NTFS RAID disk array
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

## General Information

The Talon® RTX 2767 is a turnkey, multi-band record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTX 2767 is intended for military, airborne and UAV applications requiring a rugged system. With scalable A/Ds, D/As and SSD (Solid-State Drive) storage, the RTX 2767 can be configured to stream data to and from disk at rates as high as 4.0 GB/sec

The RTX 2767 uses Pentek's high-powered Virtex-6-based Cobalt® boards that provide flexibility in channel count, with optional digital downconversion capabilities. Optional 16-bit, 800 MHz D/A converters with digital upconversion allow real-time reproduction of recorded signals.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates and DUC interpolations are among the GUI-selectable system parameters, providing a fully-programmable system capable of recording and reproducing a wide range of signals.

Optional GPS time and position stamping allows the user to record this critical signal information.

## SystemFlow Software

The RTX 2767 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTX 2767 allows the user to install post processing and analysis tools to operate on the recorded data. The RTX 2767 records data to the native NTFS file system, providing immediate access to the recorded data.

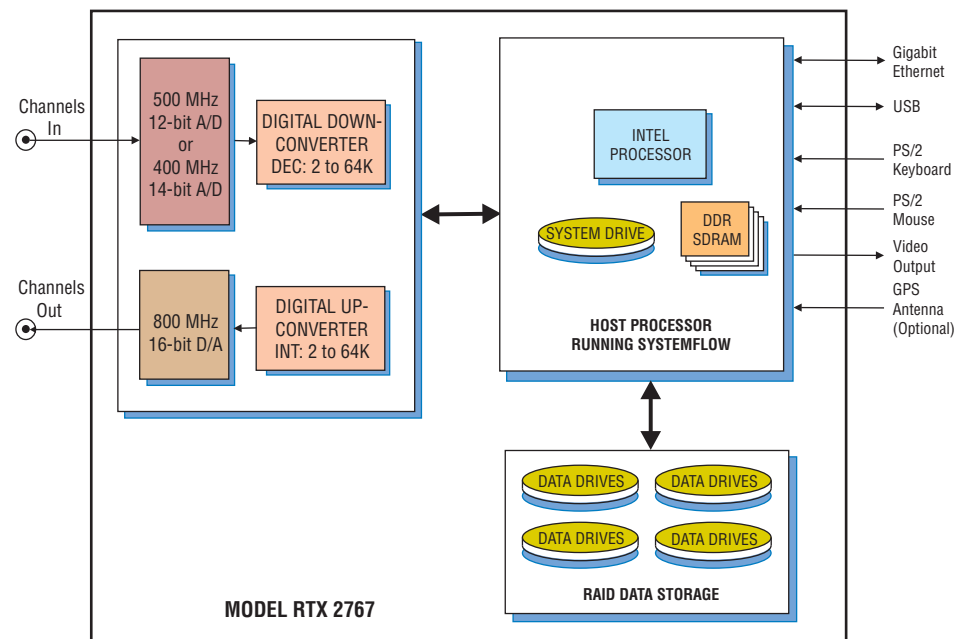

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

## Rugged Mil-Spec Chassis

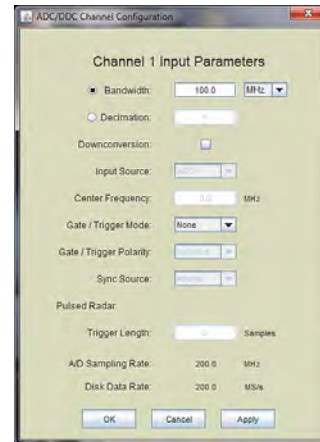

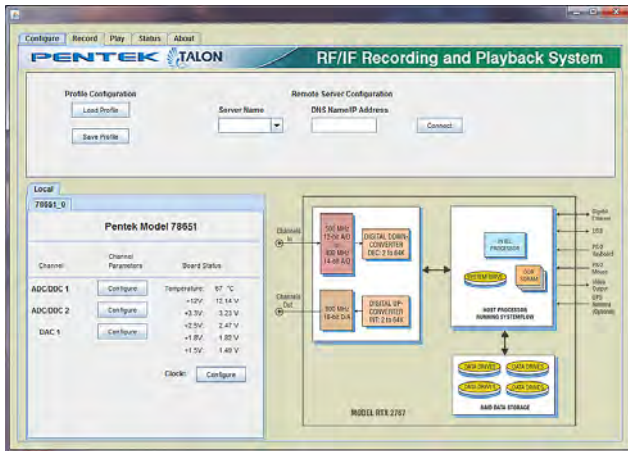

The Talon RTX 2767 uses a shock- and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

► SystemFlow Graphical User Interface

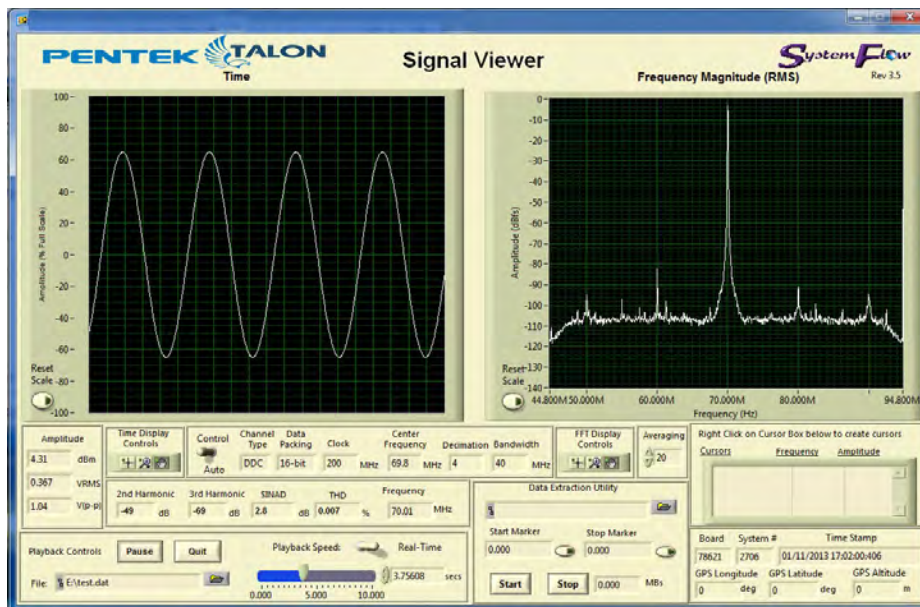

SystemFlow Recorder Interface

The RTX 2767 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

## Features

- Portable system measuring 16.9" W x 9.5" D x 13.4" H
- Lightweight: approximately 30 pounds
- Rugged aluminum alloy chassis
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 1 GHz 12-bit A/D
- 1 GHz 16-bit D/A
- 400 MHz recording and playback signal bandwidths
- Recording of IF signals up to 2 GHz
- Real-time aggregate recording rates up to 2.4 GB/sec
- Up to 7.6 TB storage with hot-swappable SSD drives
- NTFS file format
- Complete high-performance Windows® workstation with Intel® Core™ i7 processor
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Ideal for communications, radar, wireless, SIGINT, telecom and satcom
- Optional GPS time and position stamping

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2728 is a turnkey, multi-band recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2728 provides recording rates of up to 2.4 GB/sec and is ideal for the user who requires portability and solid performance in a compact recording system.

The RTR 2728 is supplied in a small footprint portable package measuring only 16.9" W x 9.5" D x 13.4" H and weighing just 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17" LCD monitor, and a high-performance SATA RAID controller.

At the heart of the RTR 2728 are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

GPS time and position stamping is optionally available.

## SystemFlow Software

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2728 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2728 records data to the native NTFS file format, providing immediate access to the recorded data.

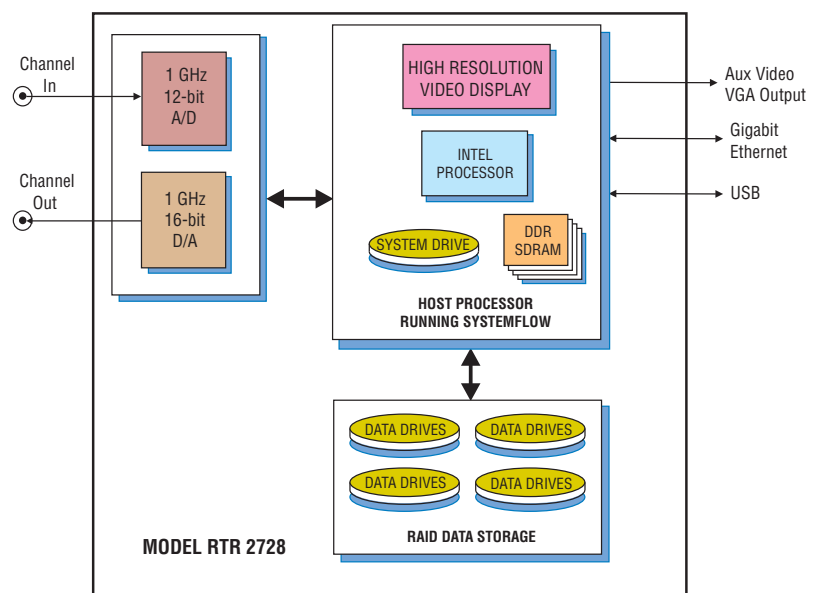

Data can be off-loaded through two 1 Gb Ethernet ports, eight USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Rugged & Flexible Architecture

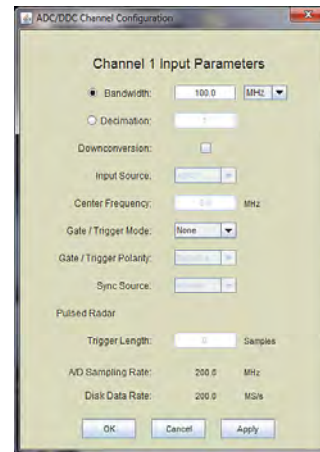

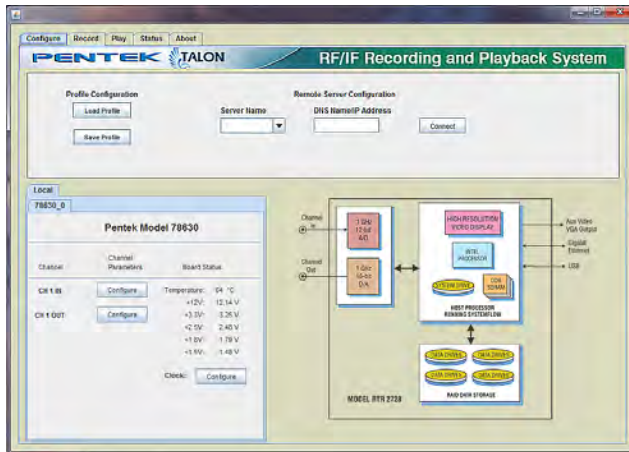

The RTR 2728 is configured in a portable, lightweight chassis with hot-swap SSDs, front panel USB ports and I/O connections on the side panel. It is built on an extremely rugged, 100% aluminum alloy unit, reinforced with shock absorbing rubber corners and an impact-resistant protective glass. Using shock- and vibration-resistant SSDs, the RTR 2728 is designed to operate reliably as a portable field instrument.

The hot-swappable SSDs provide storage capacities of up to 7.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

Multiple RAID levels including 0, 1, 5, and 6 provide a choice for the required level of redundancy. ➤

► SystemView Graphical User Interface

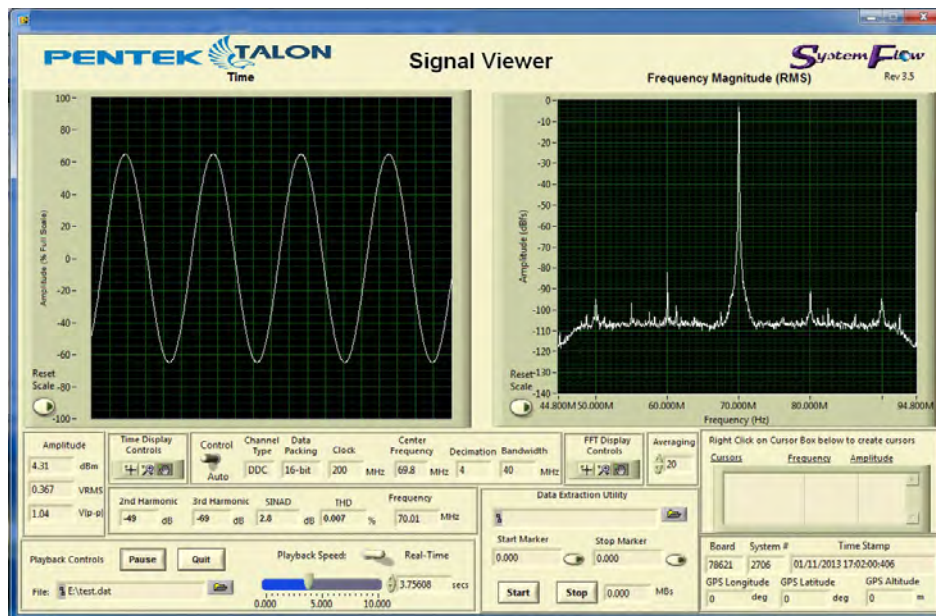

SystemFlow Recorder Interface

The RTR 2728 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2728's Configure screens provide a simple and intuitive means for setting up the system parameters. The ADC configuration screen shown here, allows user entries for gate/trigger mode, gate/trigger polarity, and sync source. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. This viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## Specifications

### PC Workstation (standard configuration)

**Operating System:** 64-bit Windows 7 Professional  
**Processor:** Intel Core i7 processor  
**Clock Speed:** 3.0 GHz or higher  
**Operating System Drive:** 128 GB SSD  
**SDRAM:** 8 GB  
**Monitor:** Built-in 17" high-resolution LCD  
 1440 x 900 pixels, 200 nits

### RAID

**Total Storage:** 1.9, 3.8 or 7.6 TB  
**Supported RAID Levels:** 0, 1, 5, and 6

**Drive Bays:** Hot-swap, removable, rear panel

**USB 2.0 Ports:** Eight on left side, two on front panel

**USB 3.0 Ports:** Two on left side

**1 Gb Ethernet Port:** Two on left side

**eSATA 3 Ports:** Two on left side

**Aux Video Output:** 15-pin VGA on left side

### Analog Recording Inputs

#### Analog Signal Inputs

**Quantity:** 1

**Input Type:** Transformer-coupled, female SSMC connector

**Transformer Type:** Macom ETC1-1-13TR

**Full Scale Input:** +10 dBm into 50 ohms

**3 dB Passband:** 5 MHz to 2 GHz

#### A/D Converter

**Type:** Texas Instruments ADS5400

**Sampling Rate ( $f_s$ ):** 100 MHz to 1 GHz

**Resolution:** 12 bits

**A/D Record Bandwidth:**  $f_s/2 =$  Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

### Analog Playback Output

#### Analog Signal Outputs

**Quantity:** 1

**Output Type:** Transformer-coupled, female SSMC connector

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converter

**Type:** TI DAC5681Z

**Interpolation:** 1x, 2x or 4x

**Input Data Rate to DAC5681Z:** 500 MS/sec max.

**Output Sampling Rate:** 1 GHz, max.

**Output IF:** 700 MHz, max.

**D/A Resolution:** 16 bits

**Clock Sources:** Selectable from onboard programmable VCXO or external clock

#### External Clock

**Type:** Female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz input clock or 10 MHz system reference

#### Internal Clock

**Type:** Programmable VCXO

**VCXO Frequency Ranges:** 100 to 945 MHz, 970 MHz to 1 GHz

### Physical and Environmental

**Dimensions:** 16.9" W x 9.5" D x 13.4" H

**Weight:** 30 lb, approximately

**Power:** 90 to 265 VAC, 50 - 60 Hz

**Operating Temp:** 5° to +45° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Model RTR 2728 Ordering Information and Options

### Channel Configurations

**Option -201** 1-channel recording

**Option -202** 2-channel recording

**Option -221** 1-channel playback

**Option -222** 2-channel playback

### Storage Options

**Option -405** 1.9 TB SSD storage capacity

**Option -410** 3.8 TB SSD storage capacity

**Option -415** 7.6 TB SSD storage capacity

### General Options (append to all options)

**Option -261** GPS time & position stamping

**Option -264** IRIG-B time stamping

Contact Pentek for compatible Option combinations

Storage and Channel-count Options may change, contact Pentek for the latest information

# Model RTR 2728A

# 1 GS/sec RF/IF Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 1 GHz 12-bit A/D
- 1 GHz 16-bit D/A
- 400 MHz recording and playback signal bandwidths
- Recording and playback of IF signals up to 2 GHz
- Real-time aggregate recording rates up to 4.0 GB/sec
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with Signal Viewer analysis tool
- Optional file headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

Contact the factory for options, for number and type of analog channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2728A is a turnkey, multi-band recording and playback system that allows the user to record and reproduce high-bandwidth signals with a lightweight, portable and rugged package. The RTR 2728A provides recording rates of up to 4.0 GB/sec and is ideal for the user who requires portability and solid performance in a compact recording system.

The RTR 2728A is supplied in a small-footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17" LCD monitor, and up to 61.4 TB of SSD storage.

At the heart of the RTR 2728A are Pentek Cobalt® Series Virtex-6 software radio boards featuring A/D and D/A converters. This architecture allows the system engineer to take full advantage of the latest technology in a turnkey system.

Optional GPS time and position stamping allows the user to record this critical signal information.

### SystemFlow Software

Included in this system is the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2728A allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2728A records data to the native NTFS file format, providing immediate access to the recorded data.

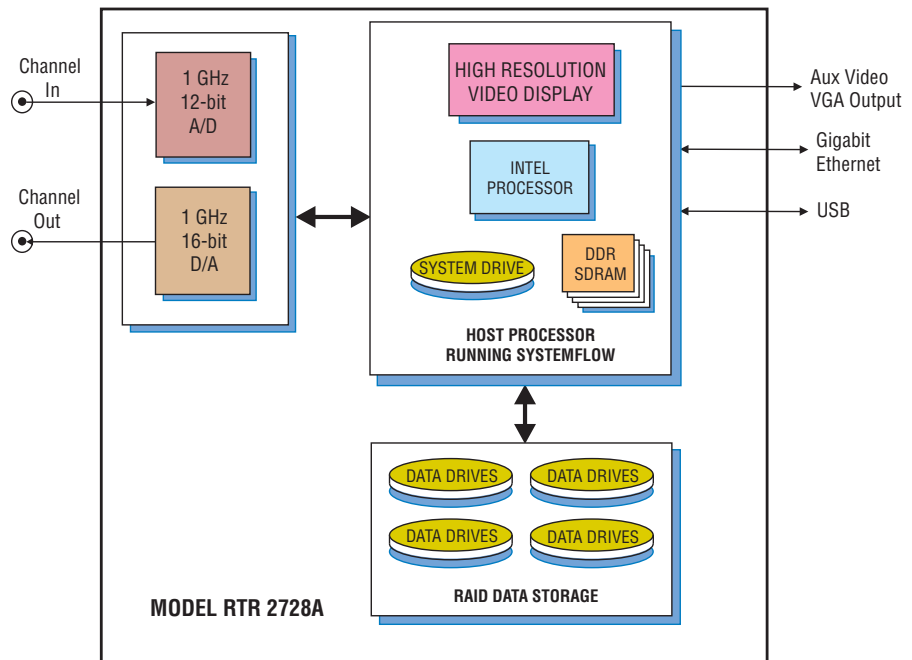

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

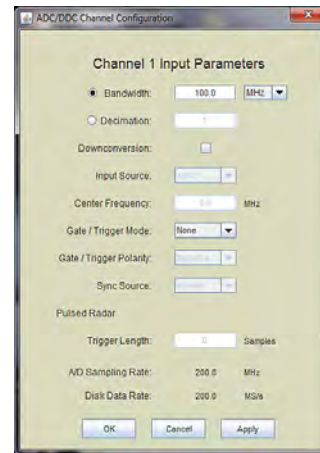

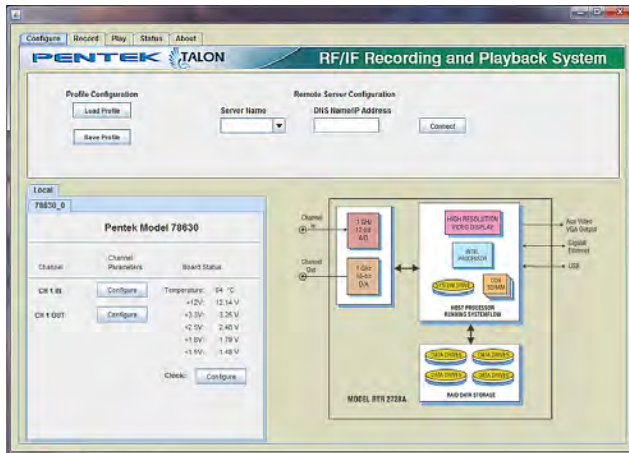

### Rugged Chassis with SSD Storage

The RTR 2728A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy. ➤

► SystemView Graphical User Interface

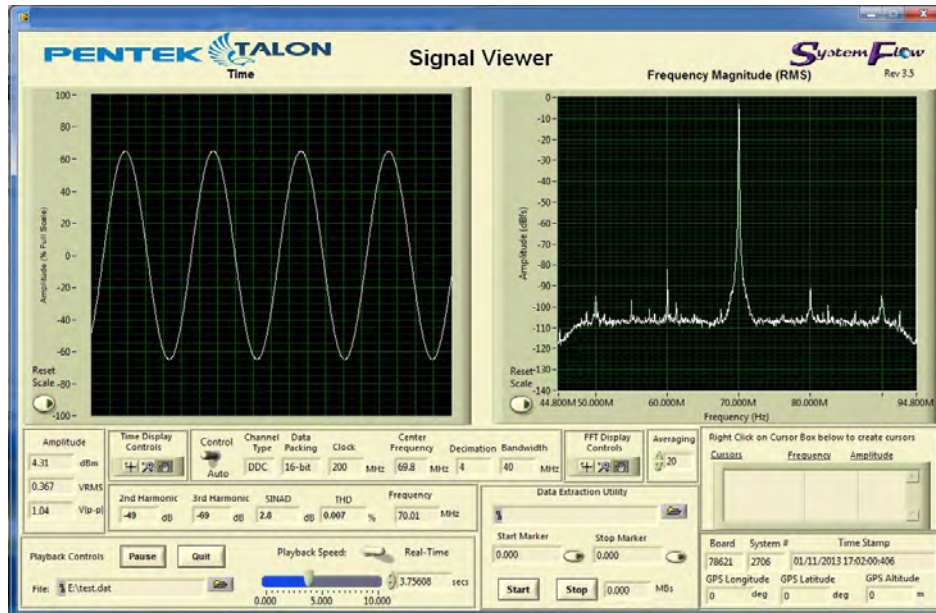

SystemFlow Recorder Interface

The RTR 2728A GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, playback a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2728A's Configure screens provide a simple and intuitive means for setting up the system parameters. The ADC configuration screen shown here, allows user entries for gate/trigger mode, gate/trigger polarity, and sync source. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. This viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## Features

- Designed to operate under conditions of shock and vibration
- Recording of IF signals up to 2 GHz.
- 1 GHz 12-bit A/Ds
- 1 GHz 16-bit D/As
- 400 MHz recording and playback signal bandwidths
- Real-time aggregate recording rates up to 4.0 GB/sec
- 4U 19-inch rugged rackmount PC server chassis
- Available in 21" deep 24-bay rackmount chassis or 26" deep 40-bay rackmount chassis
- Up to 46 terabytes of SSD storage to NTFS RAID solid state disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- Complete high-performance Windows® workstation with Intel® Core™ i7 processor
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

Contact factory for options, for number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2748 is a turnkey recording and playback system that allows users to record and reproduce signals with bandwidths up to 500 MHz. The RTR 2748 can be configured as a one- or two-channel system to provide real-time recording and playback rates up to 4.0 GB/sec to an array of solid-state drives.

The RTR 2748 uses Pentek's high-powered Virtex-6-based Cobalt® boards that provide the data streaming engine for the high-speed A/D converters.

A built-in synchronization module is provided to allow for multichannel phase-coherent operation.

GPS time and position stamping is optionally available.

## SystemFlow Software

The RTR 2748 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2748 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2748 records data to the native NTFS file system that provides immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports, six USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Rugged and Flexible Architecture

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2748 performs well in ground, shipborne and airborne environments. The drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Available in a 21" deep, 24-bay chassis or a 26" deep, 40-bay chassis, the system can be populated with SSD storage up to 46 TB.

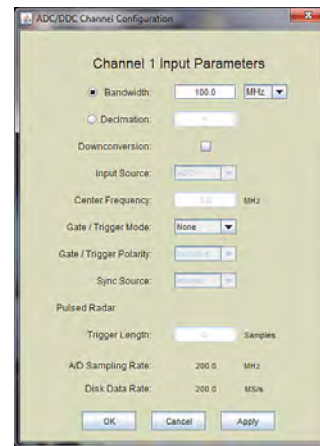

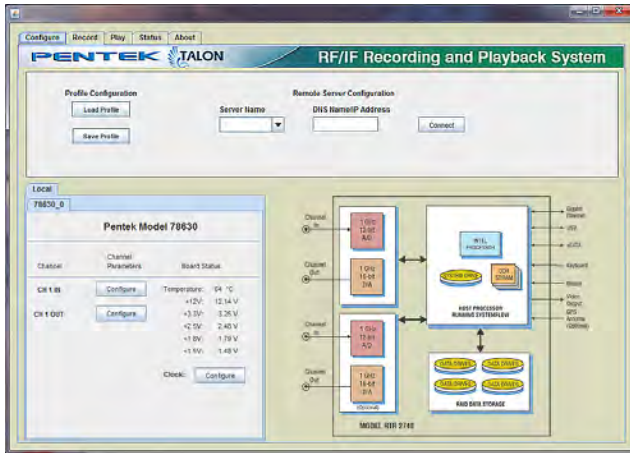

The RTR 2748 is configured in a rugged rackmount chassis, with hot-swappable data drives, front panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10, and 50 provide a choice for the required level of redundancy. ➤

New!

### Features

- Designed to meet MIL-STD-810 shock and vibration
- Designed to meet EMC/EMI per MIL-STD-461 EMC
- 4U 19-inch rugged rackmount PC server chassis, 22" deep
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 1 GHz 12-bit A/Ds
- 1 GHz 16-bit D/As
- 400 MHz recording and playback signal bandwidths
- Recording of IF signals up to 2 GHz.
- Real-time aggregate recording rates up to 4.0 GB/sec
- Up to four front-panel removable QuickPac SSD drive canisters with eight drives each
- Up to 30 terabytes of storage to NTFS RAID disk array
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

### General Information

The Talon® RTX 2768 is a turnkey recording and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTX 2768 is intended for military, airborne and UAV applications requiring a rugged system. With scalable A/Ds, D/As and SSD (Solid-State Drive) storage, the RTX 2768 can be configured to stream data to and from disk at rates as high as 4.0 GB/sec

The RTX 2768 uses Pentek's high-powered Virtex-6-based Cobalt® boards that provide the data-streaming engine for the high-speed A/D and D/A converters. This system allows users to record and reproduce signals with bandwidths up to 400 MHz.

A built-in synchronization module is provided to allow for multichannel phase-coherent operation.

Optional GPS time and position stamping allows the user to record this critical signal information.

### SystemFlow Software

The RTX 2768 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTX 2768 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTX 2768 records data to the native NTFS file system that provides immediate access to the recorded data.

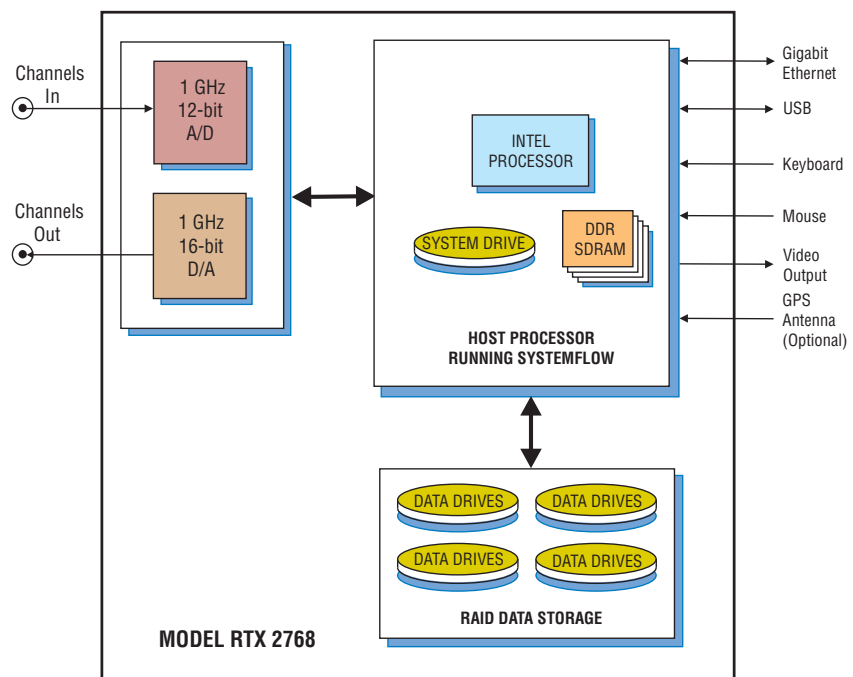

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

### Rugged Mil-Spec Chassis

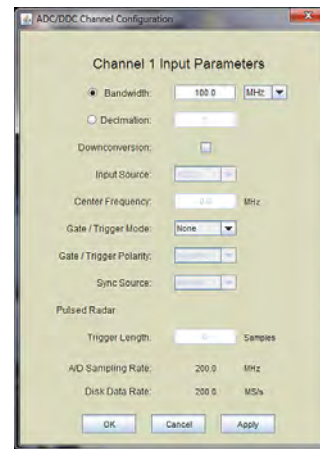

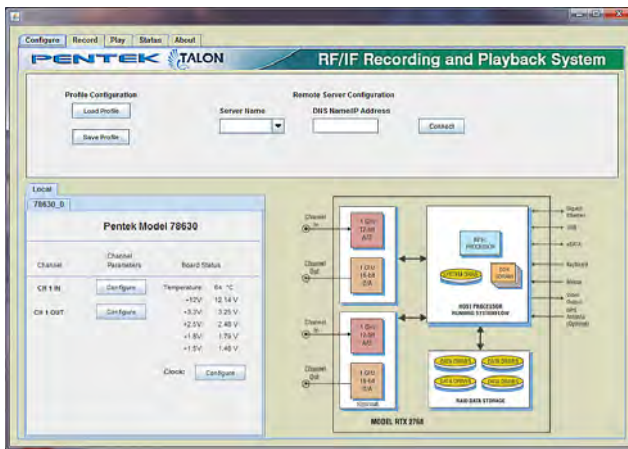

The Talon RTX 2768 uses a shock- and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

► SystemFlow Graphical User Interface

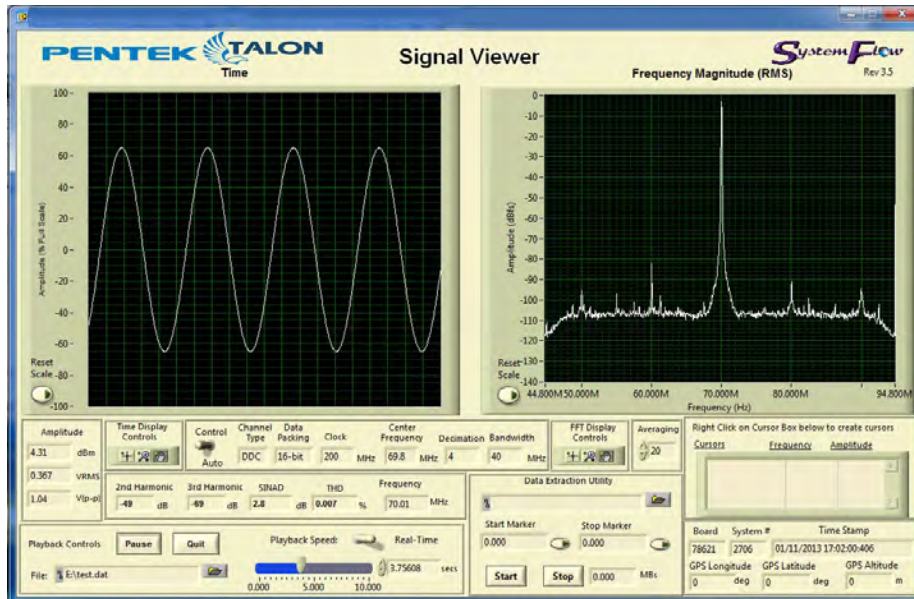

SystemFlow Recorder Interface

The RTX 2768 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTX 2768 Configure screens provide a simple and intuitive means for setting up the system parameters. The A/D configuration screen shown here, allows user entries for gate/trigger mode, gate/trigger polarity, and trigger source. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**SDRAM:** 8 GB

### Data Storage

**Style:** Up to four front-panel removable QuickPac drive canisters; up to eight SSDs contained in each canister

**Location:** Front panel

**Capacity:** Up to 30 TB

**Number of Drives:** Up to 32 total

**Supported RAID Levels:** 0, 1, 5 and 6

### Analog Recording Input Channels

#### Analog Signal Inputs

**Connector Type:** Rear-panel female SMA connectors

**Input Type:** Transformer-coupled

**Full Scale Input:** +10 dBm into 50 ohms

**3 dB Passband:** 5 MHz to 2 GHz

#### A/D Converters

**Type:** Texas Instruments ADS5400

**Sample Rate ( $f_s$ ):** 100 MHz to 1 GHz

**Resolution:** 12 bits

**A/D Record Bandwidth:**  $f_s/2 =$  Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

#### Sample and Reference Clocks

**External Sample Clock:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms 10 to 1000 MHz, common to both A/Ds

**VCXO Sample Clock:** Programmable, 10 to 1000 MHz, phase-locked to 10MHz reference, common to both A/Ds

**Reference Clock:** Sine wave, 0 to +10 dBm, A-C coupled, 50 ohms, 10 MHz, used for phase-locking the VCXO

**Connector Type:** Rear panel female SMA connector for external sample or reference clock input

#### External Trigger

**Number:** One common trigger for both input channels

**Input Level:** LVTTTL with selectable rising or falling edge

**Connector Type:** Rear panel female SMA connector

### Analog Playback Output Channels

#### Analog Signal Outputs

**Output Type:** Rear-panel female SSMC connectors

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### D/A Converters

**Type:** Texas Instruments DAC5681Z

**Output Sampling Rate:** 1 GHz, max.

**Resolution:** 16 bits

**Input Sample Data Rate to:** 500 MS/sec max.

**Output IF:** 700 MHz, max.

**Interpolation:** 1x, 2x or 4x

#### Sample and Reference Clocks

**External Sample Clock:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms 100 MHz to 1 GHz, common to both A/Ds

**VCXO Sample Clock:** 100 to 945 MHz, 970 MHz to 1 GHz phase-locked to 10MHz reference, common to all D/As

**Reference Clock:** Sine wave, 0 to +10 dBm, A-C coupled, 50 ohms, 10 MHz, used for phase-locking the VCXO

**Connector Type:** Rear panel female SMA connector for external sample or reference clock input

#### External Trigger

**Number:** One common trigger for both output channels

**Input Level:** LVTTTL with selectable rising or falling edge

**Connector Type:** Rear panel female SMA connector

### Physical and Environmental

**Dimensions:** 19" W x 22" D x 7" H

**Weight:** 50 lb, approx.

**Operating Temp:** -20° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 10% to 95%, non-condensing

**Operating Shock:** Designed to MIL-STD 810F, method 514.5, procedures I and VI

**Operating Vibration:** Designed to MIL-STD 810F, method 514.5, procedure I

**EMI/EMC:** Designed to MIL-STD 461E, CE101, CE102, CS101, CS113, RE101, RE102, RS101, RS103

**Input Power:** 85 to 264 VAC, 47- 400 Hz, 600 W max.

## Model RTX 2768 Order Information and Options

### Channel Configurations

<b>Option -201</b>	1-channel recording
<b>Option -202</b>	2-channel recording
<b>Option -221</b>	1-channel playback
<b>Option -222</b>	2-channel playback

### Storage Options

		<b>Max. Data Rate</b>
<b>Option -410</b>	3.8 TB SSD storage	4.0 GB/sec
<b>Option -415</b>	7.6 TB SSD storage	4.0 GB/sec
<b>Option -418</b>	11.5 TB SSD storage	4.0 GB/sec ►

### ► Storage Options

<b>Option -420</b>	15.3 TB SSD storage
<b>Option -425</b>	23.0 TB SSD storage
<b>Option -430</b>	30.7 TB SSD storage

### General Options (append to all options)

<b>Option -261</b>	GPS time & position stamping
<b>Option -264</b>	IRIG-B time stamping
<b>Option -680</b>	28 VDC power supply
<b>Option -625</b>	Front-panel removable OS drive

# Model RTR 2729A

# 3.6 GS/sec Ultra Wideband RF/IF Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Sample rates up to 3.6 GHz in single-channel mode
- Sample rates up to 1.8 GHz in dual-channel mode
- 12-bit A/D, with 16- and 8-bit packing modes
- Capable of recording RF/IF frequencies to 1.75 GHz in single-channel mode
- Capable of recording RF/IF frequencies to 2.8 GHz in dual-channel mode
- Real-time sustained recording rates of up to 4.0 GB/sec
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61.4 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with signal viewer analysis tool
- Optional file headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

### General Information

The Talon® RTR 2729A is a turnkey system that allows users to record very high-bandwidth signals in a lightweight and rugged portable package. Equipped with a 3.6 GHz 12-bit A/D converter and user-programmable DDC (digital downconverter) the RTR 2729A is capable of capturing RF/IF signals with bandwidths as high as 360 MHz continuously for over four hours.

The RTR 2729A is supplied in a small-footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor, a high-resolution 17" LCD monitor and up to 61.4 TB of SSD storage.

The RTR 2729A uses a high-powered Pentek Virtex-7-based Onyx® board that includes a PCIe Gen. 3 engine to provide data streaming for the high-speed A/D converter. Coupled with a high-performance PCIe Gen. 3 SATA III RAID controller, the RTR 2729A is capable of streaming contiguous data to disk in real-time at rates up to 4.0 GB/sec.

The RTR 2729A can operate as a single-channel 3.6 GHz or a two-channel 1.8 GHz recorder. The channel mode operation, sample rate, DDC settings, packing modes and trigger settings are controllable via the built-in SystemFlow GUI (Graphical User Interface).

An optional GPS receiver and timing card can be added to the system to provide precise time and position stamping of the recorded data.

### SystemFlow Software

The RTR 2729A includes Pentek's SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means

to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

The GUI provides a very simple interface for system setup. This includes pull-down selections for a handful of parameters, a checkbox to enable/disable the DDC and a data-entry field for the sample rate. Once set up, the GUI provides the ability to save profiles that can be reloaded at the click of a button.

SystemFlow also includes signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope and spectrum analyzer.

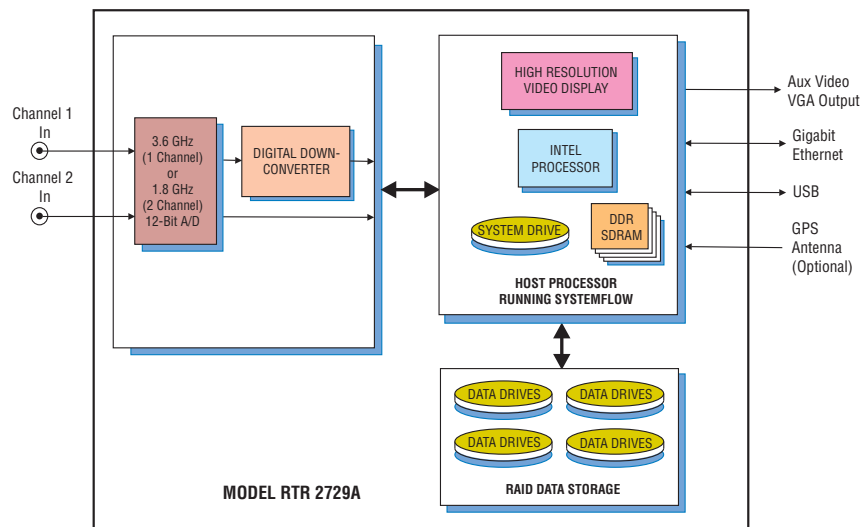

Built on a Windows 7 Professional workstation, the RTR 2729A allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2729A records data in the native NTFS file system for immediate access to the data.

