## Company Profile

Founded in 1986, Pentek has become the premier source for high-speed real-time recording systems, DSP (Digital Signal Processing), SDR (Software-Defined Radio), and data acquisition products. Our customers enjoy our ISO 9001 SGS certification and the performance and flexibility afforded by our board- and system-level commercial and ruggedized product lines and our world-class applications support.

Pentek is the leading board and system manufacturer offering COTS and ruggedized products in formats such as VPX, PMC/XMC, PCI Express, AMC, FMC, CompactPCI, and PCI, featuring the latest Xilinx Virtex and Kintex FPGAs.

Pentek's data acquisition line is extensive and includes A/Ds, D/As, Digital Receivers/Transmitters, Digital I/O, Analog RF downconverters, High-speed recorders, Development systems and more.

No other embedded vendor can provide such seasoned, in-depth technical expertise in data acquisition, digital signal processing and software-defined radio.

## Mission Statement

Pentek's mission is to provide the embedded community with leading edge board- and system-level solutions for the most demanding requirements in data acquisition, digital signal processing and software radio applications through excellence and innovation.

## Pentek Strategies

We support an aggressive new product development cycle to meet market demands as we design the next generation of embedded products.

We consistently invest more than 15% of revenues in product development, engineering and applications support.

We will help you solve the most challenging DSP problems through our dedicated staff of systems engineers who are trained to provide the answers to your hardware, software or applications questions.

We recognize today's time-to-market pressures and budget constraints on development resources and we offer low-risk, easy-to-use embedded solutions.

## Product Overview

You can select from the industry's most extensive line of advanced analog and digital I/O products, along with exclusive development tools that help you create a custom system. Many of these products include Xilinx Virtex or Kintex FPGAs for customized processing.

### High-Speed Real-Time Recording Systems

- Economical alternatives to in-house development
- Fully tested and ready to run right out-of-the-box
- Easy to use with full-featured software installed

### Processor Engines

- Xilinx Virtex and Kintex FPGAs

### Data Acquisition

- Single or multichannel A/Ds and D/As
- Sampling rates to 3.6 GHz
- Resolution to 24 bits

### Software Radio

- Up to 1100 channels per slot
- Narrow-, wide- and multi-band versions
- Digital downconverters and upconverters
- Analog downconverters
- Development systems

For more information about us, please visit: <http://pentek.com/about/about.cfm?HID2=TM>

*"Pentek takes pride in listening to its customers and creating new products to meet their needs. We promise an atmosphere of freedom and creativity among our engineers, so they can design industry-leading products to satisfy the most demanding applications. This has been the key to our success through the years."*  
Rodger Hosking, Vice President and Co-founder

*Pentek's 88,000 sq. ft. facility in Upper Saddle River, NJ*

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71620 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71620 includes general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71620 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules, ideally matched to the board's analog interfaces. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchro-

nization functions, a test signal generator, and a PCI interface complete the factory-installed functions and enable the 71620 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

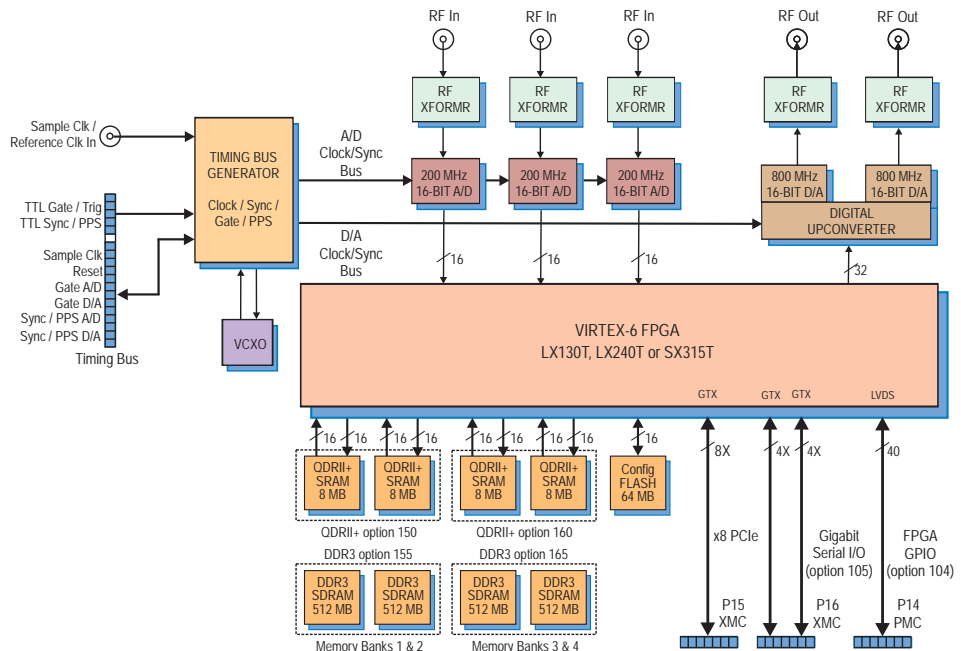

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ▶

**A/D Acquisition IP Modules**

The 71620 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 71620 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

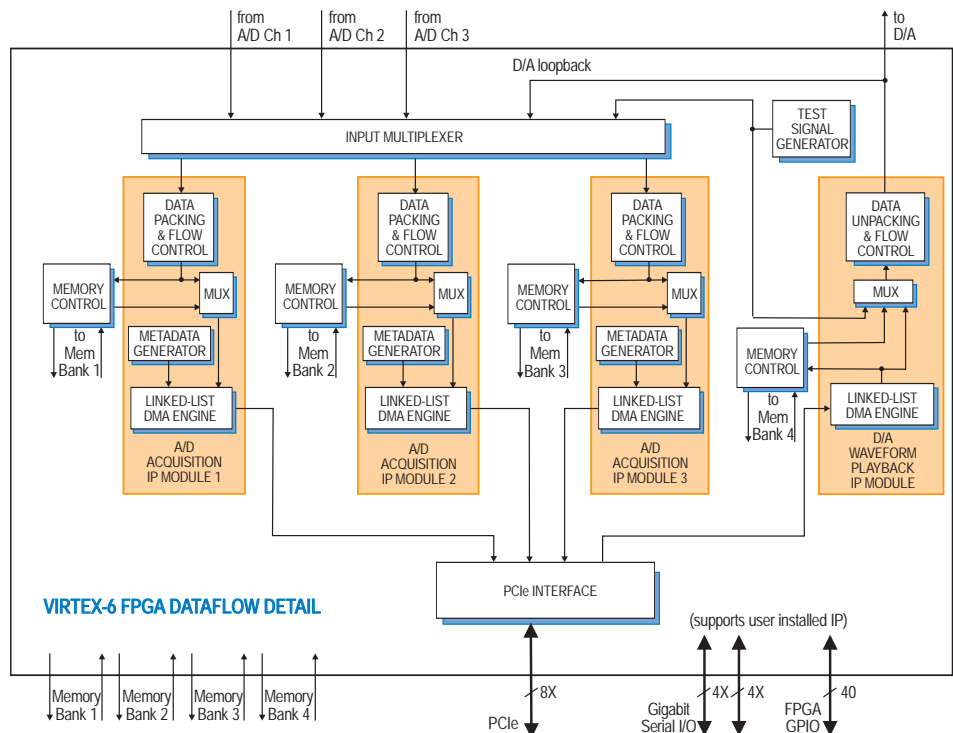

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71620's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71620 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - XMC
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## XMC Interface

The Model 71620 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71620 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71620 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

## Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8;

Gen. 2: x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71621 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71621 includes a general purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71621 factory installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71621 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

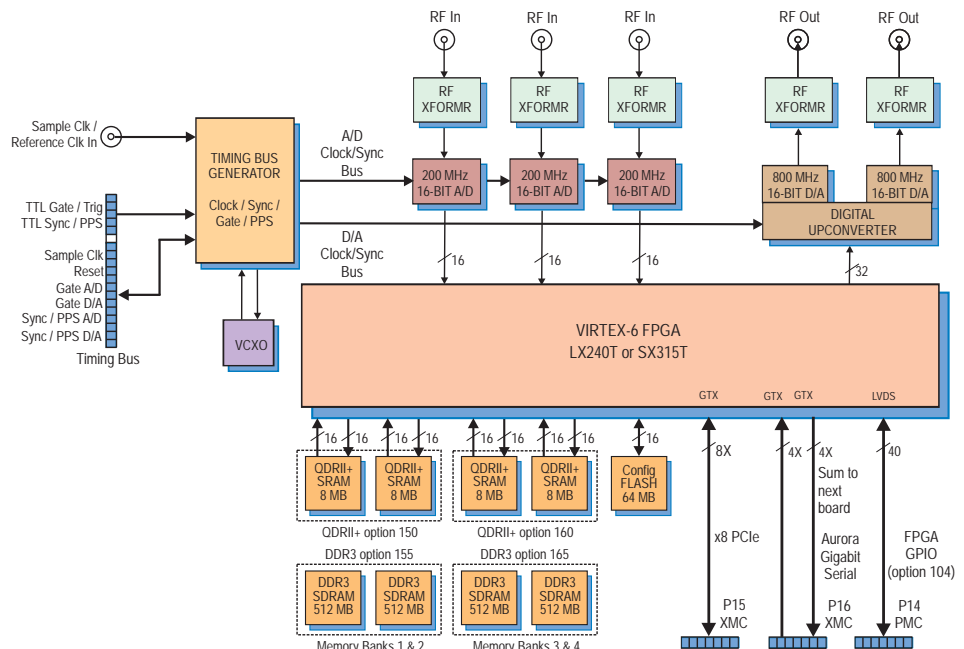

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71621 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71621 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

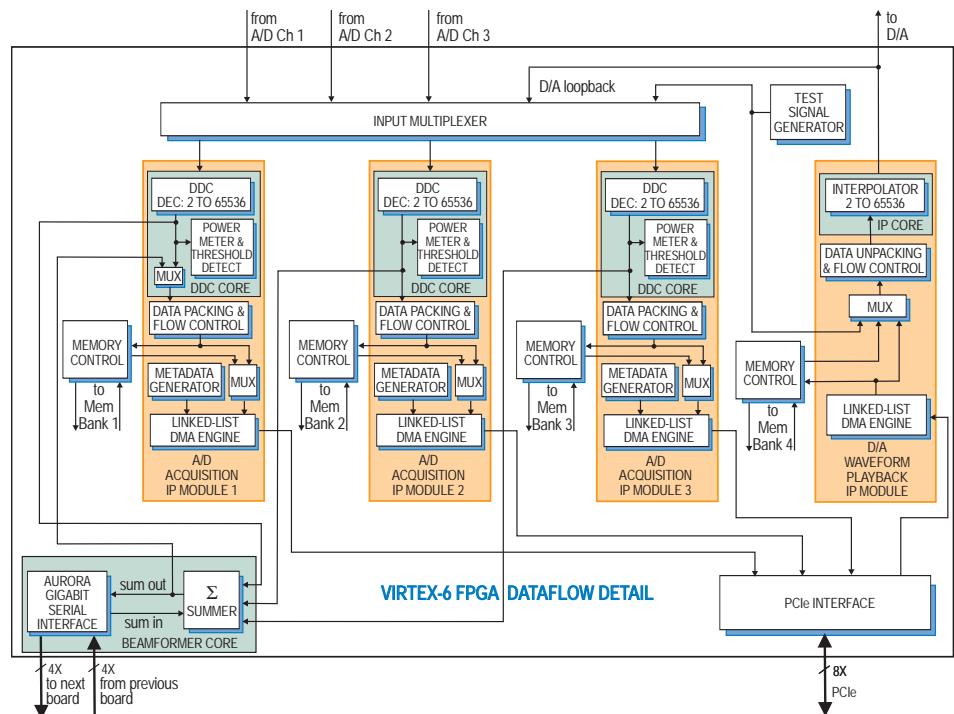

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71621's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 71621 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71621's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71621 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### XMC Interface

The Model 71621 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71621 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple modules.

### PCI Express Interface

The Model 71621 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71621	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - XMC
<b>Options:</b>	
-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through P14 connector
-150	Two 8 MB QDR II+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDR II+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Three channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

### Memory

**Option 150 or 160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8;  
 Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Standard XMC module, 2.91 in. x 5.87 in.

► associated with one of the two D/A converters using a final interpolation factor of  $\times 4$ . After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the Model 71624 adaptive relay. Because of the complexity and proprietary nature of these functions, the FPGA cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in

gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controller

Two output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2.

When a target memory buffer is filled, the 71624 issues an interrupt to the system processor and then begins filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, the 71624 signals the processor with an interrupt and moves to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz. ►

► A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts two summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two transformer-coupled analog IF outputs are delivered through a pair of front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71624's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### PCI Express XMC Interface

The Model 71624 complies with the VITA 42.0 XMC specification. The primary XMC connector on P15 supports an industry-standard interface fully compliant with PCIe Gen. 1 x8, bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the module.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com). ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in. ►

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71630 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and D/A converters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71630 includes optional general purpose and gigabit serial card connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71630 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and

synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71630 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

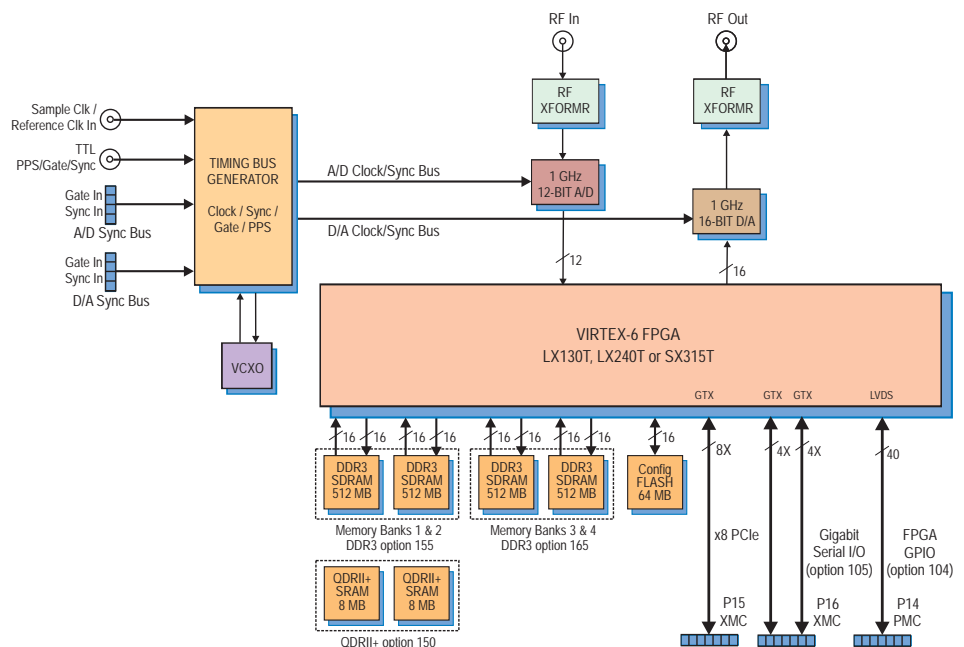

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

**A/D Acquisition IP Module**

The 71630 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 71630 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 71630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel μSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7192 and Model 9192 Cobalt Synchronizers can drive multiple 71630 μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 71630 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71630	1 GHz A/D and D/A, Virtex-6 FPGA - XMC

## ► XMC Interface

The Model 71630 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71630 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71630 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

### D/A Converter

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

## Memory

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen.1: x4 or x8;  
Gen 2: x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Sync bus for multimodule synchronization
- PCI Express Gen. 2 interface x8 wide
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71640 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71640 includes optional general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71640 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator

and a PCIe interface complete the factory-installed functions and enable the 71640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

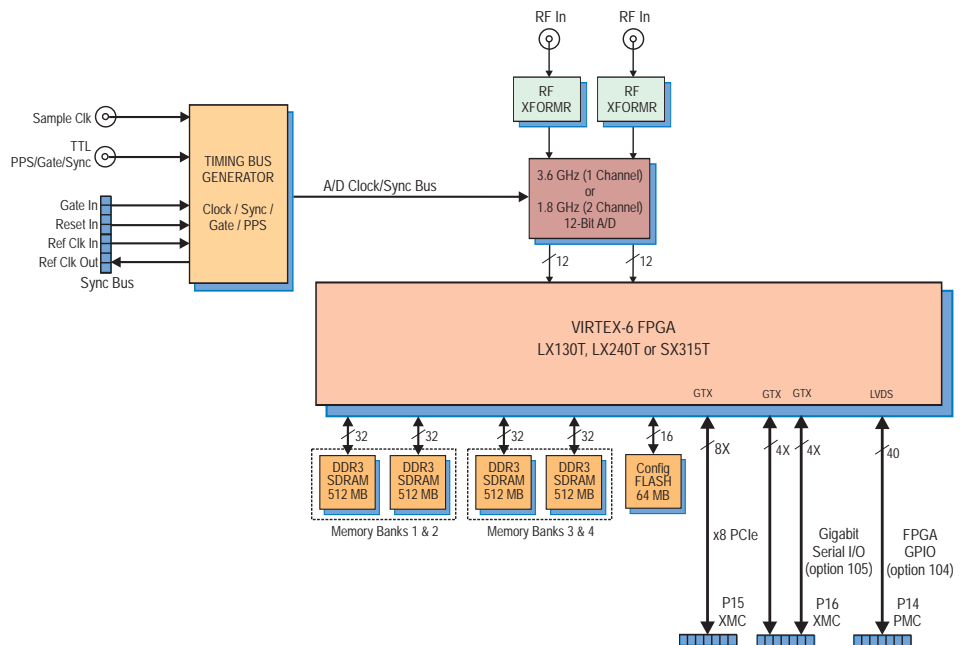

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support other serial protocols. ➤

► **A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 71640 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

The 71640 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple modules to be synchronized, ideal for larger multichannel

systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 71640s can be synchronized using the Cobalt high speed sync module to drive the sync bus.