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

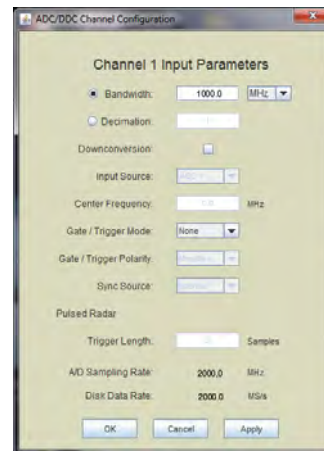

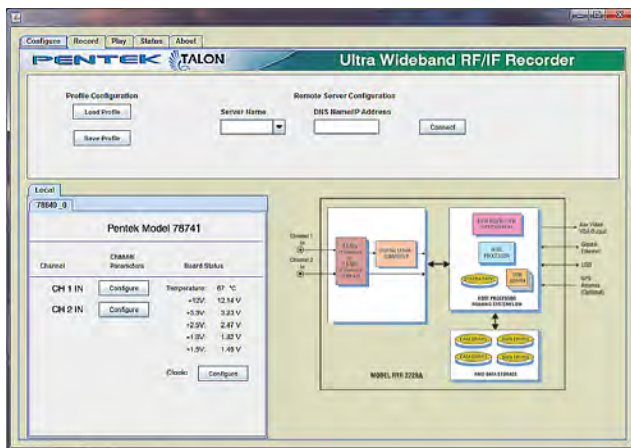

### Rugged Chassis with SSD Storage

The RTR 2729A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy. ➤

► SystemFlow Graphical User Interface

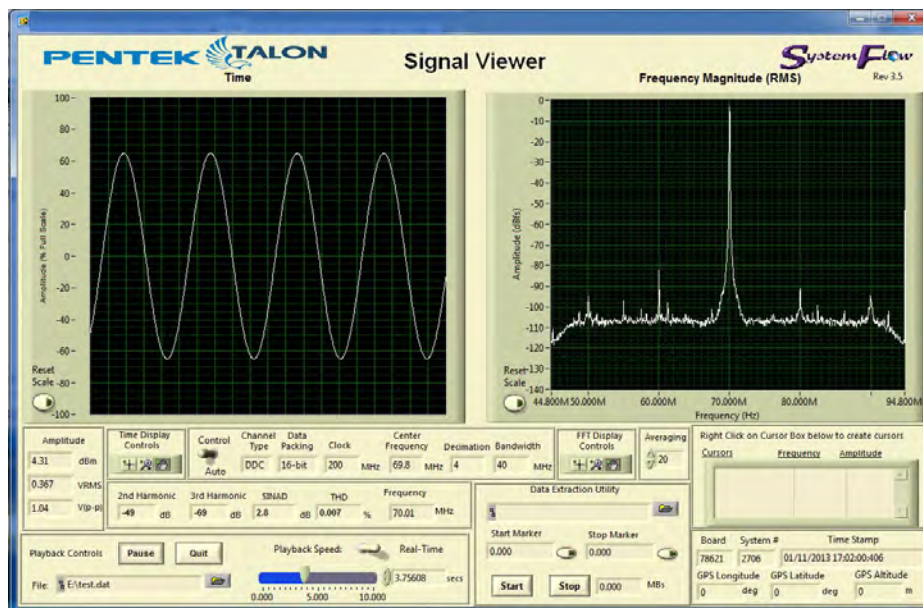

SystemFlow Recorder Interface

The RTR 2729A GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2729A Configure screens provide a simple and intuitive means for setting up the system parameters. The configuration screen shown here, allows user entries for input source, sampling frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** 64-bit Windows workstation

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**Operating System Drive:** 128 GB SSD

**SDRAM:** 8 GB

**Monitor:** Built-in 17.3" high-resolution LCD,  
1920 x 1080 pixels, 16:9 aspect ratio, anti-glare surface  
Brightness: 300 cd/m<sup>2</sup>; Contrast ratio: 400:1 typical

### RAID

**Total Storage:** 7.6 – 61.4 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, side panel

**USB 2.0 Ports:** Four on left side, two on front panel

**USB 3.0 Ports:** Two on left side

**1 Gb Ethernet Ports:** Two on left side

**Aux. Video Output:** 15-pin VGA on left side

### Analog Signal Inputs

**Connectors:** Two side panel SSMC connectors, In 1 & In 2

**Input Type:** Single-ended, non-inverting

**Full Scale Input:** +4 dBm into 50 ohms

**Coupling:** Transformer-coupled

**Input Transformers**

**Bandwidth:** 4.5 kHz to 3.0 GHz

### A/D Converters

**Type:** Texas Instruments ADC12D1800

**Sampling Rate**

Single-channel mode: 500 MHz to 3.6 GHz

Dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Maximum Usable Input Frequency**

Single-channel mode: 1.75 GHz

Dual-channel mode: 2.8 GHz

**Anti-Aliasing Filters:** External, user-supplied

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate ( $f_s$ ):**

One-channel mode: 3.6 GHz

Two-channel mode: 1.8 GHz

**Decimation Range (D):**

One-channel mode: 8x, 16x, 32x, bypass

Two-channel mode: 4x, 8x, 16x, bypass

**DDC Usable Bandwidth:**  $0.8 * f_s / D$

**Sampling Clock Source:** Internal fixed-frequency or

programmable oscillator (selectable by option);

in single-channel mode, the sample rate is 2x the clock

frequency; in dual-channel mode, the sample rate equals

the clock frequency

**Frequency Reference:** Accepts external 10 MHz reference at

0 to +4 dBm to phase-lock the clock oscillator

### Optional DC Power supply

**Voltage:** 10 to 36 VDC

**Input Current:** 42 to 26 A (39 A at 24 VDC)

**Inrush Current:** 100 A at 24 VDC

**Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C

**Efficiency:** >80% typical at 24 V full load

**Power Good Signal:** On delay 100 to 500 msec

**OverPower Protection:** 110% to 160%

**Remote Control:** On/Off

**Safety:** Meets UL, TUV, CB specifications

### Physical and Environmental

**Size:** 16.0" W x 6.9" D x 13.0" H

**Weight:** 30 lb max.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 30 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,

20 to 500 Hz: 1.4 g peak acceleration

**Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Model RTR 2729A Ordering Information and Options

### Sample Clock Options

**Option -910** User-Programmable Sample Clock

**Option -911** 1.5 / 3.0 GHz sample clock

**Option -912** 1.6 / 3.2 GHz sample clock

**Option -915** 1.8 / 3.6 GHz sample clock

**Note** Custom fixed-frequency sample clocks available upon request.

### Storage Options

**Option -415** 7.6 TB SSD Storage

**Option -420** 15.3 TB SSD Storage

**Option -430** 30.7 TB SSD Storage

**Option -460** 61.4 TB SSD Storage

### Additional Options

**Option -261** GPS Time & Position Stamping

**Option -264** IRIG-B Time Stamping

**Option -285** RAID 5 Configuration

**Option -286** RAID 6 Configuration

**Option -309** 16 GB System Memory

**Option -311** 64 GB System Memory

**Option -625** Removable Operating System Drive

**Option -681** 10 to 36 VDC Power Supply

## Features

- Designed to operate under conditions of shock and vibration
- Sample rates up to 3.6 GHz in single-channel mode
- Sample rates up to 1.8 GHz in dual-channel mode
- Capable of recording RF/IF frequencies to 1.75 GHz in single-channel mode
- Capable of recording RF/IF frequencies to 2.8 GHz in dual-channel mode
- 12-bit A/D, with 16- and 8-bit packing modes
- Real-time aggregate recording rates of up to 4.8 GB/sec
- 4U 19-inch rugged rackmount PC server chassis
- Windows® 7 Professional workstation with high performance Intel® Core™ i7 processor
- Up to 46 terabytes of SSD storage to NTFS RAID solid state disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- N+1 redundant power supply
- SystemFlow® GUI with signal viewer analysis tool
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

Contact factory for options, for number and type of analog channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2749 is a turnkey system, used for recording high-bandwidth signals. The RTR 2749 uses 12-bit, 3.6 GHz A/D converters. It can be configured as a one- or two-channel system and can record sampled data, packed as 8-bit- or 16-bit-wide consecutive samples (12-bit digitized samples residing in the 12 MSBs of the 16-bit word). A high-speed RAID array provides a maximum streaming recording rate to disk of 4.8 GB/sec.

The RTR 2749 uses Pentek's high-powered Virtex-7-based Onyx® boards that provide the data streaming engine for the high-speed A/D converters. Channel and packing modes as well as gate and trigger settings are among the GUI-selectable system parameters, providing complete control over this ultra wideband recording system.

Optional GPS time and position stamping allows the user to capture this critical information in the header of each data file.

## SystemFlow Software

The RTR 2749 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and

after a recording session. These tools include a virtual oscilloscope and a virtual spectrum analyzer.

Built on a Windows 7 Professional workstation, the RTR 2749 allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2749 records data to the native NTFS file system that provides immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports, six USB 2.0 ports or two eSATA ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

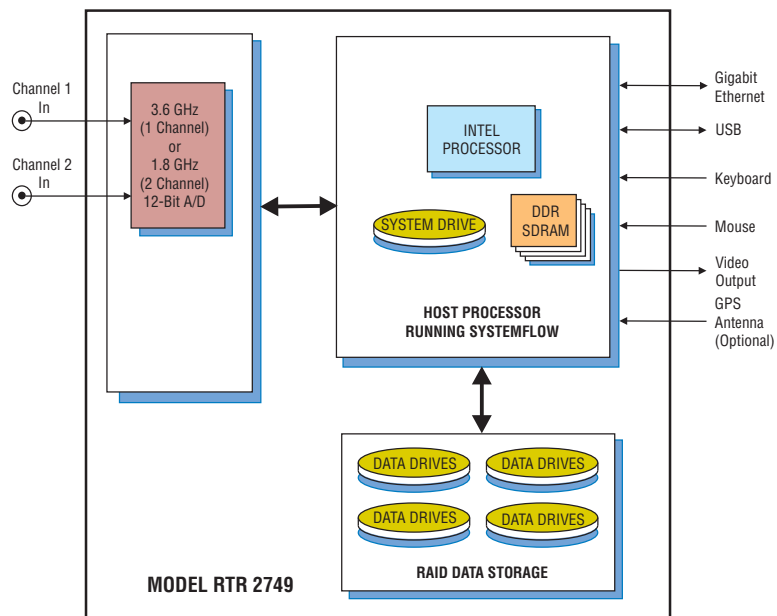

## Rugged and Flexible Architecture

Because SSDs operate reliably under conditions of vibration and shock, the RTR 2749 performs well in ground, shipborne and airborne environments. The hot-swappable SSDs provide storage capacity of up to 46 TB. The drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

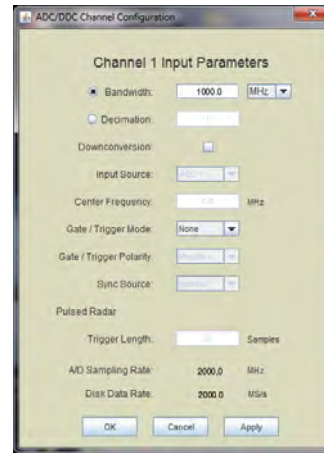

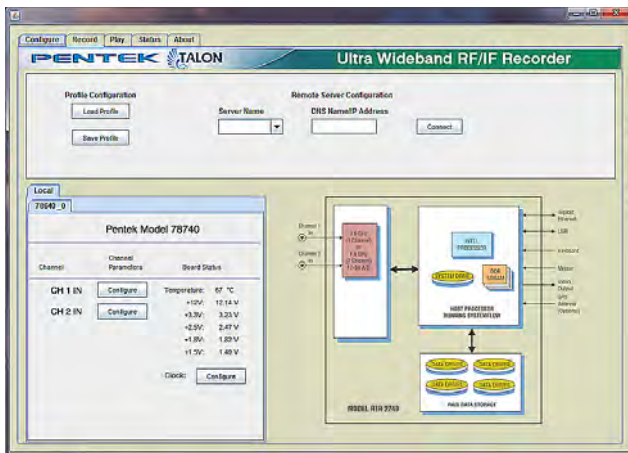

The RTR 2749 is configured in a 4U 19" rugged rackmount chassis, with hot-swappable data drives, front panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50 provide a choice for the required level of redundancy. ➤

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

### Sample and Reference Clocks

**Sample Clock Source:** Internal fixed-frequency or programmable oscillator (selectable by Option number); in single-channel mode, the sample rate is 2x the clock frequency; in dual-channel mode, the sample rate equals the clock frequency

**Reference Clock:** External 10 MHz reference at 0 to +4 dBm to phase-lock the clock oscillator

**Connector Type:** Rear-panel female SMA connector

### External Trigger

**Number:** One common trigger for both channels

**Input Level:** LVTTTL with selectable rising or falling edge

**Connector Type:** Rear panel female SMA connector

### Physical and Environmental

**Dimensions:** 19" W x 22" D x 7" H

**Weight:** 50 lb, approx.

**Operating Temp:** -20° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 10% to 95%, non-condensing

**Operating Shock:** Designed to MIL-STD 810F, method 514.5, procedures I and VI

**Operating Vibration:** Designed to MIL-STD 810F, method 514.5, procedure I

**EMI/EMC:** Designed to MIL-STD 461E, CE101, CE102, CS101, CS113, RE101, RE102, RS101, RS103

**Input Power:** 85 to 264 VAC, 47–400 Hz, 600 W max.

## Model RTX 2769 Order Information and Options

### Sample Clock Options

<b>Option -910</b>	<b>User-Programmable Sample Clock</b> Dual-channel mode sample clock range 150 MHz – 945 MHz 970 MHz – 1134 MHz 1213 MHz – 1417.5 MHz Single-channel mode sample clock range 500 MHz – 1890 MHz 1940 MHz – 2268 MHz 2426 MHz – 2835 MHz
<b>Option -911</b>	<b>Fixed-frequency clock</b> 1.5 / 3.0 GHz sample clock
<b>Option -912</b>	<b>Fixed-frequency clock</b> 1.6 / 3.2 GHz sample clock
<b>Option -915</b>	<b>Fixed-frequency clock</b> 1.8 / 3.6 GHz sample clock

Sample rates are set up for dual-channel mode first and single-channel mode second: e.g. 1.5 / 3.0 is 1.5 in dual-channel mode and 3.0 in single-channel mode.

### Storage Options

<b>Option -410</b>	3.8 TB SSD storage
<b>Option -415</b>	7.6 TB SSD storage
<b>Option -420</b>	15.3 TB SSD storage
<b>Option -430</b>	30.7 TB SSD storage
<b>Option -460</b>	61.0 TB SSD storage

### General Options

<b>Option -261</b>	GPS time & position stamping
<b>Option -264</b>	IRIG-B time stamping
<b>Option -680</b>	28 VDC power supply
<b>Option -625</b>	Front-panel removable OS drive

# Model RTR 2613

# Talon 3 GHz RF/IF Sentinel Intelligent Signal Scanning Portable Recorder

### Features

- Search and capture system using Pentek's Sentinel™ Intelligent Signal Scanner
- Captures RF signals up to 3 GHz
- Capture and scan bandwidths up to 40 MHz
- 30 GHz/sec scan rate
- Selectable threshold triggered or manual record modes
- 16-bit A/D with 75 dB SNR & 86 dB SFDR
- Built-in DDC with selectable decimation range from 2 to 65,536
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Storage capacities to 61.4 TB
- RAID levels 0, 5, and 6
- Windows® workstation with Intel Core™ i7 processor
- Optional RF upconversion
- SystemFlow GUI with virtual oscilloscope, spectrum analyzer and spectrogram displays

### General Information

The Talon® RTR 2613 combines Pentek's Sentinel Intelligent Signal Scanning software with real-time recording in a lightweight, portable and rugged package. The RTR 2613 provides SIGINT engineers the ability to scan the 3 GHz spectrum for signals of interest and monitor or record bandwidths up to 40 MHz wide once a signal band of interest is detected.

A spectral scan facility allows the user to sweep the spectrum at 30 GHz/sec, while threshold detection allows the system to automatically lock onto and record signal bands. Scan results are displayed in a waterfall plot and can also be recorded to allow users to look back at some earlier spectral activity.

Once a signal of interest is detected, the real-time recorder can capture and store up to 61.4 terabytes of data to disk, allowing users to store days'-worth of data.

### Hardware Features

The Pentek Model 78621 Cobalt board transceiver serves as the engine of the RTR 2613 and is coupled with a 3 GHz tuner to provide excellent dynamic range across the entire spectrum. The 200 MHz 16-bit A/D board provides 86 dB of spurious-free dynamic range and 75 dB of SNR.

The FPGA-based DDC with selectable decimations up to 64 k provides exceptional processing gain while allowing users to zoom into communications signals of varying bandwidths.

The RTR 2613 is supplied in a small footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing

just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17 in. LCD monitor, and up to 61.4 TB of SSD storage.

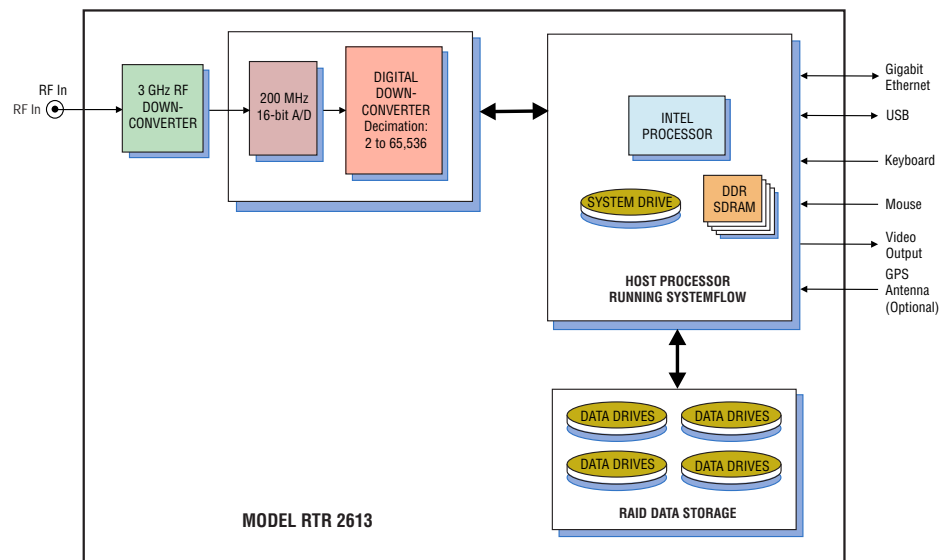

An optional GPS receiver and built-in PLLs allow all devices in the RF chain to be locked in phase and correlated to GPS time. GPS position information can optionally be recorded, allowing the recorder's position to be tracked while acquiring RF signals.

### Sentinel Features

Pentek's Sentinel™ recorders add intelligent signal monitoring and detection for Talon real-time recording systems. The intuitive GUI allows users to monitor the entire spectrum or select a region of interest, while a selectable resolution bandwidth allows the user to trade sweep rate for a finer resolution and better dynamic range. Scan settings can be saved as profiles to allow for quick setup in the field.

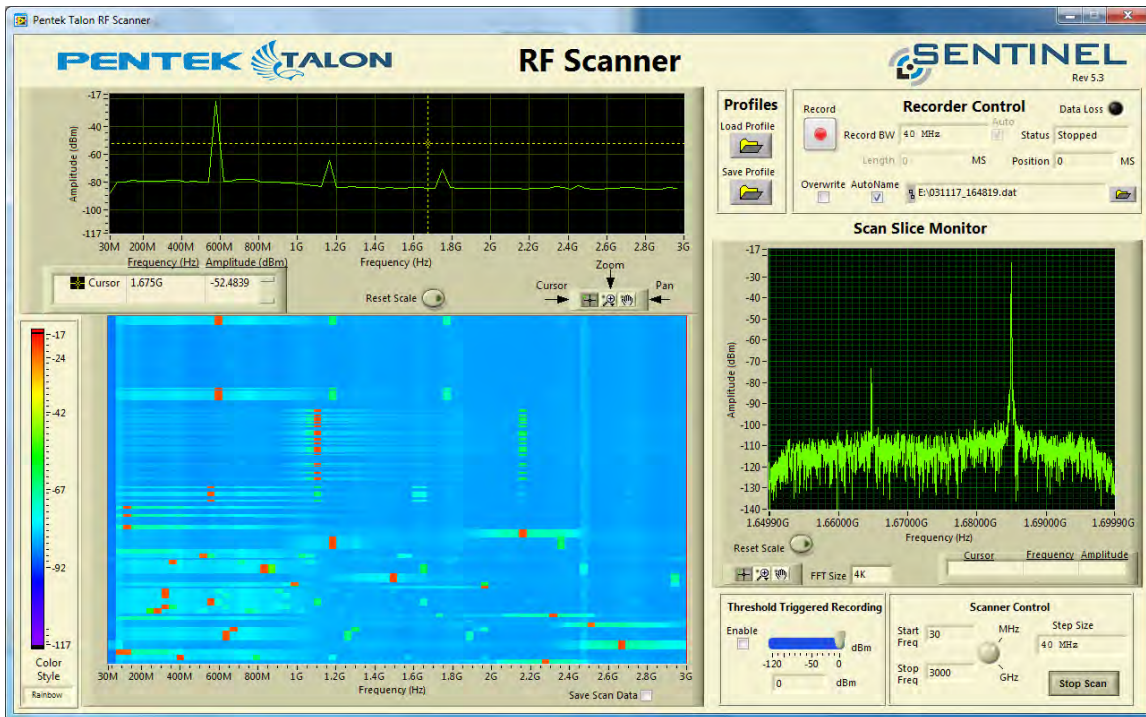

RF energy in each band of the scan is detected and presented in a waterfall display. Any RF band can be selected for real-time monitoring or recording. In addition to manually selecting a band for recording, a recording can be automatically started by configuring signal strength threshold levels to trigger a recording.

The Sentinel hardware resources are controlled through enhancements to Talon's SystemFlow® software package that includes a virtual oscilloscope, virtual spectrum analyzer and spectrogram displays. These provide a complete suite of analysis tools to compliment the Sentinel hardware resources. ➤

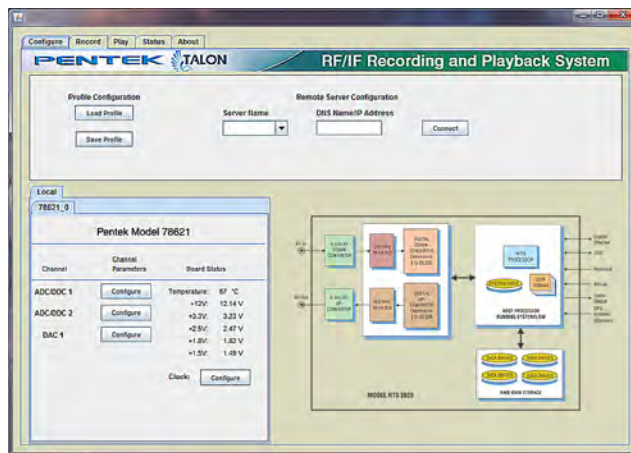

► Graphical User Interface

**RF Scanner GUI**

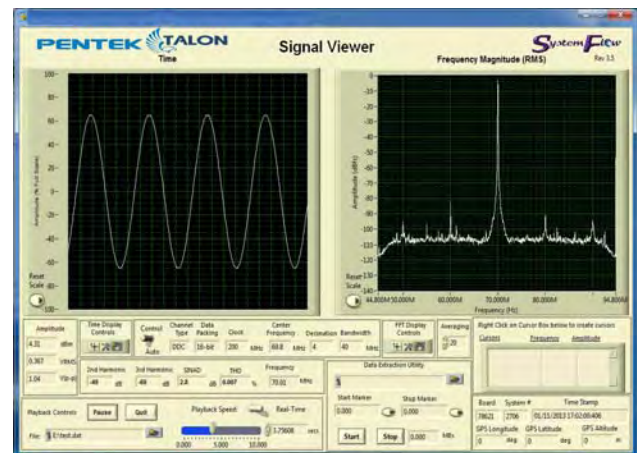

An RF Scanner GUI allows complete control of the system through a single interface. Start and stop frequencies of a scan can be set by the user as well as the resolution bandwidth. All user parameters can be saved as profiles for easy setup in the field.

Frequency slices from the waterfall display can be selected and monitored, allowing the user to zoom into bands of interest. Threshold triggering levels can be set to record signals that exceed a specified energy. Recordings can also be manually started and stopped from the RF Scanner GUI.

**SystemFlow Recorder Interface**

The RTR 2613 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, and play back a recorded signal. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

**SystemFlow Signal Viewer**

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). ►

### ► SystemFlow Software

The RTR 2613 includes the SystemFlow® Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

SystemFlow also includes signal viewing and analysis tools, that allow the user to monitor the signal prior to, during, and after a recording session. These tools include virtual oscilloscope, spectrum analyzer and spectrogram displays.

Built on a Windows workstation, the RTR 2613 allows the user to install post-processing and analysis tools to operate on the recorded

data. The RTR 2613 records data to the native NTFS file system providing immediate access to the recorded data.

Data can be off-loaded via gigabit Ethernet ports or USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Specifications

### RF Tuner Specifications

**RF Tuner Frequency Range:** 30 to 3000 MHz

**Tuning resolution:** 1 kHz

**Internal frequency accuracy:** ±1.0 ppm (-20 to +60°C)

**External Reference Input Frequency:** 10 MHz

**External Reference Input Level:** 0 dBm ±3 dBm

**RF input:** 50 ohms nominal

**Noise figure:** 13 dB typical, 16 dB max

**Maximum RF input without damage:** +15 dBm

**In-Band Input IP3:** +3 dBm typical, -3 dBm min

**In-Band Input IP2:** +30 dBm min, +36 dBm typical

**IF bandwidth:** Nominal 40 MHz bandwidth (3 dB)

**IF center frequency:** 70 MHz center

**Gain:** +15 dB nominal above RF input

**Gain control:** Manual -40 dB range (min)

**Image rejection:** 65 dB min (> 80 dB typical)

**IF rejection:** 65 dB min (80 dB typical)

**Phase noise at 2.500 MHz:**

**1 kHz offset:** -75 dBc/Hz typical

**20 kHz offset:** -80 dBc/Hz max

**100 kHz offset:** -100 dBc/Hz typical

**1 MHz offset:** -125 dBc/Hz typical

**Internally generated spurious:** -100 dBm equivalent  
RF input typical

# Model RTR 2623

# Talon 6 GHz RF/IF Sentinel Intelligent Signal Scanning Portable Recorder

### Features

- Search and capture system using Pentek's Sentinel™ Intelligent Signal Scanner
- Captures RF signals up to 6 GHz
- Capture and scan bandwidths up to 40 MHz
- 30 GHz/sec scan rate
- Selectable threshold triggered or manual record modes
- 16-bit A/D with 75 dB SNR & 87 dB SFDR
- Built-in DDC with selectable decimation range from 2 to 65,536
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Storage capacities to 61 TB
- RAID levels 0, 5, and 6
- Windows workstation with Intel Core™ i7 processor
- Optional RF upconversion
- SystemFlow GUI with virtual Oscilloscope, Spectrum Analyzer and Spectrogram displays

### General Information

The Talon® RTR 2623 combines Pentek's Sentinel Intelligent Signal Scanning software with real-time recording in a lightweight, portable and rugged package. The RTR 2623 provides SIGINT engineers the ability to scan the 6 GHz spectrum for signals of interest and monitor or record bandwidths up to 40 MHz wide once a signal band of interest is detected.

A spectral scan facility allows the user to sweep the spectrum at 30 GHz/sec, while threshold detection allows the system to automatically lock onto and record signal bands. Scan results are displayed in a waterfall plot and can also be recorded to allow users to look back at some earlier spectral activity.

Once a signal of interest is detected, the real-time recorder can capture and store up to 30 terabytes of data to disk, allowing users to store days worth of data.

### Hardware Features

The Pentek Model 78621 Cobalt board transceiver serves as the engine of the RTR 2623 and is coupled with a 6 GHz tuner to provide excellent dynamic range across the entire spectrum. The 200 MHz 16-bit A/D board provides 86 dB of spurious-free dynamic range and 74 dB of SNR.

The Virtex-6-based DDC with selectable decimations up to 64 k provides exceptional processing gain while allowing users to zoom into communications signals of varying bandwidths.

The RTR 2623 is supplied in a small footprint portable package measuring only 16.0" W x 6.9" D x 13.0" H and weighing

just less than 30 pounds. With measurements similar to a small briefcase, this portable workstation includes an Intel Core i7 processor a high-resolution 17 in. LCD monitor, and up to 61.4 TB of SSD storage.

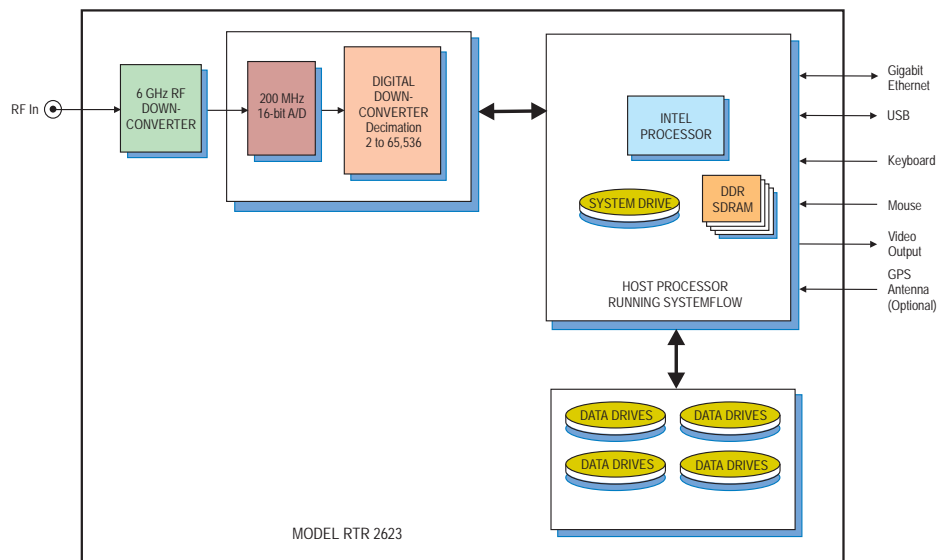

An optional GPS receiver and built-in PLLs allow all devices in the RF chain to be locked in phase and correlated to GPS time. GPS position information can optionally be recorded, allowing the recorder's position to be tracked while acquiring RF signals.

### Sentinel Features

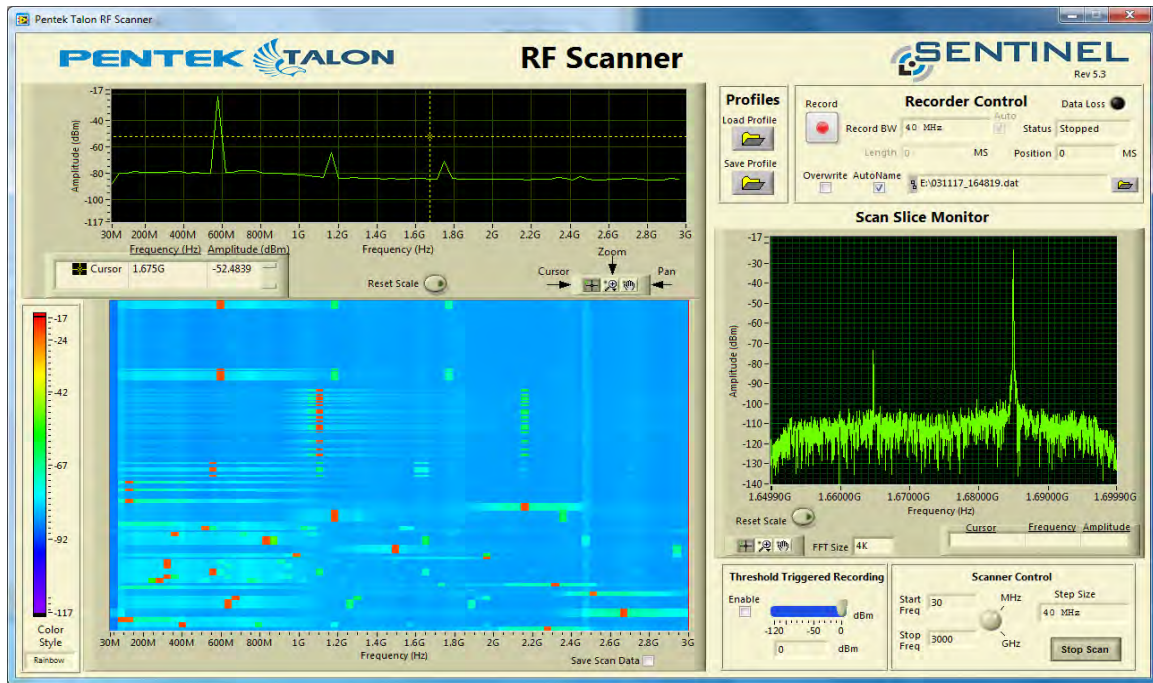

Pentek's Sentinel™ recorders add intelligent signal monitoring and detection for Talon real-time recording systems. The intuitive GUI allows users to monitor the entire spectrum or select a region of interest, while a selectable resolution bandwidth allows the user to trade sweep rate for a finer resolution and better dynamic range. Scan settings can be saved as profiles to allow for quick setup in the field.

RF energy in each band of the scan is detected and presented in a waterfall display. Any RF band can be selected for real-time monitoring or recording. In addition to manually selecting a band for recording, a recording can be automatically started by configuring signal strength threshold levels to trigger a recording.

## Model RTR 2546

## 200 MS/sec RF/IF Rugged SFF Recorder

### Features

- Housed in a small chassis measuring 5.25" H x 8.5" W x 14" D
- Weighs 17 lb (7.7 kg)
- Shock and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 200 MHz 16-bit A/Ds
- 800 MHz 16-bit D/As
- Real-time aggregate recording rates of up to 1.6 GB/sec
- DDC decimation and DUC interpolation range from 2 to 65,536
- 80 MHz record and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- Up to 30 terabytes of SSD storage to NTFS RAID solid state disk array
- Windows® workstation with high performance Intel® Core™ i7 processor
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

### General Information

Optimized for SWaP (size, weight and power,) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

Configured with four 200 MS/sec 16-bit A/Ds the RTR 2546 is capable of recording the full four-channel bandwidth at a 1.6 GB/sec sustained rate to disk. An 800 MHz 16-bit D/A allows for real-time full-bandwidth signal reproduction.

Built-in digital downconverters and upconverters allow for IF signals to be converted to baseband and reproduced at the original IF frequency.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates, and DUC interpolations are among the GUI-selectable system parameters, providing a fully programmable system capable of recording and reproducing a wide range of signals.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. SFF Models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds. An optional GPS receiver allows for precise GPS time and position stamping.

### SystemFlow Software

All Talon Rugged Small Form Factor recorders include the Pentek SystemFlow recording software. SystemFlow features a

Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder. A user API is also included to allow custom recorder control interfaces to be easily built.

SystemFlow provides signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope, spectrum analyzer and spectrogram displays.

Built on a Windows Professional workstation, all Talon SFF recorders allow the user to install post-processing and analysis tools to operate on the recorded data. The system records data to the native NTFS file system, providing immediate access to the recorded data files.

### Rugged Chassis with SSD Storage

The SFF system is configured with hot-swappable SSDs, front-panel USB ports, and I/O connectors on the rear panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 30.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy.

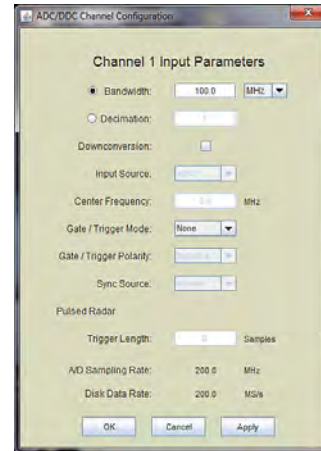

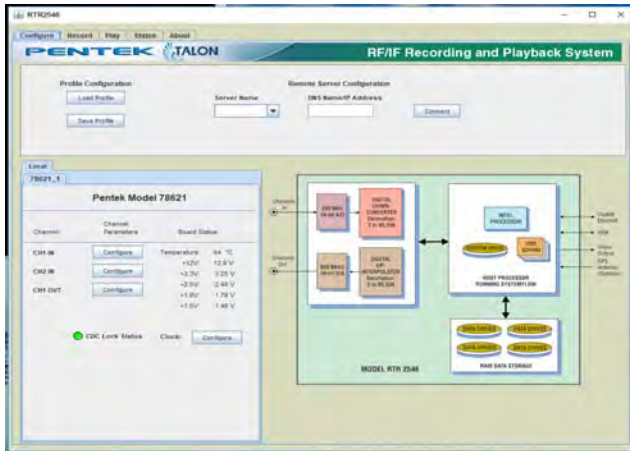

A push of a button unlatches each of the data drives and the OS drive. Drives are mounted on sleds and can be easily transferred to an offload system while the recorder stays in the field.

PC and signal I/O is available on the rear panel with standard connectors. ➤

► SystemView Graphical User Interface

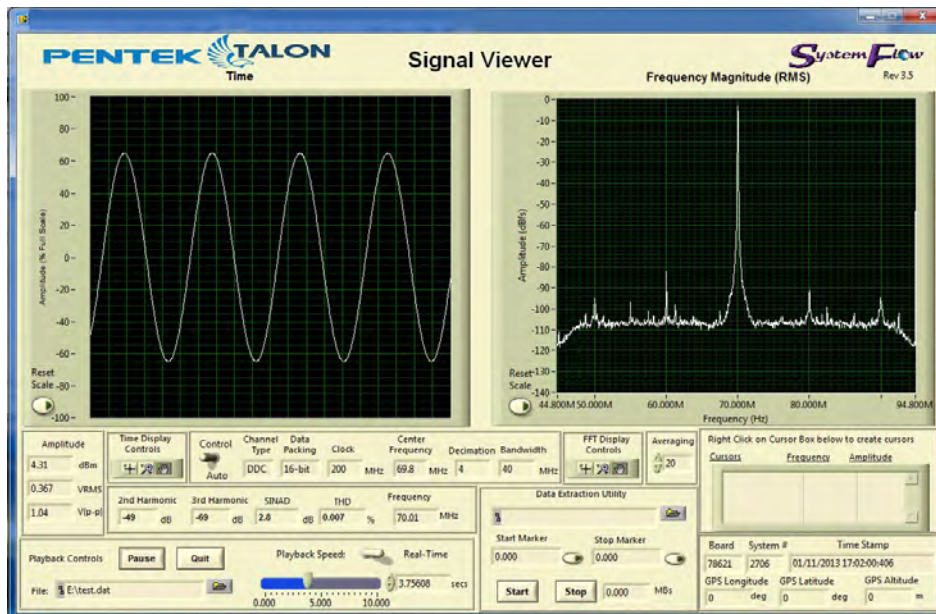

SystemFlow Recorder Interface

The RTR 2546 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, playback a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

SystemFlow Hardware Configuration Interface

The RTR 2546's Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

**Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows workstation  
**Processor:** Intel i7 7700K (7th Gen) quad core processor  
**Clock Speed:** 4.2 GHz  
**Operating System Drive:** 250 GB SSD  
**SDRAM:** 8 standard, 16 or 32 GB optional  
**RAID**

**Total Storage:** 3.8 TB – 30.6 TB  
**Supported RAID Levels:** 0, 5 and 6  
**Drive Bays:** Hot-swap, removable, front panel

**Rear Panel I/O**

Four USB 3.0 ports  
 Two Gigabit RJ45 ports  
 Two HDMI and One DVI ports  
 Audio and PS2 ports  
 USB 3.0 Type-C port  
 Two Wi-Fi antenna ports

**Front Panel I/O**

Two USB 2.0 ports  
 Power and recessed RESET buttons  
 LED indicators for power and HDD access

**Analog Signal Inputs**

Transformer-coupled, female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate ( $f_s$ ):** 10 MHz to 200 MHz  
**Resolution:** 16 bits  
**A/D Record Bandwidth:**  $f_s/2$  = Nyquist bandwidth  
**Anti-Aliasing Filters:** External, user-supplied

**Digital Downconverter**

**Type:** Pentek IP Core  
**Decimation(D):** 2 to 65,536  
**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits  
**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

**Analog Signal Outputs**

**Connectors:** Transformer-coupled, female SSMC  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Digital Upconverter, Interpolator and D/As**

**D/A Resolution:** 16 bits  
**Output Signal:** Analog, real or quadrature  
**Type:** TI DAC5688 and Pentek-installed IP core interpolator  
**Interpolation:** 2 to 65,536

**Input Data Rate to DAC5688:** 250 MS/sec max.

**Output Sampling Rate:** 800 MHz max

**Output IF:** DC to 400 MHz

**Bandwidth Range:** Matches recording bandwidths

**Clock Sources:** Selectable from onboard programmable VCXO, external or LVDS clocks

**External Clocks**

**Type:** Female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, 10 to 200 MHz

**Physical and Environmental**

**Size:** 5.25" H x 8.5" W x 14.0" D

**Weight:** 17 lb (7.7 kg)

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
 20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 150 W max.

**Model RTR 2546 Ordering Information and Options**

**Channel Configurations**

**Option -201** 1-Channel Recording  
**Option -202** 2-Channel Recording  
**Option -203** 3-Channel Recording  
**Option -204** 4-Channel Recording  
**Option -221** 1-Channel Playback  
**Option -222** 2-Channel Playback  
**Option -224** 4-Channel Playback

**Storage Options**

**Option -410** 3.8 TB SSD Storage  
**Option -415** 7.6 TB SSD Storage  
**Option -420** 15.3 TB SSD Storage  
**Option -430** 30.6 TB SSD Storage

**Additional Options**

**Option -261** GPS Time and Position Stamping  
**Option -285** Raid 5 Configuration  
**Option -286** Raid 6 Configuration  
**Option -309** 16 GB System Memory  
**Option -310** 32 GB System Memory  
**Option -630** 6 to 30 VDC Power Supply

**Contact Pentek for compatible Option combinations**  
**Storage and Channel-count Options may change, contact Pentek for the latest information**

*Specifications subject to change without notice*

## Features

- Housed in a small chassis measuring 5.25" H x 8.5" W x 14" D
- Weighs 17 pounds (7.7 kg)
- Shock and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 500 MHz 12-bit A/Ds or 400 MHz 14-bit A/Ds
- 800 MHz 16-bit D/As
- 200 MHz record and playback signal bandwidths
- Real-time aggregate recording rates of up to 2.0 GB/sec
- DDC decimation and DUC interpolation range from 2 to 65,536
- Up to 200 MHz record and playback signal bandwidths
- Recording and playback of IF signals up to 700 MHz
- Up to 30 terabytes of SSD storage to NTFS RAID solid state disk array
- Windows® workstation with high performance Intel® Core™ i7 processor
- SystemFlow® GUI with Signal Viewer analysis tool
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

## General Information

Optimized for SWaP (size, weight and power,) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

Configured with two A/Ds and two D/As, the 2547 provides the ability to play back two channels of real data or one channel of complex data with the available DUC.

Built-in digital downconverters and upconverters allow for IF signals to be converted to baseband and reproduced at the original IF frequency.

A/D sampling rates, DDC decimations and bandwidths, D/A sampling rates, and DUC interpolations are among the GUI-selectable system parameters, providing a fully programmable system capable of recording and reproducing a wide range of signals.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. SFF Models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds. An optional GPS receiver allows for precise GPS time and position stamping.

## SystemFlow Software

All Talon Rugged Small Form Factor recorders include the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Inter-

face) that provides a simple means to configure and control the recorder. A user API is also included to allow custom recorder control interfaces to be easily built.

SystemFlow provides signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope, spectrum analyzer and spectrogram displays.

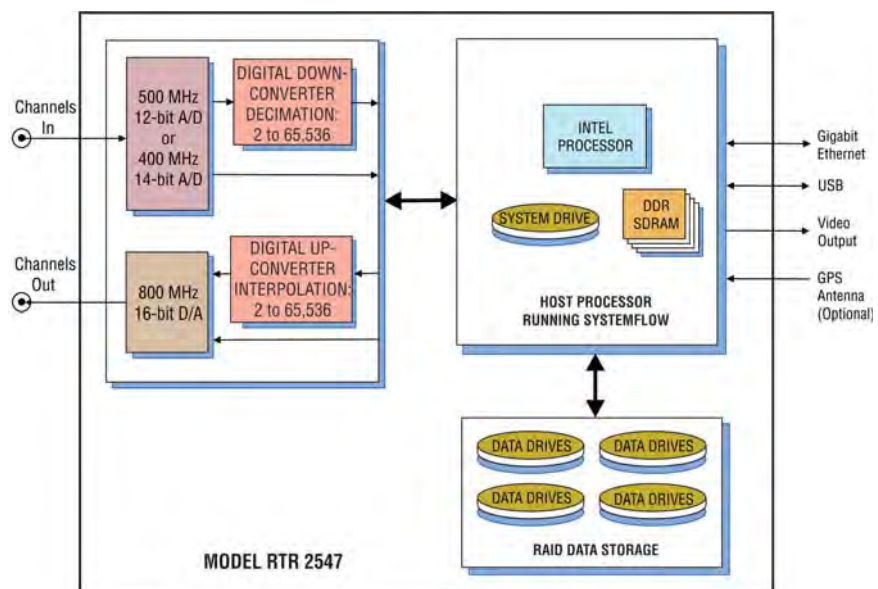

Built on a Windows Professional workstation, all Talon SFF recorders allow the user to install post-processing and analysis tools to operate on the recorded data. The system records data to the native NTFS file system, providing immediate access to the recorded data files.

## Rugged and Flexible Architecture

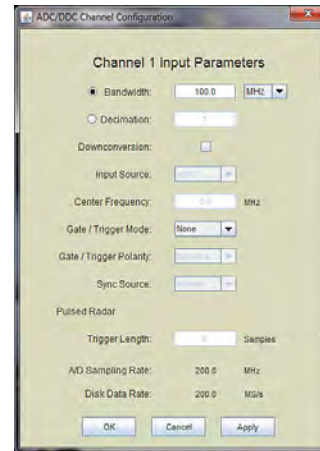

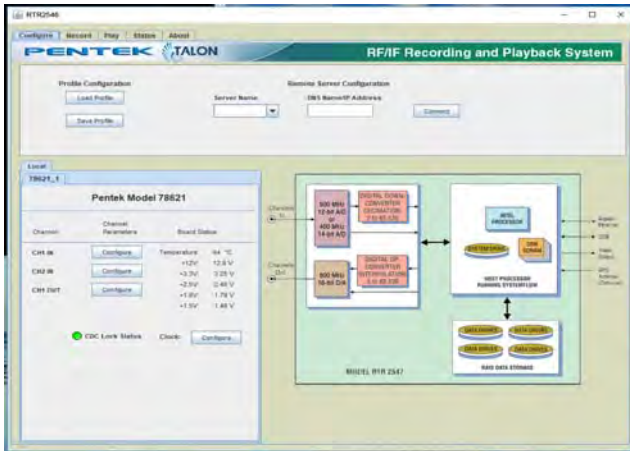

The SFF system is configured with hot-swappable SSDs, front-panel USB ports, and I/O connectors on the rear panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 30.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy.

A push of a button unlatches each of the data drives and the OS drive. Drives are mounted on sleds and can be easily transferred to an offload system while the recorder stays in the field.

PC and signal I/O is available on the rear panel with standard connectors. ➤

► SystemFlow Graphical User Interface

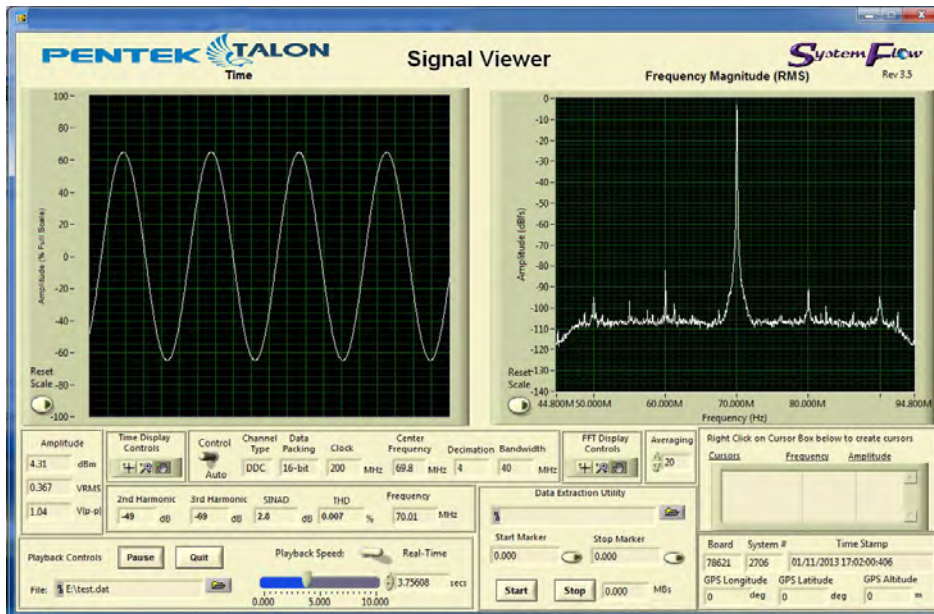

SystemFlow Recorder Interface

The RTR 2747 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2747 Configure screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, allows user entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** Windows workstation

**Processor:** Intel i7 7700K (7th Gen) quad core processor

**Clock Speed:** 4.2 GHz

**Operating System Drive:** 250 GB SSD

**SDRAM:** 8 GB standard, 16 GB or 32 GB optional

### RAID

**Total Storage:** 3.8 TB – 30.6 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, front panel

### Rear Panel I/O

Four USB 3.0 ports

Two Gigabit RJ45 ports

Two HDMI and One DVI ports

Audio and PS2 ports

USB 3.0 Type-C port

Two Wi-Fi antenna ports

### Front Panel I/O

Two USB 2.0 ports

Power and recessed RESET buttons

LED indicators for power and HDD access

### Analog Signal Inputs

Transformer-coupled, female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5463 or ADS5474 (Option-014)

**Sampling Rate ( $f_s$ ):** 10 MHz to 500 MHz

**Resolution:** 12 Bits or 14 bits (Option -014)

**A/D Record Bandwidth:**  $f_s/2$  = Nyquist bandwidth

**Anti-Aliasing Filters:** External, user-supplied

### Digital Downconverter

**Type:** Pentek IP Core

**Decimation(D):** 2 to 65,536

**IF Center Frequency Tuning:** DC to  $f_s$ , 32 bits

**DDC Usable Bandwidth:**  $0.8 \cdot f_s / D$

### Analog Signal Outputs

**Connectors:** Transformer-coupled, female SSMC

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Digital Upconverter, Interpolator and D/As

**D/A Resolution:** 16 bits

**Output Signal:** Analog, real or quadrature

**Type:** TI DAC5688 and Pentek-installed IP core interpolator

**Interpolation:** 2 to 65,536

**Input Data Rate to DAC5688:** 250 MS/sec max.

**Output Sampling Rate:** 800 MHz max

**Output IF:** DC to 400 MHz

**Bandwidth Range:** Matches recording bandwidths

**Clock Sources:** Selectable from onboard programmable

VCXO, external or LVDS clocks

### External Clocks

**Type:** Female SSMC connector, sine wave, 0 to +12 dBm,

AC-coupled, 50 ohms, 10 to 500 MHz divider input clock or PLL system reference

**Internal Clock:**

**Type:** Programmable VCXO from 10 to 810 MHz

### Physical and Environmental

**Size:** 5.25" H x 8.5" W x 14.0" D

**Weight:** 17 lb (7.7 kg)

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,

20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 150 W max.

**General Information**

Optimized for SWaP (size, weight and power,) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

Configured with 1.0 GS/sec 12-bit A/D the RTR 2548 is capable of recording the full-channel bandwidth at a 2.0 GB/sec sustained rate to disk. A 1.0 GHz 16-bit D/A allows for real-time full-bandwidth signal reproduction.

A/D and D/A sampling rates are among the GUI-selectable system parameters, providing a fully programmable system capable of recording and reproducing a wide range of signals. A built-in synchronization module is provided to allow for multichannel phase-coherent operation.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. SFF Models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds. An optional GPS receiver allows for precise GPS time and position stamping.

Optimized for SWaP (size, weight and power,) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

The RTR 2549 uses 12-bit, 3.6 GHz A/D converters. It can be configured as a one- or two-channel system and can record sampled data, packed as 8-bit or 16-bit-wide consecutive samples (12-bit digitized samples residing in the 12 MSBs of the 16-bit word). A high-speed RAID array provides a maximum streaming recording rate to disk of 4.0 GB/sec.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. SFF Models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds.

Optional GPS time and position stamping allows the user to capture this critical information in the header of each data file.

**SystemFlow Software**

All Talon Rugged Small Form Factor recorders include the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to

configure and control the recorder. A user API is also included to allow custom recorder control interfaces to be easily built.

SystemFlow provides signal viewing and analysis tools that allow the user to monitor the signal prior to, during, and after a recording session. These tools include a virtual oscilloscope, spectrum analyzer and spectrogram displays.

Built on a Windows Professional workstation, all Talon SFF recorders allow the user to install post-processing and analysis tools to operate on the recorded data. The system records data to the native NTFS file system, providing immediate access to the recorded data files.

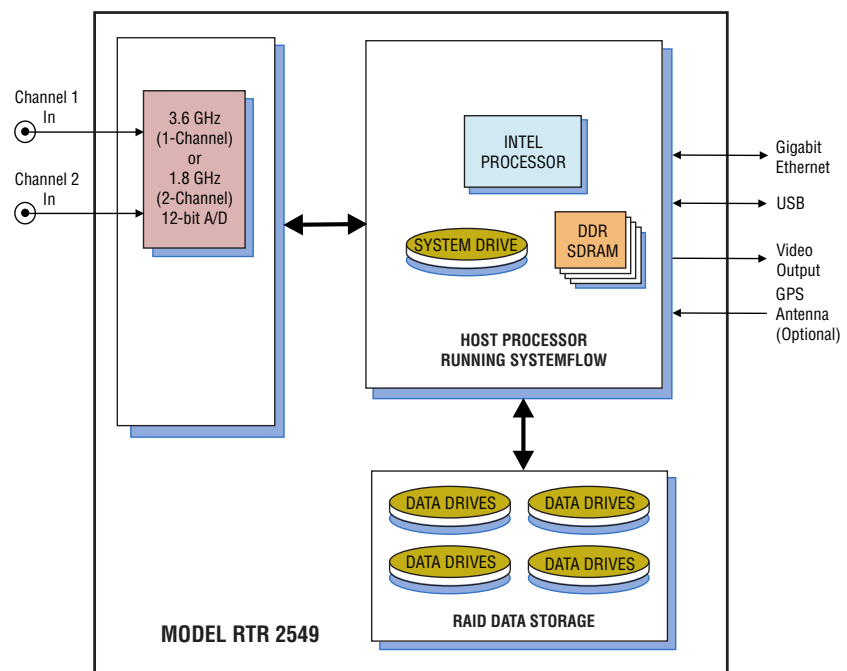

**Rugged Chassis with SSD Storage**

The SFF system is configured with hot-swappable SSDs, front-panel USB ports, and I/O connectors on the rear panel. It is built in a rugged steel and aluminum chassis and is tested for shock and vibration.

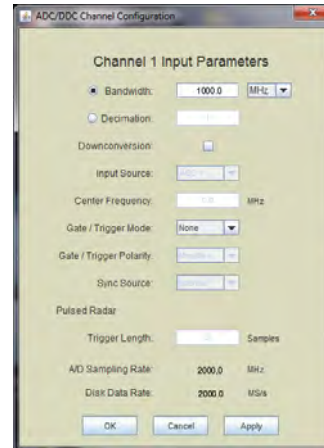

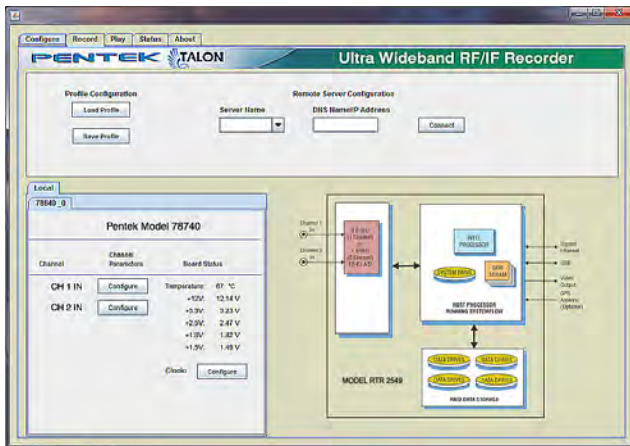

The SSDs provide storage capacities of up to 30.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels including 0, 5, and 6, provide a choice for the required level of redundancy.

A push of a button unlatches each of the data drives and the OS drive. Drives are mounted on sleds and can be easily transferred to an offload system while the recorder stays in the field.

PC and signal I/O is available on the rear panel with standard connectors. ➤

► SystemFlow Graphical User Interface

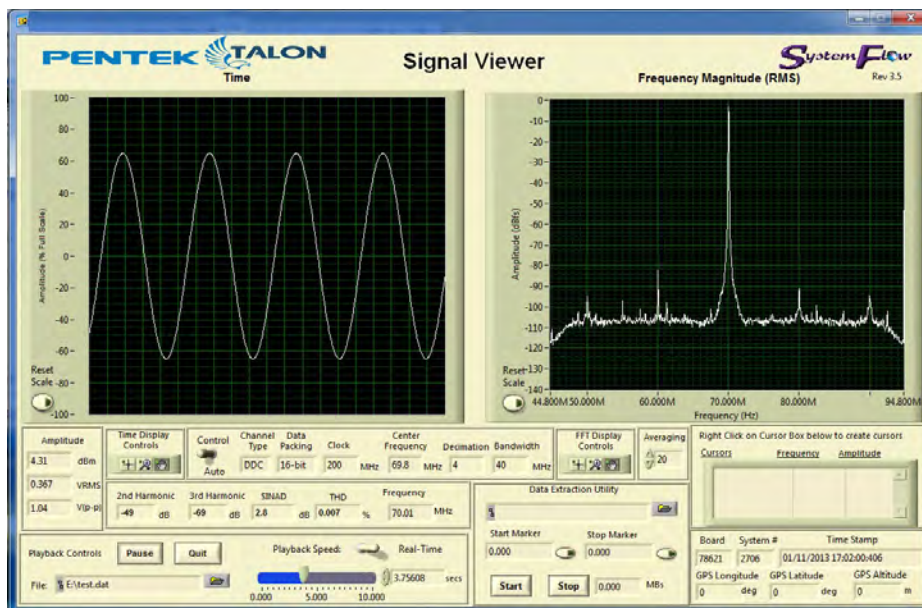

SystemFlow Recorder Interface

The RTR 2549 GUI provides the user with a control interface for the recording system. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or signals recorded on disk.

SystemFlow Hardware Configuration Interface

The RTR 2549 Configure screens provide a simple and intuitive means for setting up the system parameters. The configuration screen shown here, allows user entries for input source, sampling frequency, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual, annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field. ►

**► Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows workstation  
**Processor:** Intel i7 7700K (7th Gen) quad core processor  
**Clock Speed:** 4.2 GHz

**Operating System Drive:** 250 GB SSD  
**SDRAM:** 8 GB standard, 16 GB or 32 GB optional  
**RAID**

**Total Storage:** 3.8 TB – 30.6 TB  
**Supported RAID Levels:** 0, 5 and 6  
**Drive Bays:** Hot-swap, removable, front panel

**Rear Panel I/O**

Four USB 3.0 ports  
 Two Gigabit RJ45 ports  
 Two HDMI and One DVI ports  
 Audio and PS2 ports  
 USB 3.0 Type-C port  
 Two Wi-Fi antenna ports

**Front Panel I/O**

Two USB 2.0 ports  
 Power and recessed RESET buttons  
 LED indicators for power and HDD acces

**Analog Signal Inputs**

**Connectors:** Two rear panel SSMC connectors, In 1 & In 2  
**Input Type:** Single-ended, non-inverting  
**Full Scale Input:** +4 dBm into 50 ohms  
**Coupling:** Transformer-coupled  
**Analog Input Transformers:**  
**Bandwidth:** 4.5 kHz to 3.0 GHz

**A/D Converters**

**Type:** Texas Instruments ADC12D1800  
**Sampling Rate:**  
 Single-channel mode: 500 MHz to 3.6 GHz  
 Dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits  
**Maximum Usable Input Frequency**  
 Single-channel mode: 1.75 GHz  
 Dual-channel mode: 2.8 GHz  
**Anti-Aliasing Filters:** External, user-supplied

**Digital Downconverters**

**Modes:** One or two channels, programmable  
**Supported Sample Rate ( $f_s$ ):**  
 One-channel mode: 3.6 GHz  
 Two-channel mode: 1.8 GHz  
**Decimation Range (D):**  
 One-channel mode: 8x, 16x, 32x, bypass  
 Two-channel mode: 4x, 8x, 16x, bypass  
**Usable Output Bandwidth:**  $0.8 \cdot f_s / D$

**Physical and Environmental**

**Size:** 5.25" H x 8.5" W x 14.0" D  
**Weight:** 17 lb (7.7 kg)  
**Operating Temp:** 0° to +50° C  
**Storage Temp:** -40° to +85° C  
**Relative Humidity:** 5 to 95%, non-condensing  
**Operating Shock:** 15 g max. (11 msec, half-sine wave)  
**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
 20 to 500 Hz: 1.4 g peak acceleration  
**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 150 W max.

**Model RTR 2549 Ordering Information and Options**

**Storage Options**

**Option -415** 7.6 TB SSD storage capacity  
**Option -420** 15.3 TB SSD storage capacity  
**Option -430** 30.6 TB SSD storage capacity

**Additional Options**

**Option -261** GPS Time and Position Stamping  
**Option -285** Raid 5 Configuration  
**Option -286** Raid 6 Configuration  
**Option -309** 16 GB System Memory  
**Option -310** 32 GB System Memory  
**Option -630** 6 to 30 VDC Power Supply

**Contact Pentek for compatible Option combinations**  
**Storage and Channel-count Options may change, contact Pentek for the latest information**

*Specifications are subject to change without notice*

**General Information**

The Talon® RTS 2715 is a complete turn-key recording system for storing one or two ten-gigabit Ethernet (10GbE) streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and supports both TCP and UDP protocols.

Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 1.6 GB/sec.

Rear panel SFP+ connectors accommodate copper, multi-mode or single-mode fibre interfaces.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTS 2715 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTS 2715 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTS 2715 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

**Flexible Architecture**

The RTS 2715 is configured in a 4U or 5U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

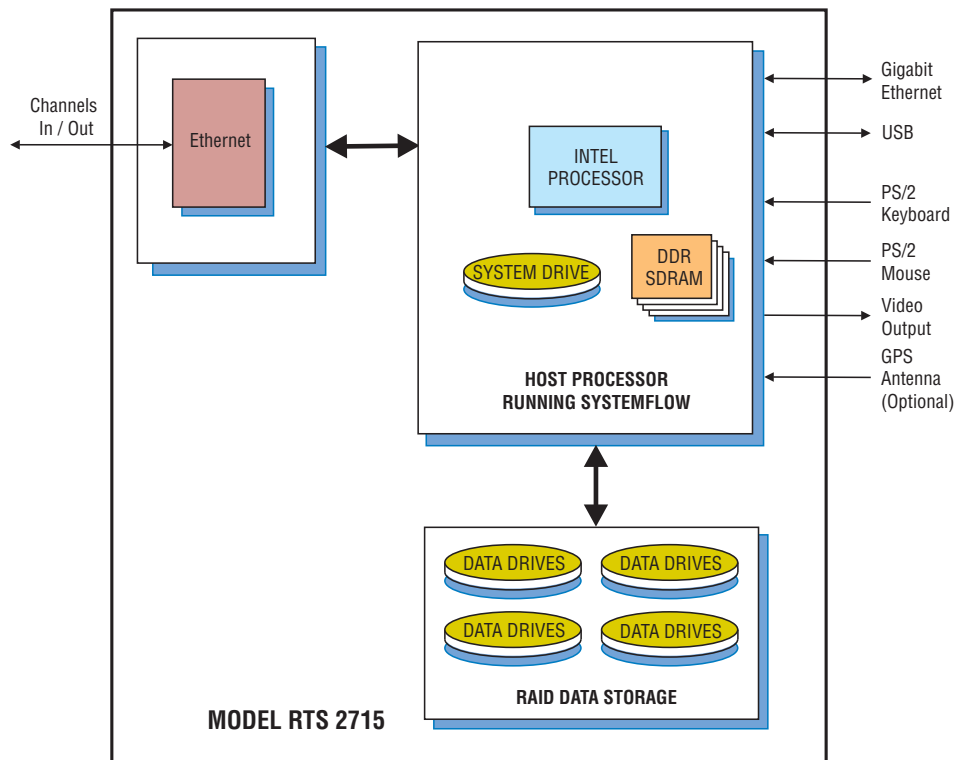

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. The hot-swappable HDDs provide storage capacities of up to 100 TB in a single 6U chassis. ➤

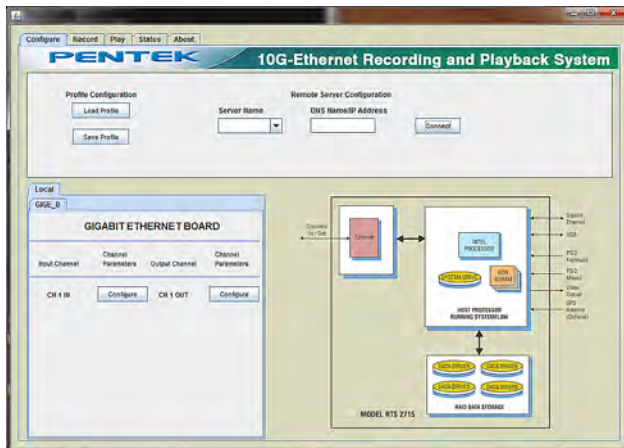

**Features**

- Records 10-gigabit Ethernet streams
- TCP and UDP protocols
- Copper or optical 10GbE interfaces
- Aggregate recording rates to 1.6 GB/sec
- 4U or 5U 19-inch industrial rackmount PC server chassis
- Windows® 7 Professional workstation with a high performance Intel® Core™ i7 processor
- Up to 100 terabytes storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into applications
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

Contact factory for options, number of channels, recording rates, and disk capacity.

► SystemFlow Graphical User Interface

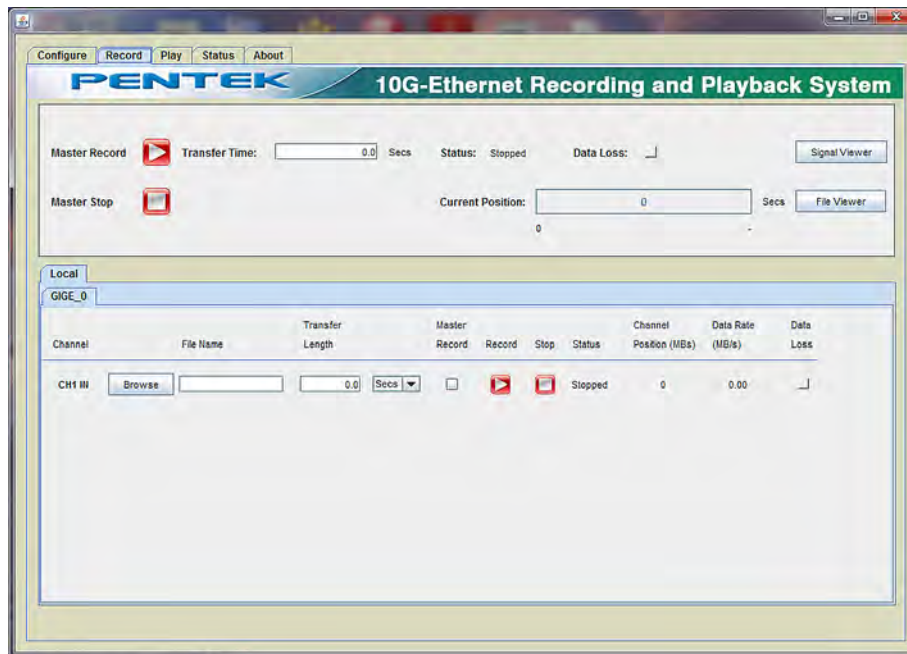

SystemFlow Main Interface

The RTS 2715 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying UDP or TCP protocol, client or server connection, the IP address and port number. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

### ► SystemFlow API

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTS 2715 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTS 2715 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

### Specifications

#### PC Workstation

## Features

- Designed to operate under conditions of shock and vibration
- Records 10-Gigabit Ethernet streams
- TCP and UDP protocols
- Copper or optical 10GbE interfaces
- Aggregate recording rates to 4.0 GB/sec
- Removable SSD drives
- 4U short 19-inch rugged rackmount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- Up to 46 terabytes of storage to NTFS RAID solid state disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into applications
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

Contact factory for options, number of channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2755 is a complete turn-key recording system for storing 10-Gigabit Ethernet (10GbE) streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and supports both TCP and UDP protocols.

Using highly-optimized disk storage technology, the system guarantees loss-free performance at aggregate recording rates up to 4.0 GB/sec.

Two rear panel SFP+ LC connectors for 850 nm multi-mode or single-mode fibre cables, or CX4 connectors for copper twinax cables accommodate all popular 10GbE interfaces.

Optional GPS time and position stamping accurately identifies each record in the file header.

## SystemFlow Software

The RTR 2755 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTR 2755 allows the

user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2755 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

## Rugged and Flexible Architecture

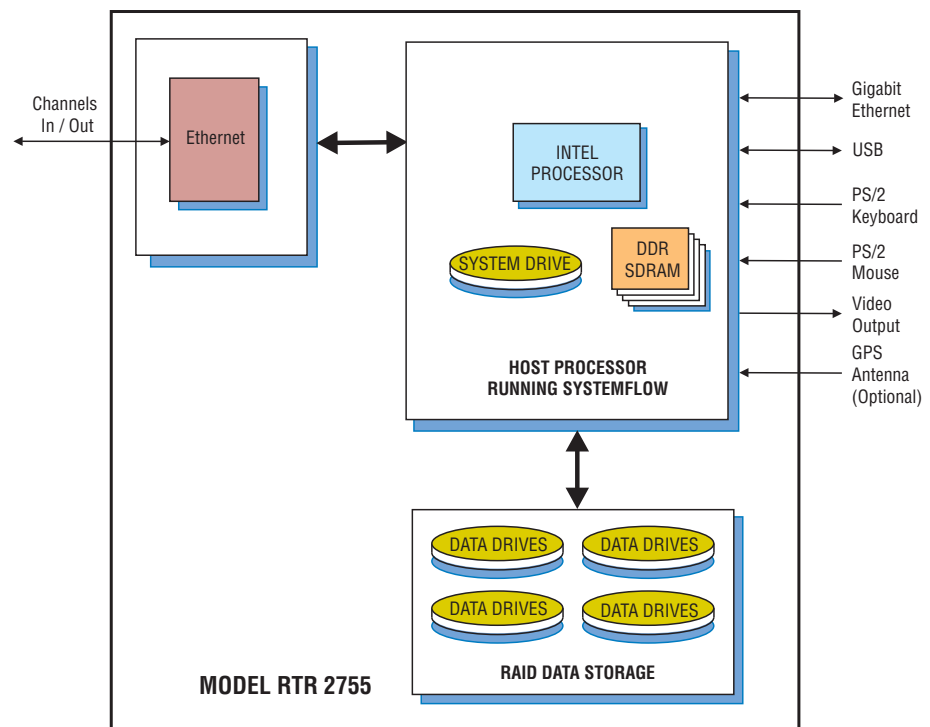

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2755 performs well in ground, shipborne and airborne environments. The hot-swappable SSDs provide storage capacity of up to 46 TB. The drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

The RTR 2755 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. ➤

## ► SystemFlow API

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2755 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2755 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

Specifications are subject to change without notice

**Features**

- Designed to meet MIL-STD-810 shock and vibration
- Designed to meet EMC/EMI per MIL-STD-461 EMC
- 4U 19-inch rugged rackmount PC server chassis, 22" deep
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- Records 10-gigabit Ethernet streams
- One or two channels
- TCP and UDP protocols
- Copper or optical 10GbE interfaces
- Real-time aggregate recording rates up to 4.0 GB/sec
- Up to four front-panel removable QuickPac SSD drive canisters with eight drives each
- Up to 30 terabytes of storage to NTFS RAID disk array
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

**General Information**

The Talon® RTX 2775 is a turnkey record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTX 2775 is intended for military, airborne and UAV applications requiring a rugged system.

The RTX 2775 records one or two 10-gigabit Ethernet (10GbE) streams; it is ideal for capturing any type of streaming sources, including live transfers from sensors or data from other computers, and supports both TCP and UDP protocols.

Using highly-optimized disk storage technology, the system guarantees loss-free performance at aggregate recording rates up to 4.0 GB/sec.

Two rear panel SFP+ LC connectors for 850 nm multi-mode or single-mode fibre cables, or CX4 connectors for copper twinax cables accommodate all popular 10GbE interfaces.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTX 2775 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTX 2775 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTX 2775 records data to the native NTFS file system, providing immediate access to the recorded data.

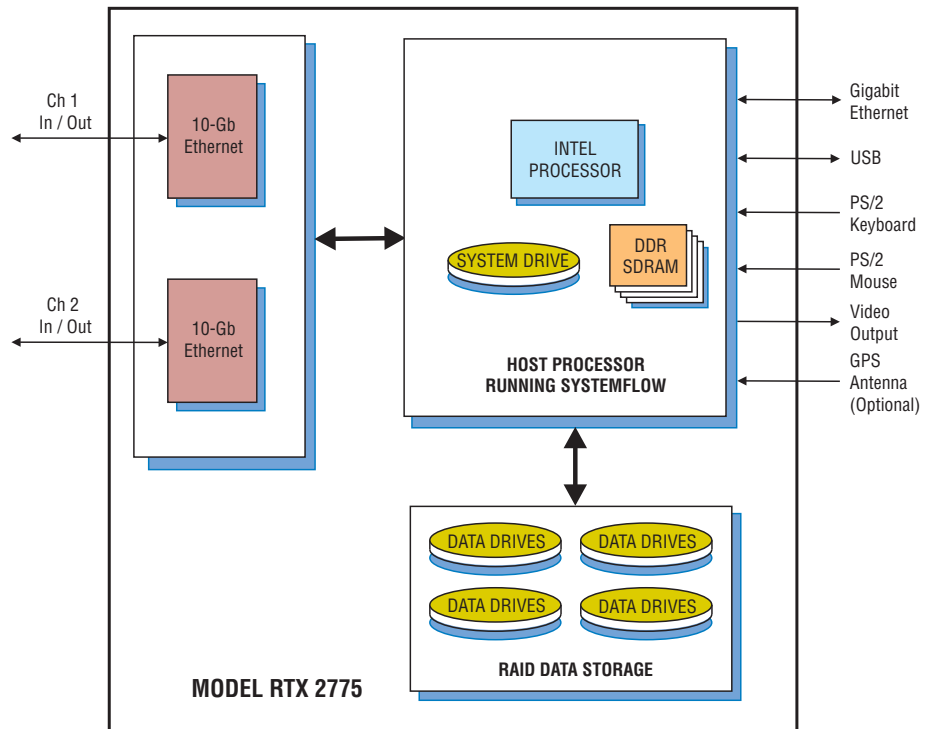

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

**Rugged Mil-Spec Chassis**

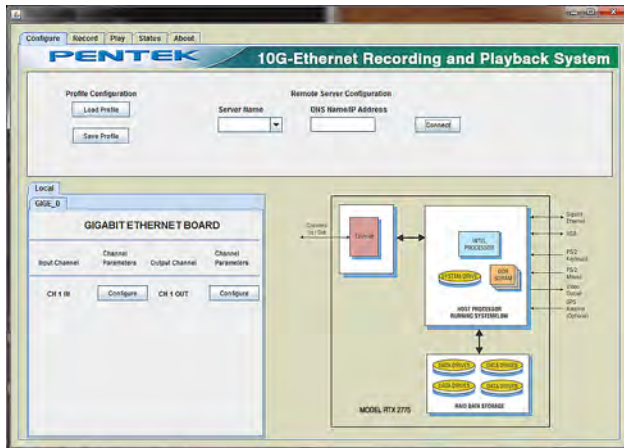

The Talon RTX 2775 uses a shock- and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

► SystemFlow Graphical User Interface

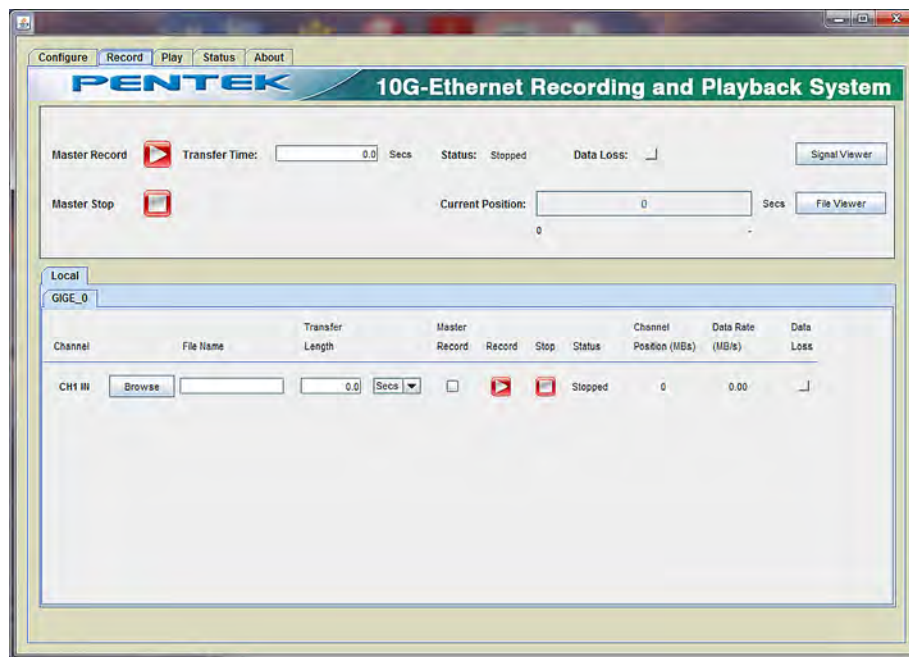

SystemFlow Main Interface

The RTX 2775 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying UDP or TCP protocol, client or server connection, the IP address and port number. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

**► SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2755 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2755 as a high-performance server front-end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

New!

# Model RTR 2735A

# 1-, 10-, 40-Gigabit Portable Ethernet Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, approximately 25 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Records gigabit, 10-gigabit or 40-gigabit Ethernet streams
- TCP and UDP protocols
- Copper or optical interfaces
- Aggregate recording rates to 4.0 GB/sec
- Windows workstation with a high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- Multiple RAID levels, including 0, 5, and 6,
- SystemFlow® GUI with Signal Viewer analysis tool
- C-callable API for integration of recorder into applications
- Optional file headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

Contact factory for options, number of channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2735A can accommodate multiple Ethernet datastreams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and supports both TCP and UDP protocols.

The RTR 2735A can accommodate gigabit, 10-gigabit and 40-gigabit Ethernet interfaces.

Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 4.0 GB/sec.

Rear panel SFP+ or RJ45 connectors accommodate copper, multi-mode or single-mode fibre interfaces.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

### SystemFlow Software

The RTR 2735A includes the Pentek System-Flow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows Server 2016 workstation, the RTR 2735A allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2735A records data to the native NTFS file system, providing immediate access to the recorded data.

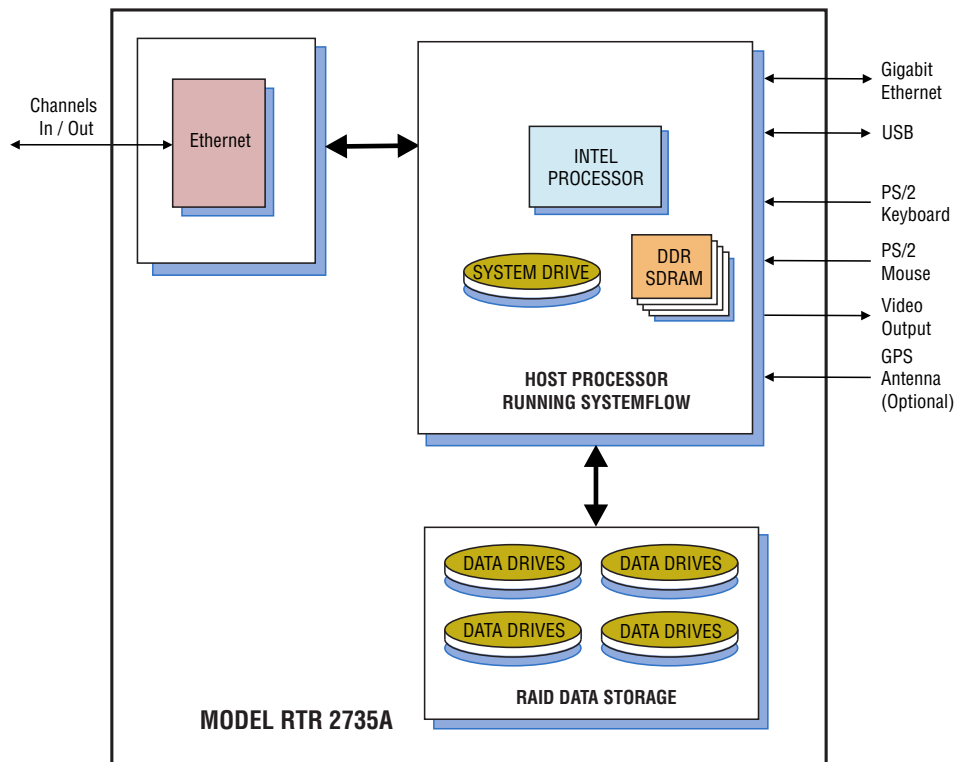

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk using the 8X double layer DVD±R/RW drive.

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

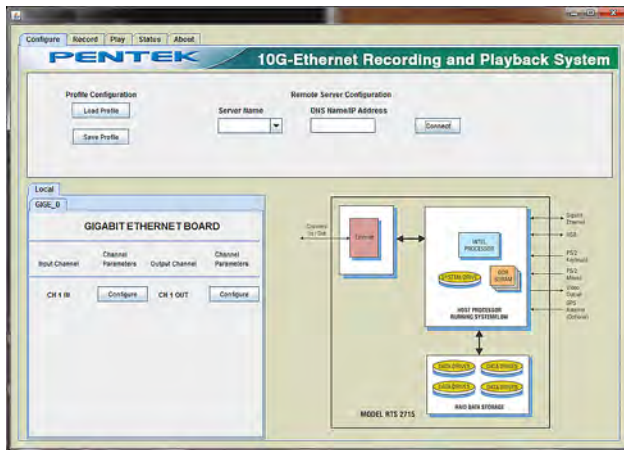

### Rugged Chassis with SSD Storage

The RTR 2735A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration.

The SSDs provide storage capacities of up to 61,4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy. ▶

► SystemFlow Graphical User Interface

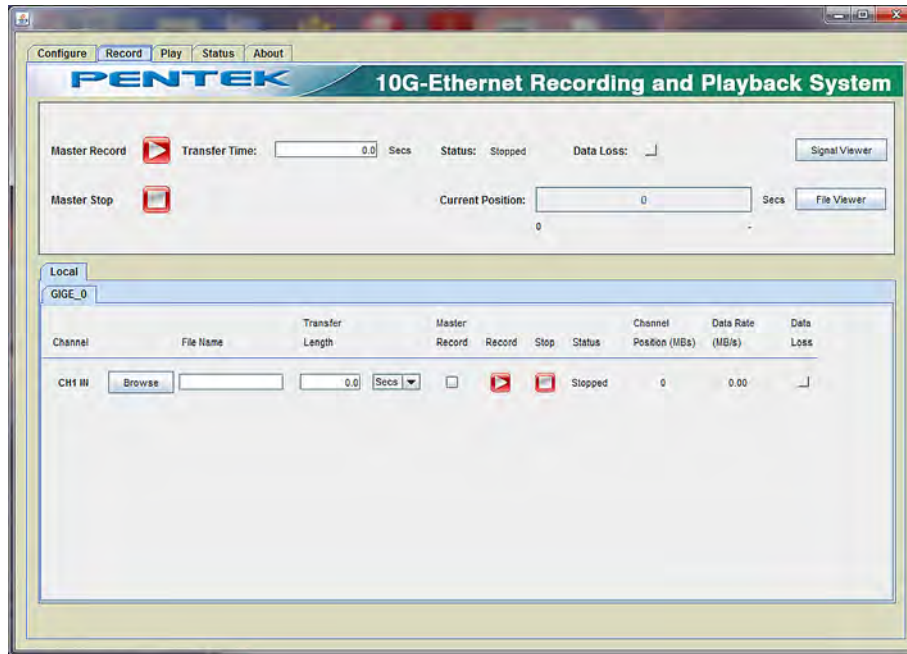

SystemFlow Main Interface

The RTR 2735A GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying UDP or TCP protocol, client or server connection, the IP address and port number. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

**► SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2735A from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2735A as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation (standard configuration)**

- Operating System:** 64-bit Windows workstation
- Processor:** Intel Core i7 processor
- Clock Speed:** 3.0 GHz or higher
- Operating System Drive:** 250 GB SSD
- SDRAM:** 8 GB standard, optionally up to 64 GB
- Monitor:** Built-in 17.3" high-resolution LCD, 1920 x 1080 pixels, 16:9 aspect ratio, anti-glare surface
- Brightness:** 300 cd/m<sup>2</sup>; **Contrast ratio:** 400:1 typical
- RAID**
  - Storage:** 3.8 to 61.4 TB
  - Drive Type:** Solid-state drives
  - Supported RAID Levels:** 0, 5, and 6
  - Drive Bays:** Hot-swap, removable, side panel
- USB 2.0 Ports:** Four on left side, two on front panel
- USB 3.0 Ports:** Two on left side
- 1 Gb Ethernet Ports:** Two on left side
- Aux Video Output:** 15-pin VGA on left side

**Optional DC Power supply**

- Voltage:** 10 to 36 VDC
- Input Current:** 42 to 26 A (39 A at 24 VDC)
- Inrush Current:** 100 A at 24 VDC
- Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C
- Efficiency:** >80% typical at 24 V full load
- Power Good Signal:** On delay 100 to 500 msec
- OverPower Protection:** 110% to 160%
- Remote Control:** On/Off
- Safety:** Meets UL, TUV, CB specifications

**Physical and Environmental**

- Size:** 16.0" W x 6.9" D x 13.0" H
- Weight:** 30 lb max.
- Operating Temp:** 0° to +50° C
- Storage Temp:** -40° to +85° C
- Relative Humidity:** 5 to 95%, non-condensing
- Operating Shock:** 30 g max. (11 msec, half-sine wave)
- Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz: 1.4 g peak acceleration
- Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS
- Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

**Model RTR 2735A Ordering Information and Options**

**Interface Options**

- Option -101** Gigabit Ethernet
- Option -102** 10-Gigabit Ethernet
- Option -103** 40-Gigabit Ethernet

**Channel Configuration**

- Option -201** 1-Ethernet port
- Option -202** 2-Ethernet ports
- Option -204** 4-Ethernet ports
- Option -208** 8-Ethernet ports

**10GBE Interfaces available with Option -102**

- Option -280** SFP+ connectors
- Option -281** Multi-mode optical, LC connectors
- Option -282** Single-mode optical, LC connectors
- Option -284** RJ45 Connector

**Storage Options**

- Option -410** 3.8 TB SSD storage capacity
- Option -415** 7.6 TB SSD storage capacity
- Option -420** 15.3 TB SSD storage capacity
- Option -430** 30.7 TB SSD storage capacity
- Option -460** 61.4 TB SSD Storage Capacity

**Additional Options**

- Option -261** GPS Time & Position Stamping
- Option -264** IRIG-B Time Stamping
- Option -285** RAID 5 Configuration
- Option -286** RAID 6 Configuration
- Option -309** 16 GB System Memory
- Option -311** 64 GB System Memory
- Option -625** Removable Operating System Drive
- Option -681** 10 to 36 VDC Power Supply

**Contact Pentek for compatible Option combinations**

New!