**Memory Resources**

The 71640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module’s DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**XMC Interface**

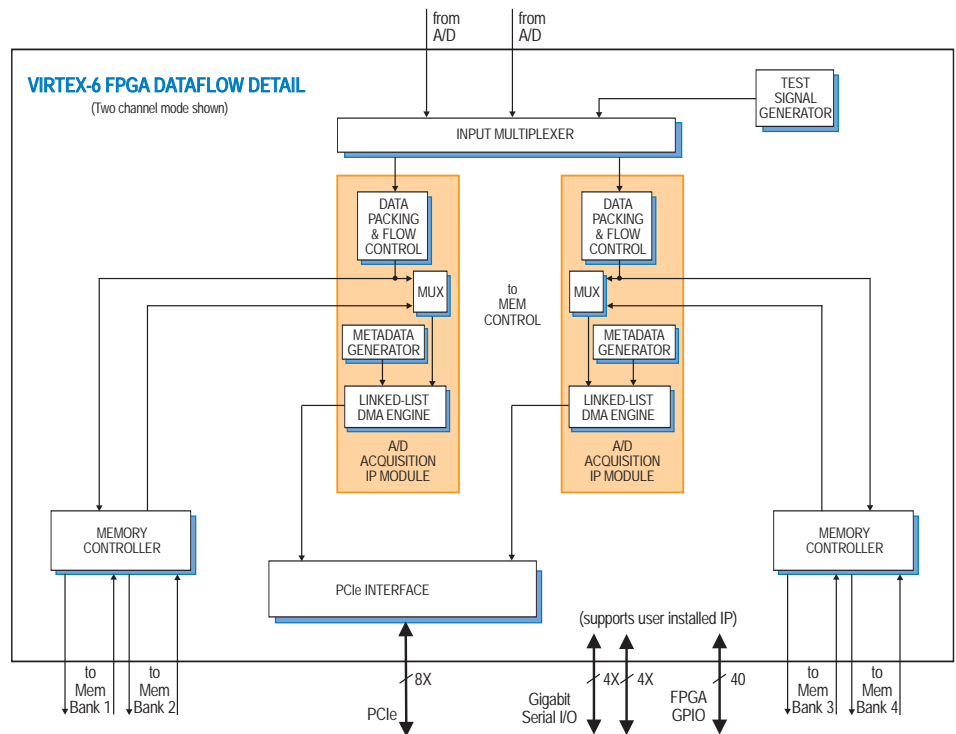

The Model 71640 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 5 GHz bit clock. With dual XMC connectors, the 71640 supports x8 PCIe on the first XMC connector leaving the optional second connector free to support user-installed transfer protocols specific to the target application. ►

**A/D Acquisition IP Module**

The 71640 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71640	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, Virtex-6 FPGA - XMC

### Options:

-002*	-2 FPGA speed grade
-062	XC6VLX240T
-064	XC6VVSX315T
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

## ► PCI Express Interface

The Model 71640 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multi-pin connectors, bus includes gate, reset and in and out ref clock

### External Trigger Input

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2, or XC6VVSX315T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**General Information**

Model 71641 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, Model 71641 includes an optional connection to the Virtex-6 FPGA for custom I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71641 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a

controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71641 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

For applications that require additional control and status signals, option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

**A/D Converter Stage**

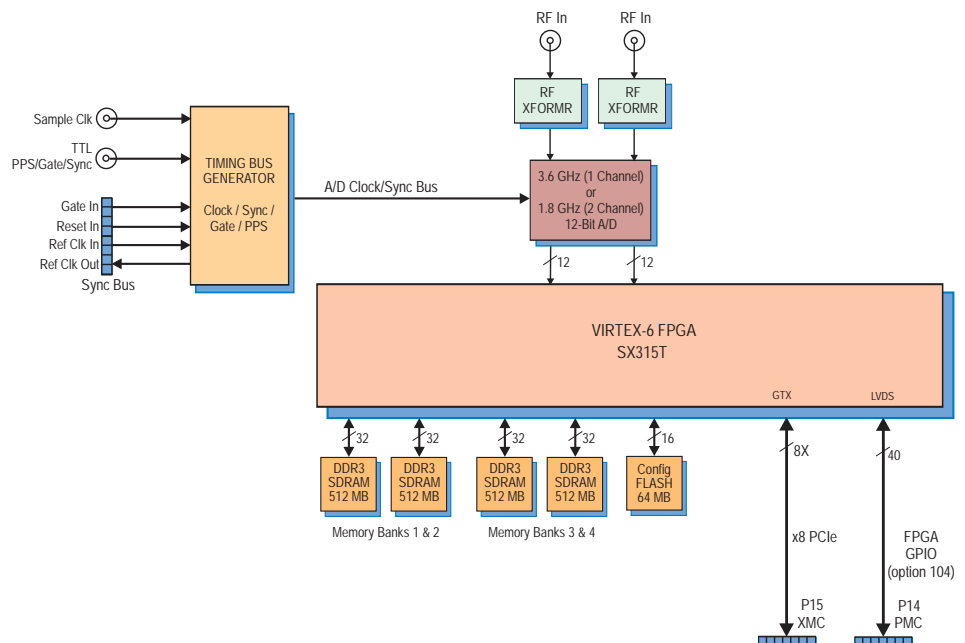

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 71641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources. ➤

**Features**

- Ideal radar and software radio interface solution
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 2 GB of DDR3 SDRAM
- Sync bus for multimodule synchronization
- PCI Express Gen. 2 interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Module**

The 71641 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

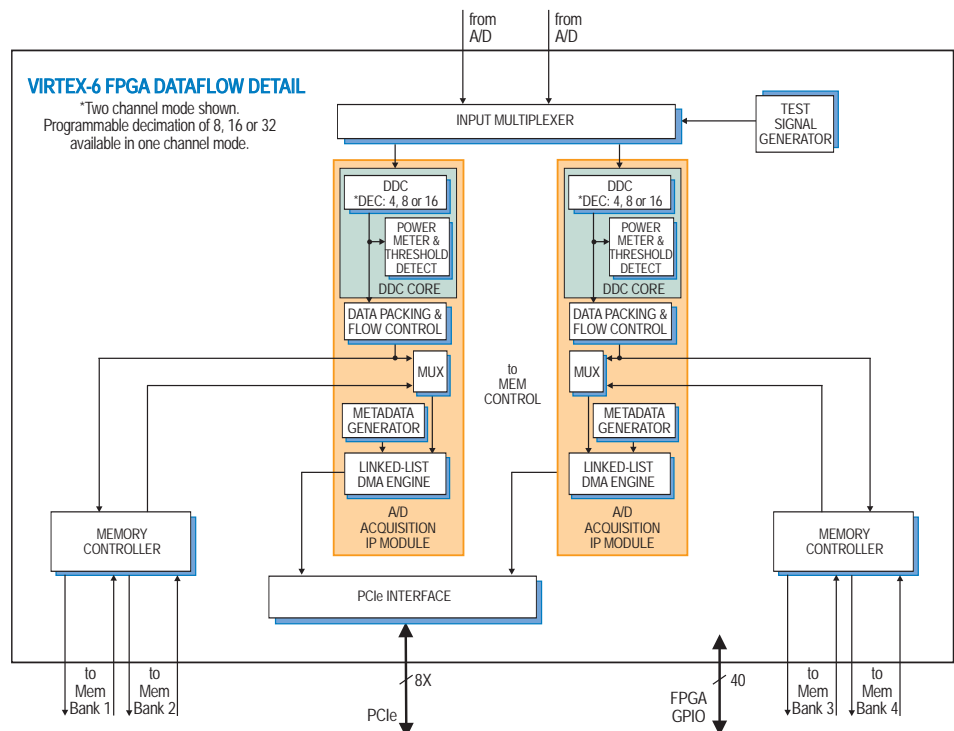

**▶ Clocking and Synchronization**

The 71641 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple modules to be synchronized, ideal for multichannel systems. The sync bus includes gate, reset, and in and out reference clock signals. Two 71641's can be synchronized with a simple cable. For larger systems, multiple 71641's can be synchronized using the Cobalt 7192 high-speed sync module to drive the sync bus.

**Memory Resources**

The 71641 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ▶

### General Information

Model 71650 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, one DUC (Digital Upconverter), two D/As, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71650 includes optional general-purpose and gigabit serial card connectors for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71650 factory-installed functions include two A/D acquisition and one D/A waveform playback IP modules. In addition, IP modules for either DDR3 or QDRII+ waveforms are available.

memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71650 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

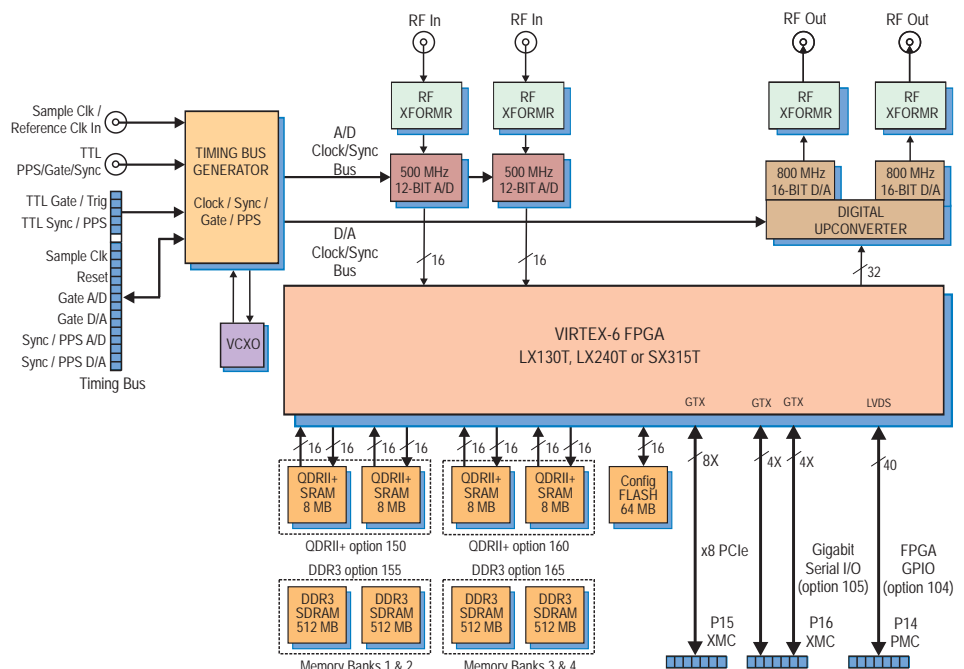

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 71650 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfers, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 71650 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts two full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

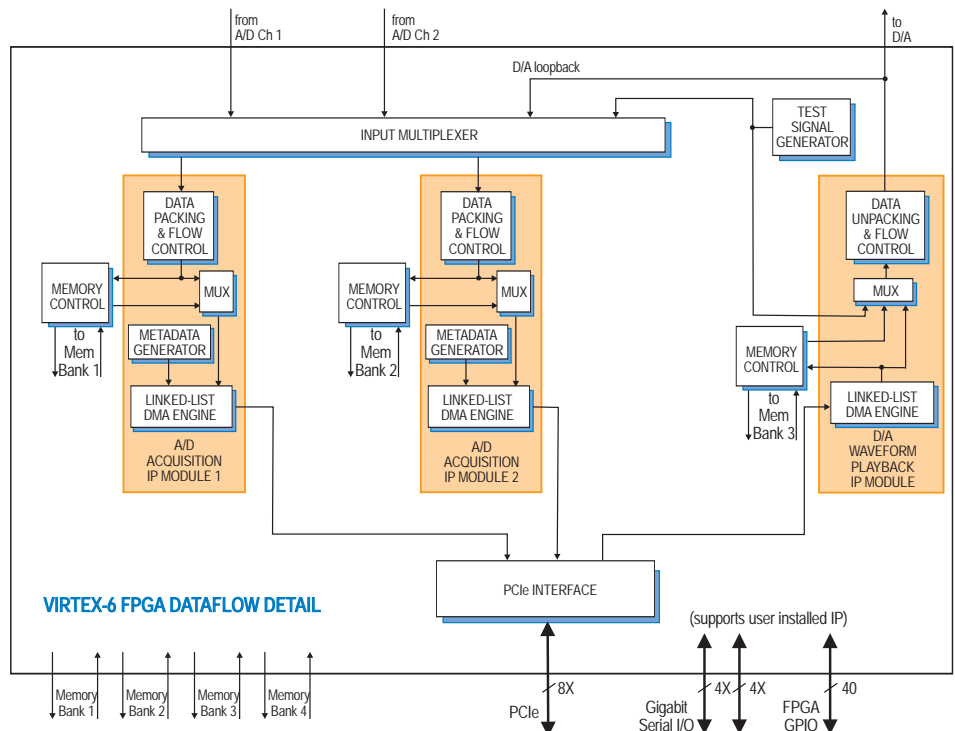

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71650’s can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71650 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## XMC Interface

The Model 71650 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71650 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71650 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

### A/D Converters (option 014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz, max.  
**Output IF:** DC to 400 MHz, max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz, max. with interpolation  
**Resolution:** 16 bits

## Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen.1 or Gen.2, x4 or x8

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71651 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71651 includes a general purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71651 factory installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71651 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

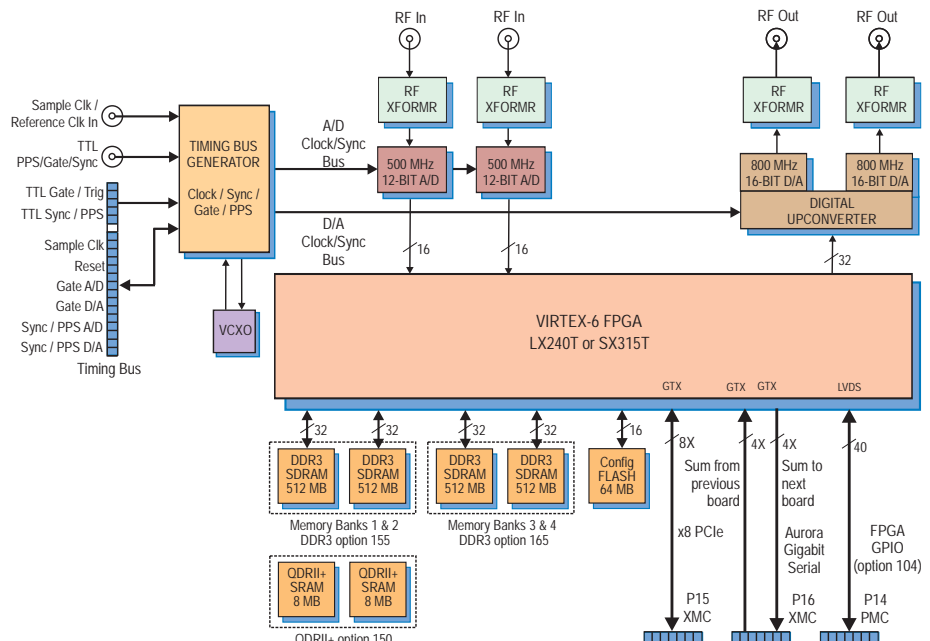

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71651 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71651 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

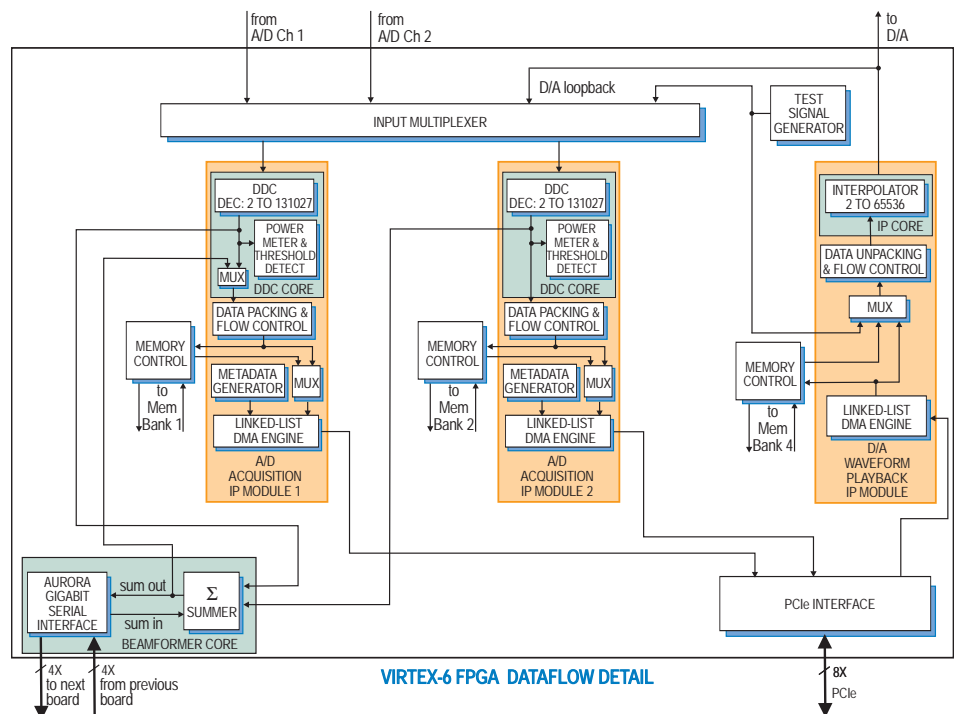

A programmable summation block provides summing of any of the two DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71651's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 71651 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71651's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71651 architecture supports up to three independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### XMC Interface

The Model 71651 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71651 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple modules.

### PCI Express Interface

The Model 71651 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
71651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - XMC

**Options:**

-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through P14 connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

**► Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option -014)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters**

**Quantity:** Two channels

**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformer**

**Summation:** Two channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71660 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71660 includes general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71660 factory-installed functions include four A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal

generator, and a PCIe interface complete the factory-installed functions and enable the 71660 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

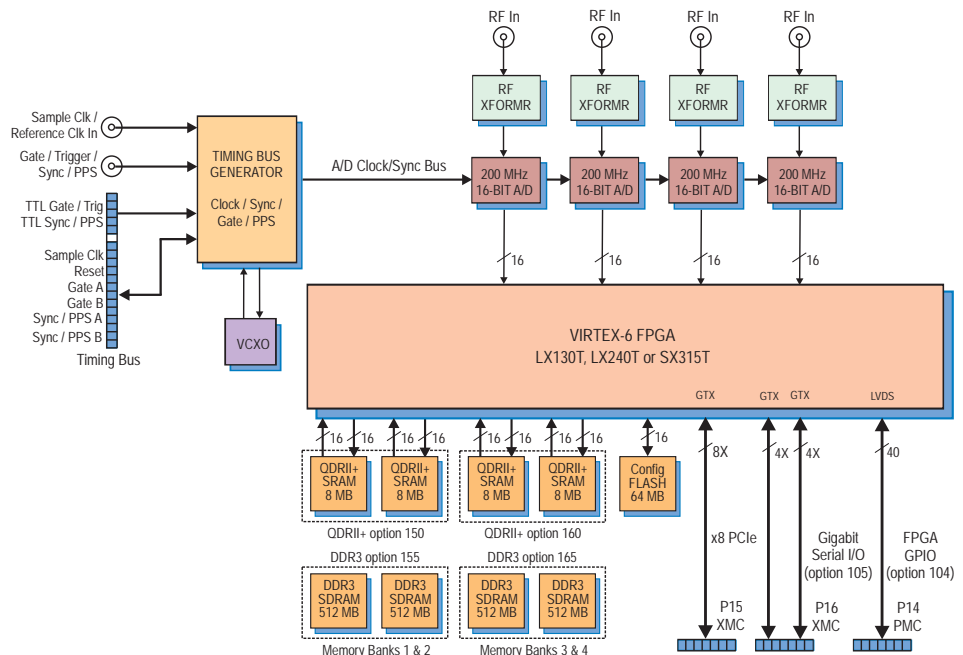

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

► **A/D Converter Stage**

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71660's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71660 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**XMC Interface**

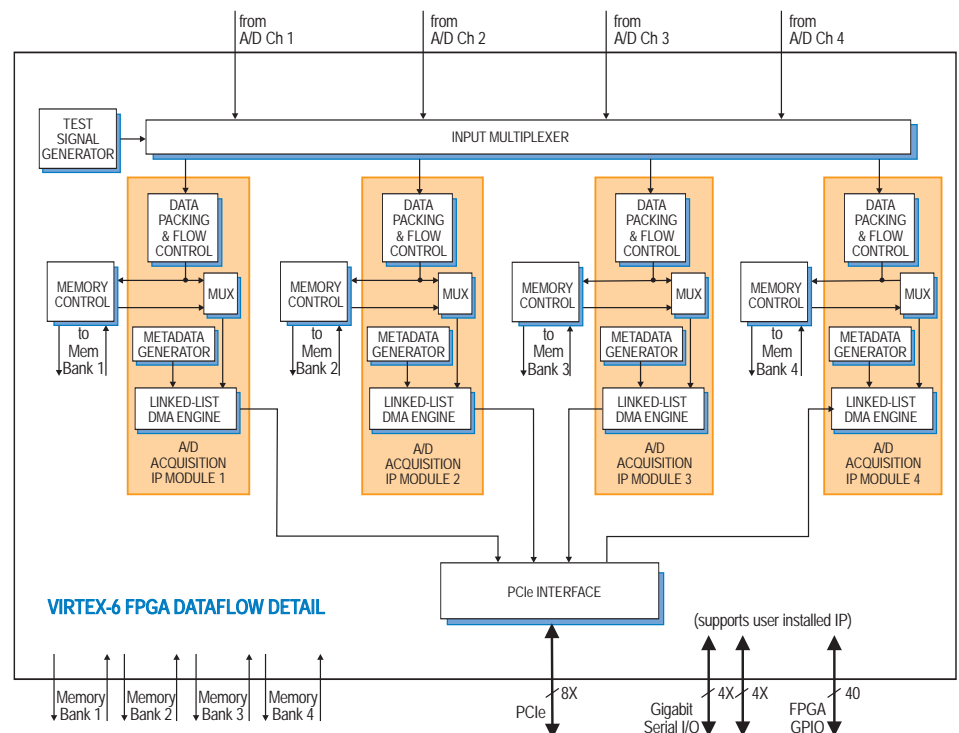

The Model 71660 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71660 ►

**A/D Acquisition IP Modules**

The 71660 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

## Model 8266

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8;

Gen. 2: x4

## Environmental

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71661 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (Digital Downconverter) IP core. IP modules

for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71661 to operate as a complete turnkey solution without the need to develop any FPGA IP.

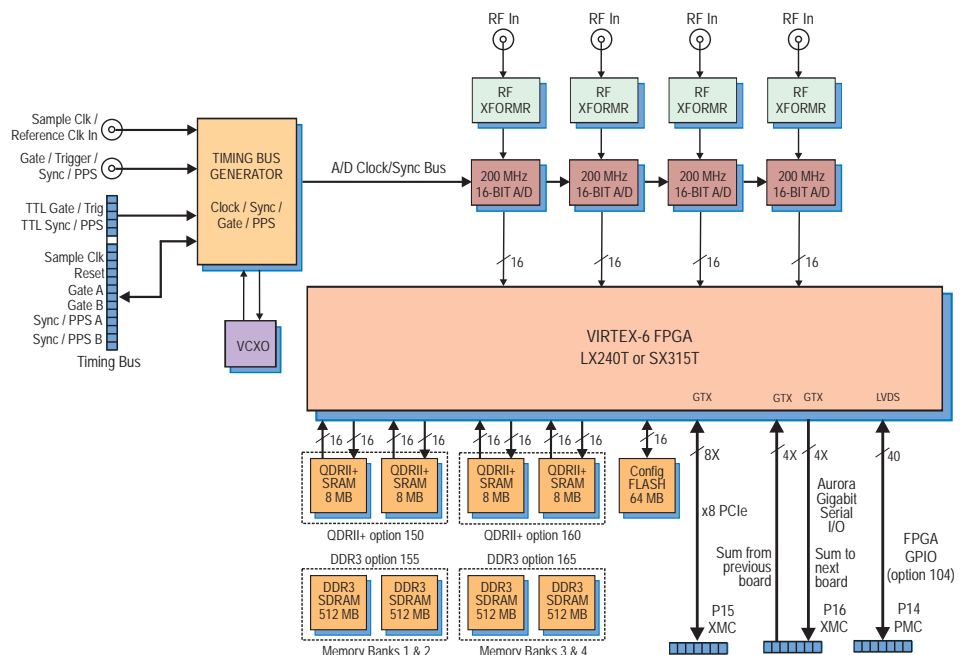

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71661 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71661 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the

summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

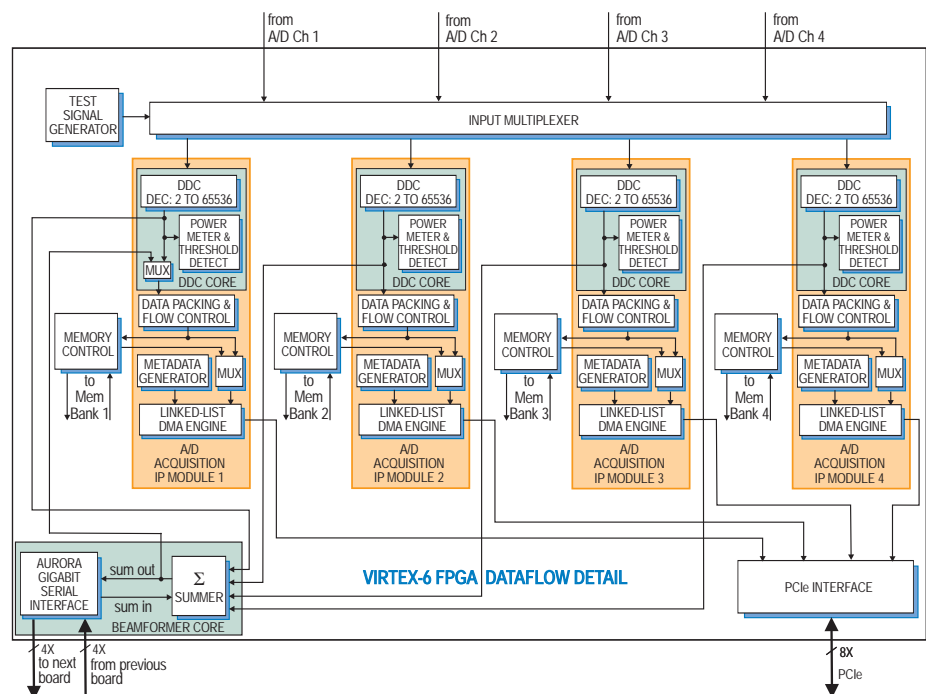

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator. ➤

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Up to 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable serial gigabit interfaces
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71662 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed data converter with programmable DDCs (digital downconverters) is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71662 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and trigger functions, a test signal generator, voltage and temperature monitoring, DDR3 SDRAM memory controllers, and a PCIe

interface complete the factory-installed functions and enable the 71662 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

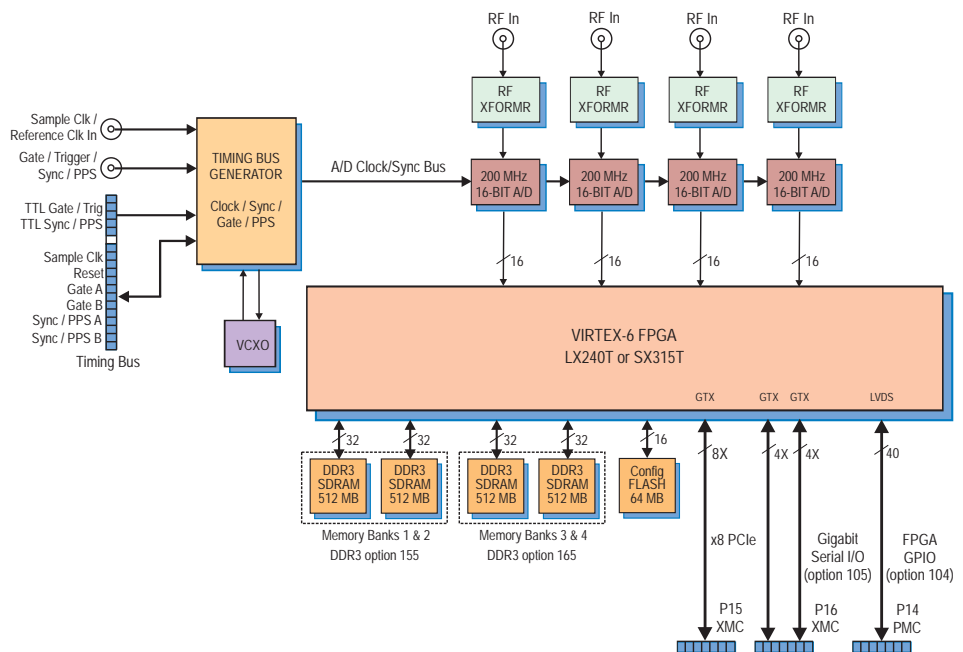

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 71662 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range is programmable in steps of 8 from 16 to 1024 and steps of 64

from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

► **A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

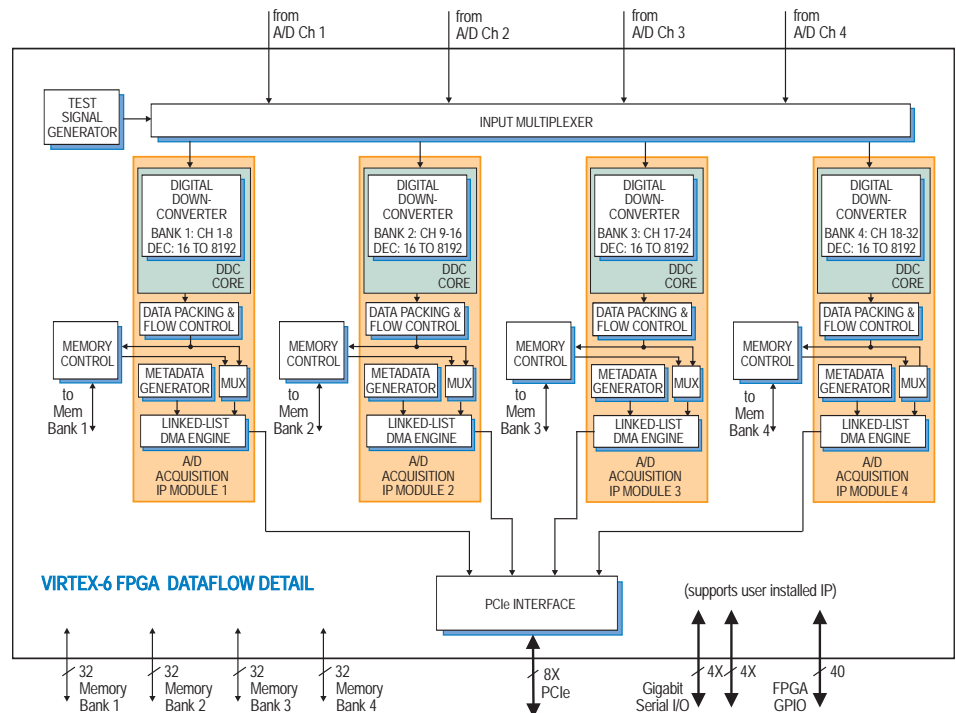

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71662's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71662 architecture supports up to four independent memory banks which can be configured with DDR3 SDRAM. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71662	4-Ch 200 MHz A/D with 32-Ch DDC and Virtex-6 FPGA - XMC

### Options:

-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## XMC Interface

The Model 71662 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71662 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71662 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

### Memory

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x8

**General Information**

Model 71663 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 71663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

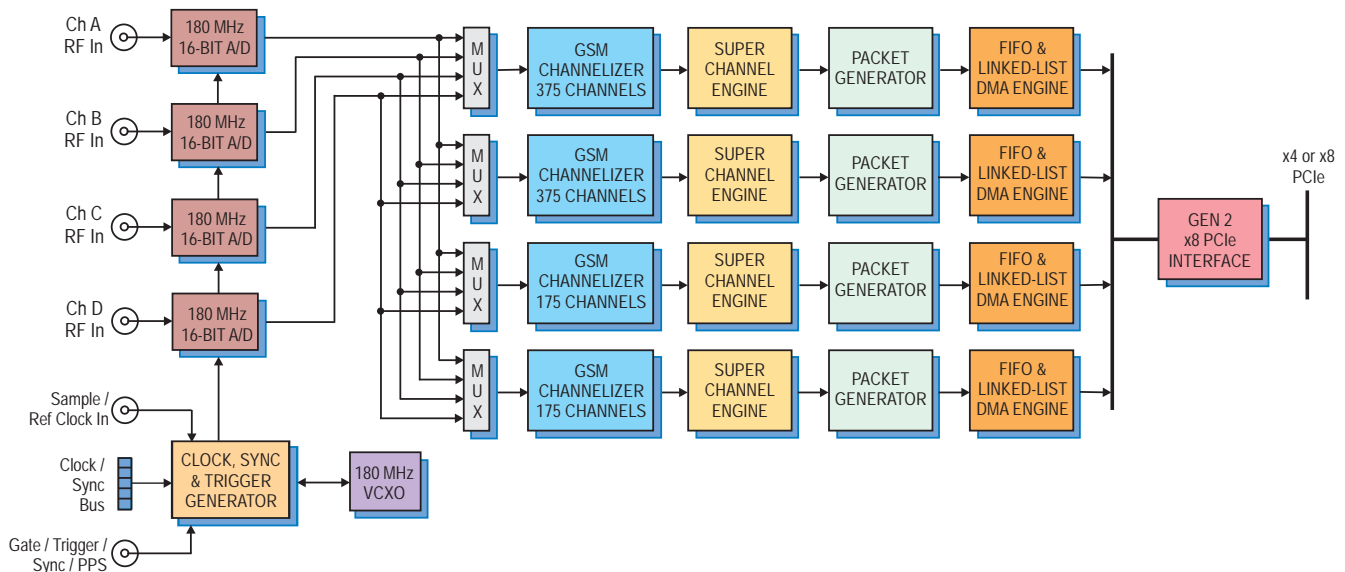

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**GSM Channelizer Cores**

The 71663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 71663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 71663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 71663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 71663 and host. ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**► Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

New!

Features

- Complete radar and software radio interface solution
- PCIe output supports VITA 49.0 Radio Transport (VRT) Standard
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

General Information

Model 71664 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs (digital downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP. The 71664 PCIe output supports fully the VITA 49.0 Radio Transport (VRT) Standard.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71664 includes a general purpose connector for application-specific I/O.

The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71664 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC

(Digital Downconverter) IP core. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71664 to operate as a complete turnkey solution without the need to develop any FPGA IP.

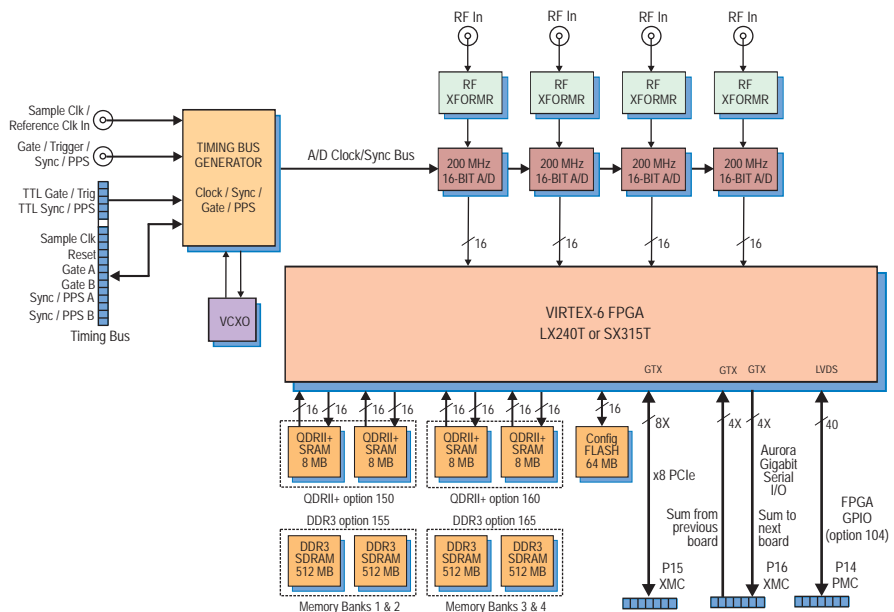

Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71664 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71664 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and

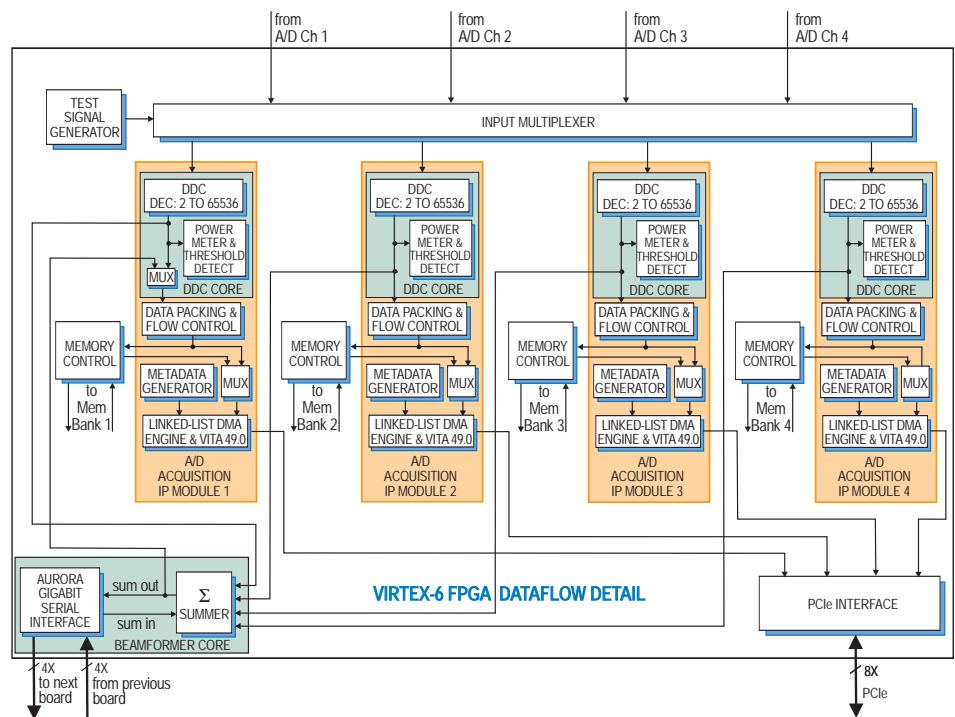

threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71664's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA 49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

The 71664 supports fully the VITA 49.0 specification. ➤

### ► A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71664's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71664 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 71664 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### XMC Interface

The Model 71664 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71664 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple boards. ►

## Model 8266

The Model 8266 is a PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8;  
 Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in. ►

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual- $\mu$ Sync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71670 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71670 includes general purpose and gigabit serial connectors for application-specific I/O .