Features

- Complete Serial FPDP record and playback system
- Lowest-cost entry into Serial FPDP
- Quick delivery: Model RTV 2602 ships from stock
- 4U 19-inch industrial rack-mount PC server chassis
- Windows® 7 Professional workstation with high-performance Intel® Core™ i3 processor
- Real-time aggregate recording rates up to 400 MB/sec
- 4 TB of data storage to NTFS RAID disk array
- SystemFlow® recording software
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

General Information

The Talon® RTV 2602 Serial FPDP Value Recorder is designed to provide a low-cost solution to users looking to capture and play back multiple Serial FPDP streams. It can record up to four Serial FPDP channels to the built-in 4 TB RAID consisting of cost-effective, enterprise-class HDD storage. It is a complete turnkey recording system, ideal for capturing any type of streaming sources. These include live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification.

Like all Talon recorders in the RTV Value Recorder series, the RTV 2602 ships from stock allowing users to be up and running in the field just days after purchase.

The RTV 2602 comes in a 4U 19 in. rack-mount package that is 22.75 in. deep. Signal I/O is provided in the rear of the unit, while the hot-swappable data drives are available in the front. Air is pulled through the system from front to back to allow operation at ambient temperatures from 5° to 35° C.

The RTV 2606 can be populated with up to four SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates. Up to four channels can be recorded simultaneously with an aggregate recording rate of up to 400 MB/sec.

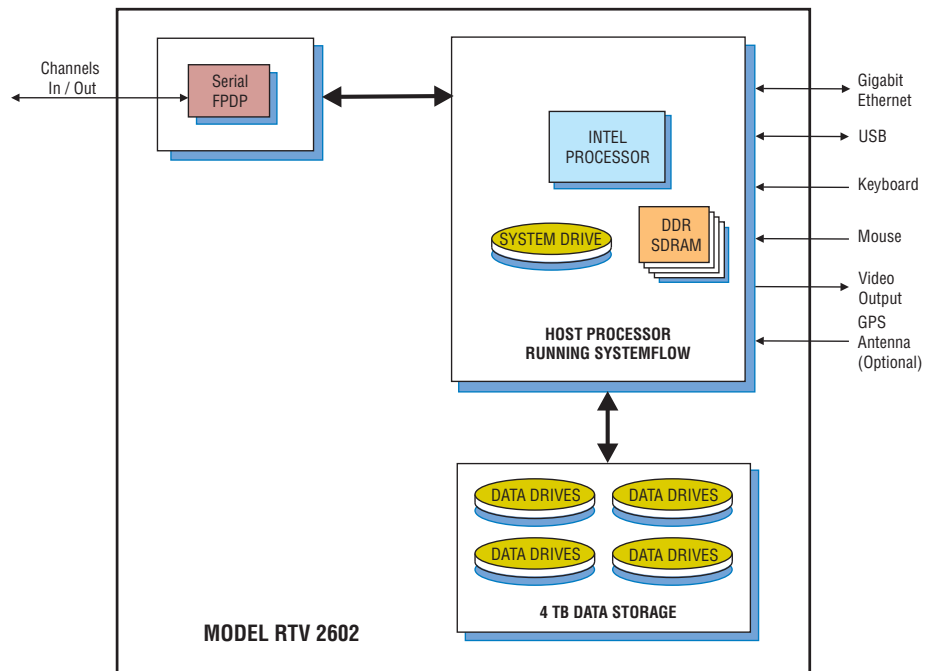

As an option, a GPS or IRIG receiver card can be supplied with the system providing accurate time stamping of recorded data. Additionally, the GPS receiver delivers GPS position information that can be recorded along with the input signals.

SystemFlow Software and API

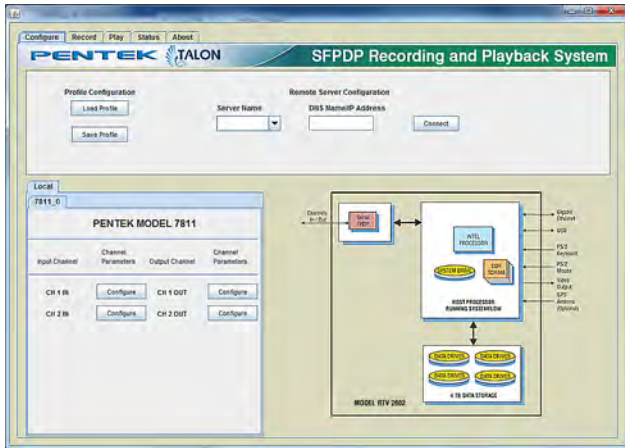

The RTV 2602 includes the Pentek SystemFlow recording software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the recorder.

Custom configurations can be stored as profiles and later loaded when needed, so users can select preconfigured settings with a single click.

In addition to the GUI, the RTV 2602 provides a C-callable API that allows the user to integrate the recorder control into any application. A simple set of commands that provide configuration and control come with source code and examples to allow for an exceptionally fast integration. ➤

► SystemFlow Graphical User Interface

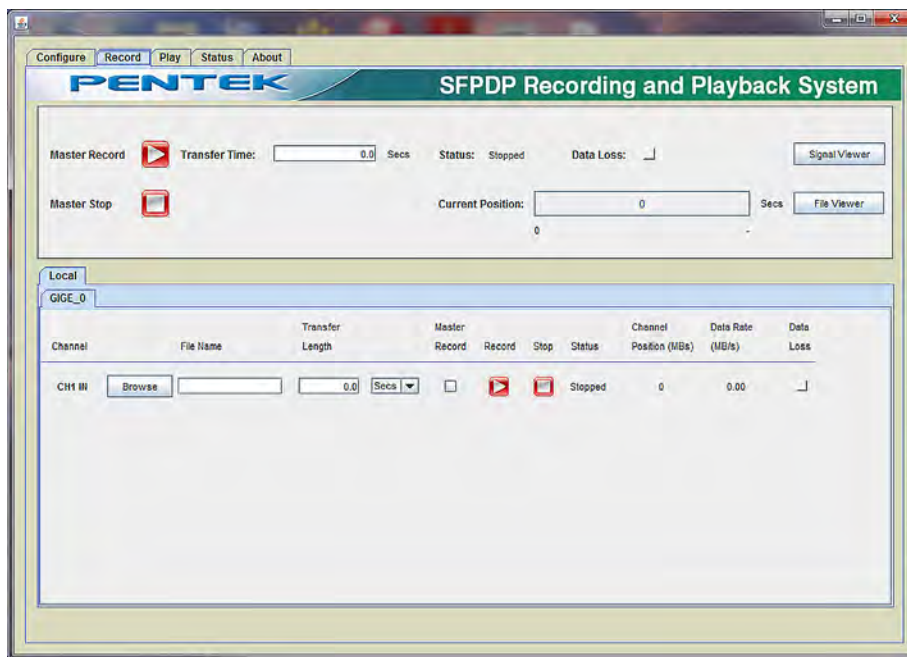

SystemFlow Main Interface

The RTV 2602 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying the flow control settings and the recognition of a CRC in the data stream. Each channel can also be set up to utilize Serial FPDP's copy/loop mode. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified and monitoring functions inform the operator of recording progress. ►

**► System Architecture**

Built on a Windows 7 Professional workstation, the RTV 2602 allows the user to install post-processing and analysis tools to operate on the recorded data. The recorder stores data in the native NTFS file system, providing immediate access to any installed Windows application. Alternately, the NTFS drive can be accessed remotely over the built-in gigabit Ethernet link from a remote Windows or Linux machine.

Recorded data can be off-loaded via the rear-panel gigabit Ethernet port, two front-panel USB 3.0 ports, two rear-panel USB 3.0 ports or four rear-panel USB 2.0 ports. A built-in DVD +/- R/RW drive allows the user to burn recorded data to disk. Hot-swappable front-panel drives can be easily removed and replaced with empty drives to provide additional data storage.

**Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i3 processor

**Clock Speed:** 2.0 GHz or higher

**SDRAM:** 8 GB

**RAID**

**Storage:** 4 TB

**Number of Drives:** Six, removable, front panel access

**Optical Drive:** DVD +/- R/RW, front panel access

**USB Ports:** Front panel: Two USB 3.0; rear panel:

Two USB 3.0; Four USB 2.0

**Ethernet:** Single 1GbE, rear panel

**Supported RAID Levels:** 0

**Serial FPDP Interface**

**Copper - Option 280**

**Cable:** 100-ohm shielded twin-ax

**Connector Type:** SFP+

**Max. Cable Length:** 20 m

**Multi-mode Fiber Optical - Option 281**

**Cable:** Multi-mode fiber, 850 nm

**Connector Type:** LC

**Max. Cable Length:** Up to 300 m

**Single-mode Fiber Optical - Option 282**

**Cable:** Single-mode fiber

**Connector Type:** LC

**Max. Cable Length:** Up to 10 km

**Physical and Environmental**

**Size:** 19" W x 22.75" D x 7" H

**Weight:** 50 lbs

**Operating Temp:** +5° to +35° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

**Model RTV 2602 Options Information**

**General Options**

**Option -261** GPS time & position stamping

**Option -264** IRIG-B time stamping

**Serial FPDP Interface**

**Option -280** SFP+ connectors

**Option -281** Multi-mode optical, LC connectors

**Option -282** Single-mode optical, LC connectors

*Specifications are subject to change without notice*

## Features

- Complete Serial FPDP record and playback system
- Up to eight I/O channels in a single 4U or 5U 19 inch industrial rackmount PC server chassis
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 1.6 GB/sec
- Up to 100 terabytes of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high performance Intel® Core™ i7 processor

Contact factory for options, number of channels, recording rates, and disk capacity.

## General Information

The Talon® RTS 2716 is a complete turn-key recording system capable of recording and playing multiple Serial FPDP data streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 1.6 GB/sec.

The RTS 2716 can be populated with up to eight SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates supporting data transfer rates of up to 420 MB/sec per Serial FPDP link.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

## SystemFlow Software

The RTS 2716 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTS 2716 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTS 2716 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

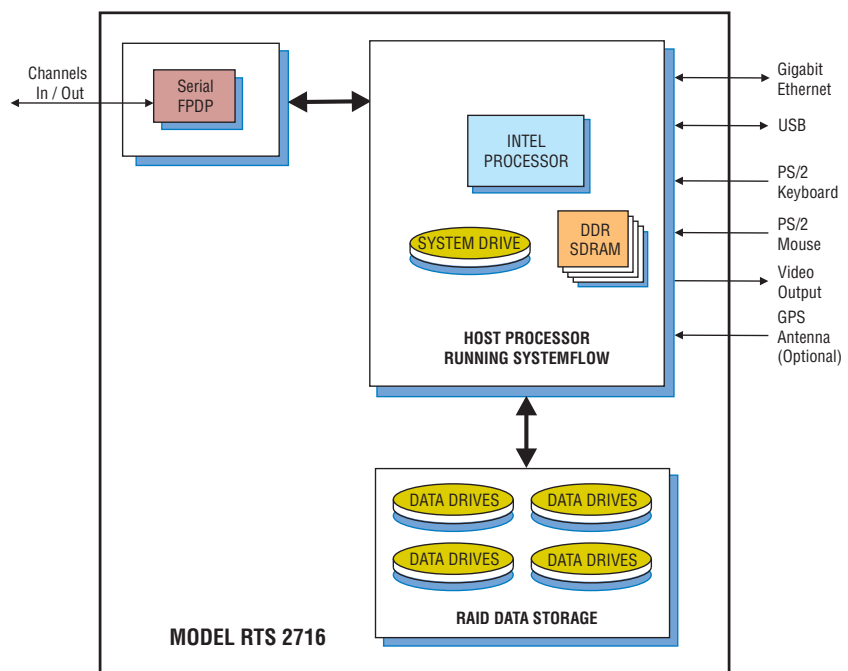

## Flexible Architecture

The RTS 2716 is configured in a 4U or 5U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

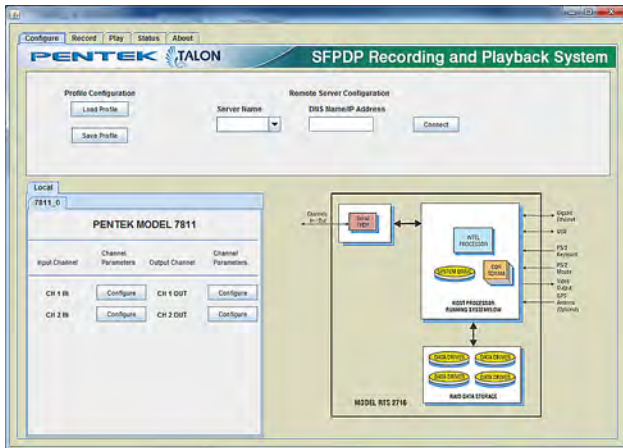

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. The hot-swappable HDDs provide storage capacities of up to 100 TB in a single 6U chassis. ➤

► SystemFlow Graphical User Interface

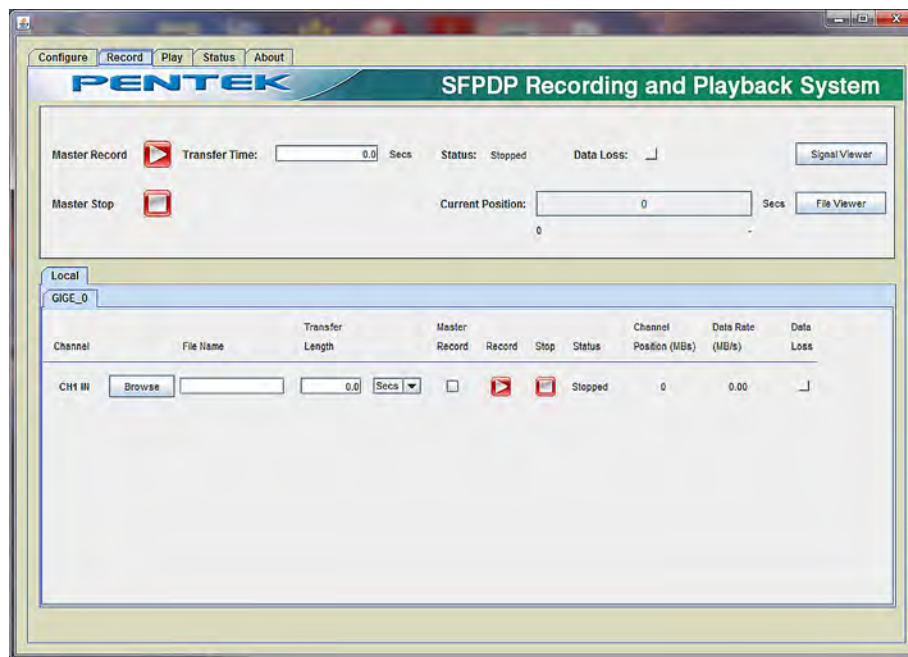

SystemFlow Main Interface

The RTS 2716 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying the flow control settings and the recognition of a CRC in the data stream. Each channel can also be set up to utilize Serial FPDP's copy/loop mode. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

## Features

- Designed to operate under conditions of shock and vibration
- Portable system measures 16.9" W x 9.5" D x 13.4" H
- Rugged aluminum alloy chassis
- Lightweight, approximately 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Up to eight I/O channels
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 2.4 GB/sec
- Up to 7.6 terabytes of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5 and 6
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

## General Information

The Talon® RTR 2736 is a complete turn-key recording system capable of recording and playing back multiple Serial FPDP data streams in a rugged, lightweight portable package. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 2.4 GB/sec.

The RTR 2736 can be populated with up to eight SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates supporting data transfer rates of up to 420 MB/sec per Serial FPDP link.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

## SystemFlow Software

The RTR 2736 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTR 2736 allows the user to install post-processing and analysis tools to operate on the recorded data.

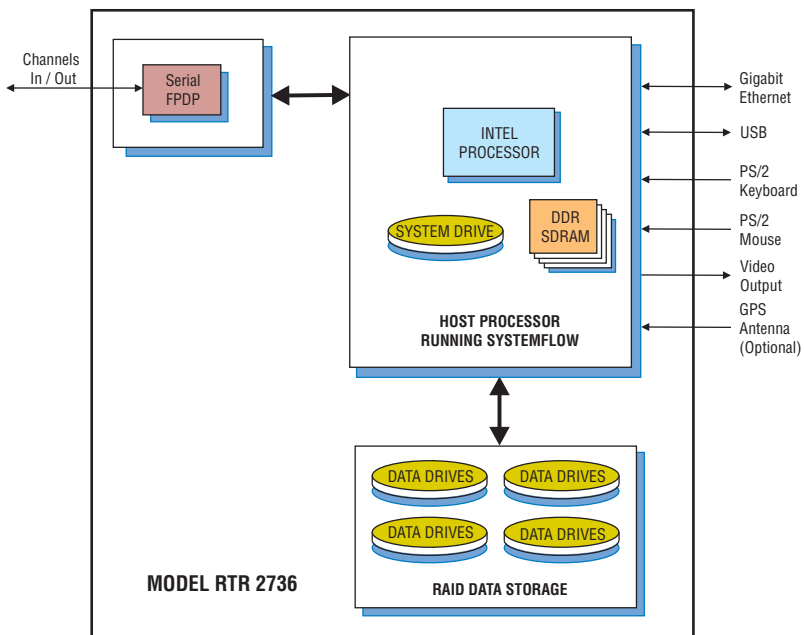

The RTR 2736 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via a gigabit Ethernet port, eight USB 2.0 ports, two USB 3.0 ports or two eSATA 3 Ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

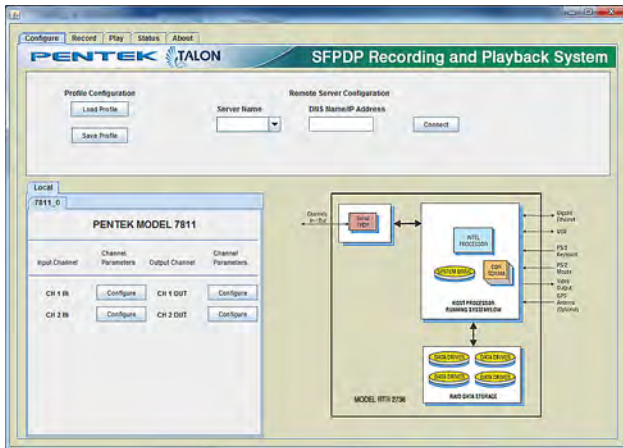

## Rugged and Flexible Architecture

The RTR 2736 is configured in a portable, lightweight chassis with hot-swap SSDs, front panel USB ports and I/O connections on the side panel. It is built on an extremely rugged, 100% aluminum alloy unit, reinforced with shock absorbing rubber corners and an impact-resistant protective glass. Using shock- and vibration-resistant SSDs, the RTR 2736 is designed to reliably operate as a portable field instrument.

The hot-swappable SSDs provide storage capacities of up to 7.6 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 1, 5 and 6, provide a choice for the required level of redundancy. ▶

► SystemFlow Graphical User Interface

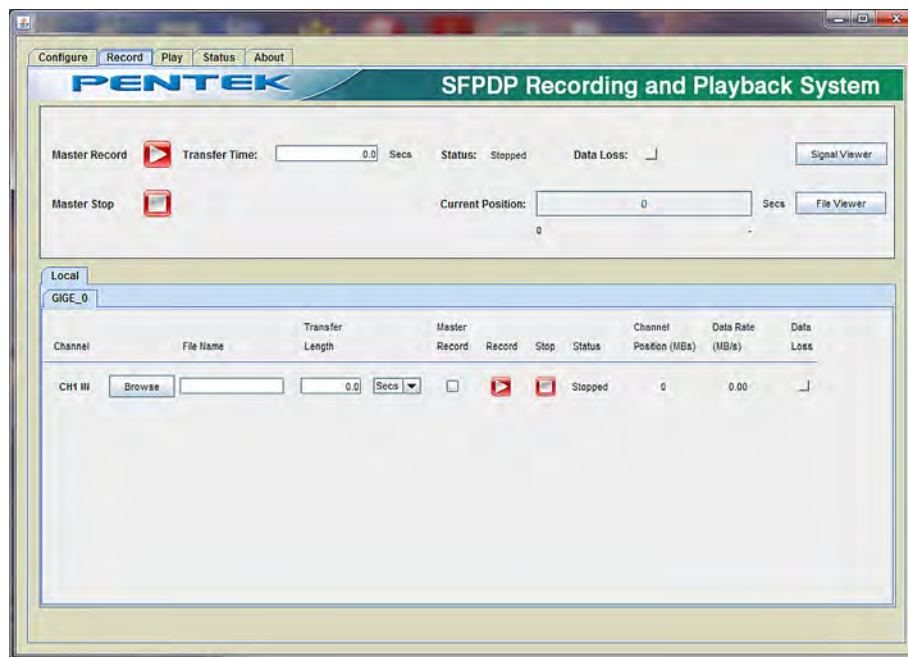

SystemFlow Main Interface

The RTR 2736 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. # Model RTR 2736A

# Serial FPDP Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measuring 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Up to eight I/O channels
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 3.2 GB/sec
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with Signal Viewer analysis tool
- Optional file headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 10–36 VDC power supply

Contact factory for options, number of channels, recording rates, and disk capacity.

### General Information

The Talon® RTR 2736A is a complete turn-key recording system capable of recording and playing back multiple Serial FPDP data streams in a rugged, lightweight portable package. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 3.2 GB/sec.

The RTR 2736A can be populated with up to eight SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy /loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125, and 4.25 GBaud link rates supporting data transfer rates of up to 420 MB/sec per Serial FPDP link.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

### SystemFlow Software

The RTR 2736A includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive

means to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

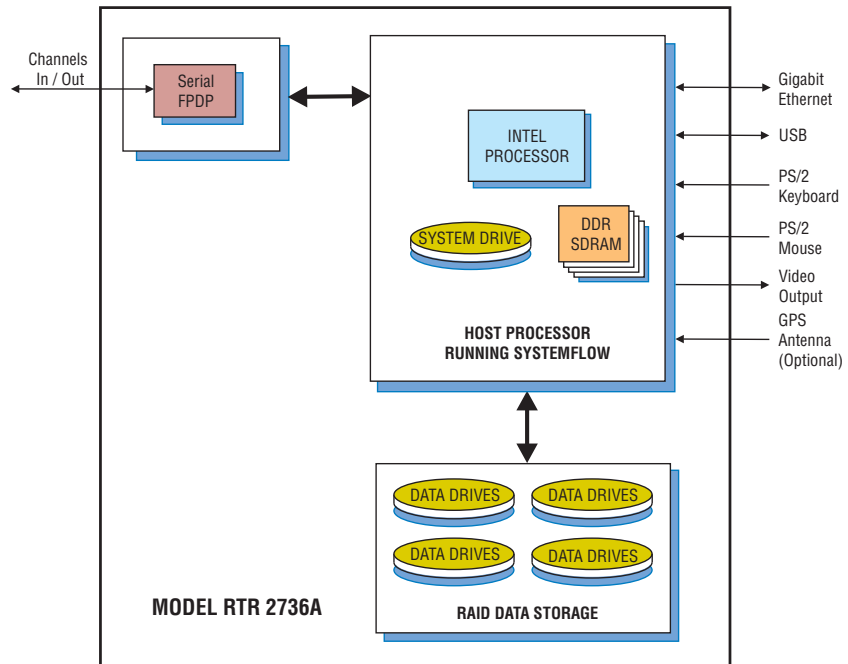

Built on a server-class Windows workstation, the RTR 2736A allows the user to install post-processing and analysis tools to operate on the recorded data. The RTR 2736A records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

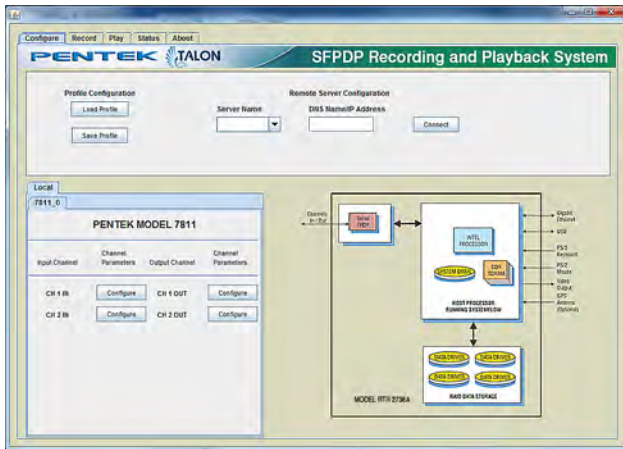

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

### Rugged Chassis with SSD Storage

The RTR 2736A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy. ➤

► SystemFlow Graphical User Interface

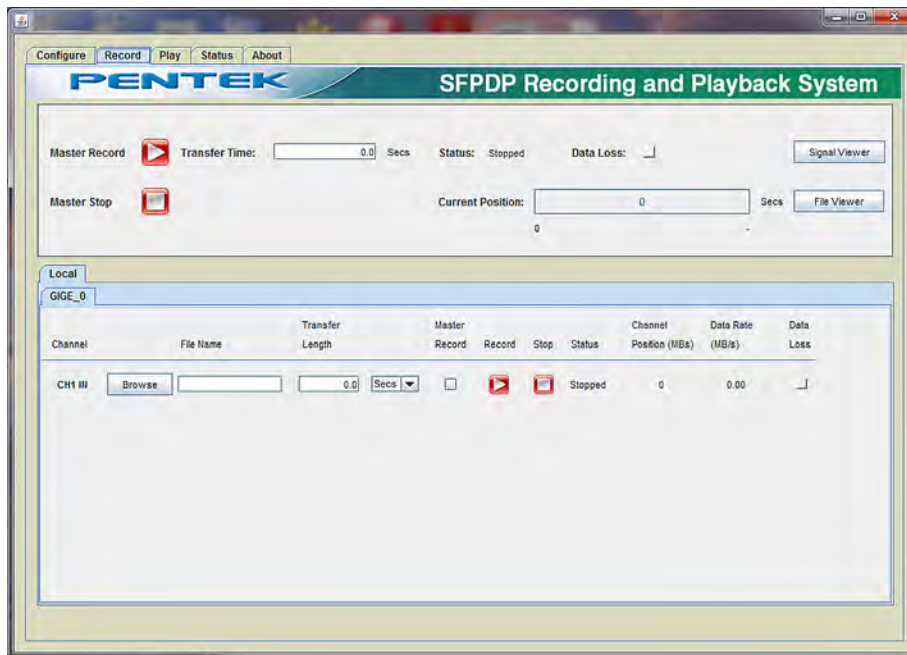

SystemFlow Main Interface

The RTR 2736A GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying the flow control settings and the recognition of a CRC in the data stream. Each channel can also be set up to utilize Serial FPDP's copy/loop mode. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

**► SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2736A from a custom application. High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2736A as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation (standard configuration)**

- Operating System:** 64-bit Windows 7 Professional
- Processor:** Intel Core i7 processor
- Clock Speed:** 3.0 GHz or higher
- Operating System Drive:** 128 GB SSD
- SDRAM:** 8 GB
- Monitor:** Built-in 17.3" high-resolution LCD, 1920 x 1080 pixels, 16:9 aspect ratio, anti-glare surface  
Brightness: 300 cd/m<sup>2</sup>; Contrast ratio: 400:1 typical
- RAID**
  - Total Storage:** 1.9, 3.8, 7.6 or 15.3 TB
  - Supported RAID Levels:** 0, 1, 5 and 6
  - Drive Bays:** Hot-swap, removable, side panel
- USB 2.0 Ports:** Four on left side, two on front panel
- USB 3.0 Ports:** Two on left side
- 1 Gb Ethernet Ports:** Two on left side
- Aux Video Output:** 15-pin VGA on left side

**Serial FPDP Interface**

**Copper - Option 280**

- Cable:** 100-ohm shielded twin-ax
- Connector Type:** SFP+
- Max. Cable Length:** 20 m

**Multi-mode Fiber Optical - Option 281**

- Cable:** Multi-mode fiber, 850 nm
- Connector Type:** LC
- Max. Cable Length:** Up to 300 m

**Single-mode Fiber Optical - Option 282**

- Cable:** Single-mode fiber
- Connector Type:** LC
- Max. Cable Length:** Up to 10 km

**Optional DC Power supply**

- Voltage:** 18 to 36 VDC
- Input Current:** 42 to 26 A (39 A at 24 VDC)
- Inrush Current:** 100 A at 24 VDC
- Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C
- Efficiency:** >80% typical at 24 V full load
- Power Good Signal:** On delay 100 to 500 msec
- OverPower Protection:** 110% to 160%
- Remote Control:** On/Off
- Safety:** Meets UL, TUV, CB specifications

**Physical and Environmental**

- Size:** 16.0" W x 6.9" D x 13.0" H
- Weight:** 30 lb max.
- Operating Temp:** 0° to +50° C
- Storage Temp:** -40° to +85° C
- Relative Humidity:** 5 to 95%, non-condensing
- Operating Shock:** 30 g max. (11 msec, half-sine wave)
- Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz: 1.4 g peak acceleration
- Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS
- Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

**Model RTR 2736A Ordering Information and Options**

**Channel Configurations**

- Option -204** 4-channel recording
- Option -208** 8-channel recording

**Storage Options**

- Option -405** 1.9 TB SSD storage capacity
- Option -410** 3.8 TB SSD storage capacity
- Option -415** 7.6 TB SSD storage capacity
- Option -420** 15.3 TB SSD storage capacity

**Serial FPDP Interface (append to all options)**

- Option -280** Copper, SFP+ connectors
- Option -281** Multi-mode optical, LC connectors
- Option -282** Single-mode optical, LC connectors

**General Options (append to all options)**

- Option -261** GPS time & position stamping
- Option -264** IRIG-B time stamping
- Option -625** Removable operating system drive
- Option -681** 18 to 36 VDC Power Supply

**Contact Pentek for compatible Option combinations  
Storage and Channel-count Options may change, contact Pentek for the latest information**

## Features

- Designed to operate under conditions of shock and vibration
- Complete Serial FPDP record and playback system
- Up to eight I/O channels in a single 4U 19-inch rugged rack-mount PC server chassis
- Removable SSDs
- Up to 46 terabytes of storage to NTFS RAID disk array
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 3.2 GB/sec
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- RAID levels of 0, 1, 5, 6, 10 and 50
- Optional N+1 redundant power supply
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

Contact factory for options, for number and type of channels, recording rates, and disk capacity.

## General Information

The Talon® RTR 2756 is a complete turn-key recording system capable of recording and playing back multiple Serial FPDP data streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 3.2 GB/sec.

The RTR 2756 can be populated with up to eight SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates supporting data transfer rates of up to 425 MB/sec per Serial FPDP link.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

## SystemFlow Software

The RTR 2756 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTR 2756 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2756 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

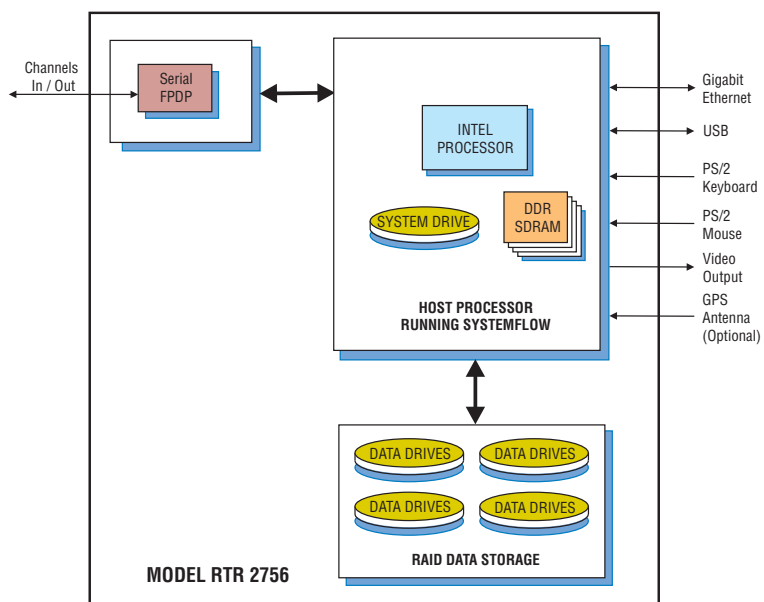

## Rugged and Flexible Architecture

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2756 performs well in ground, shipborne and airborne environments. Configurable with hot-swappable SSDs, the RTR 2756 can provide storage capacities of up to 46 TB in a rugged chassis. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

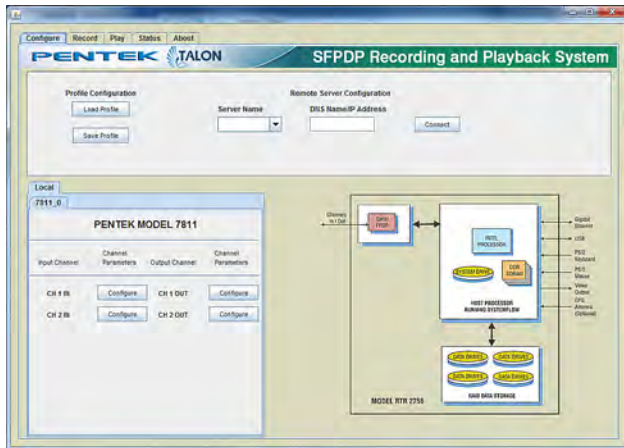

The RTR 2756 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front-panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50 provide a choice for the required level on redundancy. Redundant power supplies are optionally available to provide a robust and reliable high-performance recording system. ➤

► SystemFlow Graphical User Interface

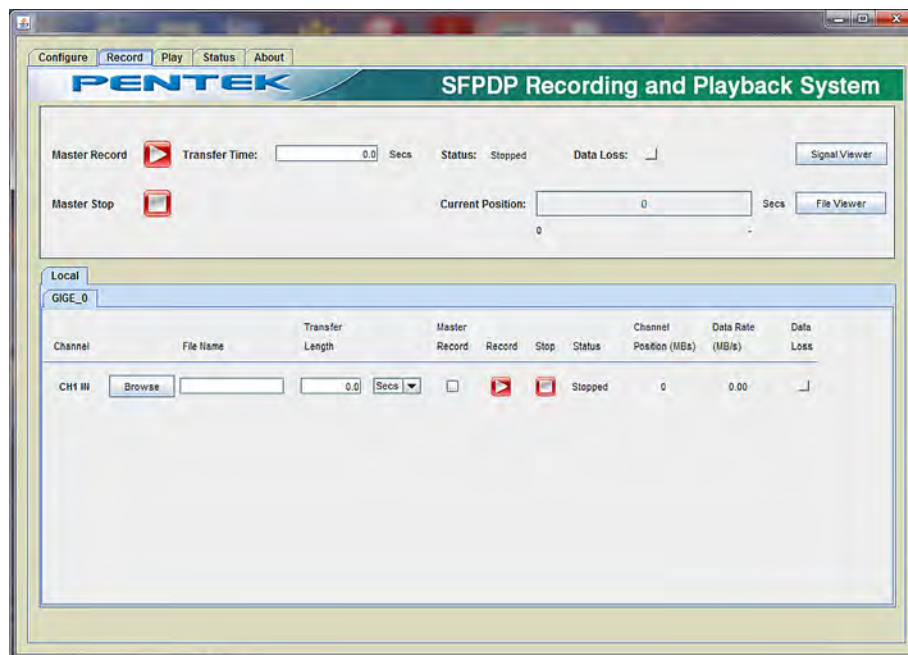

SystemFlow Main Interface

The RTR 2756 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying the flow control settings and the recognition of a CRC in the data stream. Each channel can also be set up to utilize Serial FPDP's copy/loop mode. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

**► SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2756 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2756 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation**

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 2.0 GHz or greater

**SDRAM:** 6 GB

**RAID**

**Storage:** 3.8, 7.6, 15.3, 30.7 or 46.0 TB

**Supported Levels:** 0, 1, 5, 6, 10 and 50

**Serial FPDP Interface**

**Copper - Option 280**

**Cable:** 100-ohm shielded twin-ax

**Connector Type:** SFP+

**Max. Cable Length:** 20 m

**Multi-mode Fiber Optical - Option 281**

**Cable:** Multi-mode fiber, 850 nm

**Connector Type:** LC

**Max. Cable Length:** Up to 300 m

**Single-mode Fiber Optical - Option 282**

**Cable:** Single-mode fiber

**Connector Type:** LC

**Max. Cable Length:** Up to 10 km

**Physical and Environmental**

**Dimensions & Weights**

**All options except 085:** 19" W x 21" D x 7" (4U) H

**Weight:** 50 lb, approx.

**Option 085:** 19" W x 26" D x 7" (4U) H

**Weight:** 65-90 lb

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak, 20 to 500 Hz; 1.4 g peak acceleration

New!

### Features

- Designed to meet MIL-STD-810 shock and vibration
- Designed to meet EMC/EMI per MIL-STD-461 EMC
- 4U 19-inch rugged rackmount PC server chassis, 22" deep
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- Four or eight channels
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 3.2 GB/sec in eight-channel configuration
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- Up to four front-panel removable QuickPac™ SSD drive canisters with eight drives each
- Up to 30 terabytes of storage to NTFS RAID disk array
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping

### General Information

The Talon® RTX 2776 is a turnkey record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTX 2776 is intended for military, airborne and UAV applications requiring a rugged system.

The Talon RTX 2776 is a complete turnkey recording system capable of recording and playing back multiple Serial FPDP data streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 3.2 GB/sec.

The RTX 2776 can be populated with up to eight SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

### SystemFlow Software

The RTX 2776 includes the SystemFlow Recording Software. SystemFlow features a

Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTX 2776 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTX 2776 records data to the native NTFS file system, providing immediate access to the recorded data.

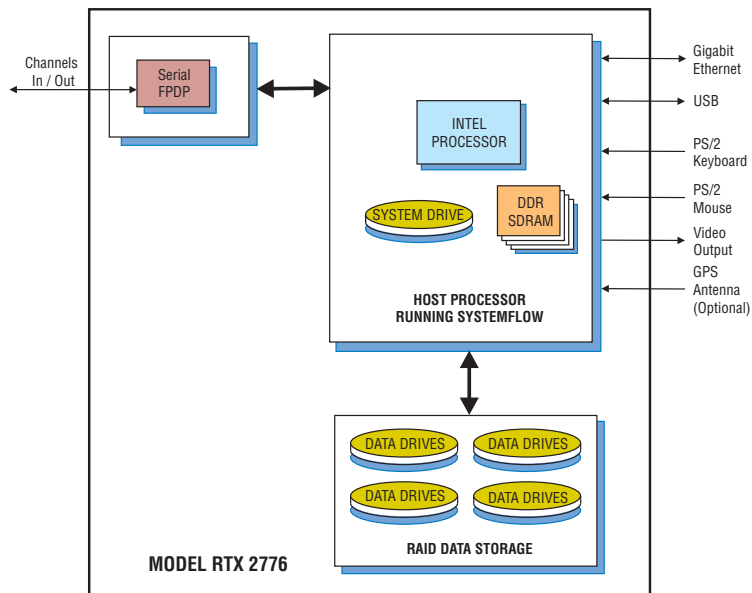

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

### Rugged Mil-Spec Chassis

The Talon RTX 2776 uses a shock and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

**► SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTX 2776 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTX 2776 as a high-performance server front-end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**SDRAM:** 8 GB

**Data Storage**

**Style:** Up to four front-panel removable QuickPac drive canisters; up to eight SSDs contained in each canister

**Location:** Front panel

**Capacity:** Up to 30 TB

**Number of Drives:** Up to 32 total

**Supported RAID Levels:** 0, 1, 5 and 6

**Serial FPDP Interface**

**Copper - Option 280**

**Cable:** 100-ohm shielded twin-ax

**Connector Type:** SFP+

**Features**

- 32 bits of LVDS digital I/O
- LVDS clock, Data Valid and Data Suspend signals
- Supports clock rates up to 250 MHz
- Real-time aggregate recording rates up to 1.6 GB/s
- Up to 20 terabytes of storage to NTFS RAID disk array
- RAID levels of 0, 1, 5, 6, 10 and 50
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

Contact factory for options, recording rates, and disk capacity.