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71670 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions,

a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 71670 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

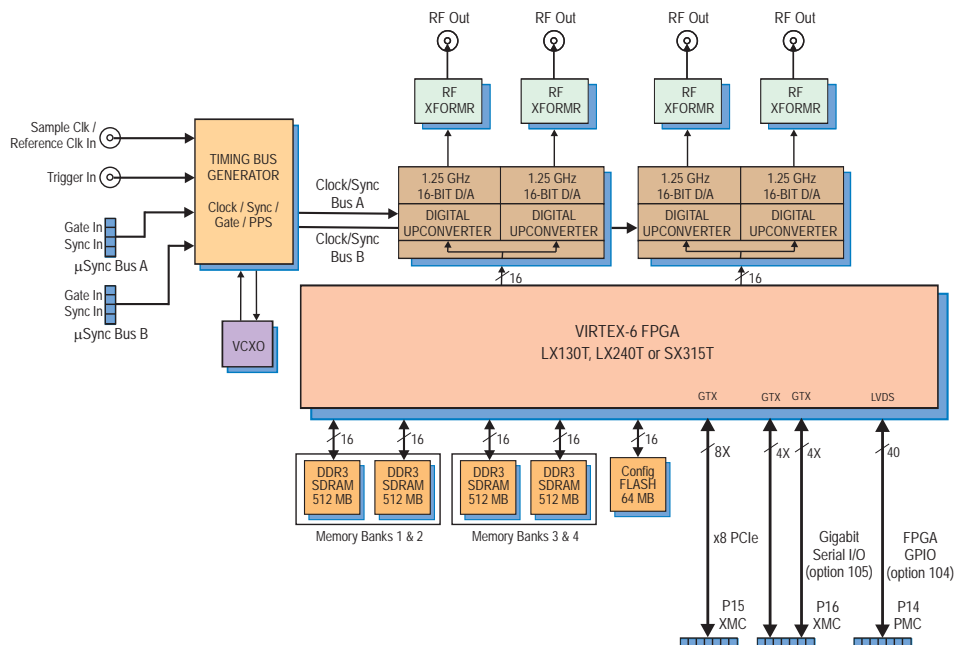

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support serial protocols. ▶

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a base-band real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 7192 or 9192 Cobalt Synchronizers can drive multiple 71670 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 71670 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

XMC Interface

The Model 71670 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 3.125 GHz bit clock. With dual XMC connectors, the 71670 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application. ►

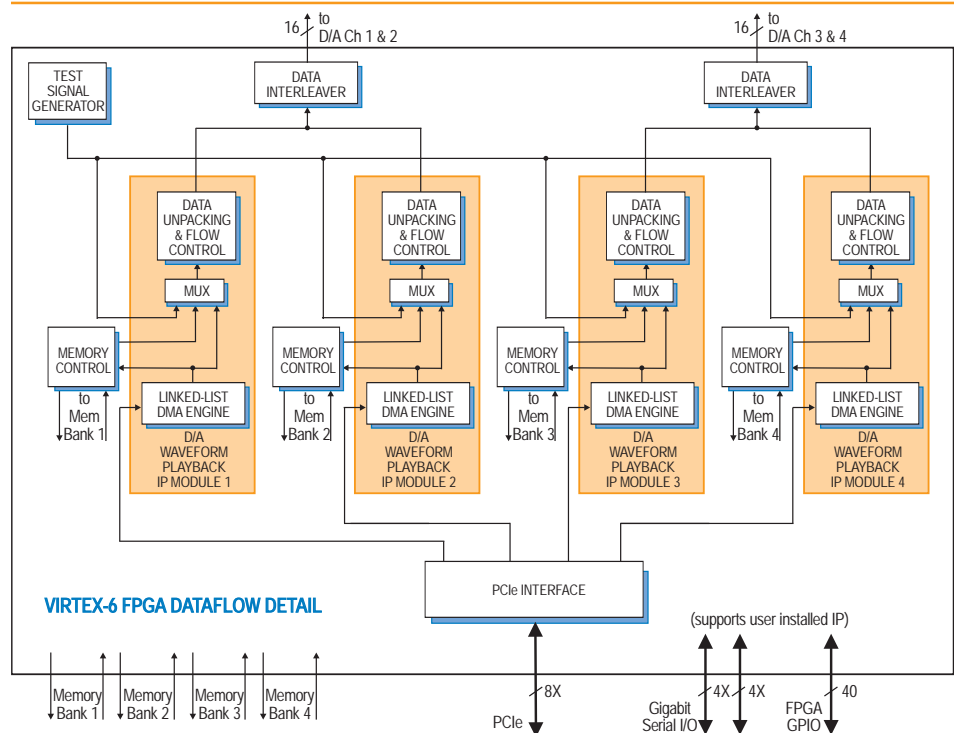

D/A Waveform Playback IP Module

The Model 71670 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► PCI Express Interface

The Model 71670 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### D/A Converters

**Type:** TI DAC3484  
**Input Data Rate:** 312.5 MHz max.  
**Output Bandwidth:** 250 MHz max.  
**Output Sampling Rate:** 1.25 GHz max. with interpolation  
**Interpolation:** 2x, 4x, 8x or 16x  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Quantity:** Four D/A outputs  
**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps  
**Full Scale Output Programming:**  $1.0 \times (G+1) / 16$  Vp-p, where 4-bit integer  $G = 0$  to 15

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock  
**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz  
**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

### External Trigger Input

**Type:** Front panel female SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VVSX315T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as two 4X or one 8X gigabit serial links to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

## External Trigger Input

**Type:** Front panel female SSMC connector

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

## Field Programmable Gate Array:

Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as two 4X or one 8X gigabit serial links to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA boosts LNB (low-noise block) antenna signal levels with up to 60 dB gain
- Programmable analog downconverter provides I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two 200 MHz 16-bit A/Ds digitize the I + Q signals synchronously
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1 & 2) interface, up to x8
- Clock/sync bus for multimodule synchronization
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 71690 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A 2-Channel high-speed data converter, it is suitable for connection directly to the RF port of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 71690 includes general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71690 factory-installed functions include two A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal

generator, and a PCIe interface complete the factory-installed functions and enable the 71690 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

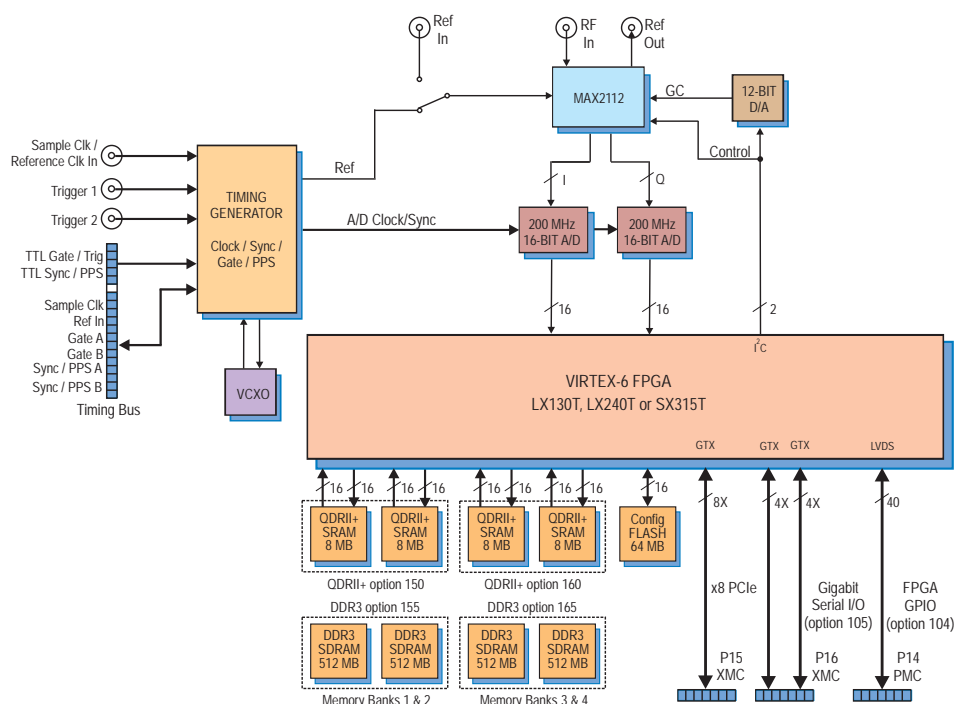

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs the P14 PMC connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

► RF Tuner Stage

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz from an antenna LNB (low noise block). A Maxim MAX2112 tuner directly converts these L-Band signals to baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA (low noise amplifier), a PLL (phase-locked loop) synthesized local oscillator, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

An integrated lowpass filter with variable bandwidth provides bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

A/D Converter Stage

The analog baseband I and Q analog tuner outputs are then applied to two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

A/D Clocking and Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the module. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave modules, supporting synchronous sampling and sync functions across all connected modules.

Memory Resources

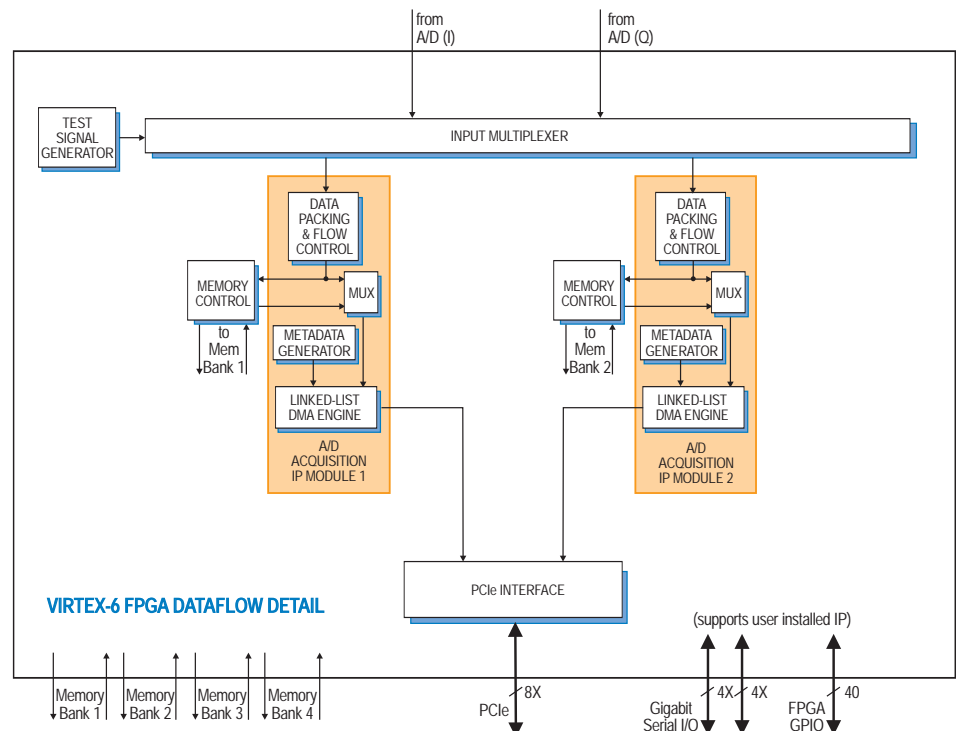

The 71690 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

A/D Acquisition IP Modules

The 71690 features two A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71690	L-Band RF Tuner with 2-Channel 200 MHz A/D and Virtex-6 FPGA - XMC

### Options:

-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA.

## XMC Interface

The Model 71690 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to a 6 GHz bit clock. With dual XMC connectors, the 71690 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71690 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC

**Impedance:** 50 ohms

### L-Band Tuner

**Type:** Maxim MAX2112

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$\text{freq}_{\text{VCO}} = (N.F) \times \text{freq}_{\text{REF}}$

where integer N = 19 to 251 and

fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel

SSMC connector or on-board 27 MHz

crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a

programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

\*Usable Full-Scale Input Range: -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

## A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board timing generator/synthesizer

## A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

## Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 20 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8;

Gen. 2 x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched-fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 71720 is a member of the Onyx® family of high-performance XMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71720 includes general-purpose and gigabit-serial connectors for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 71720 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 71720 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

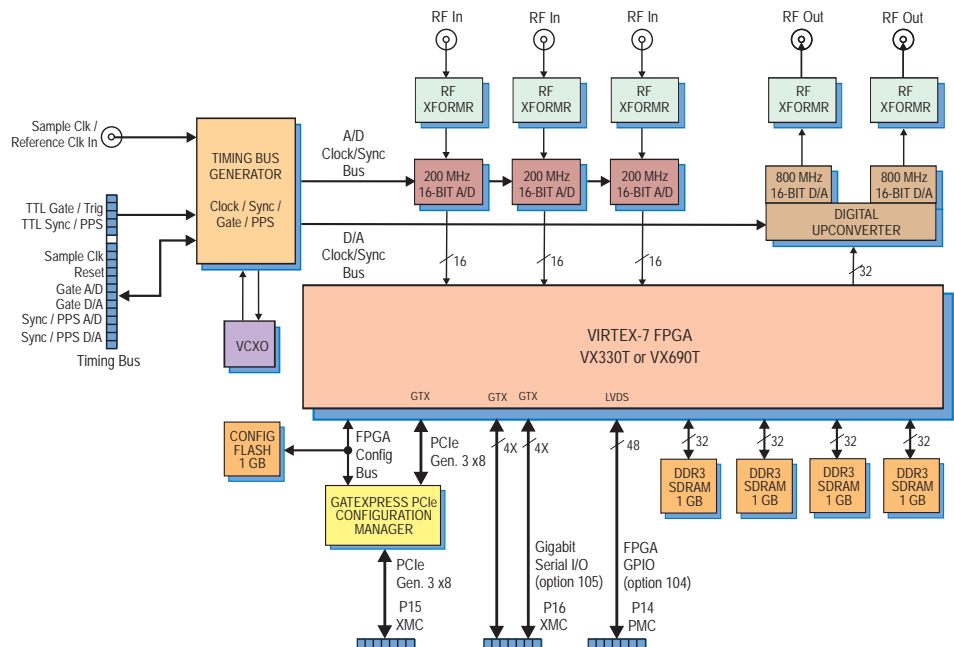

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support serial protocols. ▶

**A/D Acquisition IP Modules**

The 71720 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 71720 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board’s configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board’s PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

**A/D Converter Stage**

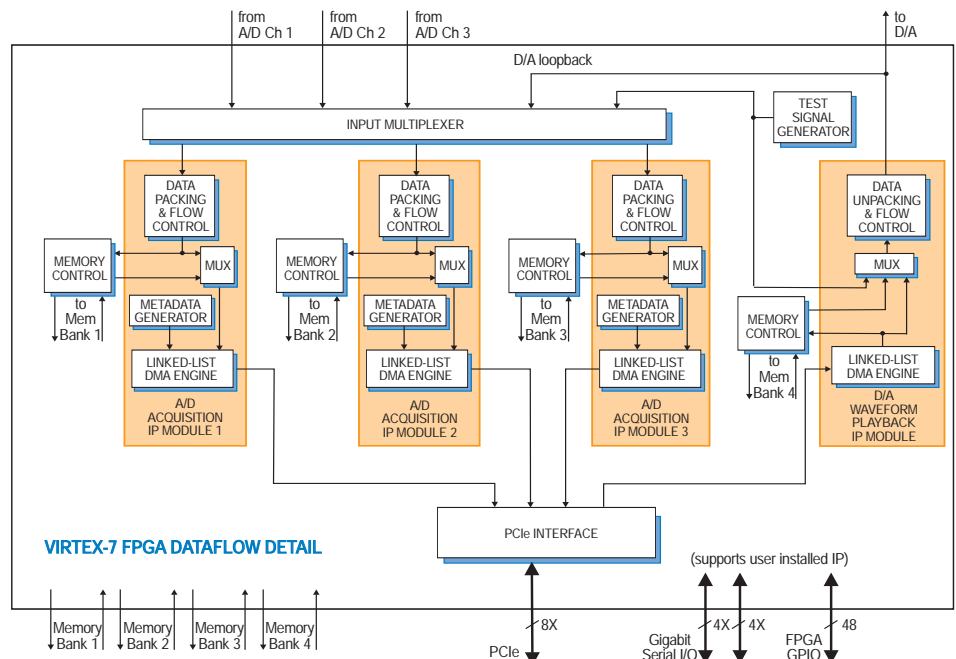

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors. ►

## Memory Resources

The 71720 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - XMC

### Options:

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

## XMC Interface

The Model 71720 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 GB/sec per lane. With dual XMC connectors, the 71720 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## PCI Express Interface

The Model 71720 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3; x4 or x8; Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 71721 is a member of the Onyx® family of high performance XMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71721 includes an optional connection to the Virtex-7 FPGA for custom I/O .

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 71721 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71721 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

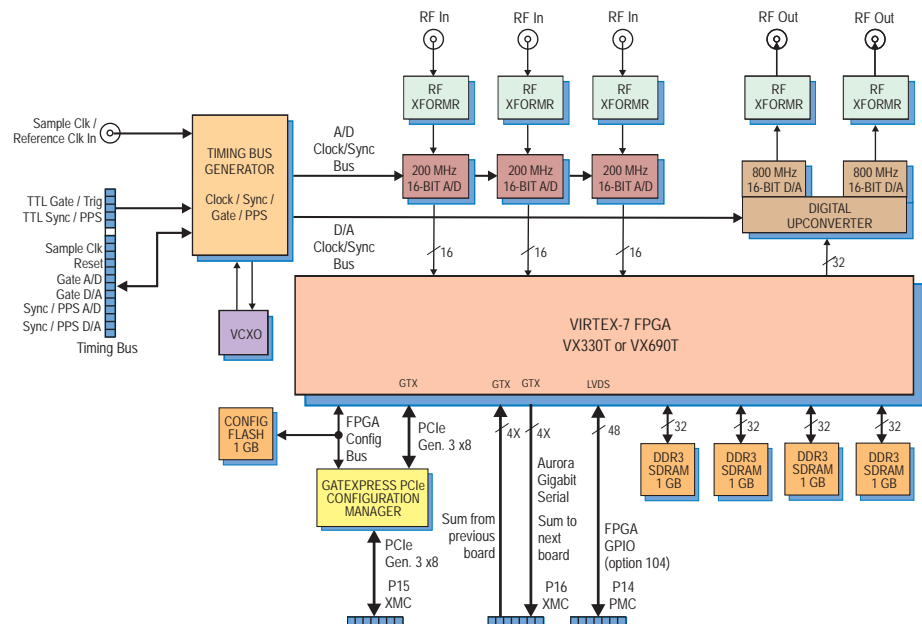

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71721 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be program-med from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71721 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

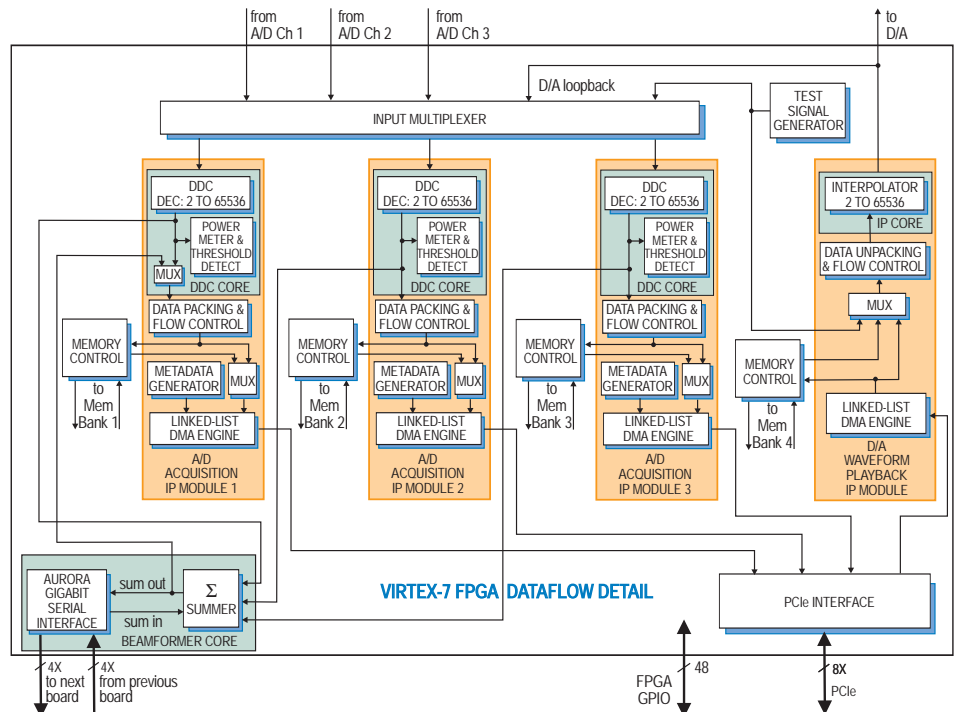

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71721's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 71721 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71721's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules. ►

## XMC Interface

The Model 71721 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71721 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple modules.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71721	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - XMC

### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8266	PC Development System See 8266 Datasheet for Options

## Memory Resources

The 71721 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 71721 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Three channels

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 71730 is a member of the Onyx<sup>®</sup> family of high performance XMC modules based on the Xilinx Virtex-7 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and D/A converters and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71730 includes optional general purpose and gigabit serial card connectors for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 71730 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71730 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