**General Information**

The Talon® RTS 2718 is a complete turn-key system for recording and playing back digital data using the Pentek Model 78610 LVDS digital I/O board. Using highly optimized disk storage technology, the system achieves sustained recording rates of up to 1.6 GB/sec.

The RTS 2718 utilizes a 32-bit LVDS interface that can be clocked at speeds up to 250 MHz. It includes Data Valid and Suspend signals and provides the ability to turn these signals on and off as well as control their polarity.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTS 2718 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

Built on a Windows 7 Professional workstation, the RTS 2718 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTS 2718 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or eight USB ports. Additionally, data can be copied to optical disk

using the 8X double layer DVD±R/RW drive.

**Flexible Architecture**

The RTS 2718 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

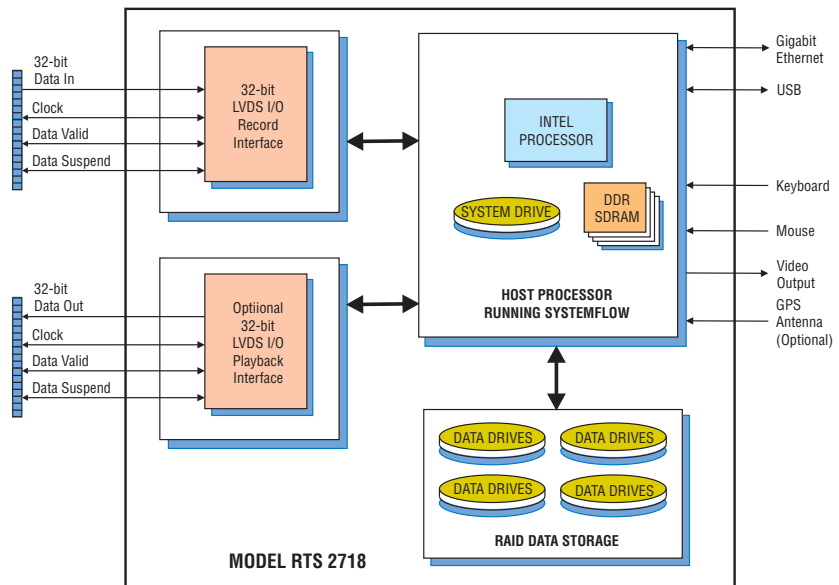

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50, provide a choice for the required level of redundancy. Up to 16 hot-swappable SATA drives are optionally available, allowing up to 20 terabytes of real-time data storage space in a single 4U chassis.

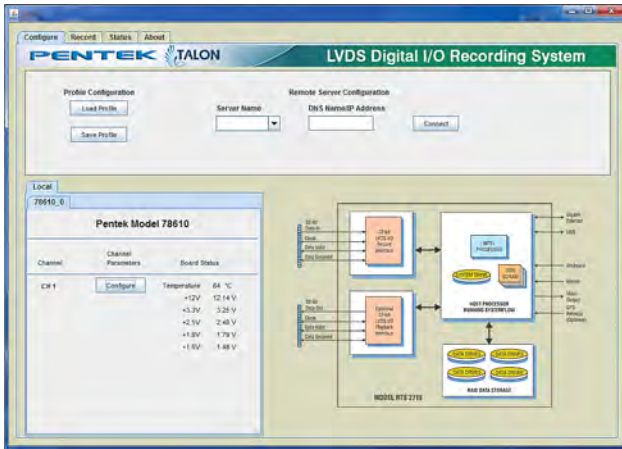

**SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) that supports control and status queries of all operations of the RTS 2718 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTS 2718 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection. ➤

► SystemFlow Graphical User Interface

SystemFlow Main Interface

The RTS 2718 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. These parameters include data valid and suspend enables, as well as polarity control for both signals. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The SystemFlow Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

**Specifications**

**PC Workstation**

**Operating System:** Windows 7 Professional

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

# Model RTR 2738A

# LVDS Digital I/O Rugged Portable Recorder

### Features

- Designed to operate under conditions of shock and vibration
- Portable system measures 16.0" W x 6.9" D x 13.0" H
- Lightweight, just less than 30 pounds
- Shock- and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- 32 bits of LVDS digital I/O
- LVDS clock, Data Valid and Data Suspend signals
- Supports clock rates up to 250 MHz
- Real-time aggregate recording rates up to 1.0 GB/s
- Windows® workstation with high performance Intel® Core™ i7 processor
- Up to 61 terabytes of SSD storage to NTFS RAID solid state disk array
- SystemFlow® GUI with Signal Viewer analysis tool
- Optional file headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional 18–36 VDC power supply

Contact factory for options, recording rates, and disk capacity.

### General Information

The Talon® RTR 2738A is a complete turn-key system for recording and playing back digital data using the Pentek Model 78610 LVDS digital I/O board. Using highly optimized disk storage technology, the rugged, lightweight portable package achieves sustained recording rates of up to 1.0 GB/sec.

The RTR 2738A utilizes a 32-bit LVDS interface that can be clocked at speeds up to 250 MHz. It includes Data Valid and Suspend signals and provides the ability to turn these signals on and off as well as control their polarity.

Optional GPS time and position stamping allows the user to mark the beginning of a recording in the recording file's header.

### SystemFlow Software

The RTR 2738A includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system. It also includes a C-callable API that allows users to easily integrate the Talon recorder into a larger system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTR 2738A allows the user to install post-processing and analysis tools to operate on the recorded data.

Data can be off-loaded via gigabit Ethernet, USB 2.0 and USB 3.0 ports. Additionally,

data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

Option -625 replaces the DVD±R/RW drive with a removable operating system drive; an external DVD drive can be used.

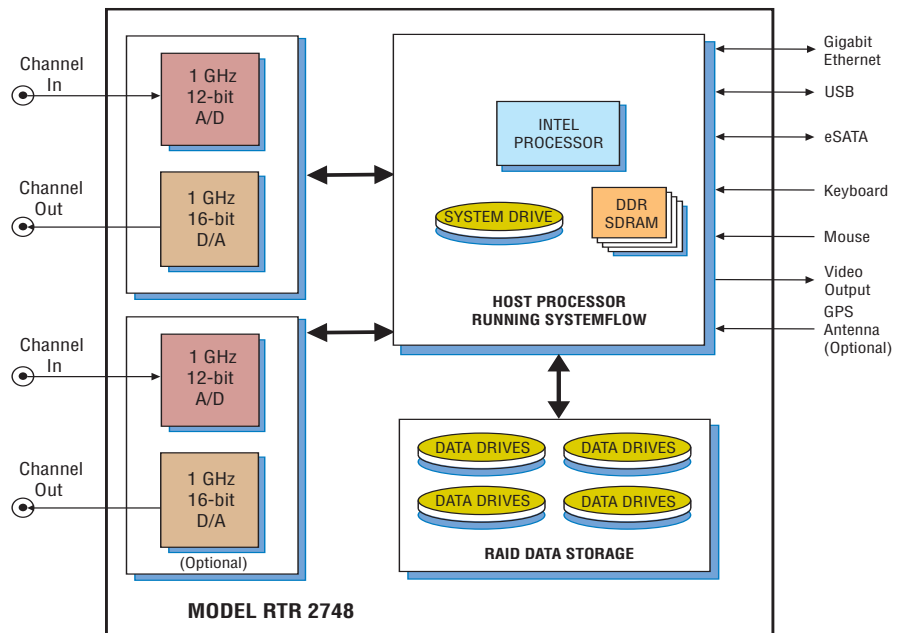

### Rugged Chassis with SSD Storage

The RTR 2736A is configured with hot-swappable SSDs, front panel USB ports, and I/O connectors on the side panel. It is built in an extremely rugged steel and aluminum chassis and is tested for shock and vibration. The SSDs provide storage capacities of up to 61.4 TB. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data. Multiple RAID levels, including 0, 5, and 6, provide a choice for the required level of redundancy.

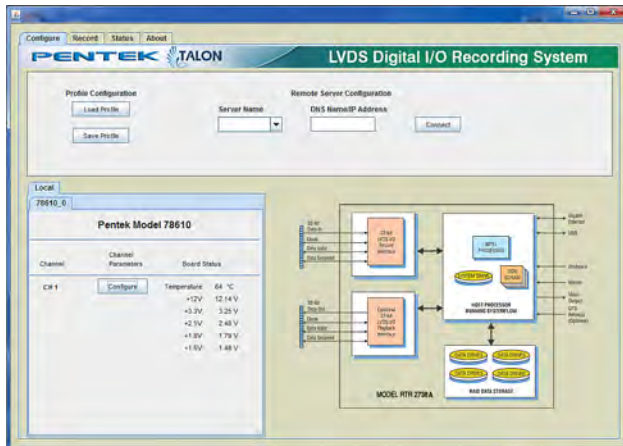

### SystemFlow API

SystemFlow includes a complete API (Application Programming Interface) that supports control and status queries of all operations of the RTR 2738A from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2738A as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection. ▶

► SystemFlow Graphical User Interface

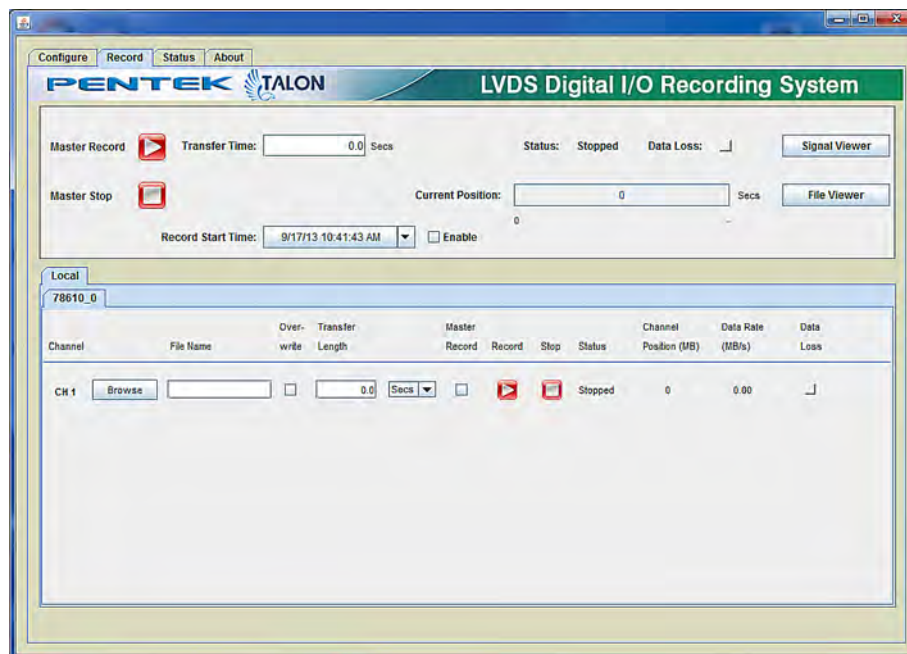

SystemFlow Main Interface

The RTR 2738A GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. These parameters include data valid and suspend enables, as well as polarity control for both signals. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The SystemFlow Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

## ► Specifications

### PC Workstation (standard configuration)

**Operating System:** 64-bit Windows workstation

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.0 GHz or higher

**Operating System Drive:** 128 GB SSD

**SDRAM:** 8 GB

**Monitor:** Built-in 17.3" high-resolution LCD,  
1920 x 1080 pixels, 16:9 aspect ratio, anti-glare surface  
Brightness: 300 cd/m<sup>2</sup>; Contrast ratio: 400:1 typical

### RAID

**Total Storage:** 3.8 – 61.4 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, side panel

**USB 2.0 Ports:** Four on left side, two on front panel

**USB 3.0 Ports:** Two on left side

**1 Gb Ethernet Ports:** Two on left side

**Aux Video Output:** 15-pin VGA on left side

### LVDS Interface

**Cable:** 80-pin ribbon cable

**Connector Type:** 2x40 pin IDC

**Data Lines:** 32 LVDS pairs, 2.5 V compliant

**Clock:** One LVDS pair, 2.5 V compliant

**Data Valid:** One LVDS pair, 2.5 V compliant

**Data Suspend:** One LVDS pair, 2.5 V compliant

### Optional DC Power supply

**Voltage:** 10 to 36 VDC

**Input Current:** 42 to 26 A (39 A at 24 VDC)

**Inrush Current:** 100 A at 24 VDC

**Temperature Range:** Oper.: 0° to 50° C, Store: -0° to 80° C

**Efficiency:** >80% typical at 24 V full load

**Power Good Signal:** On delay 100 to 500 msec

**OverPower Protection:** 110% to 160%

**Remote Control:** On/Off

**Safety:** Meets UL, TUV, CB specifications

### Physical and Environmental

**Size:** 16.0" W x 6.9" D x 13.0" H

**Weight:** 30 lb max.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 30 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,

20 to 500 Hz: 1.4 g peak acceleration

**Non-operating Vibration:** 5 to 500 Hz: 2.06 g RMS

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 500 W max.

## Model RTR 2738A Ordering Information and Options

### Channel Configurations

**Option -201** Recording Interface

**Option -221** Playback Interface

### Storage Options

**Option -410** 3.8 TB SSD Storage

**Option -415** 7.6 TB SSD Storage

**Option -420** 15.3 TB SSD Storage

**Option -430** 30.7 TB SSD Storage

**Option -460** 61.4 TB SSD Storage

### Additional Options

**Option -261** GPS Time & Position Stamping

**Option -264** IRIG-B Time Stamping

**Option -285** RAID 5 Configuration

**Option -286** RAID 6 Configuration

**Option -309** 16 GB System Memory

**Option -311** 64 GB System Memory

**Option -625** Removable Operating System Drive

**Option -681** 10 to 36 VDC Power Supply

**Features**

- Designed to operate under conditions of shock and vibration
- Removable SSDs
- 32 bits of LVDS digital I/O
- LVDS clock, Data Valid and Data Suspend signals
- Supports clock rates up to 250 MHz
- Real-time aggregate recording rates up to 1.0 GB/sec
- Up to 46 terabytes storage to NTFS RAID disk array
- RAID levels of 0 , 1 , 5 , 6 , 10 and 50
- Optional N+1 redundant power supply
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

Contact factory for options, recording rates, and disk capacity.

**General Information**

The Talon® RTR 2758 is a complete turn-key system for recording and playing back digital data using the Pentek Model 78610 LVDS digital I/O board. Using highly optimized disk storage technology, the system achieves sustained recording rates of up to 1.0 GB/sec.

The RTR 2758 utilizes a 32-bit LVDS interface that can be clocked at speeds up to 250 MHz. It includes Data Valid and Suspend signals and provides the ability to turn these signals on and off as well as control their polarity.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTR 2758 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

Built on a Windows 7 Professional workstation, the RTR 2758 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2758 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB ports. Additionally, data can be copied to optical disk using the 8X double layer DVD±R/RW drive.

**Rugged and Flexible Architecture**

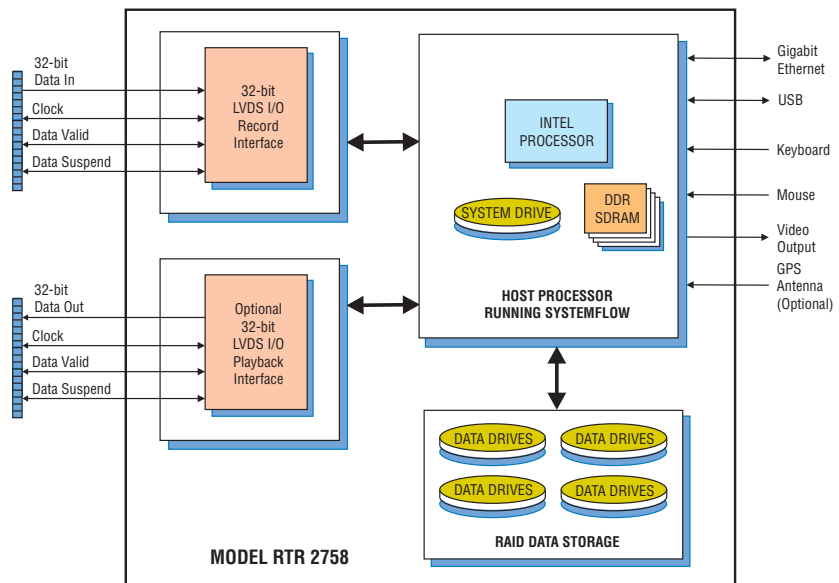

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2758 performs well in ground, shipborne and airborne environments. Configurable with hot-swappable SSDs, the RTR 2758 can provide storage capacities of up to 46 TB in a rugged 4U chassis. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

The RTR 2758 is configured in a 4U 19" rack-mountable chassis, with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel.

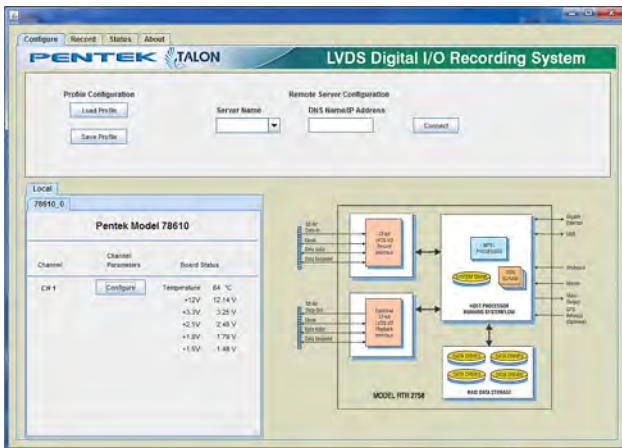

Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 1, 5, 6, 10 and 50 provide a choice for the required level on redundancy. Redundant power supplies are optionally available to provide a robust and reliable high-performance recording system. ➤

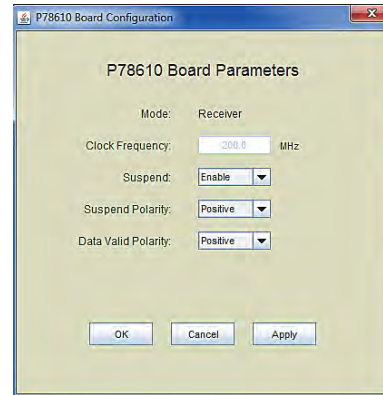

► SystemFlow Graphical User Interface

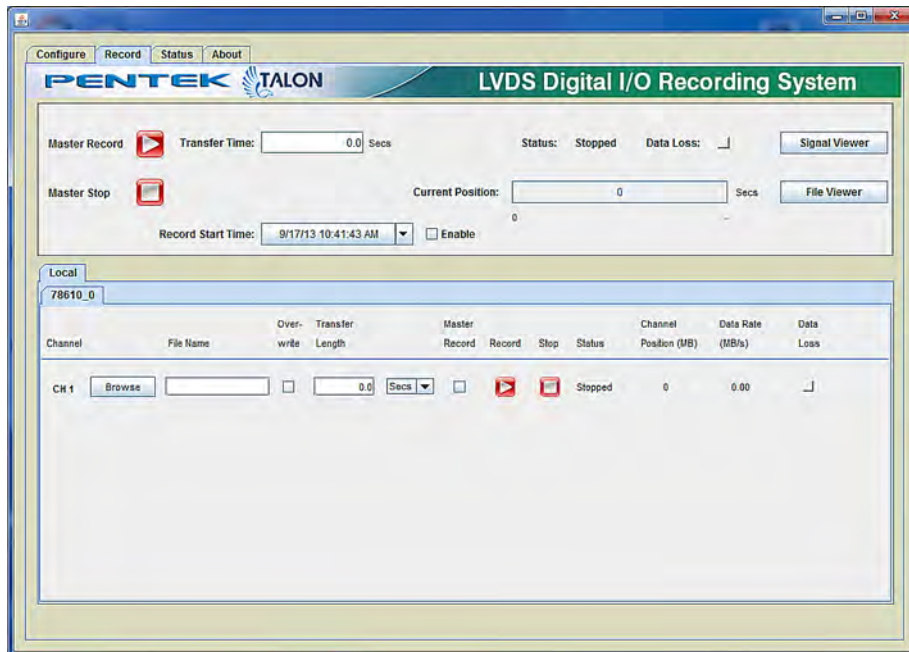

SystemFlow Main Interface

The RTR 2758 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. These parameters include data valid and suspend enables, as well as polarity control for both signals. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

### ► SystemFlow API

SystemFlow includes a complete API (Application Programming Interface) that supports control and status queries of all operations of the RTR 2758 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2758 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

New!

### Features

- Designed to meet MIL-STD-810 shock and vibration
- Designed to meet EMC/EMI per MIL-STD-461 EMC
- 4U 19-inch rugged rackmount PC server chassis, 22" deep
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor
- 32 bits of LVDS digital I/O
- LVDS clock, Data Valid and Data Suspend signals
- Supports clock rates up to 250 MHz
- Real-time aggregate recording rates of up to 1.0 GB/sec
- Up to four front-panel removable QuickPac SSD drive canisters with eight drives each
- Up to 30 terabytes of storage to NTFS RAID disk array
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Optional playback mode

### General Information

The Talon® RTX 2778 is a turnkey record and playback system that is built to operate under harsh conditions. Designed to withstand high vibration and operating temperatures, the RTX 2778 is intended for military, airborne and UAV applications requiring a rugged system.

The RTX 2778 records and plays back digital data using the Pentek Model 78610 LVDS digital I/O board. Using highly optimized disk storage technology, the system achieves aggregate recording rates of up to 1.0 GB/sec.

The RTX 2778 utilizes a 32-bit LVDS interface that can be clocked at speeds up to 250 MHz. It includes Data Valid and Suspend signals and provides the ability to turn these signals on and off as well as control their polarity.

Optional GPS time and position stamping accurately identifies each record in the file header.

### SystemFlow Software

The RTX 2778 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

Built on a Windows 7 Professional workstation, the RTX 2778 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTX 2778 records data to the native NTFS file system, providing immediate access to the recorded data.

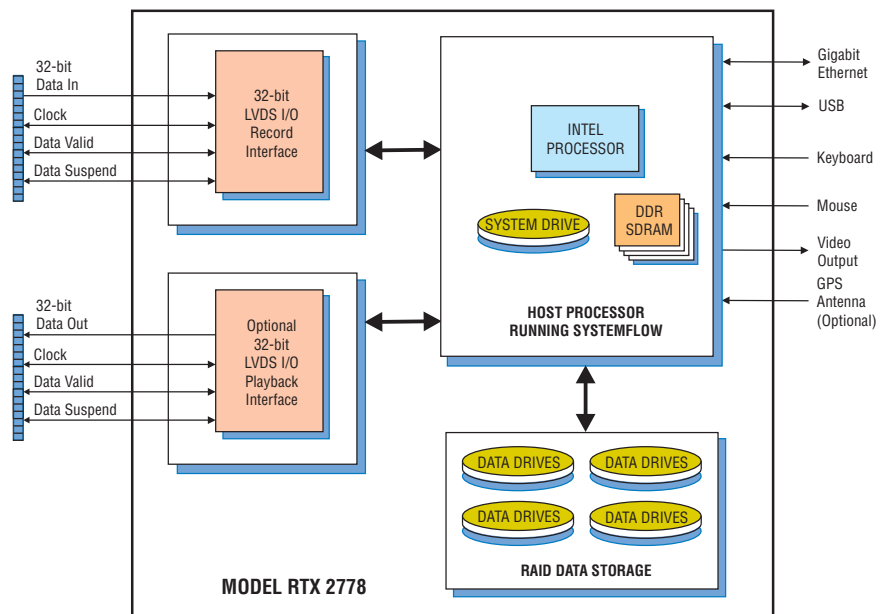

Data can be off-loaded via two rear-access gigabit Ethernet ports, two USB 3.0 ports or up to four USB 2.0 ports.

### Rugged Mil-Spec Chassis

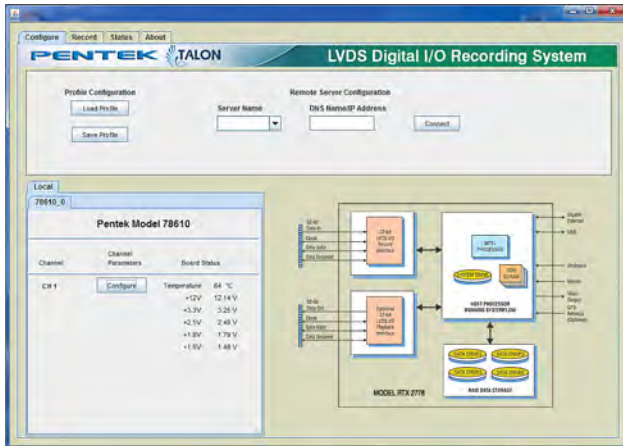

The Talon RTX 2778 uses a shock- and vibration-isolated inner chassis and solid-state drives to assure reliability under harsh conditions. The chassis uses an in-line EMI filter along with rear-panel MIL-style connectors to meet MIL-STD-461 emissions specifications.

Up to four front-panel removable QuickPac drive canisters are provided, each containing up to eight SSDs. Each drive canister can hold up to 7.6 TB of data storage and allows for quick and easy removal of mission-critical data.

Forced-air cooling draws air from the front of the chassis and pushes it out the back via exhaust fans. A hinged front door with a serviceable air filter provides protection against dust and sand. ➤

► SystemFlow Graphical User Interface

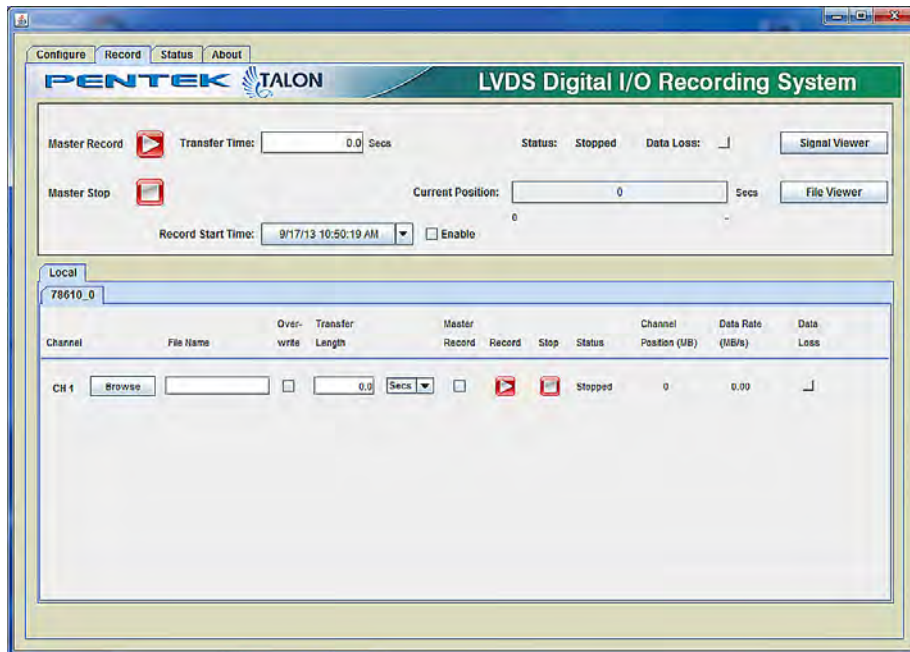

SystemFlow Main Interface

The RTX 2778 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. *Specifications are subject to change without notice*

**Features**

- Housed in a small chassis measuring 5.25" H x 8.5" W x 14" D
- Weighs 17 lb (7.7 kg)
- Shock and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Records gigabit, 10-gigabit or 40-gigabit Ethernet streams
- TCP and UDP protocols
- Copper or optical interfaces
- Aggregate recording rates to 4.0 GB/sec
- Up to 30 terabytes of storage to NTFS RAIDdisk array
- RAID levels of 0, 5 and 6
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into applications
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

**General Information**

Optimized for SWaP (size, weight and power) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

The Talon® RTR 2555 is a complete turn-key recording and playback system for storing 1-, 10- and 40-gigabit Ethernet streams. It is ideal for capturing any type of streaming sources including live transfers from sensors or data from other computers and supports both TCP and UDP protocols.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. These models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTR 2555 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed,

allowing the user to select preconfigured settings with a single click.

Built on a Windows 7 Professional workstation, the RTR 2555 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2555 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB ports. Additionally, data can be copied to optical disk using the 8X double layer DVD±R/RW drive.

**Rugged and Flexible Architecture**

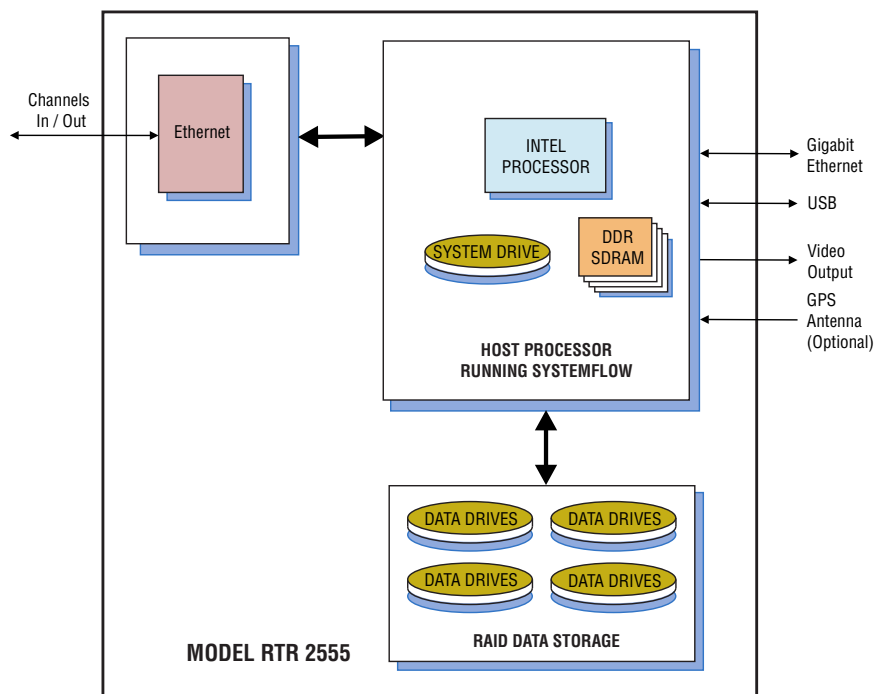

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2555 performs well in ground, shipborne and airborne environments.

Configurable with hot-swappable SSDs, the RTR 2555 can provide storage capacities of up to 30.6 TB in a rugged chassis. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

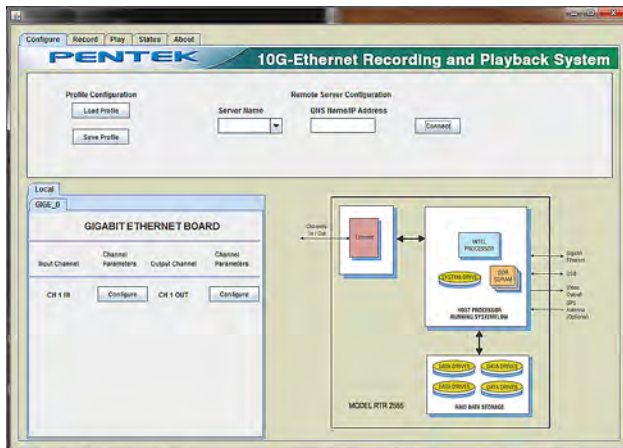

The RTR 2555 is configured with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 5 and 6 provide a choice for the required level of redundancy. ▶

► SystemFlow Graphical User Interface

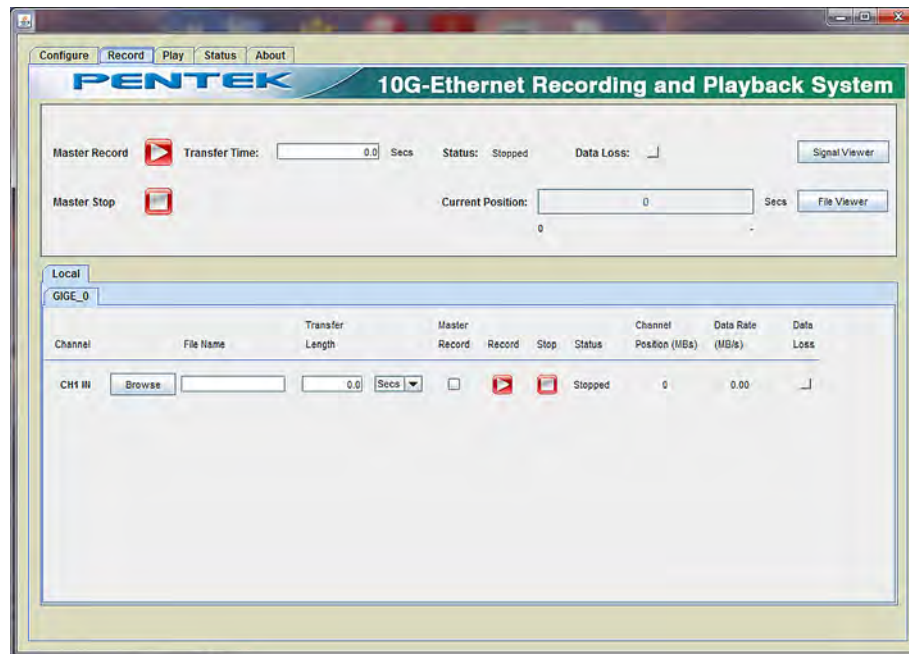

SystemFlow Main Interface

The RTR 2555 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback, and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying UDP or TCP protocol, client or server connection, the IP address and port number. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

► **SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2555 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2555 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows workstation

**Processor:** Intel i7 7700K (7th Gen) quad core processor

**Clock Speed:** 4.2 GHz

**Operating System Drive:** 250 GB SSD

**SDRAM:** 8 standard, 16 or 32 GB optional

**RAID**

**Total Storage:** 3.8 TB – 30.6 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, front panel

**Rear Panel I/O**

Four USB 3.0 ports

Two Gigabit RJ45 ports

Two HDMI and One DVI ports

Audio and PS2 ports

USB 3.0 Type-C port

Two Wi-Fi antenna ports

**Front Panel I/O**

Two USB 2.0 ports

Power and recessed RESET buttons

LED indicators for power and HDD access

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,

20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 150 W max.

**Model RTR 2555 Ordering Information and Options**

**Ethernet Interface Options**

- Option -101** Gigabit Ethernet
- Option -102** 10-Gigabit Ethernet
- Option -103** 40-Gigabit Ethernet

**Channel Configuration**

- Option -201** 1-Ethernet port
- Option -202** 2-Ethernet ports
- Option -204** 4-Ethernet ports

**Ethernet Connector Options**

- Option -280** SFP+ connectors
- Option -281** Multi-mode optical, LC connectors
- Option -282** Single-mode optical, LC connectors
- Option -284** RJ45 connectors

**Storage Options**

- Option -410** 3.8 TB SSD storage
- Option -415** 7.6 TB SSD storage
- Option -420** 15.3 TB SSD storage
- Option -430** 30.6 TB SSD storage

**General Options**

- Option -261** GPS Time and Position Stamping
- Option -285** Raid 5 Configuration
- Option -286** Raid 6 Configuration
- Option -309** 16 GB System Memory
- Option -310** 32 GB System Memory
- Option -630** 6 to 30 VDC Power Supply

**Contact Pentek for other configurations**  
**Storage and Channel-count Options may change, contact Pentek for the latest information**

## Features

- Housed in a small chassis measuring 5.25" H x 8.5" W x 14" D
- Weighs 17 lb (7.7 kg)
- Shock and vibration-resistant SSDs perform well in vehicles, ships and aircraft
- Complete Serial FPDP record and playback system
- Up to four I/O channels
- Removable SSDs
- Up to 30 terabytes of storage to NTFS RAID disk array
- Copper, single-mode and multi-mode fiber interfaces available
- Real-time aggregate recording rates of up to 1.6 GB/sec
- Supports Flow Control, CRC, and Copy/Loop Mode as a receiver and transmitter
- Supports 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates
- RAID levels of 0, 5 and 6
- SystemFlow® GUI virtual instrumentation panel for fast, intuitive operation
- C-callable API for integration of recorder into application
- File headers include time stamping and recording parameters
- Optional GPS time and position stamping
- Windows® 7 Professional workstation with high-performance Intel® Core™ i7 processor

## General Information

Optimized for SWaP (size, weight and power) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

Configured as a complete turnkey system capable of recording and playing back multiple Serial FPDP data streams, it is ideal for capturing any type of streaming sources such as live transfers from sensors or data from other computers. It is fully compatible with the VITA 17.1 specification. Using highly-optimized disk storage technology, the system achieves aggregate recording rates up to 3.2 GB/sec.

The RTR 2556 can be populated with up to four SFP connectors supporting Serial FPDP over copper, single-mode, or multi-mode fiber, to accommodate all popular Serial FPDP interfaces. It is capable of both receiving and transmitting data over these links and supports real-time data storage to disk.

Programmable modes include flow control in both receive and transmit directions, CRC support, and copy/loop modes. The system is capable of handling 1.0625, 2.125, 2.5, 3.125 and 4.25 GBaud link rates supporting data transfer rates of up to 425 MB/sec per Serial FPDP link.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds.

## SystemFlow Software

The RTR 2556 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple and intuitive means to configure and control the system.

Custom configurations can be stored as profiles and later loaded as needed, allowing the user to select preconfigured settings with a single click.

Built on a server-class Windows 7 Professional workstation, the RTR 2556 allows the user to install post-processing and analysis tools to operate on the recorded data.

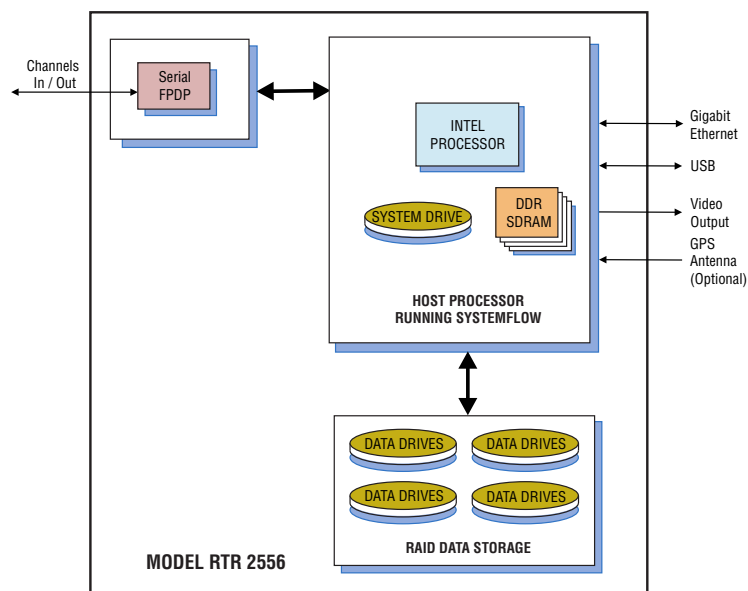

The RTR 2556 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB 2.0 ports. Additionally, data can be copied to optical disk, using the 8X double layer DVD±R/RW drive.

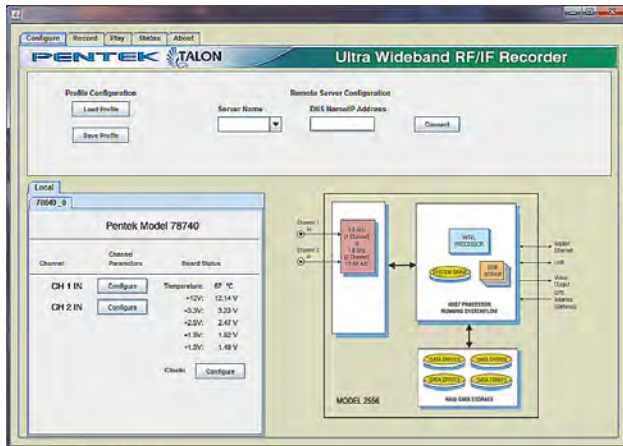

## Rugged and Flexible Architecture

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2556 performs well in ground, shipborne and airborne environments. Configurable with hot-swappable SSDs, the RTR 2556 can provide storage capacities of up to 30.6 TB in a rugged chassis. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

The RTR 2556 is configured with hot-swap data drives, front-panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates. Multiple RAID levels, including 0, 5, and 6 provide a choice for the required level of redundancy. ➤

► SystemFlow Graphical User Interface

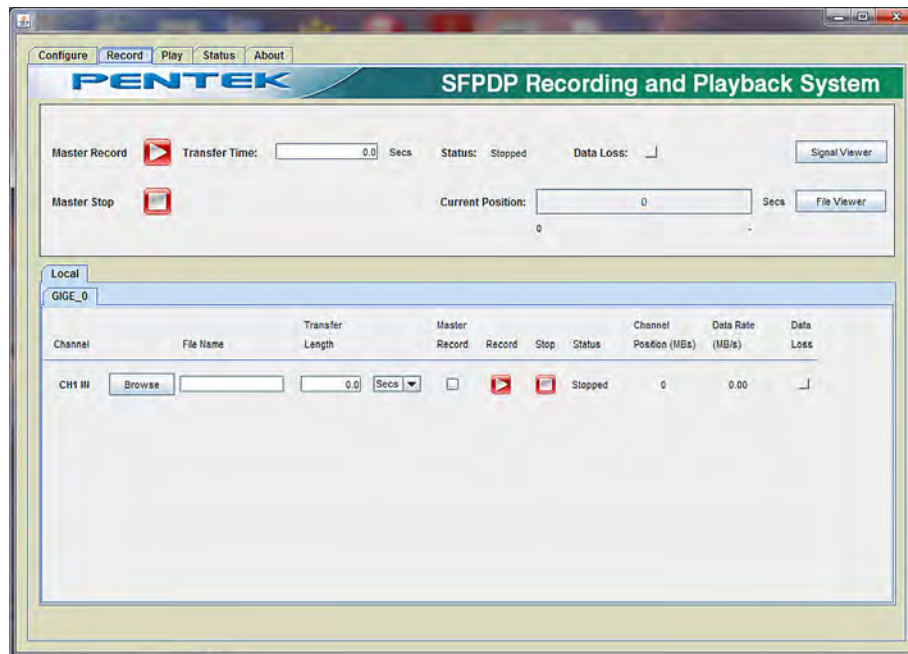

SystemFlow Main Interface

The RTR 2556 GUI shows a block diagram of the system and provides the user with a control interface for the recording system. It includes Configure, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to configure parameters, control and monitor a recording, and play back a recorded stream.

SystemFlow Hardware Configuration Interface

The Configure screen presents operational system parameters including temperature and voltages. Parameters are entered for each input or output channel specifying the flow control settings and the recognition of a CRC in the data stream. Each channel can also be set up to utilize Serial FPDP's copy/loop mode. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

SystemFlow Record Interface

The Record screen allows you to browse a folder and enter a file name for the recording. The length of the recording for each channel can be specified in megabytes or in seconds. Intuitive buttons for Record, Pause and Stop simplify operation. Status indicators for each channel display the mode, the number of recorded bytes, and the average data rate. A Data Loss indicator alerts the user to any problem, such as a disk full condition.

By checking the Master Record boxes, any combination of channels in the lower screen can be grouped for synchronous recording via the upper Master Record screen. The recording time can be specified, and monitoring functions inform the operator of recording progress. ►

► **SystemFlow API**

SystemFlow includes a complete API (Application Programming Interface) supporting control and status queries of all operations of the RTR 2556 from a custom application.

High-level C-language function calls and the supporting device drivers allow users to incorporate the RTR 2556 as a high-performance server front end to a larger system. This is supported using a socket interface through the Ethernet port, either to a local host or through an internet link for remote, stand-alone acquisition. Recorded NTFS files can be easily retrieved through the same connection.

**Specifications**

**PC Workstation (standard configuration)**

**Operating System:** Windows workstation

**Processor:** Intel i7 7700K (7th Gen) quad core processor

**Clock Speed:** 4.2 GHz

**Operating System Drive:** 250 GB SSD

**SDRAM:** 8 standard, 16 or 32 GB optional

**RAID**

**Total Storage:** 3.8 TB – 30.6 TB

**Supported RAID Levels:** 0, 5 and 6

**Drive Bays:** Hot-swap, removable, front panel

**Rear Panel I/O**

Four USB 3.0 ports

Two Gigabit RJ45 ports

Two HDMI and One DVI ports

Audio and PS2 ports

USB 3.0 Type-C port

Two Wi-Fi antenna ports

**Front Panel I/O**

Two USB 2.0 ports

Power and recessed RESET buttons

LED indicators for power and HDD access

**Physical and Environmental**

**Size:** 5.25" H x 8.5" W x 14.0" D

**Weight:** 17 lb (7.7 kg)

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Operating Shock:** 15 g max. (11 msec, half-sine wave)

**Operating Vibration:** 10 to 20 Hz: 0.02 inch peak,  
20 to 500 Hz: 1.4 g peak acceleration

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 150 W max.

**Model RTR 2556 Ordering Information and Options**

**General Information**

Optimized for SWaP (size, weight and power) the Pentek Talon® RTR Small Form Factor (SFF) product line provides the performance and storage capacity previously only possible in much larger rackmountable chassis. Measuring 5.25" H x 8.5" W x 14" D and weighing only 17 pounds (7.7 kg), this small package can hold up to 30.6 TB of SSD storage.

The Talon® RTR 2558 is a complete turn-key system for recording or playing back digital data. Using highly optimized disk storage technology, the system achieves sustained recording rates of up to 1.0 GB/sec.

The RTR 2558 utilizes a 32-bit LVDS interface that can be clocked at speeds up to 250 MHz. It includes Data Valid and Suspend signals and provides the ability to turn these signals on and off as well as control their polarity.

An ATX power supply accepts 110-240 VAC, drawing under 150 W and typically around 100 W. These models have the option for a 6-30 VDC power supply.

Eight front panel data drives can be easily removed along with a front panel removable OS drive to allow all non-volatile memory to be removed from the system in seconds.

Optional GPS time and position stamping accurately identifies each record in the file header.

**SystemFlow Software**

The RTR 2558 includes the SystemFlow Recording Software. SystemFlow features a Windows-based GUI (Graphical User Interface) that provides a simple means to configure and control the system.

Custom configurations can be stored as profiles and later loaded when needed, allowing the user to select preconfigured settings with a single click.

Built on a Windows 7 Professional workstation, the RTR 2558 allows the user to install post-processing and analysis tools to operate on the recorded data.

The RTR 2558 records data to the native NTFS file system, providing immediate access to the recorded data.

Data can be off-loaded via two gigabit Ethernet ports or six USB ports. Additionally, data can be copied to optical disk using the 8X double layer DVD±R/RW drive.

**Rugged and Flexible Architecture**

Because SSDs operate reliably under conditions of shock and vibration, the RTR 2558 performs well in ground, shipborne and airborne environments.

Configurable with hot-swappable SSDs, the RTR 2558 can provide storage capacities of up to 30.6 TB in a rugged chassis. Drives can be easily removed or exchanged during or after a mission to retrieve recorded data.

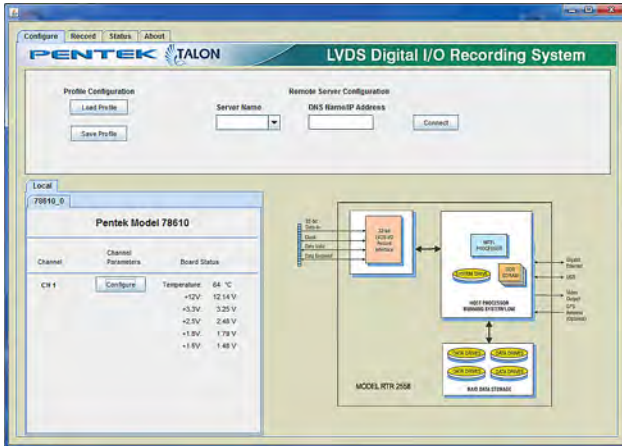

The RTR 2558 is configured with hot-swap data drives, front panel USB ports and I/O connectors on the rear panel. Systems are scalable to accommodate multiple chassis to increase channel counts and aggregate data rates.

All recorder chassis are connected via Ethernet and can be controlled from a single GUI either locally or from a remote PC.

Multiple RAID levels, including 0, 5, and 6 provide a choice for the required level of redundancy. ➤

# Customer Information

## Placing an Order

When placing a purchase order for Pentek products, please provide the model number and product description. You may place your orders by letter, telephone, email or fax; you should confirm a verbal order by mail, email or fax.

All orders should specify a purchase order number, bill-to and ship-to address, method of shipment, and a contact name and telephone number.

U.S. orders should be made out to Pentek, Inc. and may be placed directly at our office address, or c/o our authorized sales representative in your area.

International orders may be placed with us, or with our authorized distributor in your country. They have pricing and availability information and they will be pleased to assist you.

## Prices and Price Quotations

All prices are F.O.B. factory in U.S. dollars. Shipping charges and applicable import, federal, state or local taxes, are paid by the purchaser.

We're glad to respond to your request for price quotation just contact the corporate office, or your local representative. Price and delivery quotations are valid for 30 days, unless otherwise stated.

Quantity discounts for large orders are available and will be included in our price quotation, if applicable.

## Terms

Terms are Net 30 days for accounts with established credit; until credit is established, we require prepayment, or will ship C.O.D.

## Shipping

For new orders, we normally ship UPS ground with shipping charges prepaid and added to our invoice. If you are in a hurry, we will ship UPS Red, UPS Blue, FedEx, or the carrier of your choice, as you request.

## Order Cancellation and Returns

All orders placed with Pentek are considered binding and are subject to cancellation charges. Hardware products may be returned within 30 days after receipt, subject to a restocking charge. Before returning a product, please call Customer Service to obtain a Return Material Authorization (RMA) number. Software purchases are final and we cannot allow returns.

## Warranty

Pentek warrants its products to conform to published specifications and to be free from defects in materials and workmanship for a period of one year from the date of delivery, when used under normal operating conditions and within the service conditions for which they were furnished.

The obligation of Pentek arising from a warranty claim shall be limited to repairing or, optionally, replacing without charge any product which proves to be defective within the term and scope of the warranty.

Pentek must be notified of the defect or nonconformity within the warranty period. The affected product must be returned with shipping charges and insurance prepaid. Pentek will pay shipping charges for the return of product to buyer, except for products returned from outside the USA.

## Limitations of Warranty

This warranty does not apply to products which have been repaired or altered by anyone other than Pentek or its authorized representatives.

The warranty does not extend to products that have been damaged by misuse, neglect, improper installation, unauthorized modification, or extreme environmental conditions, that fall outside of the scope of the product's environmental specifications.

Due to the normal, finite write-cycle limits of Solid State Drives (SSDs), Pentek shall not be liable for warranty coverage of SSDs caused by wear-related issues that arise as an SSD reaches its write-cycle limit.

Pentek specifically disclaims merchantability or fitness for a particular purpose. Pentek shall not be held liable for incidental or consequential damages arising from the sale, use, or installation of any Pentek product. Regardless of circumstances, Pentek's liability under this warranty shall not exceed the purchase price of the product.

## Extended Warranty

You may purchase an extended warranty on our board-level products for a fee of 1% of the list price per month of coverage, or 10% of the list price per year of coverage.

All Pentek software products (excluding 3rd-party products) include free maintenance and free upgrades for one year. Extended software maintenance is available for one, two, and three years, starting after the first year.

## Service and Repair

You must obtain a Return Material Authorization (RMA) before returning any product to Pentek for service or repair. RMA requests must be submitted online at:

[Return Material Authorization Form](#)

After the form is completed in its entirety and submitted, Pentek shall email you a receipt and start processing your request. Once your request has been approved, Pentek shall e-mail you an RMA number, shipping instructions, and a quotation if the product is out of warranty.

Carefully package the product in its original packaging, if it is still available, and ship it to Pentek prepaid (if within the US) or free domicile DDP (if outside the US). Pentek shall not be responsible for loss or damage in shipment to Pentek, so you are strongly encouraged to insure the shipment for its full replacement value.

When the work is completed, we will return the product to you along with a statement of work performed.

Customer Service phone: 201-818-5900 • fax: 201-818-5697  
• email: [custsrv@pentek.com](mailto:custsrv@pentek.com)

[Customer Information](#)

[Click Here for the PRODUCT SELECTOR](#)

Last updated: April 2018

**Features**

- Simultaneous synthesis of up to five different clocks
- Eight SMC clock outputs
- Ideal for A/D and D/A converter clock sources
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four quad VCXOs allow selection from 16 different base frequencies
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status via PCI bus interface

**General Information**

Model 7190 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 7190 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 7190 can be programmed to route any of these 20 frequencies to the module's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independent quad VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a wide

range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 7190's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Interface**

The Model 7190 uses an industry-standard 32-bit, 33/66 MHz PCI interface fully compatible with PCI bus specifications. The interface allows reading and writing of status and control signals for setup, operation and monitoring of the module.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Quad VCXOs (Quantity: Four)**

- Frequencies per VCXO:** 4\*, software-programmable

**Frequency Range:** 50 to 700 MHz

- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: Eight)**

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**PCI Interface**

- PCI Bus:** 32-bit, 66 MHz (supports 33 MHz)
- Operation:** control and status interface

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard PMC module, 2.91 in. x 5.87 in.

7390	Multifrequency Clock Synthesizer - 3U cPCI

**Options**

Specify frequencies of four factory-installed quad VCXOs between 50 and 700 MHz

\* Contact Pentek to order specific frequencies

**General Information**

These Models generate up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

Models 7290 and 7390 generate eight clocks while Model 7290D generates sixteen.

**Clock Synthesizer Circuits**

These Models use the Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each quad VCXO can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The CDC7005's can output up to five frequencies each. These Models can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight or 16 front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all outputs or up to five or ten different clocks to various outputs.

With four or eight independent quad VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a

wide range of clock configurations is possible. In systems where even more different clock outputs are required simultaneously, multiple boards can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Interface**

These Models use an industry-standard 32-bit, 33/66 MHz PCI interface fully compatible with PCI bus specifications. The interface allows reading and writing of status and control signals for setup, operation and monitoring of the board.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four or eight
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Quad VCXOs (Quantity: Four or eight)**

- Frequencies per VCXO:** 4\*, software-programmable

**Frequency Range:** 50 to 700 MHz

- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: 8 or 16)**

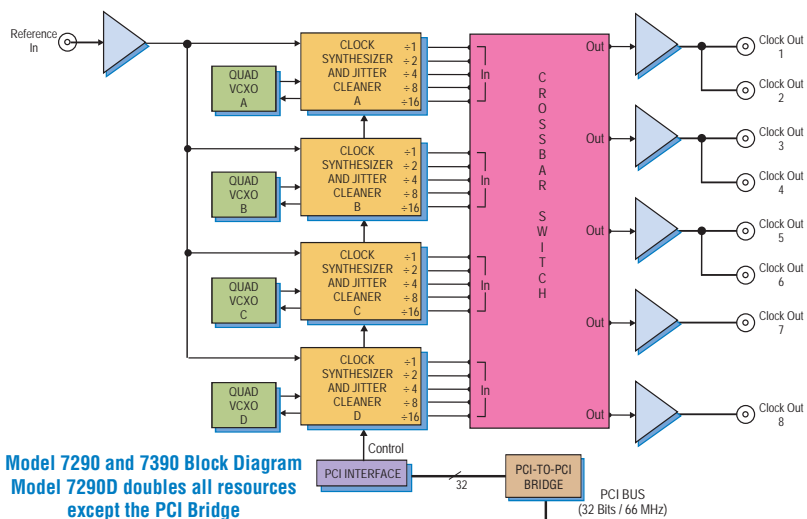

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**PCI Interface**

- PCI Bus:** 32-bit, 66 MHz (supports 33 MHz)
- Operation:** control and status interface

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** Standard 3U or 6U cPCI board

Model 7290 and 7390 Block Diagram  
Model 7290D doubles all resources  
except the PCI Bridge

**Features**

- Simultaneous synthesis of up to five different clocks
- Eight SMC clock outputs
- Ideal for A/D and D/A converter clock sources
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four quad VCXOs allow selection from 16 different base frequencies
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status via PCI bus interface

**General Information**

Model 7690 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 7690 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 7690 can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independent quad VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a wide

range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 7690's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Interface**

The Model 7690 uses an industry-standard 32-bit, 33/66 MHz PCI interface fully compatible with PCI bus specifications. It attaches directly to computer motherboards with PCI bus slots. Front panel connectors are brought out on the rear panel.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Quad VCXOs (Quantity: 4)**

- Frequencies per VCXO:** 4\*, software-programmable

**Frequency Range:** 50 to 700 MHz

- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: Eight)**

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**PCI Interface**

- PCI Bus:** 32-bit, 66 MHz (supports 33 MHz)
- Operation:** control and status interface

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard half-length PCI board

**General Information**

Model 7890 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 7890 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 7890 can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independent quad VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a wide

range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 7890's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Express Interface**

The Model 7890 includes a multiple port, 48-lane Gen. 2 PCIe switch with integrated SerDes. The switch provides x8 wide connection to the PCIe interface.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Ordering Information**

Model	Description
5390	Multifrequency Clock Synthesizer - 3U VPX

**Options**

Specify frequencies of four factory-installed quad VCXOs between 50 and 700 MHz

\* Contact Pentek to order specific frequencies

**General Information**

Model 5390 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 5390 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 5390 can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independent quad VCXOs and each CDC7005 capable of providing up to

five different submultiple clocks, a wide range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 5390's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Express Switch**

Model 5390 includes a PCIe Gen. 2 switch. The switch provides a total of 24 PCIe lanes to the Fabric-Transparent Crossbar Switch on 6 ports. Dynamic lane width negotiation within the PCIe switch allows for x1, x4, x8 or x16 widths.

**Specifications**

**Front Panel Reference Input**

**Connector Type:** SMC

**Input Impedance:** 50 ohms

**Reference Frequency:** 5 to 100 MHz

**Input Level:** -6 dBm to +10 dBm

# Models 5790 & 5890

## Multifrequency Clock Synthesizer - 6U OpenVPX

Model 5890

### Features

- Simultaneous synthesis of up to five or 10 different clocks
- Eight or 16 SMC clock outputs
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four or eight quad VCXOs allow selection from 16 different base frequencies
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status over the VPX backplane

### Ordering Information

Model	Description
5790	Multifrequency Clock Synthesizer - 6U VPX Single Density
5890	Multifrequency Clock Synthesizer - 6U VPX Double Density

### Options

Specify frequencies of factory-installed quad VCXOs between 50 and 700 MHz

\* Contact Pentek to order specific frequencies

### General Information

Models 5790 and 5890 generate up to eight or 16 synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board quad VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

### Clock Synthesizer Circuits

These models use four or eight Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to generate one of four frequencies between 50 and 700 MHz.

The CDC7005 can output the selected frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The CDC7005's can output up to five frequencies each. These models can be programmed to route any of these frequencies to the board's five or 10 output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight or 16 front panel SMC connectors supply synthesized clock outputs driven from the clock output drivers, as shown in the block diagram. This supports a single identical clock to all outputs or up to five or 10 different clocks to various outputs.

With four or eight independent quad VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a wide range of clock configurations is possible. In systems where more than 10 different clock outputs are required simultaneously, multiple 5890's can be used and phase-locked with a 5 to 100 MHz system reference.

### Specifications

#### Front Panel Reference Input

Connector Type: SMC

Input Impedance: 50 ohms

Reference Frequency: 5 to 100 MHz

Input Level: -6 dBm to +10 dBm

#### PLL Clock Synthesizers & Jitter Cleaners

Quantity: Model 5790: Four

Model 5890: eight

Type: Texas Instruments CDC7005

Frequency Dividers: 1, 2, 4, 8 and 16

#### Quad VCXOs (Quantity: Four or Eight)

Frequencies per VCXO: 4\*, software-programmable

Frequency Range: 50 to 700 MHz

Unlocked Accuracy: ±20 ppm

#### Front Panel Clock Outputs (Eight or 16)

Connector Type: SMC

Output Impedance: 50 ohms

Output Level: +3 dBm @ 700 MHz

Typ. Phase Noise: -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

#### PCI-Express Interface

PCI Express Bus: Gen. 1, 2 : x4, control and status

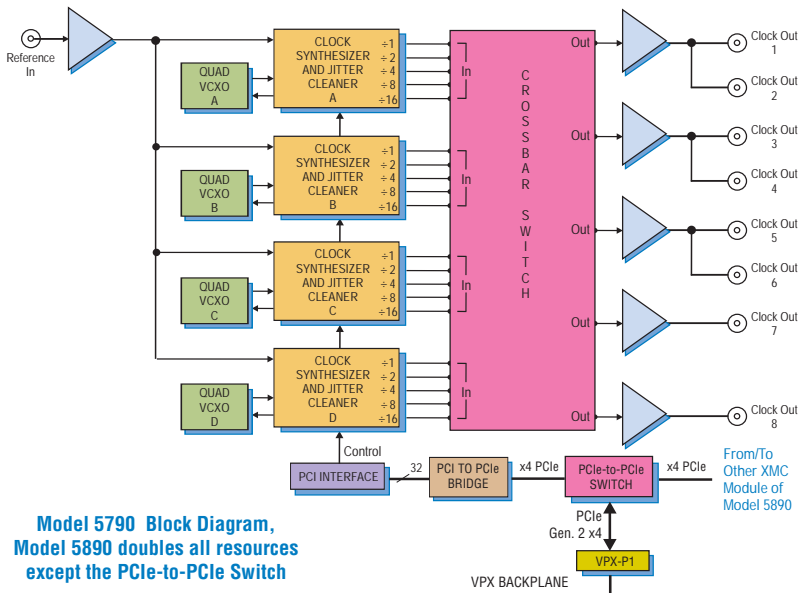

#### Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: 233 mm x 160 mm (9.173 in. x 6.299 in.)

Model 5790 Block Diagram, Model 5890 doubles all resources except the PCIe-to-PCIe Switch

**Features**

- Simultaneous synthesis of up to five different clocks
- Eight SMC clock outputs
- Ideal for A/D and D/A converter clock sources
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four programmable VCXOs with 32-bit tuning resolution
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status via PCI bus interface

**Ordering Information**

Model	Description
7191	Programmable Multifrequency Clock Synthesizer - PMC

**General Information**

Model 7191 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board programmable VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 7191 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to a desired frequency between 50 and 700 MHz with 32-bit tuning resolution.

The CDC7005 can output the programmed frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 7191 can be programmed to route any of these 20 frequencies to the module's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independently programmable VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a

wide range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 7191's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Interface**

The Model 7191 uses an industry-standard 32-bit, 33/66 MHz PCI interface fully compatible with PCI bus specifications. The interface allows reading and writing of status and control signals for setup, operation and monitoring of the module.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz

The Model 7691 uses an industry-standard 32-bit, 33/66 MHz PCI interface fully compatible with PCI bus specifications. The interface allows reading and writing of status and control signals for setup, operation and monitoring of the board.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Programmable VCXOs (Quantity: Four)**

- Frequency Range:** 50 to 700 MHz
- Tuning Resolution:** 32 bits
- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: Eight)**

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**PCI Interface**

- PCI Bus:** 32-bit, 66 MHz (supports 33 MHz)
- Operation:** control and status interface

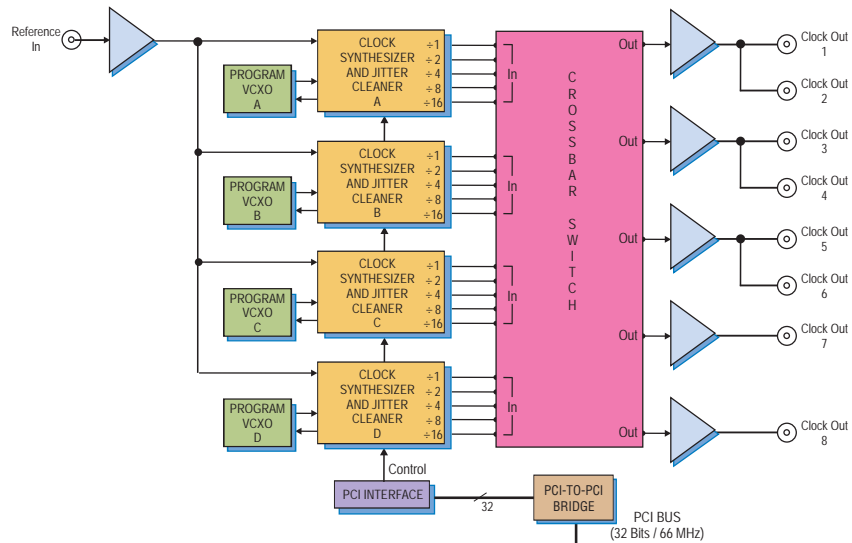

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** Standard half-length PCI board

**Ordering Information**

Model	Description
7691	Programmable Multifrequency Clock Synthesizer - PCI

**Features**

- Simultaneous synthesis of up to five different clocks
- Eight SMC clock outputs
- Ideal for A/D and D/A converter clock sources
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four programmable VCXOs with 32-bit tuning resolution
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status via PCIe bus interface

**Ordering Information**

Model	Description
7891	Programmable Multifrequency Clock Synthesizer - Half-length x8 PCIe

**General Information**

Model 7891 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board programmable VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 7891 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to a desired frequency between 50 and 700 MHz with 32-bit tuning resolution.

The CDC7005 can output the programmed frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 7891 can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independently programmable VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a

wide range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 7891's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Express Interface**

The Model 7891 includes a multiple port, 48-lane Gen. 2 PCIe switch with integrated SerDes. The switch provides x8 wide connection to the PCIe interface.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16

**Programmable VCXOs (Quantity: Four)**

- Frequency Range:** 50 to 700 MHz
- Tuning Resolution:** 32 bits
- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: Eight)**

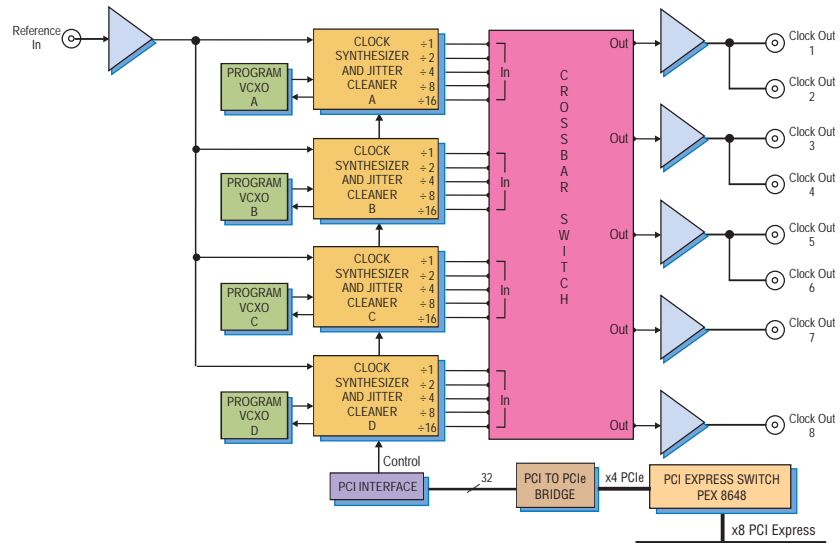

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**PCI to PCIe Interface**

- PCIe Interface:** Gen. 2, x8 width
- PCIe Ports:** one x4 port to PCI bus, one x8 port to PCIe motherboard
- Operation:** control and status interface

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** Half-length PCIe, 4.38 in. x 6.6 in.

**Features**

- Simultaneous synthesis of up to five different clocks
- Eight SMC clock outputs
- Ideal for A/D and D/A converter clock sources
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four programmable VCXOs with 32-bit tuning resolution
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status over the VPX backplane

**Ordering Information**

Model	Description
5391	Programmable Multifrequency Clock Synthesizer - 3U VPX

**General Information**

Model 5391 generates up to eight synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board programmable VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

**Clock Synthesizer Circuits**

The 5391 uses four Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to a desired frequency between 50 and 700 MHz with 32-bit tuning resolution.

The CDC7005 can output the programmed frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The four CDC7005's can output up to five frequencies each. The 5391 can be programmed to route any of these 20 frequencies to the board's five output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight front panel SMC connectors supply synthesized clock outputs driven from the five clock output drivers, as shown in the block diagram. This supports a single identical clock to all eight outputs or up to five different clocks to various outputs.

With four independently programmable VCXOs and each CDC7005 capable of provid-

ing up to five different submultiple clocks, a wide range of clock configurations is possible. In systems where more than five different clock outputs are required simultaneously, multiple 5391's can be used and phase-locked with a 5 to 100 MHz system reference.

**PCI Express Interface**

Model 5390 includes a PCIe Gen. 2 switch. The switch provides a total of 24 PCIe lanes to the Fabric-Transparent Crossbar Switch on 6 ports. Dynamic lane width negotiation within the PCIe switch allows for x1, x4, x8 or x16 widths. These can be selected in any combination.

**Specifications**

**Front Panel Reference Input**

- Connector Type:** SMC
- Input Impedance:** 50 ohms
- Reference Frequency:** 5 to 100 MHz
- Input Level:** -6 dBm to +10 dBm

**PLL Clock Synthesizers & Jitter Cleaners**

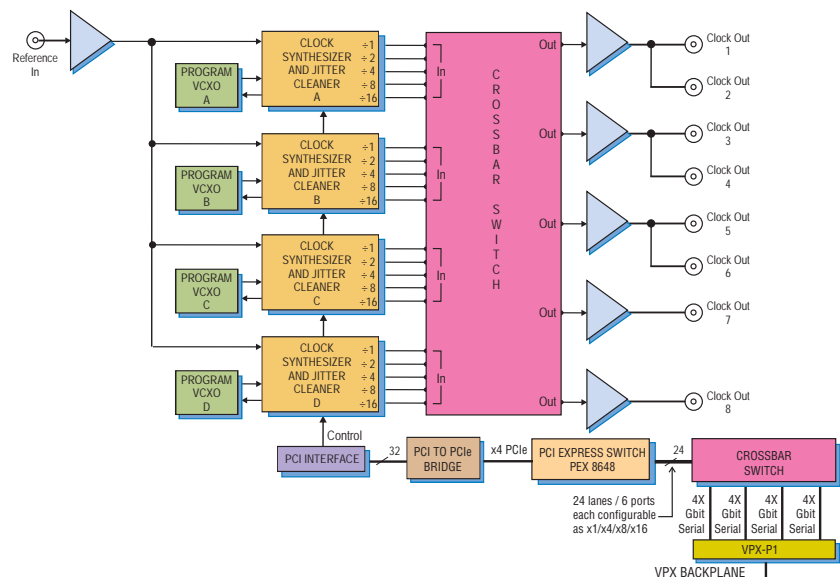

- Quantity:** Four
- Type:** Texas Instruments CDC7005
- Frequency Dividers:** 1, 2, 4, 8 and 16
- Programmable VCXOs (Quantity: Four)**
- Frequency Range:** 50 to 700 MHz
- Tuning Resolution:** 32 bits
- Unlocked Accuracy:** ±20 ppm

**Front Panel Clock Outputs (Quantity: Eight)**

- Connector Type:** SMC
- Output Impedance:** 50 ohms
- Output Level:** +3 dBm @ 700 MHz
- Typ. Phase Noise:** -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

# Models 5791 & 5891

## Programmable Multifrequency Clock Synthesizer - 6U VPX

Model 5891

### Features

- Simultaneous synthesis of up to five or 10 different clocks
- Eight or 16mSMC clock outputs
- Typical phase noise: -105 dBc/Hz @ 1 kHz offset
- All clocks are phase-locked to input reference signal
- Input reference frequency of 5 to 100 MHz
- Four or eight programmable VCXOs with 32-bit tuning resolution
- Output clocks of 1, 2, 4, 8, or 16 submultiples of VCXO base frequencies
- Output clock frequencies between 50 and 700 MHz
- Control and status over the VPX backplane

### Ordering Information

Model	Description
5791	Programmable Multifrequency Clock Synthesizer - 3U VPX Single Density
5891	Programmable Multifrequency Clock Synthesizer - 3U VPX Double Density

### General Information

Models 5791 and 5891 generate up to eight or 16 synthesized clock signals suitable for driving A/D and D/A converters in high-performance real-time data acquisition and software radio systems. The clocks offer exceptionally low phase noise and jitter to preserve the signal quality of the data converters. These clocks are synthesized from on-board programmable VCXOs (voltage controlled oscillators) and can be phase-locked to an external reference signal.

### Clock Synthesizer Circuits

These models use four or eight Texas Instruments CDC7005 clock synthesizer and jitter cleaner devices. Each CDC7005 is paired with a dedicated VCXO to provide the base frequency for the clock synthesizer. Each of the four VCXOs can be independently programmed to a desired frequency between 50 and 700 MHz with 32-bit tuning resolution.

The CDC7005 can output the programmed frequency of its associated VCXO, or generate submultiples using divisors of 2, 4, 8 or 16. The CDC7005's can output up to five frequencies each. These models can be programmed to route any of these frequencies to the board's five or 10 output drivers.

The CDC7005 includes phase-locking circuitry that locks the frequency of its associated VCXO to an input reference clock. This reference is a 5 to 100 MHz signal supplied to a front panel SMC connector.

Eight or 16 front panel SMC connectors supply synthesized clock outputs driven from the clock output drivers, as shown in the block diagram. This supports a single identical clock to all outputs or up to five or 10 different clocks to various outputs.

With four or eight independently programmable VCXOs and each CDC7005 capable of providing up to five different submultiple clocks, a wide range of clock configurations is possible. In systems where more than 10 different clock outputs are required simultaneously, multiple 5891's can be used and phase-locked with a 5 to 100 MHz system reference.

### Specifications

#### Front Panel Reference Input

- Connector Type: SMC
- Input Impedance: 50 ohms
- Reference Frequency: 5 to 100 MHz
- Input Level: -6 dBm to +10 dBm

#### PLL Clock Synthesizers & Jitter Cleaners

- Quantity: Model 5791: Four  
Model 5891: eight
- Type: Texas Instruments CDC7005
- Frequency Dividers: 1, 2, 4, 8 and 16

#### Programmable VCXOs (Four or eight)

- Frequency Range: 50 to 700 MHz
- Tuning Resolution: 32 bits
- Unlocked Accuracy: ±20 ppm

#### Front Panel Clock Outputs (Eight or 16)

- Connector Type: SMC
- Output Impedance: 50 ohms
- Output Level: +3 dBm @ 700 MHz
- Typ. Phase Noise: -105 dBc/Hz @ 1 kHz (dependent on reference source stability)

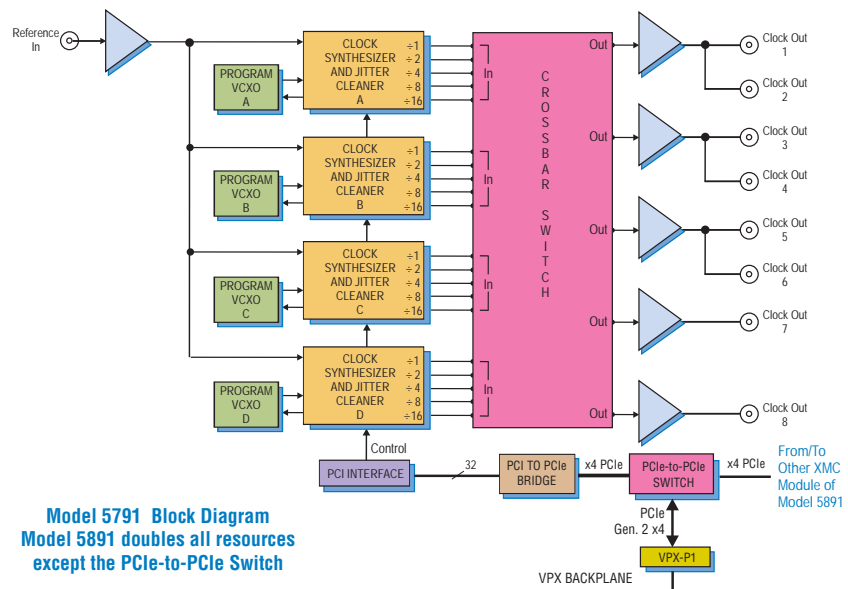

#### PCI-Express Interface

- PCI Express Bus: Gen. 1, 2: x4, control and status

#### Environmental

- Operating Temp: 0° to 50° C
- Storage Temp: -20° to 90° C
- Relative Humidity: 0 to 95%, non-cond.

Size: 6U Board 9.187 in x 6.717 in (233.35 mm x 170.61 mm)

**Features**

- Synchronizes up to four separate high-speed Cobalt, Onyx, or Jade I/O modules
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt, Onyx, or Jade modules

**General Information**

The Model 7192 High-Speed Synchronizer and Distribution Board synchronizes multiple Pentek Cobalt, Onyx, and Jade modules within a system. It enables synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to four modules can be synchronized using the 7192, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

**Input Signals**

Model 7192 provides three front panel MMCX connectors to accept input signals from external sources: one for clock, one for gate or trigger and one for a synchronization signal. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the first front panel  $\mu$ Sync output connector, allowing a single Cobalt, Onyx, and Jade board to generate the clock for all subsequent boards in the system.

**Output Signals**

The 7192 provides four front panel  $\mu$ Sync output connectors, compatible with a range of high-speed Pentek Cobalt, Onyx, and Jade modules. The  $\mu$ Sync signals include a reference clock, gate/trigger and sync signals and are distributed through matched cables, simplifying system design.

**Clock Signals**

The 7192 can accept a user supplied external clock on its front panel MMCX connector. As an alternative to the external clock, the 7192 can use its on-board programmable voltage controlled crystal oscillator (VCXO) as the clock source. The VCXO can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock input.

The external or on-board clock can operate at full rate or be divided and used to register all sync and gate/trigger signals as well as providing a reference clock to all connected modules. In addition, the clock is available at the Clock Out MMCX as a sample or reference clock for other boards in the system.

**Gate and Synchronization Signals**

The 7192 features separate inputs for gate/trigger and sync signals. A programmable delay allows the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

### Calibration

The 7192 features a calibration output specifically designed to work with the 71640/41, 71741 and 71841 3.6 GHz A/D XMC modules to provide a signal reference for phase adjustment across multiple A/Ds.

### Programming

The 7192 allows programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

The 7192 is programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt, Onyx, and Jade modules, thereby providing a single cable connection that carries both control and timing signals.

### Supported Products

The 7192 supports all high-speed models in the Cobalt, Onyx and Jade families including the 71x30 1 GHz A/D and D/A XMC modules; the 71x40/41 3.6 GHz A/D XMC modules; and the 71x70/71 Four-channel 1.25 GHz, 16-bit D/A XMC modules.

### Specifications

**Front Panel Sample Clock/Reference Input Connector Type:** MMCX  
**Input Impedance:** 50 ohms  
**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

**Front Panel Gate/Trigger & Sync Inputs Connector Type:** MMCX

**Input Level:** LVTTTL

**Front Panel  $\mu$ Sync Inputs/Outputs Quantity:** 4

**Connector Type:** 19-pin  $\mu$ HDMI  
**Signal Level:** CML

**Signals ( $\mu$ Sync connector 1):** Reference Clock In, TWSI control In, Reference Clock Out, Gate/Trigger Out, Sync Out

**Signals ( $\mu$ Sync connectors 2-4):** Reference Clock Out, Gate/Trigger Out, Sync Out

**Front Panel Clock / Calibration Output Connector Type:** MMCX

**Output Impedance:** 50 ohms

**Output Level:** +6 dBm nominal, sine wave

**Sample Clock Frequency:** 100 MHz to 1.8 GHz

**Programmable VCXO:**

**Frequency Ranges:** 10-945 MHz, 970-1134 MHz, and 1213-1417.5 MHz

**Tuning Resolution:** 32 bits

**Unlocked Accuracy:**  $\pm 20$  ppm

**PLL, Divider & Jitter Cleaner**

**Type:** Texas Instruments CDCM7005

**Frequency Dividers:** 1, 2, 3, 4, 6, 8 and 16

**PMC/XMC Interface:** Power only on PMC P1 or XMC P15

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard PMC module, 2.91 in. x 5.87 in.

### Ordering Information

Model	Description
7192	High-Speed Synchronizer and Distribution Board - PMC/XMC

### Accessories

4 ea. 18"  $\mu$ Sync cables are supplied; additional cables may be ordered:

2192-018  $\mu$ Sync cable - 18"

2192-036  $\mu$ Sync cable - 36"

Model 7392 Model 7492

**Features**

- Synchronizes four or eight separate Cobalt, Onyx, Jade or Flexor I/O boards
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt, Onyx, Jade or Flexor boards

**General Information**

These High-Speed Synchronizer and Distribution cPCI Boards synchronize multiple Pentek Cobalt, Onyx, Jade or Flexor boards within a system. They enable synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to eight boards can be synchronized using the 7492, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

**Input Signals**

These models provide three or six front panel MMCX connectors to accept input signals from external sources: one or two for clock, one or two for gate or trigger and one or two for synchronization signals. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the front panel  $\mu$ Sync output connectors, allowing a single Cobalt, Onyx, and Jade board to generate the clock for all subsequent boards in the system.

**Output Signals**

These models provide up to eight front panel  $\mu$ Sync output connectors, compatible

with Pentek's high-speed Cobalt, Onyx and Jade boards in addition to most of the Flexor products. The  $\mu$ Sync signals include reference clocks, gate/triggers and sync signals and are distributed through matched cables, simplifying system design.

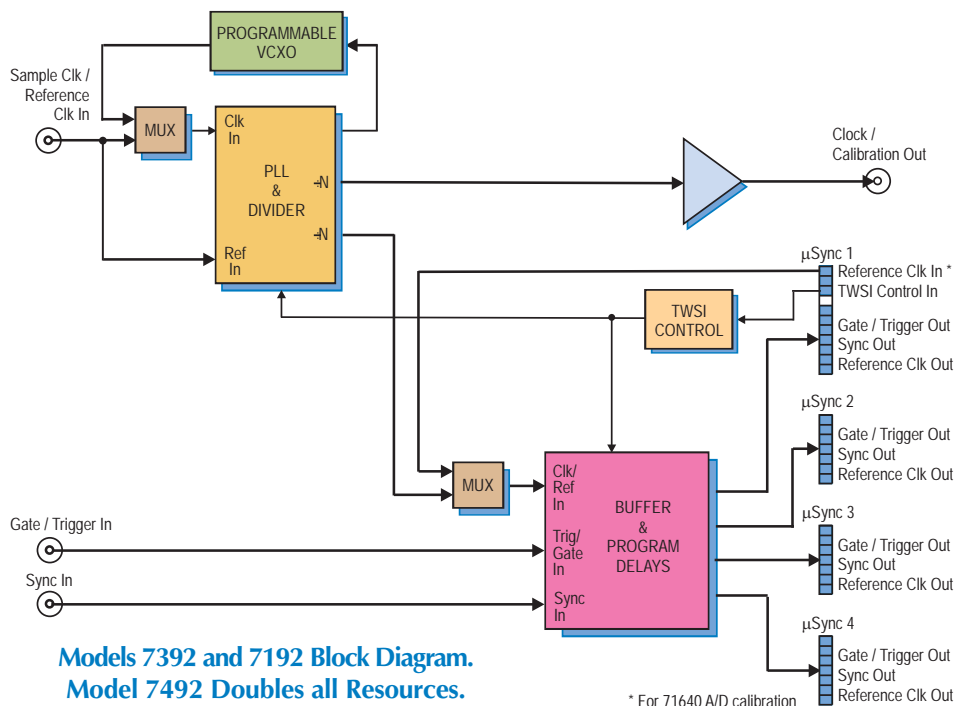

**Clock Signals**

These models can accept one or two user supplied external clocks on front panel MMCX connectors. As an alternative to the external clock, they can use on-board programmable voltage controlled crystal oscillators (VCXOs) as the clock sources. The VCXOs can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock inputs.

The external or on-board clocks can operate at full rate or be divided and used to register all sync and gate/trigger signals as well as providing reference clocks to all connected boards. In addition, the clocks are available at the Clock Out MMCX as sample or reference clocks for other boards in the system.

**Gate and Synchronization Signals**

These models feature separate inputs for gate/trigger and sync signals. Programmable delays allow the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

**Models 7392 and 7192 Block Diagram.  
Model 7492 Doubles all Resources.**

\* For 71640 A/D calibration

**Calibration**

These models feature a calibration output specifically designed to work with the 72x40/41, 73x40/41 and 74x40/41 3.6 GHz A/D cPCI boards to provide a signal reference for phase adjustment across multiple A/Ds.

**Programming**

These models allow programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

These models are programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all Cobalt, Onyx, Jade or Flexor boards, thereby providing a single cable connection that carries both control and timing signals.