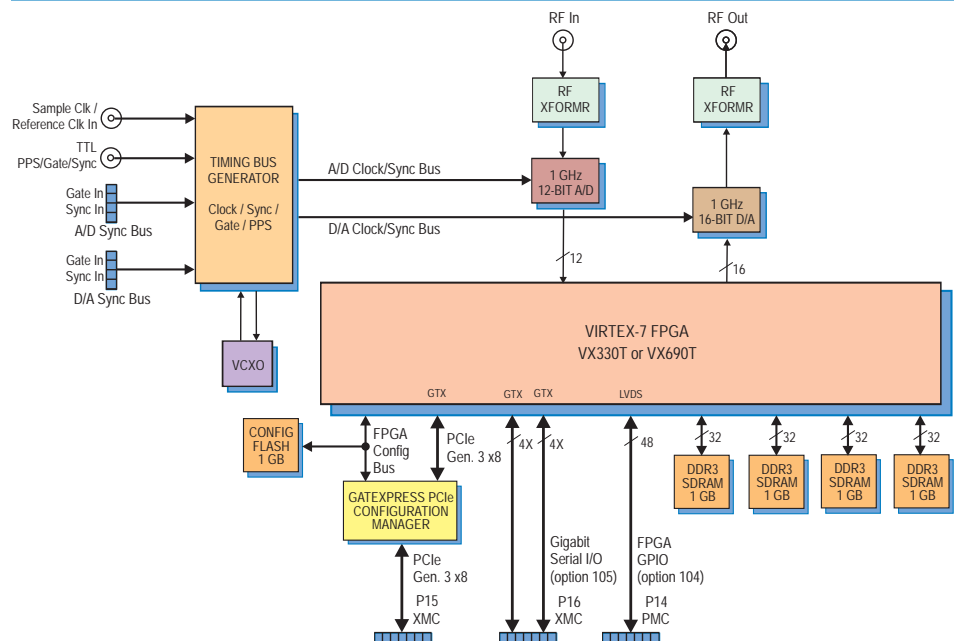

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support serial protocols. ▶

**A/D Acquisition IP Module**

The 71730 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 71730 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

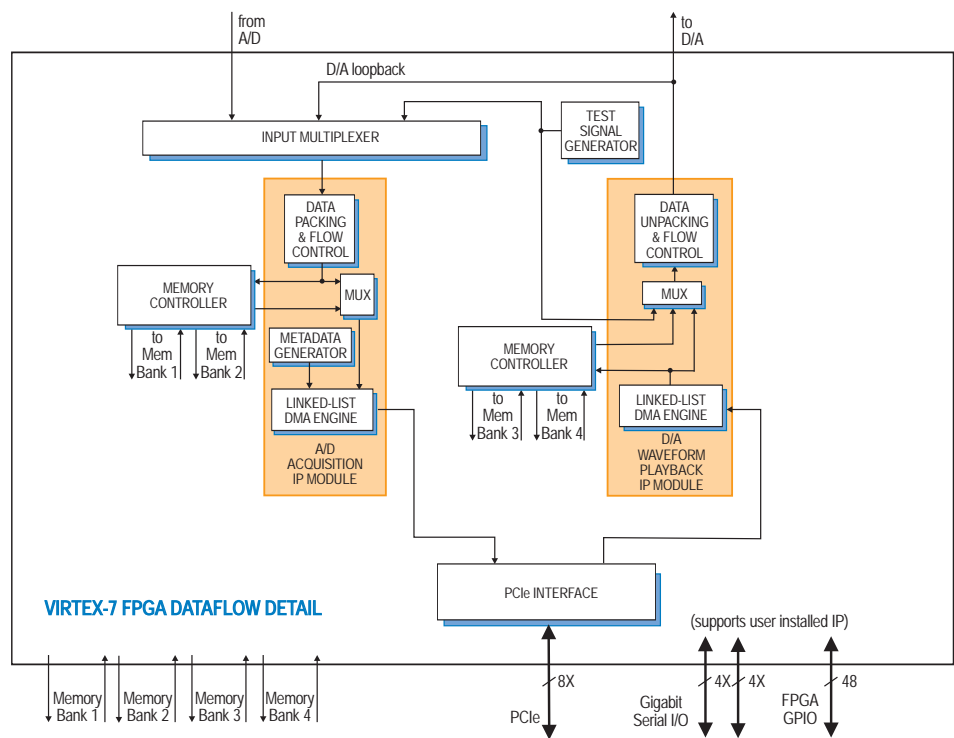

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 71730 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GS/sec, allowing it to accept full-rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector. ➤

## XMC Interface

The Model 71730 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71730 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel  $\mu$ Sync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7192 and Model 9192 Cobalt Synchronizers can drive multiple 71630  $\mu$ Sync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

## Memory Resources

The 71730 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 71730 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

### D/A Converter

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA  
**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**General Information**

Model 71741 is a member of the Onyx® family of high-performance XMC modules based on the Xilinx Virtex-7 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 71741 includes an optional connection to the Virtex-7 FPGA for custom I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 71741 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR3 SDRAM

memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71741 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

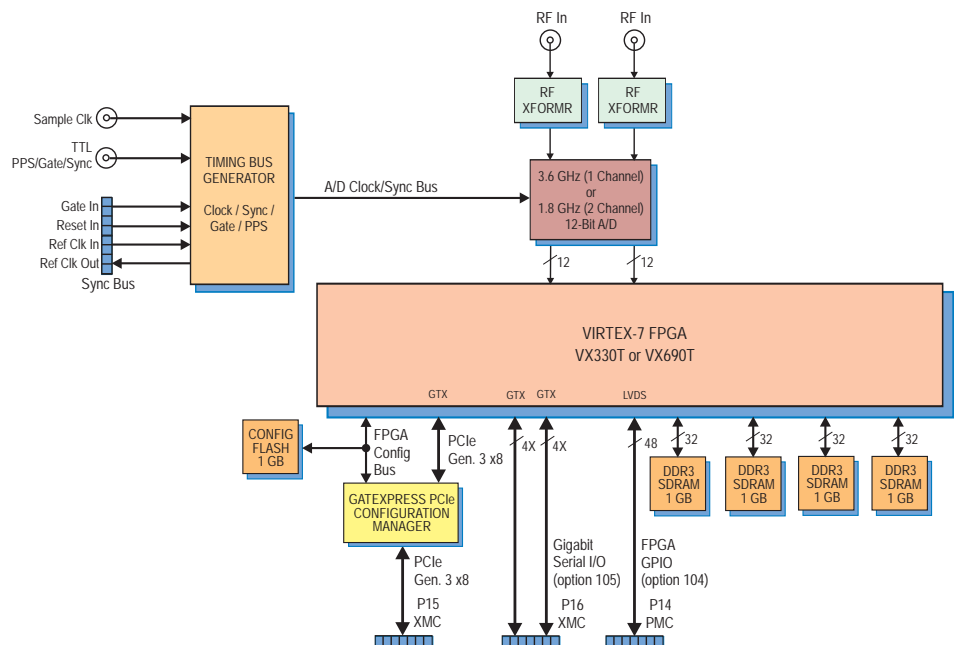

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support serial protocols. ▶

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 4 GB of DDR3 SDRAM
- μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**A/D Acquisition IP Module**

The 71741 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

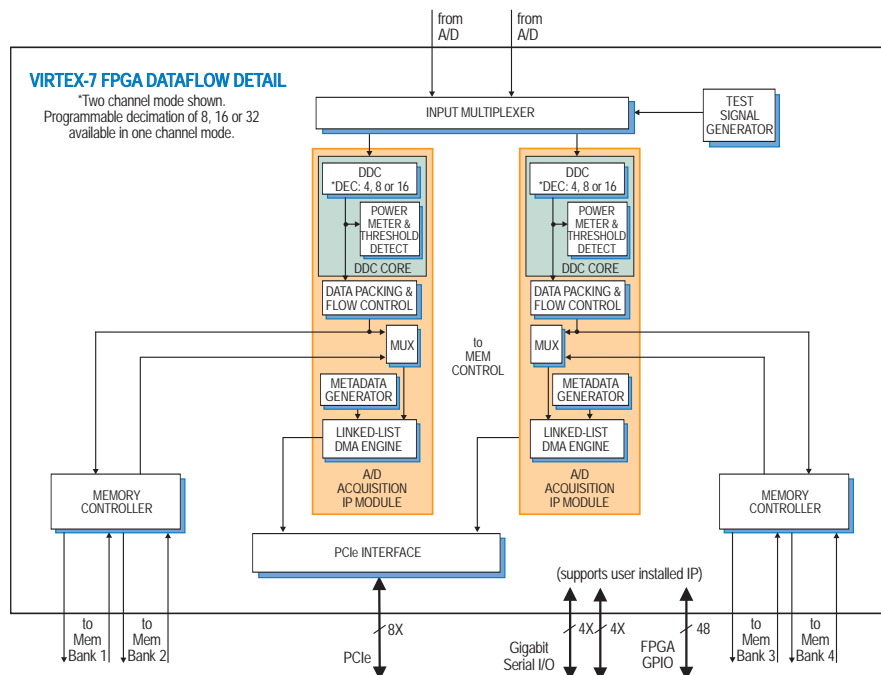

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

## Memory Resources

The 71741 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
71741	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Virtex-7 FPGA - XMC

### Options:

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 71741 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

## PCI Express Interface

The Model 71741 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Clocking and Synchronization

The 71741 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple modules to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 71741's can be synchronized with a simple cable. For larger systems, multiple 71741's can be synchronized using the Model 7192 high-speed sync module to drive the sync bus.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds

**General Information**

Model 71751 is a member of the Onyx® family of high performance XMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71751 includes a general purpose connector for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71751 factory installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 71751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

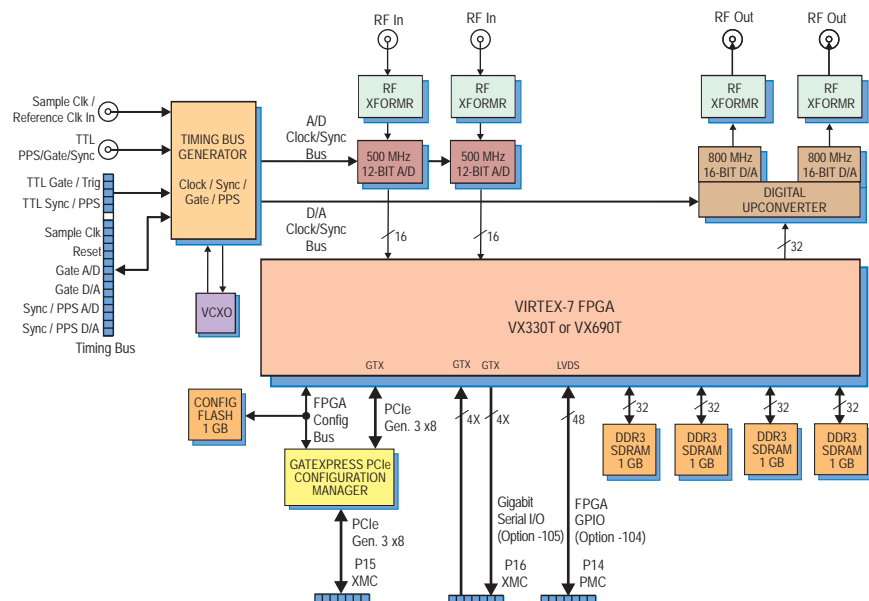

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 71751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as

two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 71751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

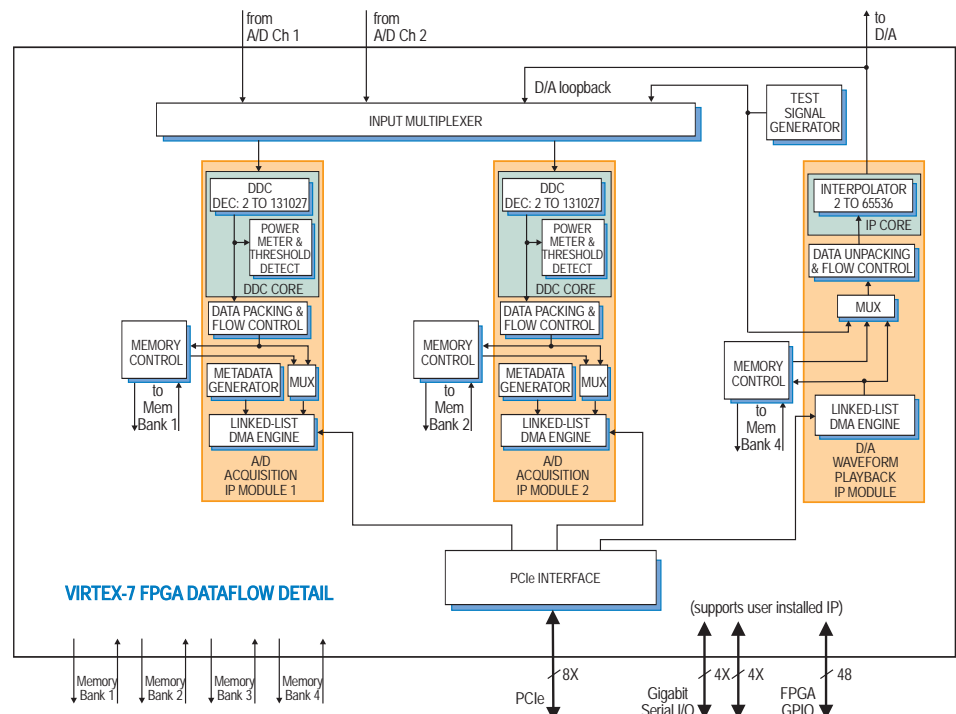

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### XMC Interface

The Model 71751 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71751 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple modules.

### PCI Express Interface

The Model 71751 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
71751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - XMC

#### Options:

-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

Model	Description
8266	PC Development System See 8266 Datasheet for Options

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

#### Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA  
**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Advanced reconfigurability features
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 71760 is a member of the Onyx® family of high-performance XMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71760 includes general-purpose and gigabit-serial connectors for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71760 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 71760 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

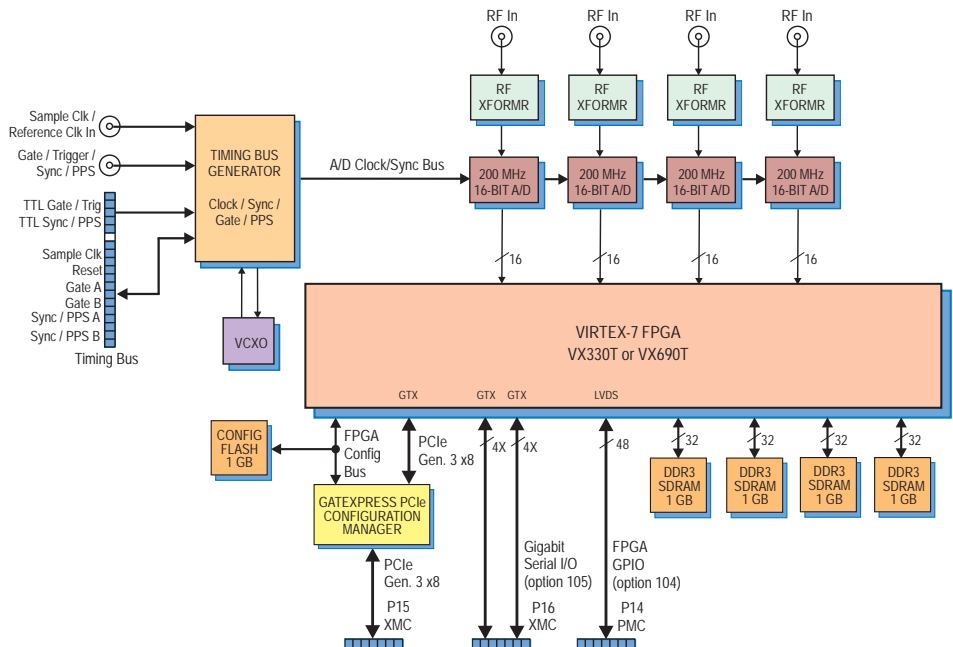

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with dual 4X gigabit links to the FPGA to support serial protocols. ▶

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an ►

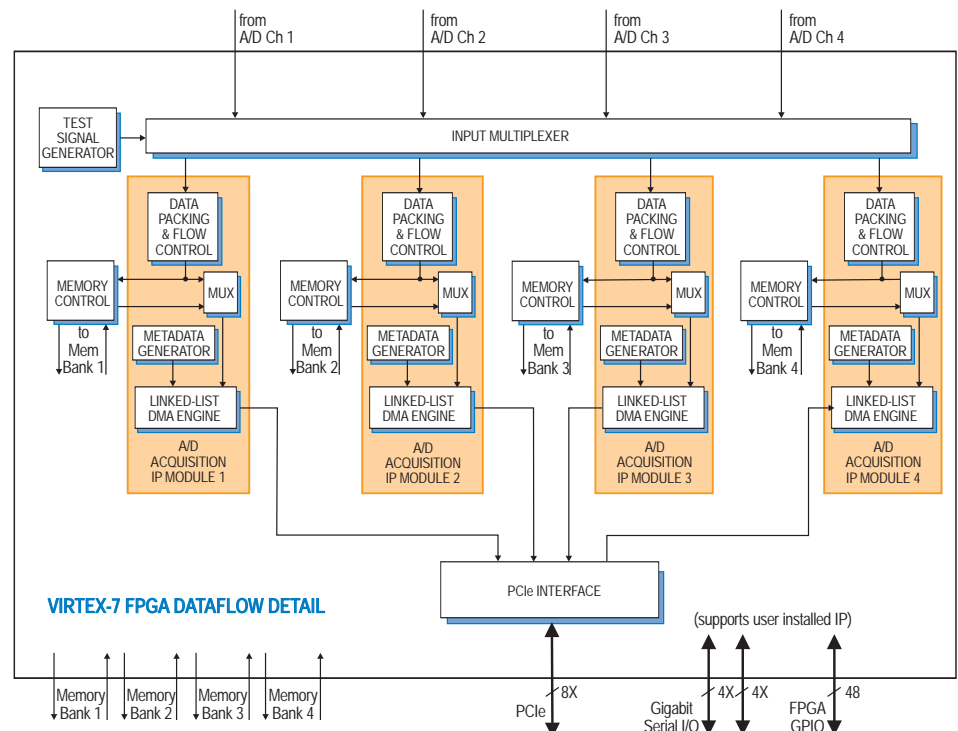

A/D Acquisition IP Modules

The 71760 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
71760	4-Channel 200 MHz A/D with Virtex-7 FPGA - XMC
<b>Options:</b>	
-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71760's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71760 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**XMC Interface**

The Model 71760 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71760 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

**PCI Express Interface**

The Model 71760 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X or two 4X gigabit serial links to the FPGA

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8 Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 71761 is a member of the Onyx® family of high performance XMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with programmable DDCs (Digital Downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71761 includes an optional connection to the Virtex-7 FPGA for custom I/O .

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 71761 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 71761 to operate as a complete turnkey solution without the need to develop any FPGA IP.