**Supported Products**

These sync products are compatible with the high-speed Cobalt, Onyx and Jade boards and all Flexor products. See the complete list of supported products on the [Model 7292](#), [Model 7392](#) and [Model 7492](#) web pages.

**Specifications**

**Front Panel Sample Clock/Reference Input**  
**Connector Type:** MMCX  
**Input Impedance:** 50 ohms  
**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

**Front Panel Gate/Trigger & Sync Inputs**

**Connector Type:** MMCX

**Input Level:** LVTTTL

**Front Panel  $\mu$ Sync Inputs/Outputs**

**Quantity:** 4 or 8

**Connector Type:** 19-pin  $\mu$ HDMI

**Signal Level:** CML

**Signals ( $\mu$ Sync connector 1):** Reference Clock In, TWSI control In, Reference Clock Out, Gate/Trigger Out, Sync Out

**Signals ( $\mu$ Sync connectors 2-4):** Reference Clock Out, Gate/Trigger Out, Sync Out

**Front Panel Clock / Calibration Output**

**Connector Type:** MMCX

**Output Impedance:** 50 ohms

7292	Four $\mu$ Sync High-Speed Synchronizer and Distribution Board - 6U cPCI
7492	Eight $\mu$ Sync High-Speed Synchronizer and Distribution Board - 6U cPCI
7392	Four $\mu$ Sync High-Speed Synchronizer and Distribution Board - 3U cPCI

**Accessories**

4 ea. 18"  $\mu$ Sync cables are supplied with Models 7292 and 7392;

8 ea. 18"  $\mu$ Sync cables are supplied with Model 7492;

additional cables may be ordered:

2192-018  $\mu$ Sync cable - 18"

2192-036  $\mu$ Sync cable - 36"

**Features**

- Synchronizes up to four separate Cobalt, Onyx, Flexor or Jade I/O boards
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt, Onyx, Flexor or Jade boards

**General Information**

The Model 7892 High-Speed Synchronizer and Distribution PCIe Board synchronizes multiple Pentek Cobalt, Onyx, Flexor or Jade boards within a system. It enables synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to four boards can be synchronized using the 7892, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

**Input Signals**

Model 7892 provides three front panel MMCX connectors to accept input signals from external sources: one for clock, one for gate or trigger and one for a synchronization signal. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the first front panel  $\mu$ Sync output connector, allowing a single Cobalt, Onyx, Flexor or Jade board to generate the clock for all subsequent boards in the system.

**Output Signals**

The 7892 provides four front panel  $\mu$ Sync output connectors, compatible with

a range of high-speed Pentek Cobalt, Onyx Flexor and Jade boards. The  $\mu$ Sync signals include a reference clock, gate/trigger and sync signals and are distributed through matched cables, simplifying system design.

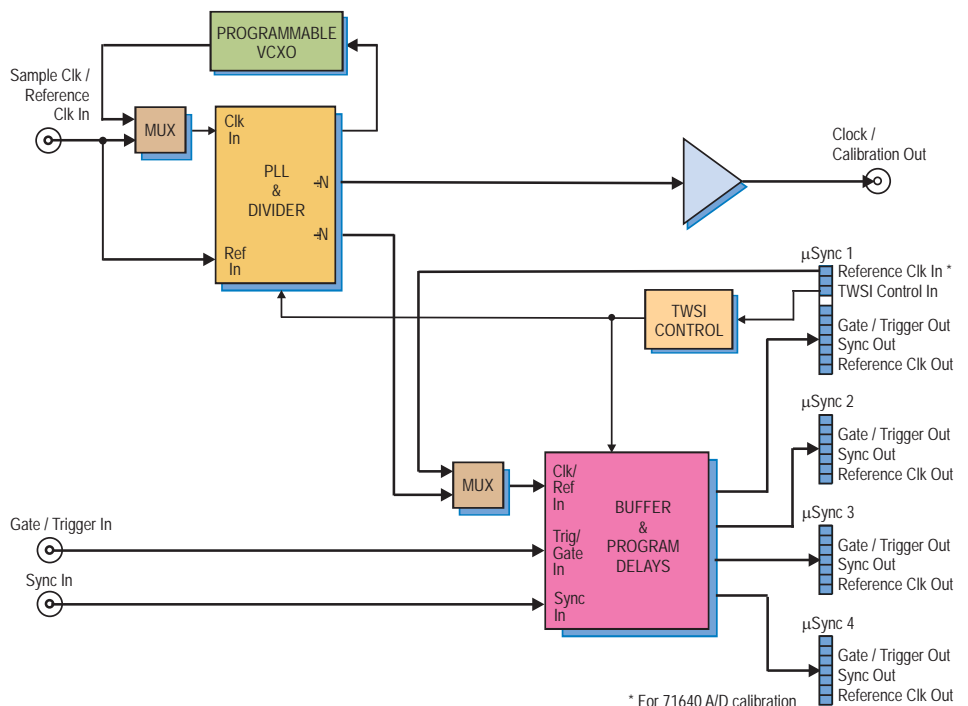

**Clock Signals**

The 7892 can accept a user supplied external clock on its front panel MMCX connector. As an alternative to the external clock, the 7892 can use its on-board programmable voltage controlled crystal oscillator (VCXO) as the clock source. The VCXO can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock input.

The external or on-board clock can operate at full rate or be divided and is used to register all sync and gate/trigger signals as well as providing a reference clock to all connected boards. In addition, the clock is available at the Clock Out MMCX as a sample or reference clock for other boards in the system.

**Gate and Synchronization Signals**

The 7892 features separate inputs for gate/trigger and sync signals. A programmable delay allows the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

### Calibration

The 7892 features a calibration output specifically designed to work with the 78640 or 78740 3.6 GHz A/D board and provide a signal reference for phase adjustment across multiple D/As.

### Programming

The 7892 allows programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

The 7892 is programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt, Onyx, Flexor and Jade boards, thereby providing a single cable connection that carries both control and timing signals.

### Supported Products

The 7892 is compatible with the high-speed Cobalt, Onyx and Jade boards, and all Flexor products.

See the complete list of supported products on the [Model 7892](#) web pages.

### Specifications

#### Front Panel Sample Clock/Reference Input

**Connector Type:** MMCX

**Input Impedance:** 50 ohms

**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

#### Front Panel Gate/Trigger & Sync Inputs

**Connector Type:** MMCX

**Input Level:** LVTTTL

#### Front Panel $\mu$ Sync Inputs/Outputs

# Model 5392

# High-Speed Synchronizer and Distribution Board - 3U VPX

Model 5392 COTS (left) and rugged version

## General Information

The Model 5392 High-Speed Synchronizer and Distribution 3U VPX Board synchronizes multiple Pentek Cobalt, Onyx, and Jade boards within a system. It enables synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to four boards can be synchronized using the 5392, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

## Input Signals

Model 5392 provides three front panel MMCX connectors to accept input signals from external sources: one for clock, one for gate or trigger and one for a synchronization signal. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the first front panel μSync output connector, allowing a single Cobalt, Onyx, or Jade board to generate the clock for all subsequent boards in the system.

## Output Signals

The 5392 provides four front panel μSync output connectors, compatible with a range of high-speed Pentek Cobalt, Onyx, and Jade boards. The μSync signals include a reference clock, gate/trigger and sync signals and are distributed through matched cables, simplifying system design.

## Clock Signals

The 5392 can accept a user supplied external clock on its front panel MMCX connector. As an alternative to the external clock, the 5392 can use its on-board programmable voltage controlled crystal oscillator (VCXO) as the clock source. The VCXO can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock input.

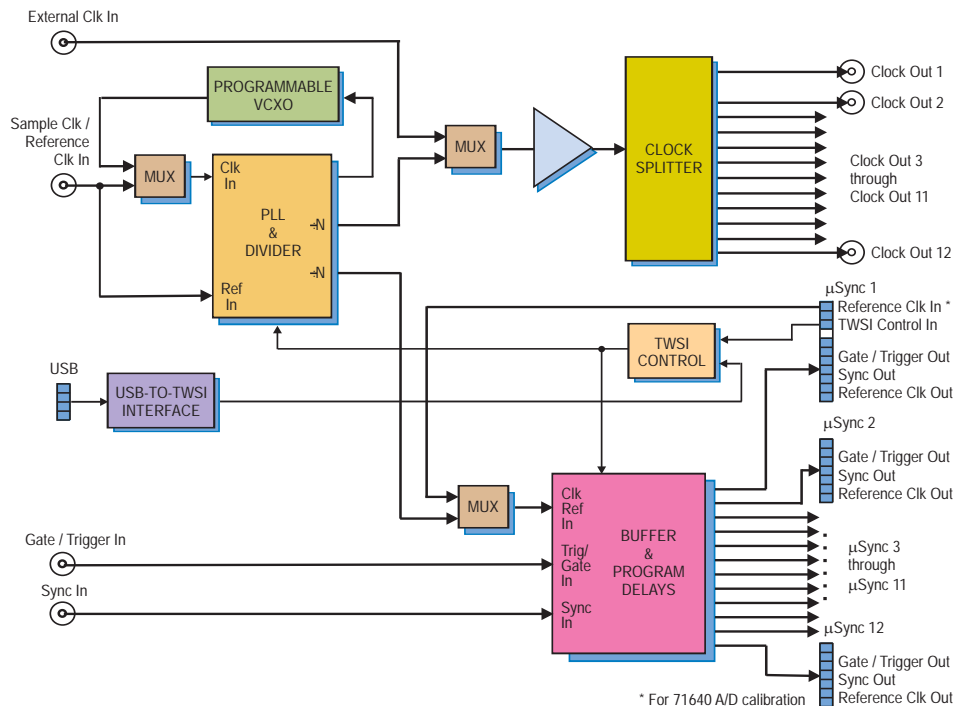

The external or on-board clock can operate at full rate or be divided and used to register all sync and gate/trigger signals as well as providing a reference clock to all connected boards. In addition, the clock is available at the Clock Out MMCX as a sample or reference clock for other boards in the system.

## Gate and Synchronization Signals

The 5392 features separate inputs for gate/trigger and sync signals. A programmable delay allows the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the μSync output connectors. ▶

## Features

- Synchronizes up to four separate high-speed Cobalt, Onyx, and Jade I/O boards
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel μSync connectors compatible with a range of Pentek Cobalt, Onyx, and Jade boards

### Calibration

The 5392 features a calibration output specifically designed to work with the 52x40/41 and 53x40/41 3.6 GHz A/D 3U VPX boards to provide a signal reference for phase adjustment across multiple A/Ds.

### Programming

The 5392 allows programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

The 5392 is programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt, Onyx and Jade boards, thereby providing a single cable connection that carries both control and timing signals.

### Supported Products

The 5392 supports all high-speed models in the Cobalt, Onyx and Jade families including the 52x30 and 53x30 1 GHz A/D and D/A 3U VPX boards; the 52x40/41 and 53x40/41 3.6 GHz A/D 3U VPX boards; and the 52x70/71 and 53x70/71 Four-channel 1.25 GHz, 16-bit D/A 3U VPX boards.

### Specifications

#### Front Panel Sample Clock/Reference Input

**Connector Type:** MMCX

**Input Impedance:** 50 ohms

**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

#### Front Panel Gate/Trigger & Sync Inputs

**Connector Type:** MMCX

**Input Level:** LVTTTL

#### Front Panel $\mu$ Sync Inputs/Outputs

**Quantity:** 4

**Connector Type:** 19-pin  $\mu$ HDMI

**Signal Level:** CML

**Signals ( $\mu$ Sync connector 1):** Reference Clock In, TWSI control In, Reference Clock Out, Gate/Trigger Out, Sync Out

**Signals ( $\mu$ Sync connectors 2-4):** Reference Clock Out, Gate/Trigger Out, Sync Out

**Signals ( $\mu$ Sync connectors 2-4):** Reference Clock Out, Gate/Trigger Out, Sync Out

#### Front Panel Clock / Calibration Output

**Connector Type:** MMCX

**Output Impedance:** 50 ohms

**Output Level:** +6 dBm nominal, sine wave

**Sample Clock Frequency:** 100 MHz to 1.8 GHz

#### Programmable VCXO:

**Frequency Ranges:** 10-945 MHz,

970-1134 MHz, and 1213-1417.5 MHz

**Tuning Resolution:** 32 bits

**Unlocked Accuracy:**  $\pm 20$  ppm

#### PLL, Divider & Jitter Cleaner

**Type:** Texas Instruments CDCM7005

**Frequency Dividers:** 1, 2, 3, 4, 6, 8 and 16

#### VPX Interface

Power only

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3U VPX board 3.937 in x 6.717 in (100.00 mm x 170.61 mm)

### Ordering Information

# Models 5792 & 5892

## High-Speed Synchronizer and Distribution Board - 6U VPX

Model 5892

### General Information

The Models 5792 and 5892 High-Speed Synchronizer and Distribution 6U VPX boards synchronize multiple Pentek Cobalt or Onyx boards within a system. They enable synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to four or eight boards can be synchronized using these models, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

### Input Signals

These models provide three or six front panel MMCX connectors to accept input signals from external sources: one or two for clock, one or two for gate or trigger and one or two for synchronization signals. Clock signals can be applied from an external source such as a high-performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the front panel  $\mu$ Sync output connectors, allowing a single Cobalt or Onyx board to generate the clock for all subsequent boards in the system.

### Output Signals

These models provide up to eight front panel  $\mu$ Sync output connectors, compatible with a range of high-speed Pentek Cobalt

and Onyx boards. The  $\mu$ Sync signals include reference clocks, gate/triggers and sync signals and are distributed through matched cables, simplifying system design.

### Clock Signals

These models can accept one or two user-supplied external clocks on front panel MMCX connectors. As an alternative to the external clock, they can use on-board programmable voltage controlled crystal oscillators (VCXOs) as the clock sources. The VCXOs can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock inputs.

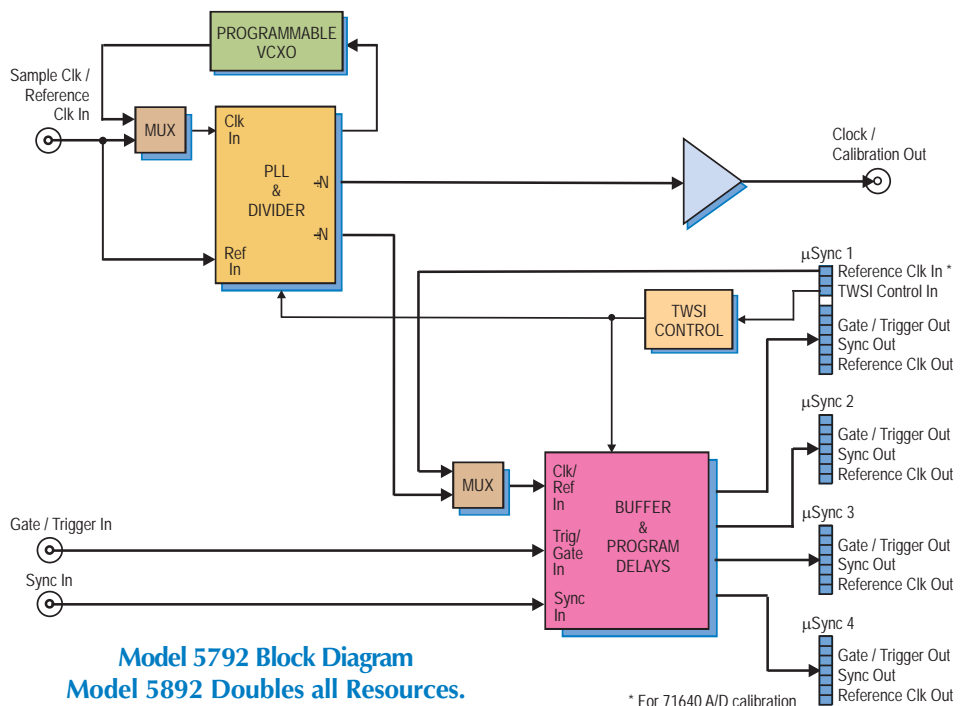

The external or on-board clocks can operate at full rate or be divided and is used to register all sync and gate/trigger signals as well as providing reference clocks to all connected boards. In addition, the clocks are available at the Clock Out MMCX as sample or reference clocks for other boards in the system.

### Gate and Synchronization Signals

These models feature separate inputs for gate/trigger and sync signals. Programmable delays allow the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

### Features

- Synchronizes four or eight separate high-speed Cobalt or Onyx I/O boards
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt and Onyx boards

Model 5792 Block Diagram  
Model 5892 Doubles all Resources.

► **Calibration**

These models feature a calibration output specifically designed to work with the 57640, 58640 or 57740, 58740 3.6 GHz A/D boards and provide a signal reference for phase adjustment across multiple D/As.

**Programming**

These models allow programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

Both models are programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt and Onyx boards, thereby providing a single cable connection that carries both control and timing signals.

**Supported Products**

These models support all high-speed models in the Cobalt and Onyx families including the 57630 and 58630 1 GHz A/D and D/A 6U VPX boards; the 57730 and 58730 1 GHz A/D and D/A 6U VPX boards; the 57640 and 58640 3.6 GHz A/D 6U VPX boards; the 57740 and 58740 3.6 GHz A/D 6U VPX boards; the 57670 and 58670 Four-channel 1.25 GHz, 16-bit D/A 6U VPX boards; the 57670 and 58670 Four-channel 1.25 GHz, 16-bit D/A 6U VPX boards; and the 57770 and 58770 Four-channel 1.25 GHz, 16-bit D/A 6U VPX boards.

**Specifications**

**Front Panel Sample Clock/Reference Input**

**Connector Type:** MMCX  
**Input Impedance:** 50 ohms  
**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

**Front Panel Gate/Trigger & Sync Inputs**

**Connector Type:** MMCX  
**Input Level:** LVTTTL

**Front Panel  $\mu$ Sync Inputs/Outputs**

**Quantity:** Model 5792: Four;  
Model 5892: Eight

**Connector Type:** 19-pin  $\mu$ HDMI  
**Signal Level:** CML

**Signals ( $\mu$ Sync connector 1):** Reference Clock In, TWSI control In, Reference Clock Out, Gate/Trigger Out, Sync Out

**Signals ( $\mu$ Sync connectors 2-4):** Reference Clock Out, Gate/Trigger Out, Sync Out

**Front Panel Clock / Calibration Output**

**Connector Type:** MMCX  
**Output Impedance:** 50 ohms  
**Output Level:** +6 dBm nominal, sine wave

**Sample Clock Frequency:** 100 MHz to 1.8 GHz

**Programmable VCXOs:**

**Frequency Ranges:** 10-945 MHz, 970-1134 MHz, and 1213-1417.5 MHz

**Tuning Resolution:** 32 bits

**Unlocked Accuracy:**  $\pm 20$  ppm

**PLL, Divider & Jitter Cleaner**

**Type:** Texas Instruments CDCM7005  
**Frequency Dividers:** 1, 2, 3, 4, 6, 8 and 16

**PCI Express Interface**

**PCI Bus:** x4 or x8, power only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 233 mm x 160 mm (9.173 in. x 6.299 in.)

# Model 5692

# High-Speed Synchronizer and Distribution Board - AMC

### General Information

The Model 5692 High-Speed Synchronizer and Distribution board synchronizes multiple Pentek Cobalt, Onyx, and Jade modules within a system. It enables synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to four modules can be synchronized using the 5692, with each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

### Input Signals

Model 5692 provides three front panel MMCX connectors to accept input signals from external sources: one for clock, one for gate or trigger and one for a synchronization signal. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the MMCX connector, a reference clock can be accepted through the first front panel  $\mu$ Sync output connector, allowing a single Cobalt, Onyx, and Jade board to generate the clock for all subsequent boards in the system.

### Features

- Synchronizes up to four separate high-speed Cobalt, Onyx or Jade I/O modules
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Front panel MMCX connectors for input signals
- Front panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt, Onyx or Jade modules

and Jade modules. The  $\mu$ Sync signals include a reference clock, gate/trigger and sync signals and are distributed through matched cables, simplifying system design.

### Clock Signals

The 5692 can accept a user supplied external clock on its front panel MMCX connector. As an alternative to the external clock, the 5692 can use its on-board programmable voltage controlled crystal oscillator (VCXO) as the clock source. The VCXO can operate alone or be locked to a system reference clock signal delivered to the front panel reference clock input.

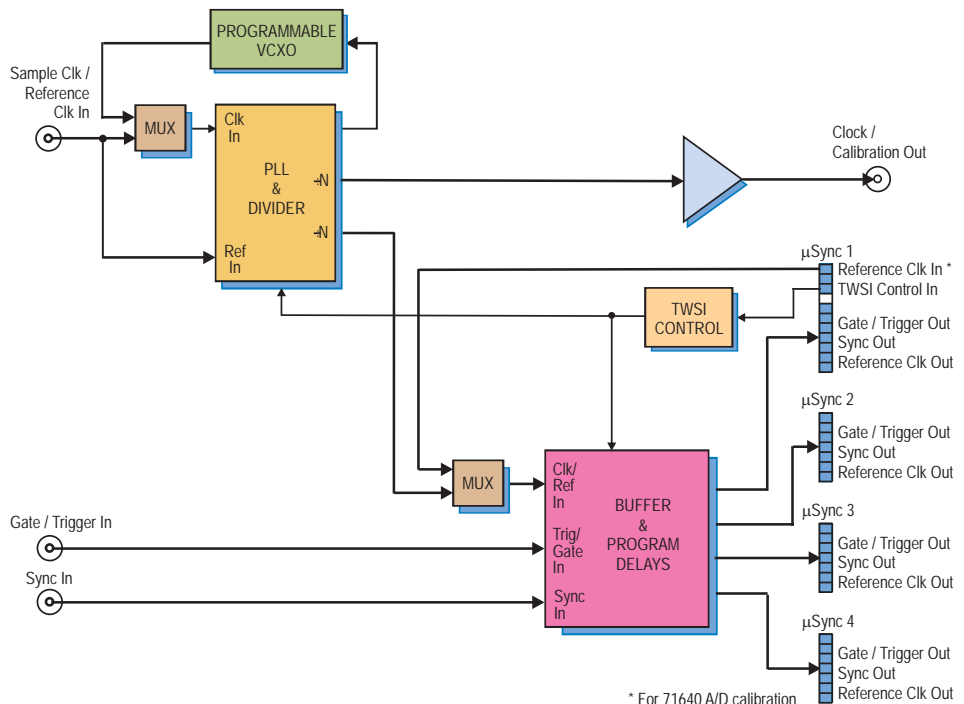

The external or on-board clock can operate at full rate or be divided and used to register all sync and gate/trigger signals as well as providing a reference clock to all connected modules. In addition, the clock is available at the Clock Out MMCX as a sample or reference clock for other boards in the system.

### Gate and Synchronization Signals

The 5692 features separate inputs for gate/trigger and sync signals. A programmable delay allows the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

### Output Signals

The 5692 provides four front panel  $\mu$ Sync output connectors, compatible with a range of high-speed Pentek Cobalt, Onyx,

### Calibration

The 5692 features a calibration output specifically designed to work with the 56640/41, 56741 and 56841 3.6 GHz A/D AMC boards to provide a signal reference for phase adjustment across multiple A/Ds.

### Programming

The 5692 allows programming of operating parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

The 5692 is programmed via a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt, Onyx, and Jade modules, thereby providing a single cable connection that carries both control and timing signals.

### Supported Products

The 5692 supports all high-speed models in the Cobalt, Onyx and Jade families including the 56x30 1 GHz A/D and D/A AMC modules; the 56x40/41 3.6 GHz A/D AMC modules; and the 56x70/71 Four-channel 1.25 GHz, 16-bit D/A AMC modules.

### Specifications

**Front Panel Sample Clock/Reference Input**  
Connector Type: MMCX

Input Impedance: 50 ohms

Input Level: 0 dBm to +10 dBm, sine wave

Sample Clock Frequency: 100 MHz to 2 GHz

Reference Frequency: 5 to 100 MHz

**Front Panel Gate/Trigger & Sync Inputs**

Connector Type: MMCX

Input Level: LVTTTL

**Front Panel  $\mu$ Sync Inputs/Outputs**

Quantity: 4

Connector Type: 19-pin  $\mu$ HDMI

Signal Level: CML

Signals ( $\mu$ Sync connector 1): Reference Clock In, TWSI control In, Reference Clock Out, Gate/Trigger Out, Sync Out

Signals ( $\mu$ Sync connectors 2-4): Reference Clock Out, Gate/Trigger Out, Sync Out

Reference Clock Out, Gate/Trigger Out, Sync Out

**Front Panel Clock / Calibration Output**

Connector Type: MMCX

Output Impedance: 50 ohms

Output Level: +6 dBm nominal, sine wave

Sample Clock Frequency: 100 MHz to 1.8 GHz

**Programmable VCXO:**

Frequency Ranges: 10-945 MHz, 970-1134 MHz, and 1213-1417.5 MHz

Tuning Resolution: 32 bits

Unlocked Accuracy:  $\pm 20$  ppm

**PLL, Divider & Jitter Cleaner**

Type: Texas Instruments CDCM7005

Frequency Dividers: 1, 2, 3, 4, 6, 8 and 16

**AMC Interface**

Power only

**Environmental**

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
5692	High-Speed Synchronizer and Distribution Board - AMC

### Accessories

4 ea. 18"  $\mu$ Sync cables are supplied; additional cables may be ordered:

2192-018  $\mu$ Sync cable - 18"

2192-036  $\mu$ Sync cable - 36"

**Features**

- Synchronizes up to eight separate Cobalt or Onyx boards
- Up to eight 7893s can be linked together to synchronize up to 64 boards
- Synchronizes sampling, data acquisition and playback for multichannel systems
- Synchronizes gating and triggering functions
- On-board programmable sample clock generator
- Output clock rates up to 800 MHz
- Front panel SMA connectors for TTL input signals and clock outputs
- Single-slot PCIe format

**General Information**

Model 7893 System Synchronizer and Distribution Board synchronizes multiple Pentek Cobalt and Onyx boards within a system. It enables synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition, DSP and software radio applications.

Up to eight boards can be synchronized using the 7893, each receiving a common clock up to 800 MHz along with timing signals that can be used for synchronizing, triggering and gating functions.

For larger systems, up to eight 7893s can be linked together to provide synchronization for up to 64 Cobalt or Onyx boards.

**Input Signals**

The Model 7893 provides four front panel SMA connectors to accept LVTTTL input signals from external sources: two for Sync/PPS and one for Gate/Trigger. In addition to the synchronization signals, a front panel SMA connector accepts sample clocks up to 800 MHz or, in an alternate mode, accepts a 10 MHz reference clock to lock an on-board VCXO sample clock source.

The 7893 also accepts the 26-pin Timing Bus connector used on Cobalt and Onyx boards. This input allows a single Cobalt or Onyx board to generate the timing and clock signals for the 7893 for distribution of up to eight additional boards. This input can also be used to link multiple 7893's for larger systems.

**Output Signals**

The 7893 provides eight timing bus output connectors for distributing all needed timing and clock signals to the front panels of Cobalt and Onyx boards via ribbon cables. The 7893 locks the Gate/Trigger and Sync/PPS signals to the system's sample clock. The 7893 also provides four front panel SMA connectors for distributing sample clocks to other boards in the system.

**Clock Signals**

The 7893 can accept a clock from either the front panel SMA connector or from the timing bus input connector. In addition, the board is equipped with a programmable on-board VCXO clock generator which can free run or be locked to a user supplied, 10 MHz typical, system reference. In all cases, the sample clock can be divided by 1, 2, 4, 8 or 16 prior to distribution to the Clock Out SMAs or the timing bus output connectors.

**USB Interface**

The 7893 is programmed via a USB interface. In addition to status and control, the USB interface can be used to generate Gate/Trigger and Sync/PPS signals for distribution to all connected boards.

**Physical Characteristics**

The 7893 is a single-slot PCIe size board which can be mounted in any PCI or PCIe slot. The board receives power from a standard six-pin PCIe power connector and uses the PCI or PCIe slot solely for physical mounting, with no electrical connections. ➤

### ► Supported Products

The 7893 supports a wide range of products in the Cobalt family including the 78620 and 78621 three-channel A/D, 200 MHz transceivers, the 78650 and 78651 two-channel A/D, 500 MHz transceivers, the 78660, 78661 and 78662 four-channel 200 MHz A/Ds, and the 78690 L-Band RF Tuner. The 7893 also supports the Onyx 78760 four-channel 200 MHz A/D and will support all complementary models in the Onyx family as they become available.

### Specifications

#### Sample Clock/Reference Clock Input

**Type:** Front panel female SMC connector  
**Signal:** Sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or 4 to 180 MHz PLL system reference, typically 10 MHz

#### TTL Gate/Trigger Input

**Type:** Front panel female SMC connector  
**Signal:** LVTTTL  
**Function:** Programmable functions include gate and trigger

#### TTL Sync/PPS Input A

**Type:** Front panel female SMC connector  
**Signal:** LVTTTL  
**Function:** Programmable functions include sync and PPS

#### TTL Sync/PPS Input B

**Type:** Front panel female SMC connector  
**Signal:** LVTTTL  
**Function:** Programmable functions include sync and PPS

#### Timing Bus In

**Type:** One rear 26-pin connector  
**Signals:** LVPECL bus includes: Sample Clock A & B In, Gate/Trigger A & B In, and Sync/PPS A & B In

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 800 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference (front panel Reference Clock Input), typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for each of five on-board clock buses.

#### Sample Clock Output

**Type:** Four front panel female SMC connectors, each can be independently divided

**Output Level:** +9 dBm, nominal, sine wave

#### Timing Bus Out

**Type:** Eight rear 26-pin connectors

**Signals:** LVPECL bus includes: Sample Clock A & B Out, Gate/Trigger A & B Out, and Sync/PPS A & B Out

**Control:** Rear USB input for connecting to motherboard on-board USB 8-pin header

**Power:** Rear 8-pin connector compatible with PCIe power connectors

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

2891	Timing Bus Cables
------	-------------------

New!

Features

- Provides sample clock for up to four separate XMC Cobalt or Onyx boards
- Locks to user-supplied 10 MHz reference clock or on-board reference.
- OCXO provides an exceptionally precise clock

General Information

Model 7194 High-Speed Clock Generator provides fixed-frequency sample clocks to Cobalt and Onyx modules in multiboard systems. It enables synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

Sample Clock Synthesizer

The Model 7194 uses a high-precision, fixed-frequency, PLO (Phase-Locked Oscillator) to generate an output sample clock. The PLO accepts a 10 MHz reference clock through a front panel SMA connector. The PLO locks the output sample clock to the incoming reference. A power splitter then receives the sample clock and distributes it to four front panel SMA connectors.

The 7194 is available with sample clock frequencies from 1.4 to 2.0 GHz.

On-board Reference Clock

In addition to accepting a reference clock on the front panel, the 7194 includes an on-board 10 MHz reference clock. The reference is an OCXO (Oven-Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

Physical Characteristics

The 7194 is a standard PMC/XMC module. The module does not require programming and the PMC P14 or XMC P15 connector is used solely for power. The module can be optionally configured with a PCIe-style 6-pin power connector allowing it to be used in virtually any chassis or enclosure.

Specifications

**Sample Clock Frequency:** Fixed, 1.4 to 2.0 GHz by ordering option

**Sample Clock Outputs**

**Type:** Four front panel female SMA connectors

**Output Level:** +10 dBm, nominal, sine wave

**Reference Clock In**

**Type:** Front panel female SMA connector

**Frequency:** 10 MHz

**Input Impedance:** 50 ohms

**Input Level:** 0 dBm to +10 dBm, sine wave

**Reference Clock Out**

**Type:** Front panel female SMA connector

**Center Frequency:** 10 MHz

**Output Impedance:** 50 ohms

**Output Level:** +10 dBm, nominal, sine wave

**Frequency Stability vs. Change in Temperature:** 50.0 ppb

**Frequency Calibration:** ±1.0 ppm

**Aging**

**Daily:** ±10 ppb/day

**First Year:** ±300 ppb

**Total Frequency Tolerance (20 years):** ±4.60 ppm

**Phase Noise**

**1 Hz Offset:** -67 dBc/Hz

**10 Hz Offset:** -100 dBc/Hz

**100 Hz Offset:** -130 dBc/Hz

**1 KHz Offset:** -148 dBc/Hz

**10 KHz Offset:** -154 dBc/Hz

**100 KHz Offset:** -155 dBc/Hz

**PMC/XMC Interface:** Power only on PMC P1 or XMC P15

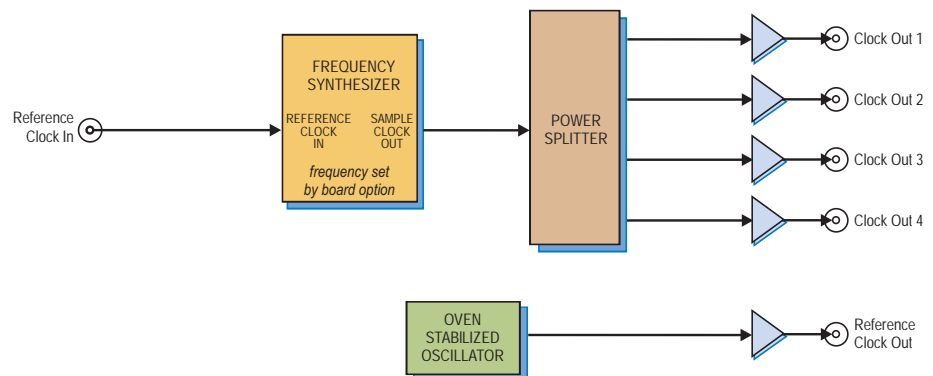

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard PMC module, 2.91 in. x 5.87 in.

Sample Clock Phase Noise

Phase Noise (1 Hz BW, typical)

Phase Noise 10.00 dB/Ref -20.00 dBc/Hz

# Models 7294, 7494 and 7394

## High-Speed Clock Generator - 3U/6U cPCI

Model 7494      Model 7394

### Features

- Provides sample clock for up to four or eight separate cPCI Cobalt or Onyx boards
- Locks to user-supplied 10 MHz reference clock or on-board reference.
- OCXO provides an exceptionally precise clock

### General Information

These High-Speed Clock Generators provide fixed-frequency sample clocks to cPCI Cobalt and Onyx boards in multiboard systems. They enable synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

Model 7394 is a 3U cPCI board that generates four clocks. Model 7294 is a 6U cPCI board that generates four clocks, while Model 7494 is a double-density 6U cPCI board that generates eight clocks.

### Sample Clock Synthesizer

These models use one or two high-precision, fixed-frequency, PLOs (Phase-Locked Oscillators) to generate four or eight output sample clocks. The PLOs accept a 10 MHz reference clock through front panel SMA connectors. The PLOs lock the output sample clocks to the incoming reference. Power splitters then receive the sample clocks and distribute them to four or eight front panel SMA connectors.

These models are available with sample clock frequencies from 1.4 to 2.0 GHz.

### On-board Reference Clock

In addition to accepting a reference clock on the front panel, these models include one or two on-board 10 MHz reference clocks. The reference clocks are OCXOs (Oven-Controlled Crystal Oscillators), which provide an exceptionally precise frequency standard with excellent phase noise characteristics.

### Physical Characteristics

These models are standard CompactPCI boards. They do not require programming and the interface connectors are used solely for power. The boards can be optionally configured with a PCIe-style 6-pin power connector allowing them to be used in virtually any chassis or enclosure.

### Specifications

**Sample Clock Frequency:** Fixed, 1.4 to 2.0 GHz by ordering option

#### Sample Clock Outputs

**Type:** Four or eight front panel female SMA connectors

**Output Level:** +10 dBm, nominal, sine wave

#### Reference Clock In

**Type:** Front panel female SMA connector

**Frequency:** 10 MHz

**Input Impedance:** 50 ohms

**Input Level:** 0 dBm to +10 dBm, sine wave

#### Reference Clock Out

**Type:** Front or eight front panel female SMA connectors

**Center Frequency:** 10 MHz

**Output Impedance:** 50 ohms

**Output Level:** +10 dBm, nominal, sine wave

**Frequency Stability vs. Change in Temperature:** 50.0 ppb

**Frequency Calibration:** ±1.0 ppm

#### Aging

**Daily:** ±10 ppb/day

**First Year:** ±300 ppb

**Total Frequency Tolerance (20 years):** ±4.60 ppm

#### Phase Noise

**1 Hz Offset:** -67 dBc/Hz

**10 Hz Offset:** -100 dBc/Hz

**100 Hz Offset:** -130 dBc/Hz

**1 KHz Offset:** -148 dBc/Hz

**10 KHz Offset:** -154 dBc/Hz

**100 KHz Offset:** -155 dBc/Hz

#### PCI Interface

**PCI Bus:** 32-bit, 66 MHz (supports 33 MHz), power only

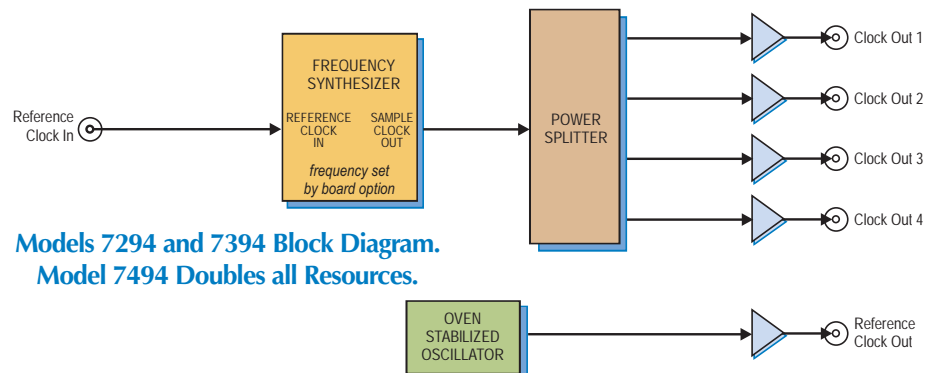

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 3U or 6U cPCI board

# Model 7894

# High-Speed Clock Generator - PCIe

### General Information

Model 7894 High-Speed Clock Generator provides fixed-frequency sample clocks to PCIe Cobalt and Onyx boards in multi-board systems. It enables synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

### Sample Clock Synthesizer

The Model 7894 uses a high-precision, fixed-frequency, PLO (Phase-Locked Oscillator) to generate an output sample clock. The PLO accepts a 10 MHz reference clock through a front panel SMA connector. The PLO locks the output sample clock to the incoming reference. A power splitter then receives the sample clock and distributes it to four front panel SMA connectors.

The 7894 is available with sample clock frequencies from 1.4 to 2.0 GHz.

### On-board Reference Clock

In addition to accepting a reference clock on the front panel, the 7894 includes an on-board 10 MHz reference clock. The reference is an OCXO (Oven-Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Physical Characteristics

The 7894 is a standard PCI Express board. The board does not require programming and the PCIe interface connector is used solely for power.

### Specifications

**Sample Clock Frequency:** Fixed, 1.4 to 2.0 GHz by ordering option

#### Sample Clock Outputs

# Model 5294

# High-Speed Clock Generator - 3U VPX

Model 5294 COTS (left) and rugged version

### Features

- Provides sample clock for up to four separate 3U VPX Cobalt or Onyx boards
- Locks to user-supplied 10 MHz reference clock or on-board reference.
- OCXO provides an exceptionally precise clock

### General Information

Model 5294 High-Speed Clock Generator provides fixed-frequency sample clocks to 3U VPX Cobalt and Onyx boards in multi-board systems. It enables synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

### Sample Clock Synthesizer

The Model 5294 uses a high-precision, fixed-frequency, PLO (Phase-Locked Oscillator) to generate an output sample clock. The PLO accepts a 10 MHz reference clock through a front-panel SMA connector. The PLO locks the output sample clock to the incoming reference. A power splitter then receives the sample clock and distributes it to four front panel SMA connectors.

The 5294 is available with sample clock frequencies from 1.4 to 2.0 GHz.

### On-board Reference Clock

In addition to accepting a reference clock on the front panel, the 5294 includes an on-board 10 MHz reference clock. The reference is an OCXO (Oven-Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Physical Characteristics

The 5294 is a standard 3U VPX board. The board does not require programming and the PCIe interface connector is used solely for power. The board can be optionally configured with a PCIe-style 6-pin power connector allowing it to be used in virtually any chassis or enclosure.

Models  
5794 & 5894

# High-Speed Clock Generator - 6U OpenVPX

Model 5894

## Features

- Provides sample clock for up to four or eight separate 6U VPX Cobalt or Onyx boards
- Locks to user-supplied 10 MHz reference clock or on-board reference.
- OCXO provides an exceptionally precise clock

## General Information

These High-Speed Clock Generators provide fixed-frequency sample clocks to 6U VPX Cobalt and Onyx boards in multi-board systems. They enable synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

Model 5794 is a 6U VPX board that generates four clocks. Model 5894 is a double-density 6U VPX board that generates eight clocks.

## Sample Clock Synthesizer

These models use one or two high-precision, fixed-frequency, PLOs (Phase-Locked Oscillators) to generate four or eight output sample clocks. The PLOs accept a 10 MHz reference clock through front panel SMA connectors. The PLOs lock the output sample clocks to the incoming reference. Power splitters then receive the sample clocks and distribute them to four or eight front panel SMA connectors.

These models are available with sample clock frequencies from 1.4 to 2.0 GHz.

## On-board Reference Clock

In addition to accepting a reference clock on the front panel, these models include one or two on-board 10 MHz reference clocks. The reference clocks are OCXOs (Oven-Controlled Crystal Oscillators), which provide an exceptionally precise frequency standard with excellent phase noise characteristics.

## Physical Characteristics

These models are standard 6U OpenVPX boards. They do not require programming and the interface connectors are used solely for power. The boards can be optionally configured with a PCIe-style 6-pin power connector allowing them to be used in virtually any chassis or enclosure.

## Specifications

### General Information

Model 5694 High-Speed Clock Generator provides fixed-frequency sample clocks to AMC Cobalt and Onyx boards in multiboard systems. It enables synchronous sampling, playback and timing for a wide range of multichannel high-speed data acquisition and software radio applications.

### Sample Clock Synthesizer

The Model 5694 uses a high-precision, fixed-frequency, PLO (Phase-Locked Oscillator) to generate an output sample clock. The PLO accepts a 10 MHz reference clock through a front-panel SMA connector. The PLO locks the output sample clock to the incoming reference. A power splitter then receives the sample clock and distributes it to four front panel SMA connectors.