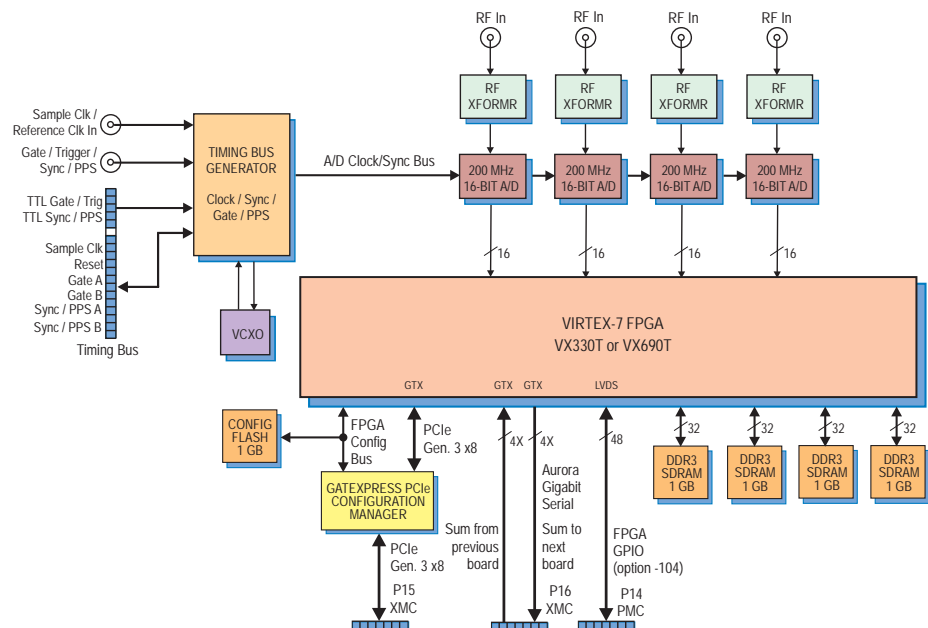

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 71761 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 71761 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71761's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple modules.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

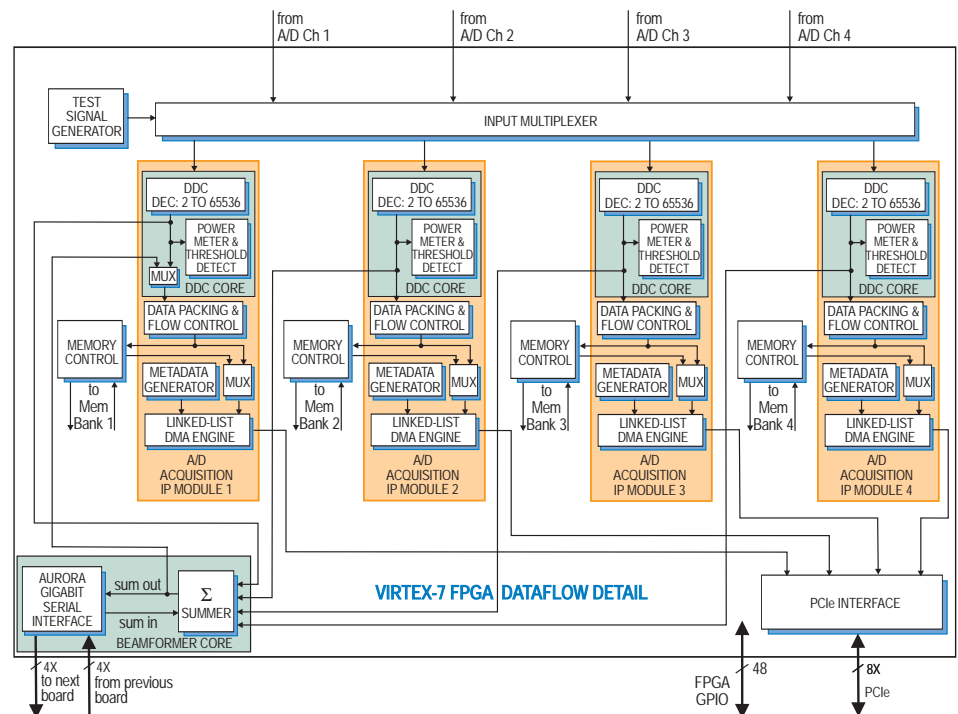

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_{sr}$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other module resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple modules can be driven from the LVPECL bus master, supporting synchro-

nous sampling and sync functions across all connected modules.

### Memory Resources

The 71761 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 71761 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### XMC Interface

The Model 71761 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71761 supports x8 PCIe on the first XMC connector. The second connector is used for the Aurora interface and provides a dedicated board-to-board interface for beamforming across multiple modules. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit  
**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards (Models 78xxx). It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

New!

# Model 71791

# L-Band RF Tuner, 2-Channel 500 MHz A/D, Virtex-7 FPGA - XMC

### Features

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA handles L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverter provides IF or I+Q baseband signals at frequencies up to 123 MHz
- Two 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2, & 3) interface, up to x8
- Clock/sync bus for multimodule synchronization
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

### General Information

Model 71791 is a member of the Onyx® family of high-performance XMC modules based on the Xilinx Virtex-7 FPGA. It is suitable for connection directly to an L-band signal for SATCOM and communications systems. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71791 includes general purpose and gigabit serial connectors for application-specific I/O.

### The Onyx Architecture

The Pentek Onyx Architecture features a Virtex-7 FPGA. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The 71791 factory-installed functions include two A/D acquisition IP modules, four DDR3 memory controllers, two DDCs (digital downconverters), an RF tuner controller, a clock and synchronization generator, a test signal generator, and a Gen 3 PCIe interface.

Thus, the 71791 can operate as a complete turnkey solution with no need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

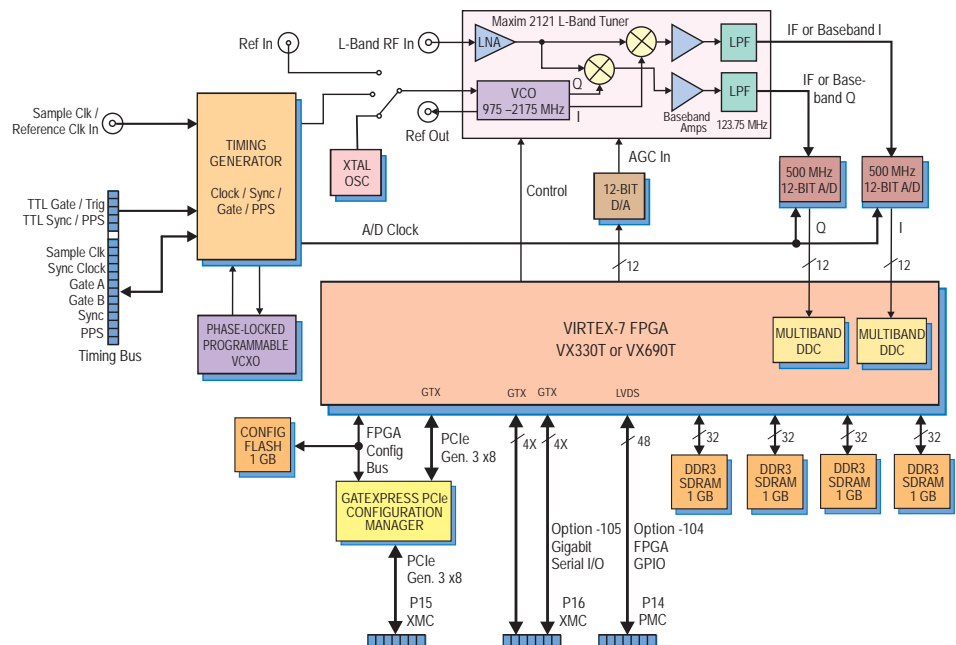

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS to match the specific requirements of external custom I/O connections to the FPGA.

Option -105 installs the P16 XMC connector with one 8X or two 4X gigabit links to the FPGA to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 71791 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

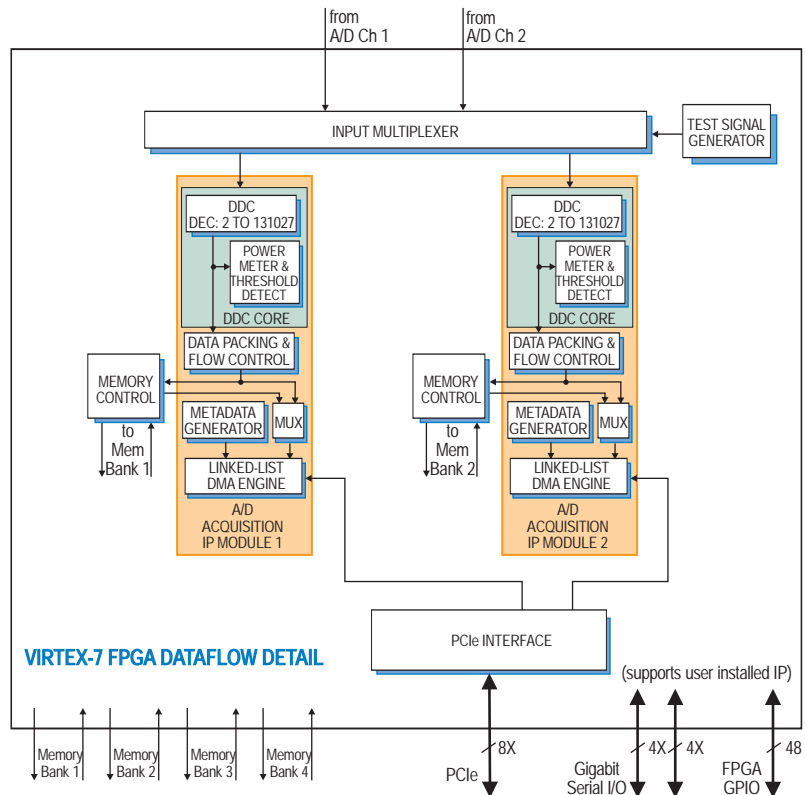

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ▶

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The two analog tuner outputs are digitized by two Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two independent A/D and DDC channels are now available for digitizing and downconverting two signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the module. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave modules, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71791 architecture supports four independent 1 GB DDR3 SDRAM for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 and 2. Banks 3 and 4 can be used to support custom user-installed IP within the FPGA .

### PCI Express Interface

The Model 71791 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCIe boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► Specifications

### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

### L-Band Tuner

**Type:** Maxim MAX2121

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$\text{freq}_{\text{VCO}} = (\text{N.F.}) \times \text{freq}_{\text{REF}}$

where integer N = 19 to 251 and

fractional F is a 20-bit binary value

**PLL Reference** ( $\text{freq}_{\text{REF}}$ ): Front panel

SSMC connector or on-board 27 MHz

crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a

programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**

-50 dBm to +10 dBm

**Baseband Low Pass Filter:**

3 dB cutoff frequency: 123.75 MHz

### A/D Converters

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 10 MHz to 500 MHz

**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources:** On-board timing generator/synthesizer

### A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL

timing bus

**Synchronization:** VCXO can be locked

to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO

can be divided by 1, 2, 4, 8, or 16, for the A/D clock

### Timing Generator External Clock Input

**Type:** Front panel female SSMC con-

connector, sine wave, 0 to +10 dBm,

AC-coupled, 50 ohms, accepts 10 to 200

MHz (up to 800 MHz when Timing Gen-

erator divider is enabled) or PLL system

reference

**Timing Generator Bus:** 26-pin front panel

connector LVPECL bus includes, clock/

sync/gate/PPS inputs and outputs;

TTL signal for gate/trigger and sync/

PPS inputs

### External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC con-

ector, LVTTTL

**Function:** Programmable functions

include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs the PMC P14 con-

connector with 24 LVDS pairs to the FPGA

**Option -105:** Provides one 8X or two 4X

gigabit links between the FPGA and VPX

P1 connector to support serial protocols.

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3\*: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

\* Gen 3 requires a compatible backplane and SBC

New!

# Model 71131

# 8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - XMC

## General Information

Model 71131 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71131 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multi-board clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71131 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71131 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 71131 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

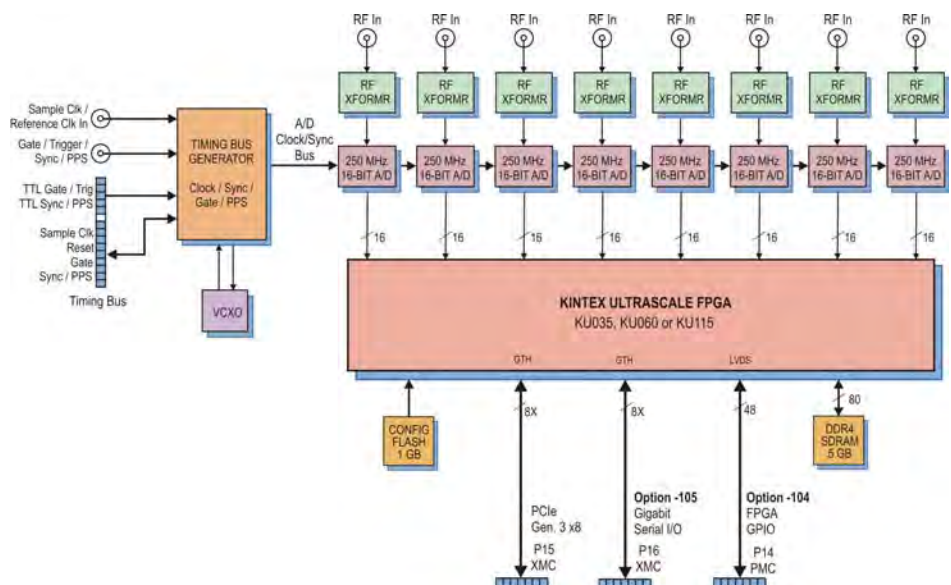

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through

## Features

- Complete radar and software radio interface solution
- Powerful Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 71131 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an

output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **KU115.** The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with eight full duplex gigabit links to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-

board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

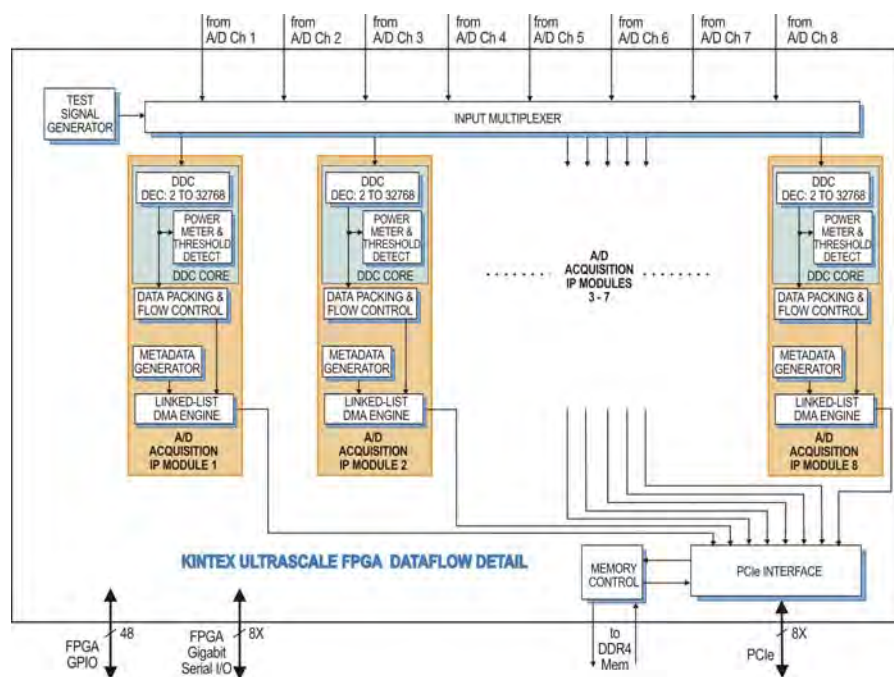

Up to three additional modules can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules. For larger systems, the Model 7893 System Synchronizer supports additional modules in increments of eight.

**Memory Resources**

The 71131 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**PCI Express Interface**

The Model 71131 includes an industry-standard interface fully compliant with PCI ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
71131	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - XMC
<b>Options:</b>	
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## XMC Interface

The Model 71131 complies with the VITA 42.0 XMC specification. Two connectors each provide dual 4X links or a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71131 supports x8 PCIe on the first XMC connector leaving the second connector free to support user-installed transfer protocols specific to the target application.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >108 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector providing 8X serial links to the FPGA

## Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

## PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

## Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

New!

# Model 71132

# 8-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - XMC

## General Information

Model 71132 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71132 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71132 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71132 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 71132 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

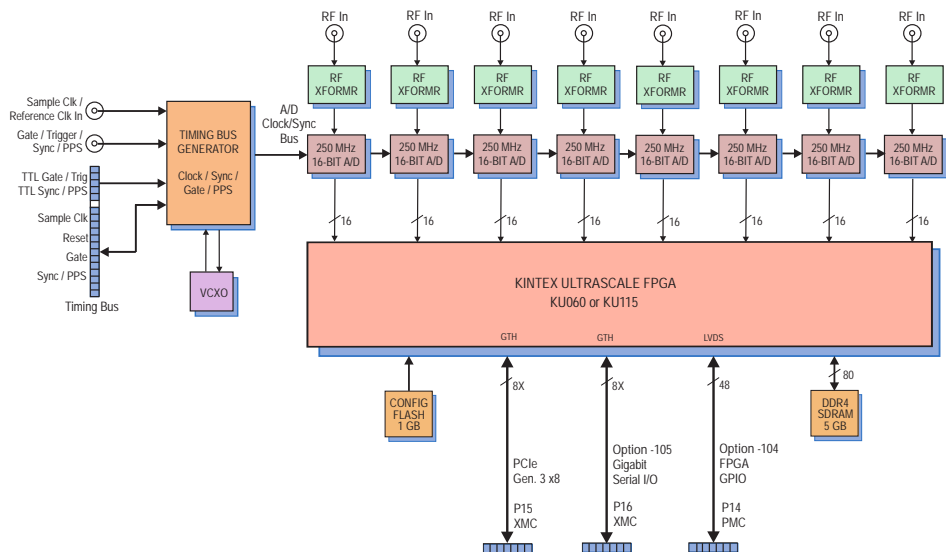

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU 115. ➤

## Features

- Complete radar and software radio interface solution
- Supports Powerful Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight wideband DDCs (digital downconverters)
- 64 multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Modules**

The 71132 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with eight full duplex gigabit links to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

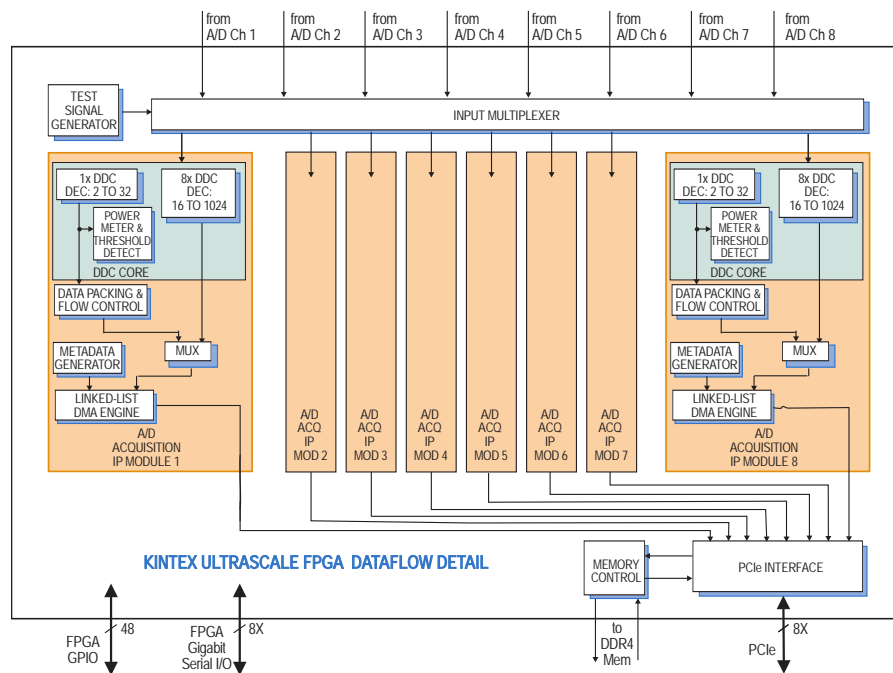

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Up to three additional modules can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules. For larger systems, the Model 7893 System Synchronizer supports additional modules in increments of eight.

**Memory Resources**

The architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of it for custom applications. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## ► PCI Express Interface

The Model 71132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## XMC Interface

The Model 71132 complies with the VITA 42.0 XMC specification. A connector provides a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71132 supports x8 PCIe on the first XMC connector leaving the second free to support user-installed transfer protocols specific to the target application.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

### Wideband Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Multiband Digital Downconverters

**Quantity:** Eight banks, 8 channels per bank  
**Decimation Range:** 16x to 1024x in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

## Clock Synthesizer

The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71141 is a high-speed analog-to-digital and digital-to-analog converter with programmable DDCs (digital downconverters) and DUCs (digital upconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and generator features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 6.4 GHz, 12-bit A/D converter, dual 6.4 GHz, 14-bit D/As and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 71141 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

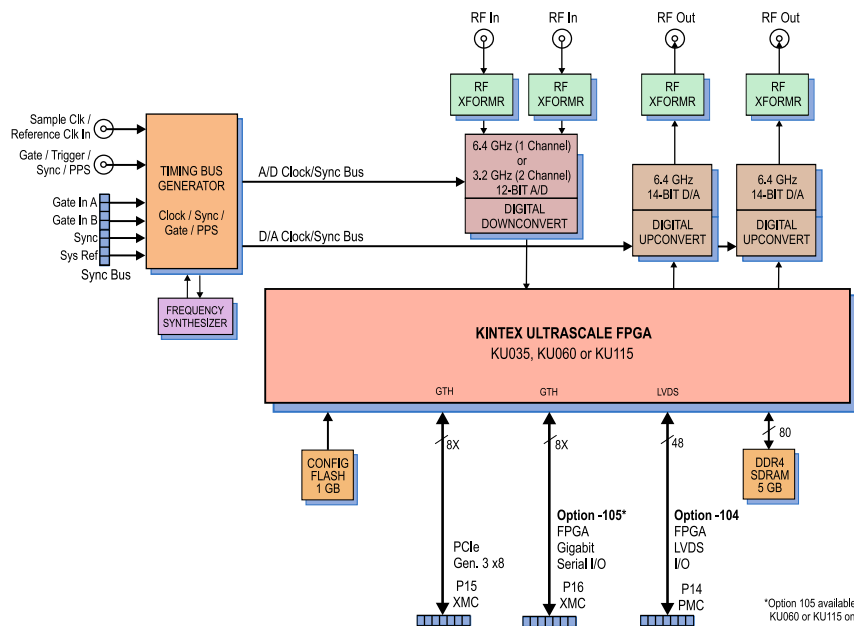

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71141 factory-installed functions include two A/D acquisition and two D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71141 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

**A/D Acquisition IP Module**

The 71141 features two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The Model 71141 factory installed functions include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the dual D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with 8X gigabit link to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D’s built-in digital down-converters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real

or complex baseband input signals. It delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The 71141 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

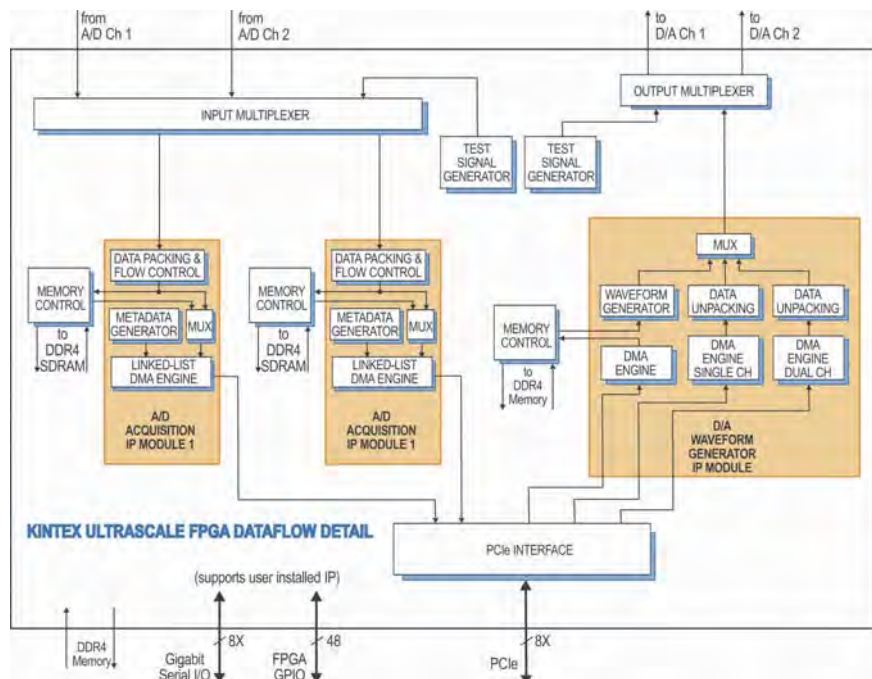

**PCI Express Interface**

The Model 71141 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

The 71141 accepts a sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple modules to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. The Model 7192 high-speed sync module can be used to drive the sync bus to synchronize multichannel systems. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode:

6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode:

7.9 GHz; dual-channel mode: 8.1 GHz

### D/A Converters

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105 (only available with option -084 or -087):** Installs the XMC P16 connector configurable as one 8X gigabit serial link to the FPGA

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** XMC module 2.910 in x 5.870 in (74.00 mm x 149.00 mm)

## Ordering Information

Model	Description
71141	1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - XMC

### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through P14 connector
- 105	Gigabit serial FPGA I/O through P16 connector
- 702	Air cooled, Level L2
- 713	Conduction-cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

Note: Not all combinations of sample rates, decimations and interpolations are available due to JESD204B and PCIe rate limitations.

New!

# Model 71821

# 3-Channel 200 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - XMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Model 71821 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71821 is a 3-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes three A/Ds, a complete multiband clock and sync section, a large DDR4 memory, three DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71821 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 71821 factory-installed functions include three A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

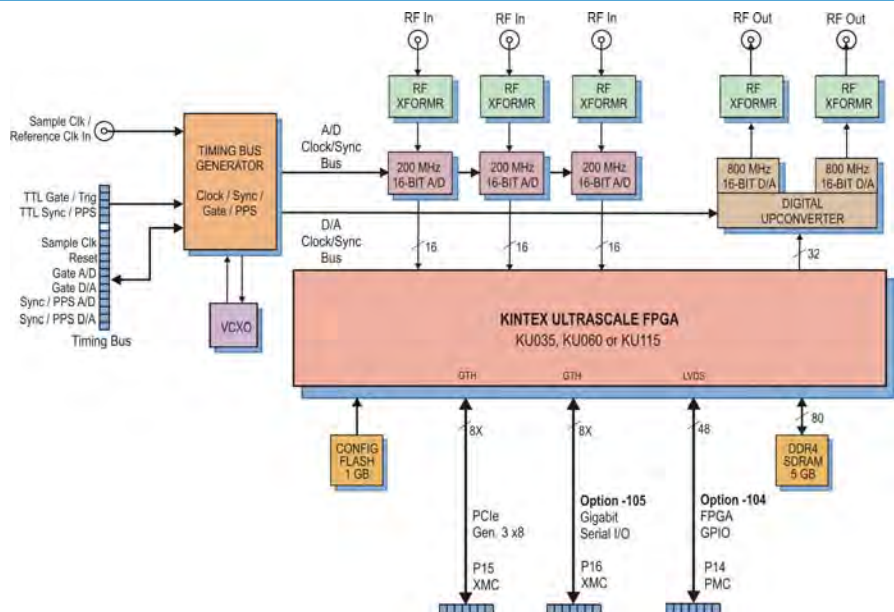

Additional IP includes: three powerful, programmable DDC IP cores; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 71821 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115. ➤

**A/D Acquisition IP Modules**

The 71821 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 71821 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the P16 XMC connector to support serial protocols.

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources.

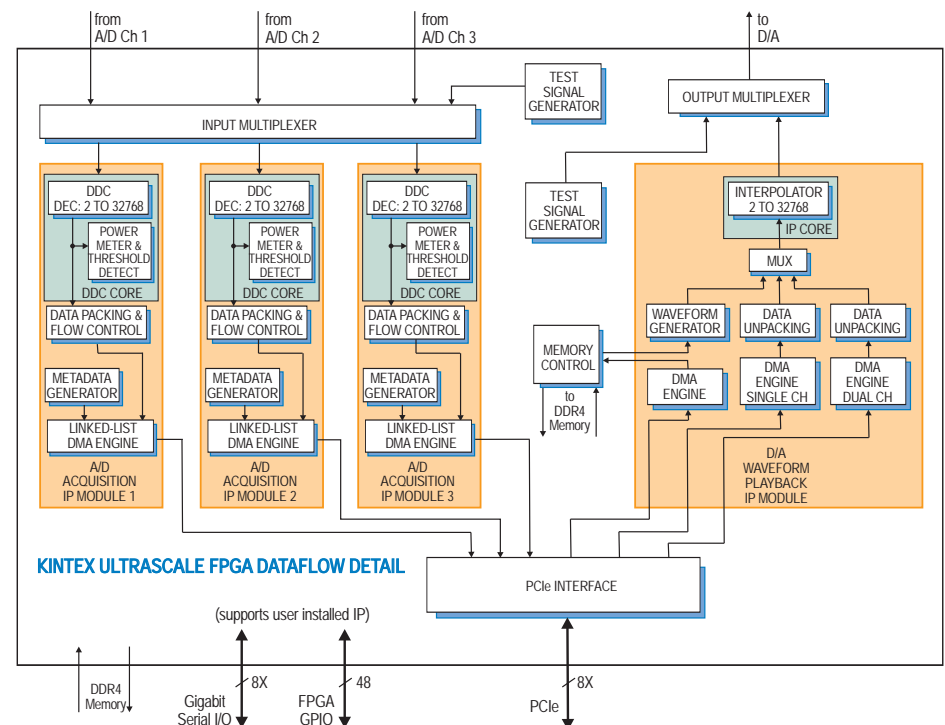

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71821's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 71821 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### XMC Interface

The Model 71821 complies with the VITA 42.0 XMC specification. Each of two connectors provides a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71821 supports x8 PCIe on the first XMC connector leaving the second one free to support user-installed transfer protocols specific to the target application.

### PCI Express Interface

The Model 71821 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description

**► Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator Core**

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA  
**Option -105:** Provides one 8X gigabit link between the FPGA and XMC P16 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

New!

# Model 71841

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Kintex UltraScale FPGA - XMC

## General Information

Model 71841 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71841 is a high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 71841 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade

architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71841 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 71841 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

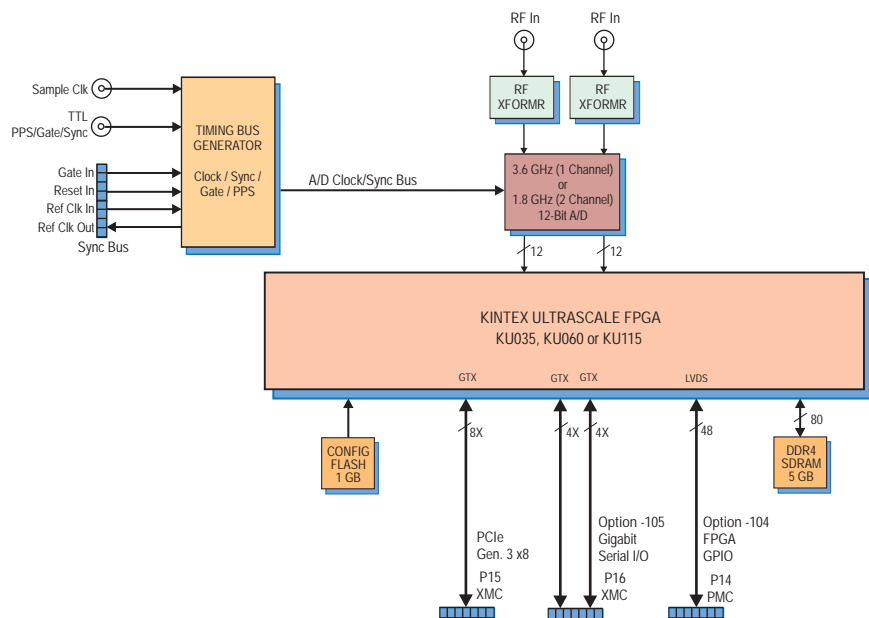

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

The 71841 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

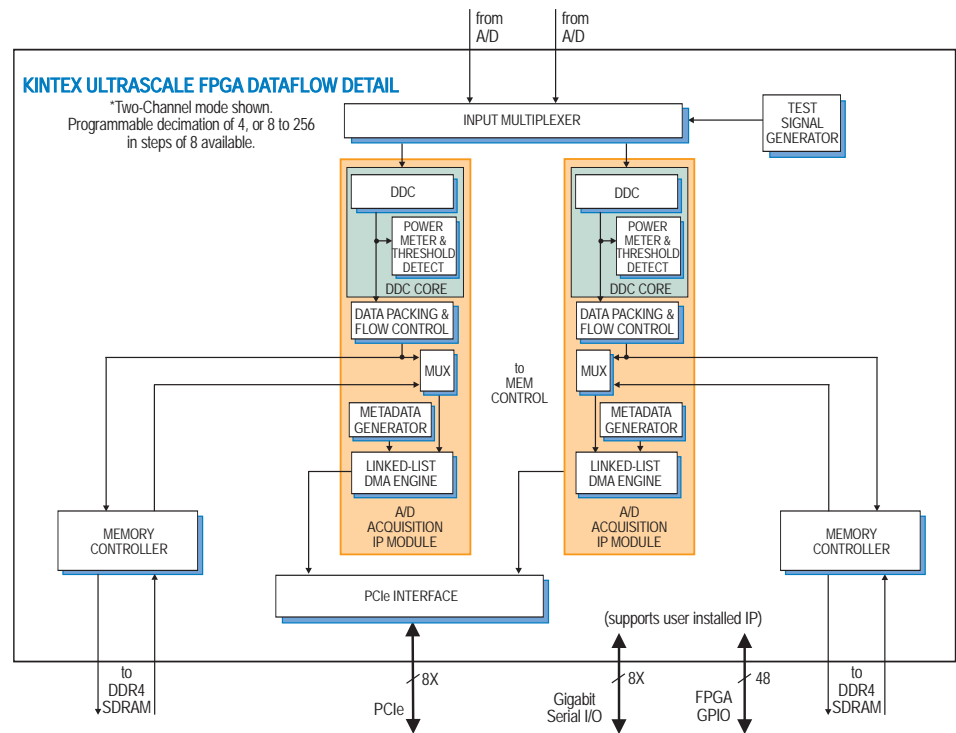

Option -105 installs the P16 XMC connector with 8X gigabit link to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
71841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - XMC

### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through P14 connector
- 105	Gigabit serial FPGA I/O through P16 connector
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

## Memory Resources

The 71861 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

## PCI Express Interface

The Model 71841 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Clocking and Synchronization

The 71841 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple modules to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 71841's can be synchronized with a simple cable. For larger systems, multiple 71841's can be synchronized using the Model 7192 high-speed sync module to drive the sync bus.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz  
**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector configurable as one 8X gigabit serial link to the FPGA

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Standard XMC module, 2.91 in. x 5.87 in.

New!

# Model 71851

## 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - XMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

### General Information

Model 71851 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71851 is a 2-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes two A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71851 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

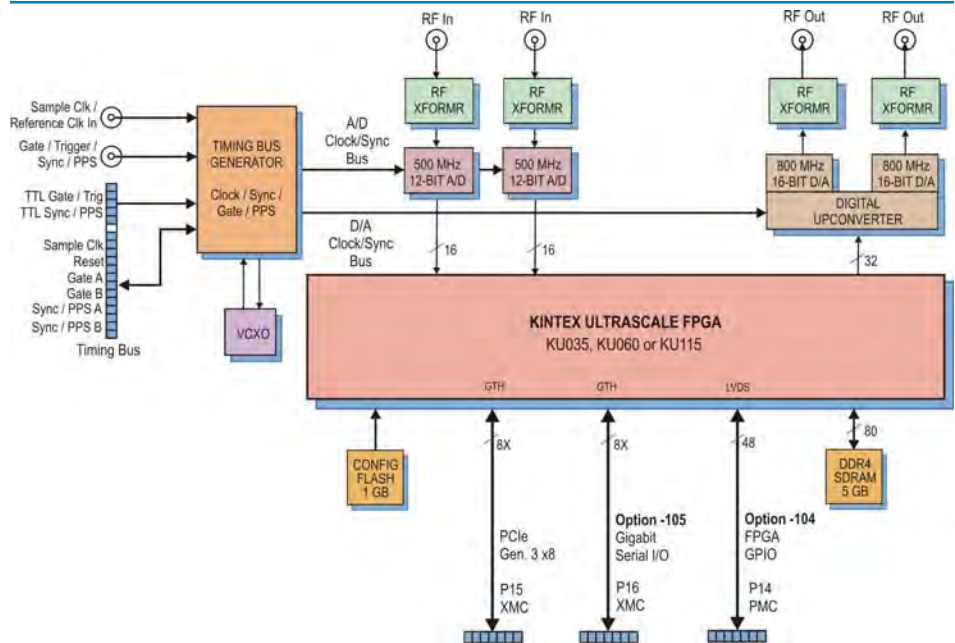

The 71851 factory-installed functions include two A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 71851 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 71851 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 71851 factory-installed functions include a sophisticated D/A Waveform Playback IP module. It allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the P16 XMC connector to support serial protocols.

**A/D Converter Stage**

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

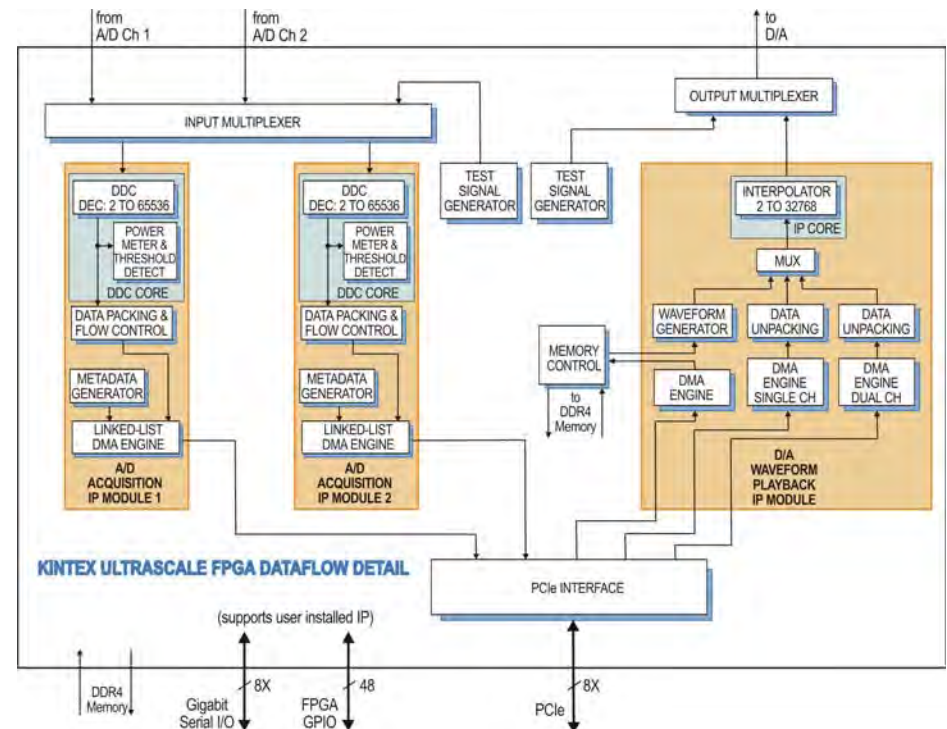

Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

**► Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector

can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 71851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71851 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**XMC Interface**

The Model 71851 complies with the VITA 42.0 XMC specification. Each of two connectors provide a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71851 supports x8 PCIe on the first XMC connector leaving the second one free to support user-installed transfer protocols specific to the target application.