The 5694 is available with sample clock frequencies from 1.4 to 2.0 GHz.

### On-board Reference Clock

In addition to accepting a reference clock on the front panel, the 5694 includes an on-board 10 MHz reference clock. The reference is an OCXO (Oven-Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Physical Characteristics

The 5694 is a standard AMC board. The board does not require programming and the PCIe interface connector is used solely for power. The board can be optionally configured with a PCIe-style 6-pin power connector allowing it to be used in virtually any chassis or enclosure.

### Specifications

**Sample Clock Frequency:** Fixed, 1.4 to 2.0 GHz by ordering option

180	1.800 GHz sample clock

Contact Pentek for additional sample clock options

**Features**

- Synchronizes up to 80 I/O modules
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Synchronizes local oscillator phase, decimation phase and frequency switching for multichannel digital receivers and upconverters
- Clock rates up to 105 MHz
- Supports most popular I/O modules
- Front panel SMA connectors for external clock and timing signal inputs and outputs
- 19-inch wide, 1.75 in. high rack-mount chassis with integral AC line power supply
- Flexible cable installation supports many different system configurations

**General Information**

Model 9190 Clock and Sync Generator synchronizes multiple Pentek I/O modules within a system to provide synchronous sampling and timing for a wide range of high-speed, multichannel data acquisition, DSP and software radio applications. Up to 80 I/O modules can be driven from the Model 9190, each receiving a common clock and up to five different timing signals which can be used for synchronizing, triggering and gating functions.

**Input Signals**

Clock and timing signals can come from six front panel SMA inputs or from one I/O module set to act as the timing signal master. (In this case, the master I/O module will not be synchronous with the slave modules due to delays through the 9190.) Alternately, the master clock can come from a socketed, user-replaceable crystal oscillator within the 9190.

**Supported Products**

Model 9190 currently supports VIM Models 6210, 6211, 6216, 6228, 6229, 6230, 6231, 6232, 6235, 6236; the PMC Models 7131, 7140, 7141, 7142 and 7150; the PCI Models 7631A, 7640, 7641, 7642 and 7650; and the cPCI Models 7231, 7331, 7240, 7340, 7241, 7341, 7242, 7342 and 7350. Contact us for an up-to-date list of supported modules.

**Output Signals**

The front panel clock and sync connectors in the list of supported modules fall into two classes, thus requiring two types of front panel cable. The first type uses a 26-pin connector (for the 621x series, the 6229, the 7x31, 7x40 and 7x42 series) delivering the clock and four timing signals. The second type uses a 36-pin connector (for the 623x series) delivering the clock and five timing signals.

Either cable type can be installed in any of the 80 positions of the Model 9190, however, systems with mixed types of I/O modules may not have all functions supported. Contact the factory for assistance with your specific configuration.

Buffered versions of the clock and five timing signals are also available as outputs on the 9190's front panel SMA connectors.

**Physical Characteristics**

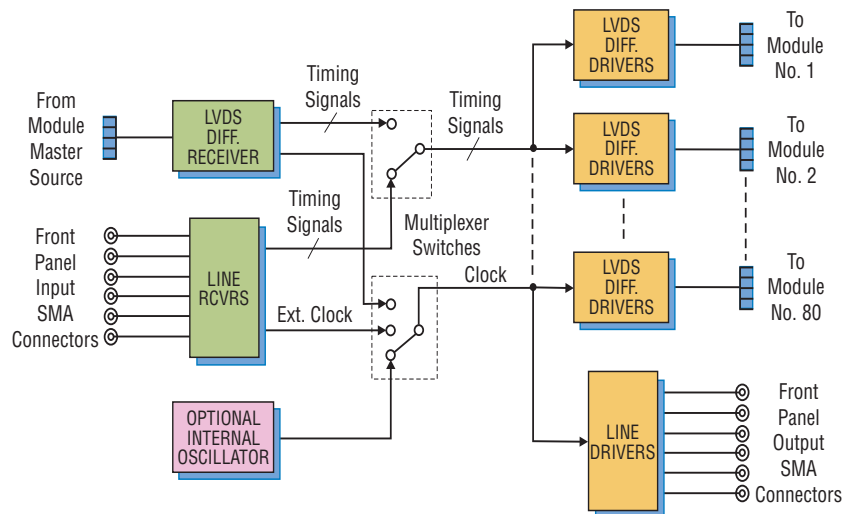

Model 9190 is housed in a line-powered, 1.75 in. high metal chassis suitable for mounting in a standard 19 in. equipment rack, either above or below the cage holding the I/O modules.

Separate cable assemblies extend from openings in the front panel of the 9190 to the front panel clock and sync connectors of each I/O module. Mounted between two standard rack-mount card cages, Model 9190 can drive a maximum of 80 clock and sync cables, 40 to the card cage above and 40 to the card cage below. Fewer cables may be installed for smaller systems.

Due to the numerous configuration possibilities allowed by the 9190, Pentek configuration services are required with its purchase.

**Ordering Information**

Model	Description
9190	Clock and Sync Generator
<b>Options:</b>	
-019	64 MHz internal oscillator
-040	40-Channel version

**General Information**

Model 9192 Rackmount High-Speed System Synchronizer Unit synchronizes multiple Pentek Cobalt, Onyx, Flexor and Jade modules within a system. It enables synchronous sampling and timing for a wide range of multichannel high-speed data acquisition, DSP, and software radio applications.

Up to twelve boards can be synchronized using the 9192, each receiving a common clock along with timing signals that can be used for synchronizing, triggering and gating functions.

**Input Signals**

Model 9192 provides four rear panel SMA connectors to accept input signals from external sources: two for clock, one for gate or trigger and one for a synchronization signal. Clock signals can be applied from an external source such as a high performance sine-wave generator. Gate/trigger and sync signals can come from an external system source. In addition to the SMA connector, a reference clock can be accepted through the first rear panel  $\mu$ Sync output connector, allowing a single Cobalt, Onyx, Flexor or Jade board to generate the clock for all subsequent boards in the system.

**Output Signals**

The 9192 provides four rear panel  $\mu$ Sync output connectors, compatible with a range of high-speed Pentek Cobalt, Onyx, Flexor and Jade boards. The  $\mu$ Sync signals include a reference clock, gate/trigger and sync signals and are distributed through matched cables, simplifying system design.

**Clock Signals**

The 9192 can accept a user supplied external clock on its rear panel SMA connector. As an alternative to the external clock, the 9192 can use its on-board programmable voltage controlled crystal oscillator (VCXO) as the clock source. The VCXO can operate alone or be locked to a system reference clock signal delivered to the rear panel reference clock input.

The on-board or external clock can operate at full rate or can be divided and used to register all sync and gate/trigger signals as well as providing a reference clock to all connected boards. In addition, the clock is available at twelve Clock Out SMAs as a sample or reference clock for other boards in the system.

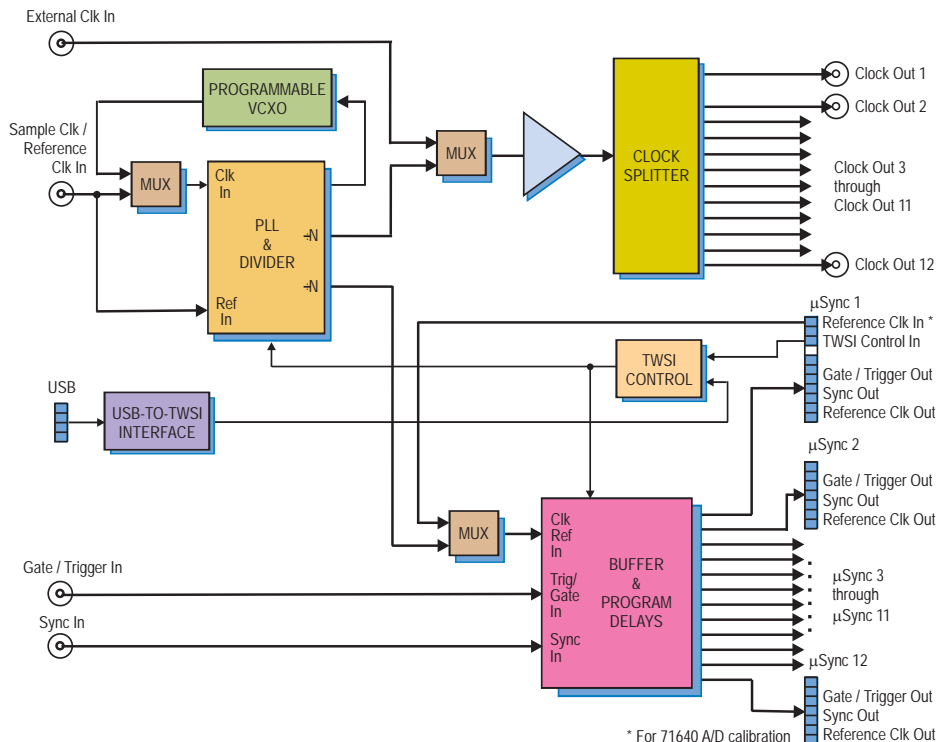

**Gate and Synchronization Signals**

The 9192 features separate inputs for gate/trigger and sync signals. A programmable delay allows the user to make timing adjustments on the gate/trigger and sync signals before they are sent to buffers for output through the  $\mu$ Sync output connectors. ➤

**Features**

- Synchronizes up to twelve separate Cobalt, Onyx, Jade or Flexor I/O modules
- Synchronizes sampling and data acquisition for multichannel systems
- Synchronizes gating and triggering functions
- Clock rates up to 1.8 GHz
- Rear panel SMA connectors for input signals
- Rear panel  $\mu$ Sync connectors compatible with a range of Pentek Cobalt, Onyx, Flexor or Jade modules

### ► Calibration

The 9192 features a calibration output specifically designed to work with the xx640, xx641, xx741 and xx841 3.6 GHz A/D XMC modules to provide a signal reference for phase adjustment across multiple A/Ds.

### Programming

The 9192 allows programming of operation parameters including: VCXO frequency, clock dividers, and delays that allow the user to make timing adjustments on the gate and sync signals. These adjustments are made before they are sent to buffers for output through the  $\mu$ Sync connectors.

The 9192 is programmed via a rear panel USB connector or a TWSI control interface on the first  $\mu$ Sync connector. The control interface is compatible with the front panel  $\mu$ Sync connectors of all high-speed Cobalt, Onyx, Jade and Flexor modules, thereby providing a single cable connection that carries both control and timing signals.

### Supported Products

The 9192 is compatible with the high-speed Cobalt, Onyx and Jade boards, and all Flexor products.

See the complete list of supported products on the [Model 9192](#) web pages.

### Specifications

**Rear Panel Sample Clock / Reference Input**  
**Connector Type:** SMA

**Input Impedance:** 50 ohms

**Input Level:** 0 dBm to +10 dBm, sine wave

**Sample Clock Frequency:** 100 MHz to 2 GHz

**Reference Frequency:** 5 to 100 MHz

**Rear Panel Gate/Trigger & Sync Inputs**

**Connector Type:** SMA

**Input Level:** LVTTTL

**Rear Panel  $\mu$ Sync Inputs/Outputs**

### Accessories

12 ea. 18"  $\mu$ Sync cables are supplied; additional cables may be ordered:

2892-018  $\mu$ Sync cable - 18"

2892-036  $\mu$ Sync cable - 36"

Specifications are subject to change without notice.

# Customer Information

## Placing an Order

When placing a purchase order for Pentek products, please provide the model number and product description. You may place your orders by letter, telephone, email or fax; you should confirm a verbal order by mail, email or fax.

All orders should specify a purchase order number, bill-to and ship-to address, method of shipment, and a contact name and telephone number.

U.S. orders should be made out to Pentek, Inc. and may be placed directly at our office address, or c/o our authorized sales representative in your area.

International orders may be placed with us, or with our authorized distributor in your country. They have pricing and availability information and they will be pleased to assist you.

## Prices and Price Quotations

All prices are F.O.B. factory in U.S. dollars. Shipping charges and applicable import, federal, state or local taxes, are paid by the purchaser.

We're glad to respond to your request for price quotation just contact the corporate office, or your local representative. Price and delivery quotations are valid for 30 days, unless otherwise stated.

Quantity discounts for large orders are available and will be included in our price quotation, if applicable.

## Terms

Terms are Net 30 days for accounts with established credit; until credit is established, we require prepayment, or will ship C.O.D.

## Shipping

For new orders, we normally ship UPS ground with shipping charges prepaid and added to our invoice. If you are in a hurry, we will ship UPS Red, UPS Blue, FedEx, or the carrier of your choice, as you request.

## Order Cancellation and Returns

All orders placed with Pentek are considered binding and are subject to cancellation charges. Hardware products may be returned within 30 days after receipt, subject to a restocking charge. Before returning a product, please call Customer Service to obtain a Return Material Authorization (RMA) number. Software purchases are final and we cannot allow returns.

## Warranty

Pentek warrants its products to conform to published specifications and to be free from defects in materials and workmanship for a period of one year from the date of delivery, when used under normal operating conditions and within the service conditions for which they were furnished.

The obligation of Pentek arising from a warranty claim shall be limited to repairing or, optionally, replacing without charge any product which proves to be defective within the term and scope of the warranty.

Pentek must be notified of the defect or nonconformity within the warranty period. The affected product must be returned with shipping charges and insurance prepaid. Pentek will pay shipping charges for the return of product to buyer, except for products returned from outside the USA.

## Limitations of Warranty

This warranty does not apply to products which have been repaired or altered by anyone other than Pentek or its authorized representatives.

The warranty does not extend to products that have been damaged by misuse, neglect, improper installation, unauthorized modification, or extreme environmental conditions, that fall outside of the scope of the product's environmental specifications.

Due to the normal, finite write-cycle limits of Solid State Drives (SSDs), Pentek shall not be liable for warranty coverage of SSDs caused by wear-related issues that arise as an SSD reaches its write-cycle limit.

Pentek specifically disclaims merchantability or fitness for a particular purpose. Pentek shall not be held liable for incidental or consequential damages arising from the sale, use, or installation of any Pentek product. Regardless of circumstances, Pentek's liability under this warranty shall not exceed the purchase price of the product.

## Extended Warranty

You may purchase an extended warranty on our board-level products for a fee of 1% of the list price per month of coverage, or 10% of the list price per year of coverage.

All Pentek software products (excluding 3rd-party products) include free maintenance and free upgrades for one year. Extended software maintenance is available for one, two, and three years, starting after the first year.

## Service and Repair

You must obtain a Return Material Authorization (RMA) before returning any product to Pentek for service or repair. RMA requests must be submitted online at:

[Return Material Authorization Form](#)

After the form is completed in its entirety and submitted, Pentek shall email you a receipt and start processing your request. Once your request has been approved, Pentek shall e-mail you an RMA number, shipping instructions, and a quotation if the product is out of warranty.

Carefully package the product in its original packaging, if it is still available, and ship it to Pentek prepaid (if within the US) or free domicile DDP (if outside the US). Pentek shall not be responsible for loss or damage in shipment to Pentek, so you are strongly encouraged to insure the shipment for its full replacement value.

When the work is completed, we will return the product to you along with a statement of work performed.

### General Information

Pentek's Navigator Design Suite includes the Navigator FDK (FPGA Design Kit) for integrating custom IP into the Pentek factory-shipped design and the Navigator BSP (Board Support Package) for creating host applications. The Navigator Design Suite takes a new approach to solving FPGA IP and control software connectivity.

Most modern FPGA-processing applications require development of specialized FPGA IP to run on the hardware, *and* software to control the FPGA hardware from a host computer.

Even when "turnkey" solutions are delivered with complete FPGA IP and software libraries, as developers add their own custom-processing IP, new software needs to be created to control the custom IP functions.

Problems often arise when the IP and software development tools treat application development as two separate tasks. Changes to FPGA IP and control software can quickly get out of sync, complicating new application development or even breaking the formally functioning turnkey components.

The Navigator Design Suite was designed from the ground up to work with Pentek's Jade™ architecture and provide a better solution to the complex task of IP and software creation.

### Navigator FDK (FPGA Design Kit)

As FPGAs become larger and IP more complex, the need for IP design tools to manage this growing complexity has never been greater.

The Xilinx Vivado Design Suite includes IP Integrator, the industry's first plug-and-play IP integration design environment. Built around a graphical block diagram interface, IP Integrator allows IP developers to leverage existing IP by importing it into their block diagram design. Pentek's Navigator FPGA Design Kit (FDK), was designed with this exact purpose.

Each Navigator FDK provides the complete IP for a specific Jade data acquisition and processing board. When the design is opened in Vivado's IP Integrator, the developer can access every component of the Pentek design, replacing or modifying blocks as needed for the application. All blocks use industry standard AXI4 interfaces providing a well-defined format for custom IP to connect to the rest of the design. Each Navigator/Jade design includes User Blocks in the data-flow path, ideal for inserting custom processing IP.

The Navigator FDK includes complete documentation, test benches and full VHDL source for developers who desire complete access to the IP. In addition to the IP specific to the supported Jade board, Navigator also includes processing blocks for some of the most commonly used algorithms. ▶

As a Certified Member of Xilinx's Alliance program, Pentek has passed a comprehensive 320-point review of its technical, business, quality, and support processes and has committed engineers who completed the same rigorous training used by Xilinx Field Application Engineers worldwide.

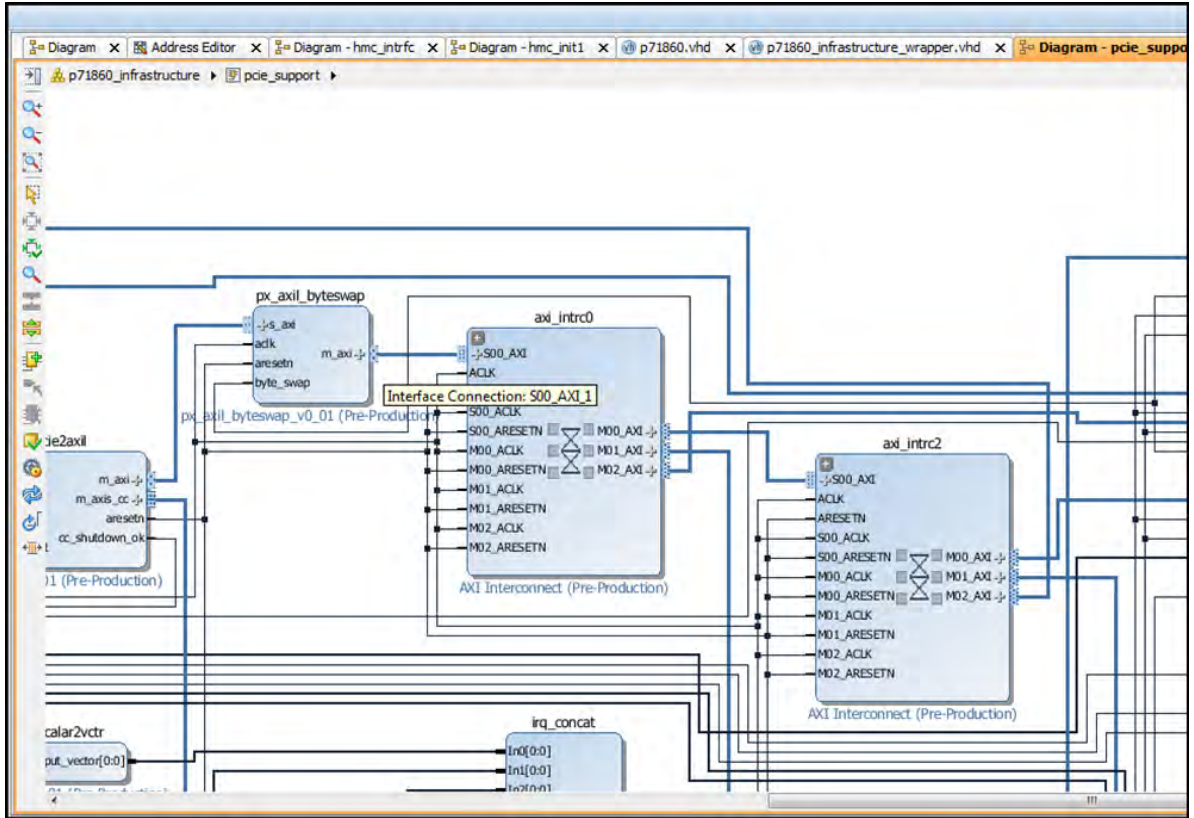

Pentek continues to demonstrate years of expertise with Xilinx devices and implementation techniques that consistently deliver high-quality products and services utilizing the Xilinx programmable platforms.

The Model 78861 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

This XMC board is also available in other formats such as 3U and 6U VPX, PCIe, 3U and 6U cPCI, and AMC.

As shown in the above screen shot, Navigator IP blocks work directly in Xilinx Vivado.

Navigator BSP (Board Support Package)

The companion product to the Navigator FDK is the Pentek Navigator Board Support Package (BSP). While Navigator FDK provides a streamlined path for creating or modifying new IP for the Pentek hardware, the Navigator BSP enables complete operational control of the hardware and all IP functions in the FPGA.

Similar to the FDK, the BSP allows software developers to work at a higher level, abstracting many of the details of the hardware through an intuitive API. The API allows developers to focus on the task of creating the application by letting the API, the hardware and IP-control libraries below it to handle many of the board-specific functions. Developers who want full access to the entire BSP library, enjoy complete C-language source code as well as full documentation.

New applications can be developed on their own or by building on one of the included example programs. All Jade boards are shipped with a full suite of built-in functions allowing operation without the need for any custom IP development. Many users find these functions ideal for addressing their application requirements.

The Navigator BSP includes the Signal Analyzer, a full-featured analysis tool, that displays data in time and frequency domains. Built-in measurement functions display 2nd and 3rd harmonics, THD (total harmonic distortion), and SINAD (signal to noise and distortion). Interactive cursors allow users to mark data points and instantly calculate amplitude and frequency of displayed signals. With the Signal Analyzer users can install the Pentek hardware and Navigator BSP and start viewing analog signals immediately. ▶

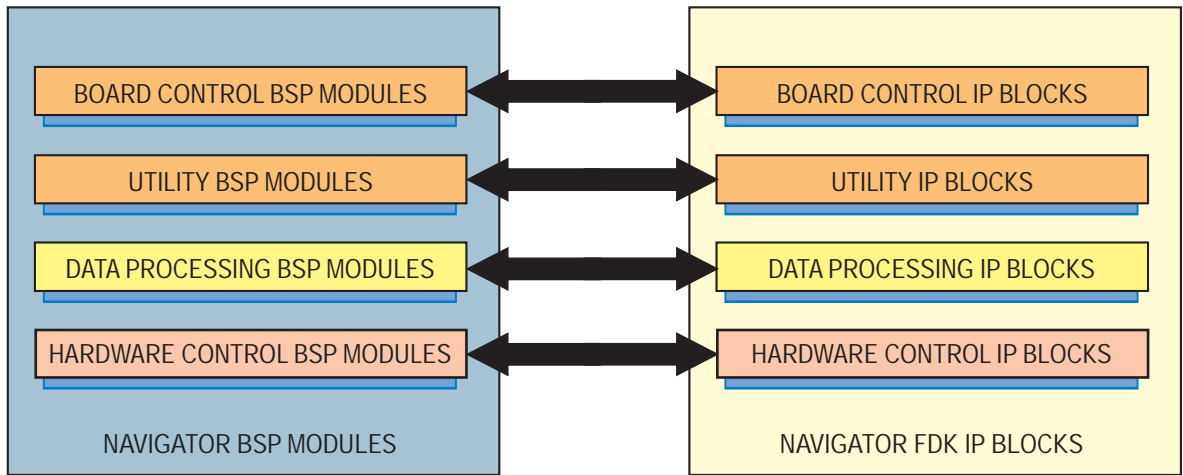

Navigator BSP Signal Analyzer

**Optimize BSP and IP Development**

For users who need to develop applications that include custom IP, the combination and compatibility of Navigator FDK and Navigator BSP streamline development.

When new IP is introduced into the design, it has the potential of changing how the hardware looks to the host, possibly breaking the software. Navigator FDK and BSP were designed together to closely match the FPGA IP blocks and the BSP functions that control them. As developers modify IP they can easily find the corresponding BSP functions and modify them in parallel.

Navigator FDK uses AXI4 for all IP block interfaces. When developers create their own IP blocks using AXI4, they are immediately compatible with the Pentek-supplied IP. Following the Navigator BSP style guide, users can similarly create BSP modules for compatibility with the Navigator BSP library.

*Optimized BSP and IP Development*

*Optimized BSP and IP Development*

**Ordering Information**

Model	Description
4811	Navigator FDK (FPGA Design Kit)
4814	Navigator BSP (Board Support Package) for Linux
4815	Navigator BSP (Board Support Package) for Windows

GateFlow® is Pentek’s family of extendable FPGA products. The GateFlow product line includes the *GateFlow FPGA Design Kit* to ease custom algorithm development and the *GateFlow Factory-installed IP Cores* in Pentek FPGA board products.

The Pentek Model 4953 GateFlow FPGA Design Kit provides the user with design information, software files and utilities for extending FPGA functions in these products.

Users can implement a variety of custom preprocessing functions such as convolution, framing, pattern recognition, decompression, FFT, delay, decoding, time stamping, averaging, summation and many more.

### Using the FPGA Design Kit

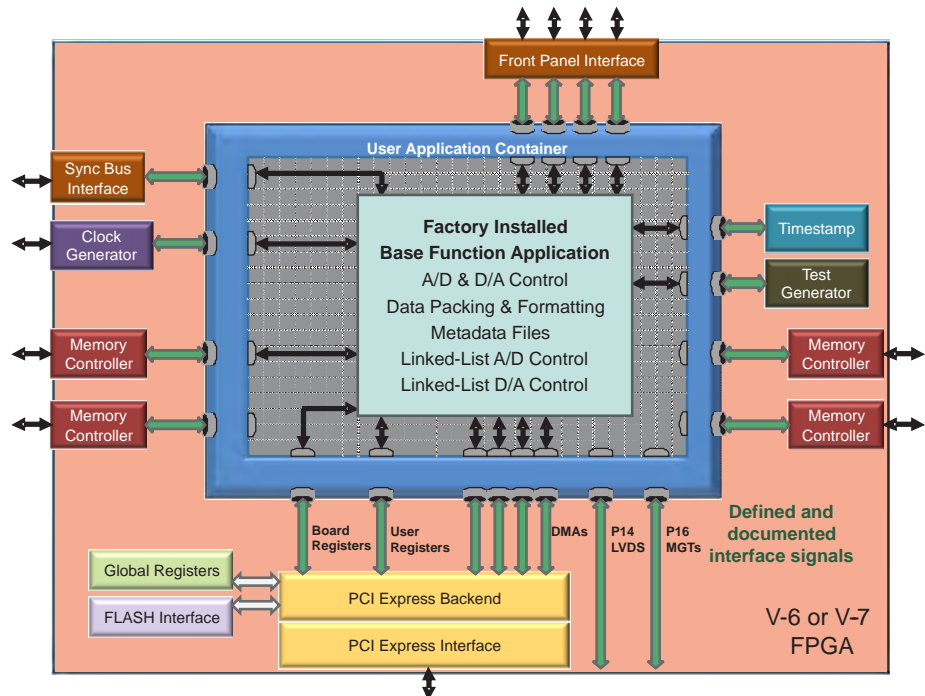

The GateFlow FPGA Design Kit allows the user to modify, replace and extend the standard factory-installed functions in the FPGA to incorporate special modes of operation, new control structures, and specialized signal-processing algorithms.

The Cobalt, Onyx and Flexor architectures configure the FPGA with standard factory-supplied interfaces including memory controllers, DMA engines, A/D and D/A interfaces, timing and synchronization structures, triggering and gating logic, time stamping and header tagging, data formatting engines, and the PCIe interface. These resources are connected to the User Application Container using well-defined ports that present easy-to-use data and control signals, effectively abstracting the lower level details of the hardware.

### The User Application Container

Shown below is the FPGA block diagram of a typical Cobalt, Onyx or Flexor module. The User Application Container holds a collection of different factory-installed IP modules connected to the various interfaces through the standard ports that surround the container. The specific IP modules for each product are described in further detail in the datasheet of that product.

The GateFlow Design Kit provides a complete Xilinx ISE Foundation or Vivado project folder containing all the files necessary for the FPGA developer to recompile the entire project with or without any required changes. VHDL source code for each module provides an example of how the IP modules work, how they might be modified, and how they might be replaced with custom IP to implement a specific function.

FPGAs in Pentek Products

The chart below shows the Xilinx FPGA families used in the three Pentek families of board-level products. These products use some FPGA resources to implement standard factory functions as well as installed IP cores.

The chart shows the approximate percentage of unused system slices and RAM available to the user for extending the FPGA to include custom algorithms for the user's application.

## General Information

Users of high-performance data acquisition and signal processing boards often find themselves frustrated by the fact that when their new devices are delivered, they are unable to put them to immediate use.

Because these boards are largely software controlled and offer a flexible range of functionality, a certain amount of programming is generally necessary to put the new cards through their paces. Then, if something does not go as planned, there is no way of knowing for sure whether the problem lies with the new code, or with the hardware itself.

To address this issue, Pentek has developed the **ReadyFlow®** BSPs (Board Support Packages) for all its board-level products. These packages:

- Provide a path for quick start-up through application completion
- Allow programming at high, intermediate and low levels to meet various needs
- Are illustrated with numerous examples
- Include complete documentation and definitions of all functions
- Include library and example source code

## What's Included in the Package

In general, functions appropriate to the board-level product, such as:

- A "How to" section
  - Build object libraries
  - Compile and link application programs
- C-callable functions
  - Initialization and test
  - Data movement and communications
  - Backplane I/O
  - Mezzanine peripheral I/O
  - Control of board resources
- Utilities
  - Flash memory program loaders

The package contains C-language examples that can be used to demonstrate the capabilities of Pentek products. The examples included provide the answers to

most of the questions that occur with first-time users of Pentek products.

These programming examples will also help you get an immediate start on writing your own application without having to reinvent the wheel. They provide sample code that is known to work, giving you, the new user, a means of verifying that your board set is operational.

ReadyFlow Board Support Packages are designed to reduce development time not only during the initial stages, but any time new hardware is added to the system. All packages are built with a consistent style and function-naming convention. Similar parameters on different boards have similar function calls, thereby allowing immediate familiarity with new hardware as it's added further shortening the learning curve.

## Command Line Interface

The Command Line Interface provides access to precompiled executable examples that operate the hardware right out of the box, without the need to write any code.

Board-specific hardware operating arguments can be entered in the command line to control the following parameters: number of channels to enable, sample clock frequency, data transfer size, data rate divider, interpolation factor, reference clock frequency, reference clock source, number of iterations to run the program, etc.

Below is an example command line for D/A capable hardware that enables the channel one output, transfers 32,768 data bytes, executes 100,000 times, divides the data rate by 2, and interpolates the data by 4:

```
C:> dacmode -chan 1 -xfersize 32768
      -loop 100000 -ratediv 2
      -interpolate 4
```

The Command Line Interface can be used to call an example application from within a larger user application to control the hardware, and parameter arguments are passed to the application for execution. Functions that control data acquisition, automatically save captured data to a pre-named host file or are routed to the Signal Analyzer example function for display. ►

For the latest list of boards supported with ReadyFlow, visit our website at:  
[www.pentek.com/readyflow](http://www.pentek.com/readyflow)

### Signal Analyzer\*

When used with the Command Line Interface, the Signal Analyzer allows users to immediately start acquiring and displaying A/D data. A full-featured analysis tool, the Signal Analyzer displays data in time and frequency domains. Built-in measurement functions display 2nd and 3rd harmonics, THD (total harmonic distortion), and SINAD (signal to noise and distortion). Interactive cursors allow users to mark data points and instantly calculate amplitude and frequency of displayed signals

### Example, Model 71620

As an example of XMC module support, the BSP for the Cobalt® Model 71620 Transceiver with three 200 MHz A/Ds, DUC (Digital Upconverter), and two 800 MHz D/As includes data structures and routines to support the following:

- PCIe Bus interface and DMA controller
- Board control registers
- Timing bus control and clock selection
- Triggering, gate enable and polarity
- Data input device management for the 200 MHz A/D
- Data output device management for the DUC and the 800 MHz D/A
- Built-in A/D Data Acquisition IP Modules
- Built-in D/A Waveform Playback IP Modules
- Built-in test waveform generator
- Interrupt generation and handling
- FPGA configuration
- Test modes and hardware revision codes
- Hardware voltage and temperature monitor

Model	Description
4996/4996A	Pentek VxWorks BSPs and Hardware Drivers

Contact Pentek for availability

The Models 4996/4996A VxWorks BSPs provide software developers with a complete library of hardware initialization, control and application functions for Pentek PowerPC®/Power Architecture® processor baseboards, VME/VXS, PMC/XMC, VIM, and cPCI boards and modules. Used in conjunction with Wind River's **Workbench**® software development environment, they speed application development by providing a high-level API for accessing all of the processor board's memory and communication resources, and control of the board's I/O interfaces and I/O modules.

Processor specific functions found in the baseboard BSPs include: cache, DMA, SDRAM, interrupt, serial port, and timer control. Some general board functions include: reading and writing to mezzanine board FIFOs, VME/VXS, PMC/XMC, cPCI, and VIM I/O control, interprocessor commu-

nication, programming DMA reads and writes, programming interrupts, using mailboxes, managing RS-232 and ethernet interfaces, and control of optional Fibre Channel interfaces.

The VxWorks BSPs are designed to reduce development time not only during the initial stages of software development, but any time new I/O hardware is added to the system. **Hardware Drivers**, each designed to control the specific hardware features of the I/O interface being used, are built with a consistent style and function naming convention. Similar parameters on different I/O modules have similar driver calls, thereby allowing immediate familiarity with new I/O hardware as it's added. This can greatly shorten the application development learning curve when a system is modified or expanded.

### Ordering Information

Contact Wind River Systems at:  
[www.windriver.com](http://www.windriver.com)

Wind River's **Workbench** development platform has dramatically improved embedded developers' "time-to-productivity". A component of Workbench, Workbench Tools, comprises a comprehensive suite of core and optional cross-development tools and utilities. The other integrated components of Workbench consist of the VxWorks run-time system, a high-performance scalable real-time operating system that executes on the target processor and a full range of communications options for the target connection to the host. Workbench Tools provides a

highly visual and automated environment that accelerates the development of even the most complex VxWorks-based applications.

At the heart of the VxWorks run-time system is the highly efficient Wind microkernel which supports a full range of real-time features. These include fast multitasking, interrupt support, and both preemptive and round-robin scheduling. The microkernel design minimizes system overhead and enables fast, deterministic response to external events.

## Features

- Complete turnkey recording and/or playback system software for Talon Recording Systems
- Software API for controlling data acquisition and recorder functions
- Graphical user interface
- Windows or Linux host
- One-year support included

## General Information

The Pentek SystemFlow Recording Software provides a rich set of function libraries and tools for controlling and building Pentek's real-time recording and data acquisition systems. These libraries ensure a consistent look and feel for developers across system families.

SystemFlow software allows developers to configure and customize system interfaces and behavior. It includes API functions not only for the real-time data acquisition and playback functions, but also for the user-control software running on the host PC including the GUI. These API functions allow developers to either modify the sample code to meet their needs or use it as a reference for custom software development.

## API Library Components

SystemFlow is based on a flexible client/server architecture. The host client application runs on a Windows or Linux platform and communicates with the server target application via a standard socket connection. In this way, server real-time recording and/or playback operations can be controlled from a local or remote host client.

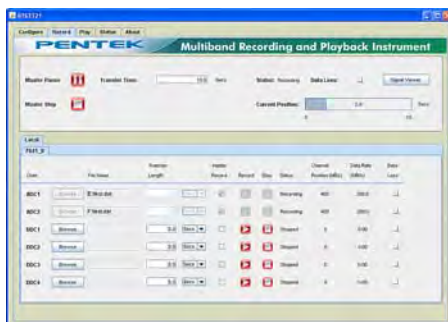

All servers use PC hardware running under Windows. The server application includes scheduling, task management, full control of data from Pentek software radio hardware, and drivers for communication with the hard disk arrays.

## SystemFlow Recorder Interface

The SystemFlow GUI provides the user with a control interface for recording data. It includes Configuration, Record, Playback and Status screens, each with intuitive controls and indicators. The user can easily move between screens to set configuration parameters, control and monitor a recording, play back a recorded signal and monitor board temperature and voltage levels. The signal viewer, integrated into the recording GUI, allows the user to monitor real-time signals or recorded signals on disk.

## Hardware Configuration Interface

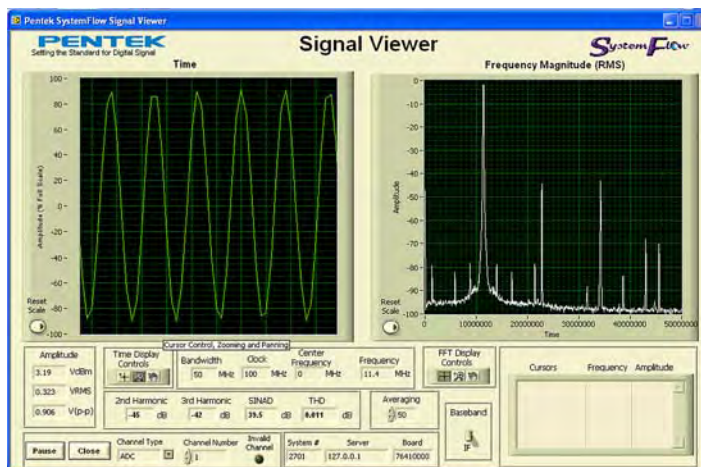

The SystemFlow configuration screens provide a simple and intuitive means for setting up the system parameters. The DDC configuration screen shown here, provides entries for input source, center frequency, decimation, as well as gate and trigger information. All parameters contain limit-checking and integrated help to provide an easier-to-use out-of-the-box experience.

Recorder Interface

Hardware Configuration Interface

Signal Viewer

## SystemFlow Signal Viewer

The SystemFlow Signal Viewer includes a virtual oscilloscope and spectrum analyzer for signal monitoring in both the time and frequency domains. It is extremely useful for previewing live inputs prior to recording, and for monitoring signals as they are being recorded to help ensure successful recording sessions. The viewer can also be used to inspect and analyze the recorded files after the recording is complete.

Advanced signal analysis capabilities include automatic calculators for signal amplitude and frequency, second and third harmonic components, THD (total harmonic distortion) and SINAD (signal to noise and distortion). With time and frequency zoom, panning modes and dual annotated cursors to mark and measure points of interest, the SystemFlow Signal Viewer can often eliminate the need for a separate oscilloscope or spectrum analyzer in the field.

# Customer Information

## Placing an Order

When placing a purchase order for Pentek products, please provide the model number and product description. You may place your orders by letter, telephone, email or fax; you should confirm a verbal order by mail, email or fax.

All orders should specify a purchase order number, bill-to and ship-to address, method of shipment, and a contact name and telephone number.

U.S. orders should be made out to Pentek, Inc. and may be placed directly at our office address, or c/o our authorized sales representative in your area.

International orders may be placed with us, or with our authorized distributor in your country. They have pricing and availability information and they will be pleased to assist you.

## Prices and Price Quotations

All prices are F.O.B. factory in U.S. dollars. Shipping charges and applicable import, federal, state or local taxes, are paid by the purchaser.

We're glad to respond to your request for price quotation just contact the corporate office, or your local representative. Price and delivery quotations are valid for 30 days, unless otherwise stated.

Quantity discounts for large orders are available and will be included in our price quotation, if applicable.

## Terms

Terms are Net 30 days for accounts with established credit; until credit is established, we require prepayment, or will ship C.O.D.

## Shipping

For new orders, we normally ship UPS ground with shipping charges prepaid and added to our invoice. If you are in a hurry, we will ship UPS Red, UPS Blue, FedEx, or the carrier of your choice, as you request.

## Order Cancellation and Returns

All orders placed with Pentek are considered binding and are subject to cancellation charges. Hardware products may be returned within 30 days after receipt, subject to a restocking charge. Before returning a product, please call Customer Service to obtain a Return Material Authorization (RMA) number. Software purchases are final and we cannot allow returns.

## Warranty

Pentek warrants its products to conform to published specifications and to be free from defects in materials and workmanship for a period of one year from the date of delivery, when used under normal operating conditions and within the service conditions for which they were furnished.

The obligation of Pentek arising from a warranty claim shall be limited to repairing or, optionally, replacing without charge any product which proves to be defective within the term and scope of the warranty.

Pentek must be notified of the defect or nonconformity within the warranty period. The affected product must be returned with shipping charges and insurance prepaid. Pentek will pay shipping charges for the return of product to buyer, except for products returned from outside the USA.

## Limitations of Warranty

This warranty does not apply to products which have been repaired or altered by anyone other than Pentek or its authorized representatives.

The warranty does not extend to products that have been damaged by misuse, neglect, improper installation, unauthorized modification, or extreme environmental conditions, that fall outside of the scope of the product's environmental specifications.

Due to the normal, finite write-cycle limits of Solid State Drives (SSDs), Pentek shall not be liable for warranty coverage of SSDs caused by wear-related issues that arise as an SSD reaches its write-cycle limit.

Pentek specifically disclaims merchantability or fitness for a particular purpose. Pentek shall not be held liable for incidental or consequential damages arising from the sale, use, or installation of any Pentek product. Regardless of circumstances, Pentek's liability under this warranty shall not exceed the purchase price of the product.

## Extended Warranty

You may purchase an extended warranty on our board-level products for a fee of 1% of the list price per month of coverage, or 10% of the list price per year of coverage.

All Pentek software products (excluding 3rd-party products) include free maintenance and free upgrades for one year. Extended software maintenance is available for one, two, and three years, starting after the first year.

## Service and Repair

You must obtain a Return Material Authorization (RMA) before returning any product to Pentek for service or repair. RMA requests must be submitted online at:

[Return Material Authorization Form](#)

After the form is completed in its entirety and submitted, Pentek shall email you a receipt and start processing your request. Once your request has been approved, Pentek shall e-mail you an RMA number, shipping instructions, and a quotation if the product is out of warranty.

Carefully package the product in its original packaging, if it is still available, and ship it to Pentek prepaid (if within the US) or free domicile DDP (if outside the US). Pentek shall not be responsible for loss or damage in shipment to Pentek, so you are strongly encouraged to insure the shipment for its full replacement value.

When the work is completed, we will return the product to you along with a statement of work performed.