**PCI Express Interface**

The Model 71851 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
71851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - XMC

### Options:

-014	400 MHz, 14-bit A/Ds
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

### Digital Downconverters

**Quantity:** Two channels

**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

### Digital Interpolator Core

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Provides one 8X gigabit link between the FPGA and XMC P16 connector to support serial protocols.

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

### Option -702: L2 (air cooled)

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

### Option -713: L3 (conduction cooled)

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** XMC module 2.910 in x 5.870 in (73.91 mm x 149.10 mm)

New!

# Model 71861

# 4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - XMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Model 71861 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71861 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71861 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

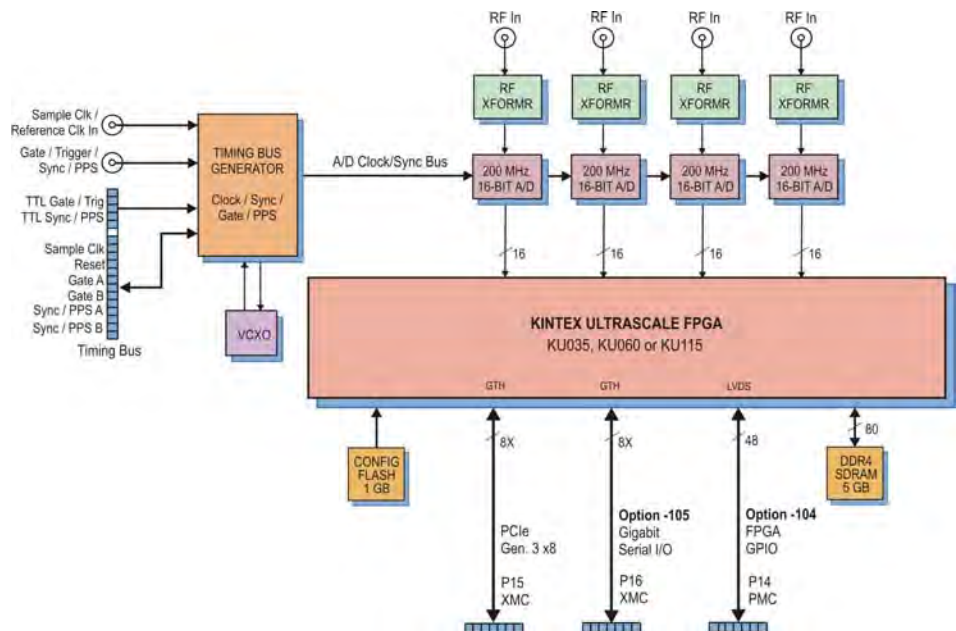

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71861 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 71861 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 71861 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X gigabit link to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

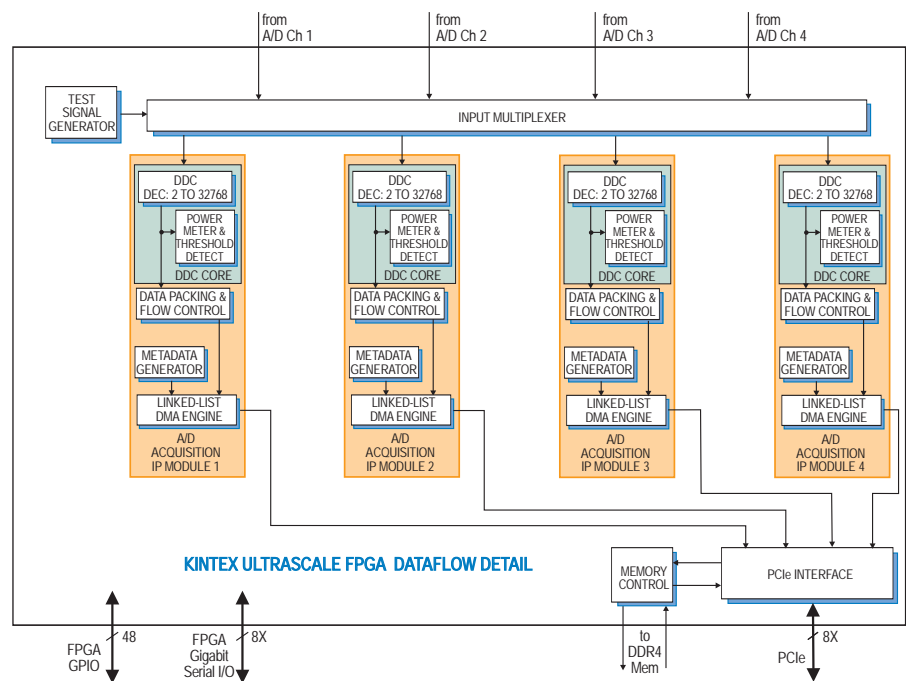

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple modules can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
71861	4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - XMC

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through P14 connector
- 105	Gigabit serial FPGA I/O through P16 connector
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**► PCI Express Interface**

The Model 71861 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**XMC Interface**

The Model 71861 complies with the VITA 42.0 XMC specification. Each of two connectors provide a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71861 supports x8 PCIe on the first XMC connector leaving the second one free to support user-installed transfer protocols specific to the target application.

**Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**FUNCTION:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector with one 8X gigabit serial link to the FPGA

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** XMC module 2.910 in x 5.870 in (74.00 mm x 149.00 mm)

New!

# Model 71862

# 4-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - XMC

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four wideband DDCs and
- 32 multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Model 71862 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 71862 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71862 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

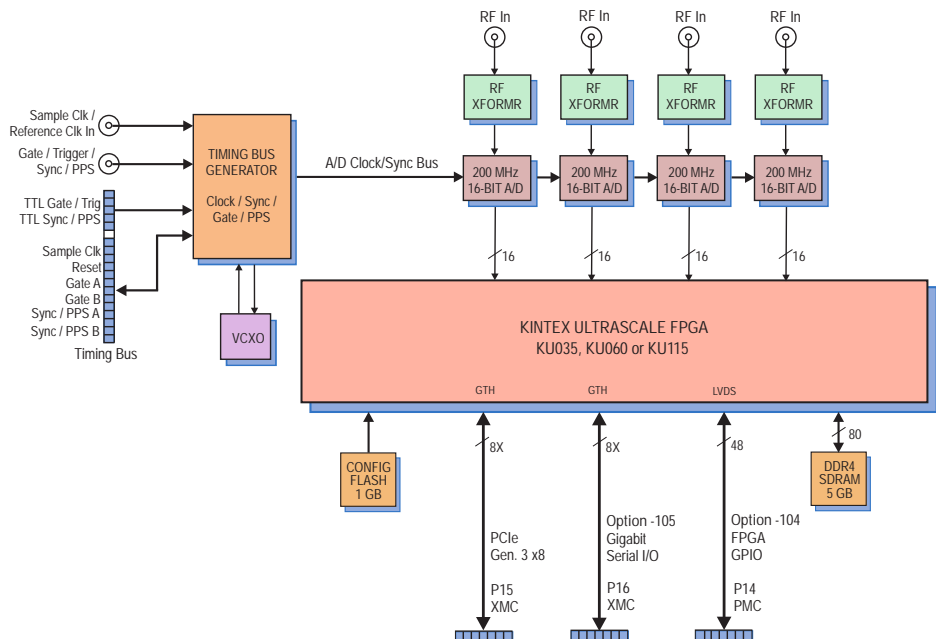

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 71862 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 71862 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 71862 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filter for all DDC s accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with one 8X gigabit link to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into four TI ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Kintex Ultra-

Scale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

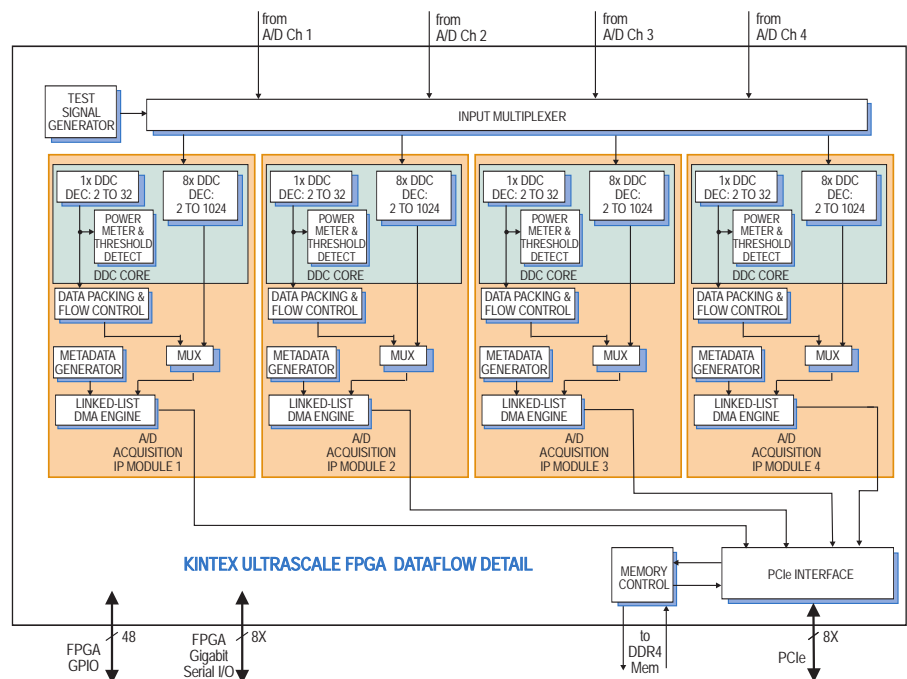

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front-panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple modules can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 71862 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## ► PCI Express Interface

The Model 71862 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## XMC Interface

The Model 71862 complies with the VITA 42.0 XMC specification. Each of two connectors provides a single 8X link with up to 10 Gb/sec per lane. With dual XMC connectors, the 71862 supports x8 PCIe on the first XMC connector leaving the second one free to support user-installed transfer protocols specific to the target application.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Wideband Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Multiband Digital Downconverters

**Quantity:** Four banks, 8 channels per bank  
**Decimation Range:** 2x to 1024x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

## Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector with one 8X gigabit serial link to the FPGA

## Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

## PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

## Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** XMC module 2.910 in x 5.870 in (74.00 mm x 149.00 mm)

### General Information

Model 71800 is a member of the Jade™ family of high-performance XMC modules. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 71800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 71800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

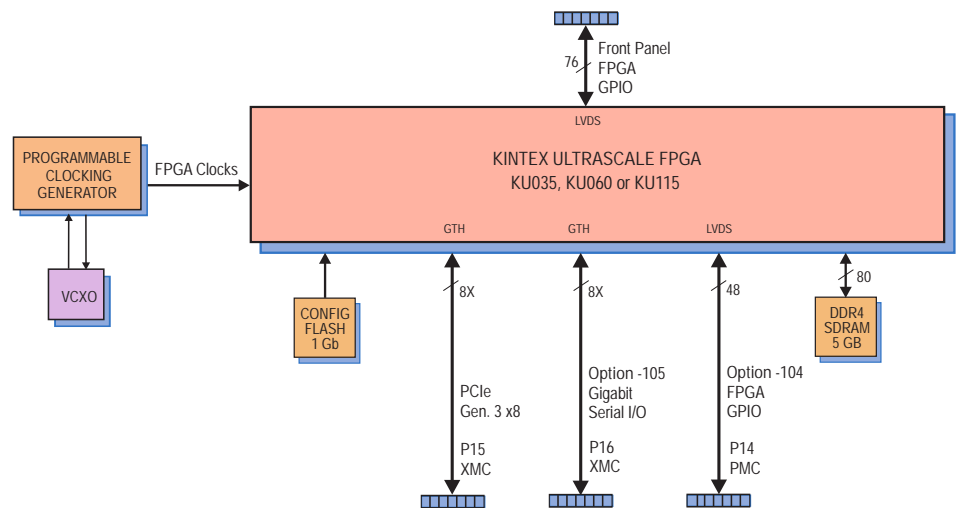

Option -105 installs the P16 XMC connector with an 8X gigabit link to the FPGA to support serial protocols.

### Front Panel Digital I/O Interface

The 71800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path. ➤

### Features

- Hi-performance co-processor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

## Ordering Information

Model	Description
71800	Kintex UltraScale FPGA Coprocessor - XMC

### Options:

- 084 XCKU060-2 FPGA
- 087 XCKU115-2 FPGA
- 104 LVDS FPGA I/O through P14 connector
- 105 Gigabit serial FPGA I/O through P16 connector
- 702 Air cooled, Level L2
- 713 Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

### Features

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

### General Information

The Bandit® Model 7120 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded PMC/XMC module with front-panel connectors for easy integration into RF systems, the module offers programmable gain, high dynamic range and a low noise figure.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 7120 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

### Programmable Input Level

The 7120 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

### Input Filter Options

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

### Quadrature Mixers

The 7120 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

### Tuning Accuracy

The 7120 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

### On-board Reference Clock

In addition to accepting a 10 MHz reference signal on the front panel, the 7120 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

### Wideband Output

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

## ► Specifications

### RF Input

**Connector Type:** SSMC

**Input Impedance:** 50 ohms

**Input Level Range:** -60 dBm to -20 dBm

**Flatness:** ±2 dB from 400 MHz to 1 GHz,  
±3 dB from 1 GHz to 3 GHz, ±5 dB from  
3 GHz to 4 GHz

**RF Attenuator:** Programmable from 0 to  
63 dB in 0.5 dB steps

### LO Synthesizer Tuning

**Frequency range:** 400–4000 MHz,

**Resolution:** < 10 kHz

**Tuning Speed:** < 500 µsec

**Phase-Locked Loop Bandwidth:** 100 kHz

### Phase Noise

**1 kHz:** -90 dBc/Hz

**100 kHz:** -110 dBc/Hz

**1 MHz:** -130 dBc/Hz

### Noise Figure (referred to input)

**60 dB gain:** 2.6 dB

### Inband Output IP3

**20 dB gain:** +10 dBm

**60 dB gain:** +42 dBm

### Reference Input/Output

**Connector Type:** SSMC

**Input/Output Impedance:** 50 ohms

### Reference Input Signal

**Frequency:** 10 MHz

**Level:** 0 dBm, sine wave

### Reference Output Signal

**Frequency:** 10 MHz

**Level:** 0 dBm, sine wave

### OCXO Reference

**Center Frequency:** 10 MHz

**Frequency Stability vs. Change in**

**Temperature:** ±50.0 ppb

**Frequency Calibration:** ±1.0 ppm

### Aging

**Daily:** ±10 ppb/day

**First Year:** ±300 ppb

### Total Frequency Tolerance

**(20 years):** ±4.60 ppm

### Phase Noise

**1 Hz Offset:** -67 dBc/Hz

**10 Hz Offset:** -100 dBc/Hz

**100 Hz Offset:** -130 dBc/Hz

**1 KHz Offset:** -148 dBc/Hz

**10 KHz Offset:** -154 dBc/Hz

**100 KHz Offset:** -155 dBc/Hz

### IF Output

**Connector Type:** SSMC

**Output Impedance:** 50 ohms

**Center Frequency:** User definable

**Output Level:** 0 dBm, nominal

### Programming

**Functions:** RF Atten, IF Atten, Int/Ext

Reference Select, LO Synthesizer Frequency

**Interface:** USB

**Connector Type:** MicroUSB

### Power

**Voltage:** +12 VDC

**Current:** 1.5 A

**PMC/XMC Interface:** Power only on PMC

P11 (option -104) or XMC P15 (option -105)

**Size:** Standard PMC module, 2.91 in. x 5.87 in.

## DESCRIPTION

3/6-Ch 200 MHz A/D, 2/4-Ch 800 MHz D/A, Virtex-6 FPGA - 6U/3U cPCI  
3/6-Ch 200 MHz A/D, DDCs, DUC, 2/4-Ch. 800 MHz D/A, Virtex-6 FPGA - 6U/3U cPCI  
2- or 4-Channel, 34- or 68-Signal Adaptive IF Relay - 6U/3U cPCI  
1/2-Ch 1 GHz A/D and 1/2-Ch 1 GHz D/A, Virtex-6 FPGA - 6U/3U cPCI  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz 12-bit A/D, Virtex-6 FPGA - 6U/3U cPCI  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz 12-bit A/D, DDC, Virtex-6 FPGA - 6U/3U cPCI  
2/4 500 MHz A/Ds, 1/2 DUCs, 2/4 800 MHz D/As, Virtex-6 FPGA - 6U/3U cPCI  
2/4-Ch 500 MHz A/D w. DDC, DUC w. 2/4-Ch 800 MHz D/A, Virtex-6 FPGA - 6U/3U cPCI  
4/8-Channel 200 MHz, 16-bit A/D, Virtex-6 FPGA - 6U/3U cPCI  
4/8-Ch 200 MHz A/D with DDCs, Beamformer and Virtex-6 FPGA - 6U/3U cPCI  
4/8-Ch 200 MHz A/D with 32/64-Ch DDC and Virtex-6 FPGA - 6U/3U cPCI  
1100/2200-Channel GSM Channelizer with Quad or Octal A/D - 6U/3U cPCI  
4/8-Channel 200 MHz A/D with DDCs, VITA-49, Virtex-6 FPGA - 6U/3U cPCI  
4/8-Channel 1.25 GHz D/A with DUC, Virtex-6 FPGA - 6U/3U cPCI  
4/8-Ch 1.25 GHz D/A with DUC, Extend. Interpol. and Virtex-6 FPGA - 6U/3U cPCI  
1/2-Ch L-Band RF Tuner, 2/4-Ch 200 MHz A/D, Virtex-6 FPGA - 6U/3U cPCI  
3/6-Ch 200 MHz A/D, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U/3U cPCI  
3/6-Ch 200 MHz A/D, DDC, DUC, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U/3U cPCI  
1/2-Ch 1 GHz A/D and 1/2-Ch 1 GHz D/A, Virtex-7 FPGA - 6U/3U cPCI  
1/2-Ch 3.6 GHz or 2/4-Ch 1.8 GHz, 12-bit A/D, DDC, Virtex-7 FPGA - 6U/3U cPCI  
2/4-Ch 500 MHz A/D, DDC, DUC, 2/4-Ch 800 MHz D/A, Virtex-7 FPGA - 6U/3U cPCI  
4/8-Channel 200 MHz, 16-bit A/D, Virtex-7 FPGA - 6U/3U cPCI  
4-Channel 200 MHz, 16-bit A/D with DDCs and Virtex-7 FPGA - 6U/3U cPCI  
L-Band RF Tuner, 2-Channel 500 MHz A/D, Virtex-7 FPGA - 6U/3U cPCI  
8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U/3U cPCI  
8-Ch. 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - 6U/3U cPCI  
1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, and Kintex FPGA - 6U/3U cPCI  
3-Chan. 200 MHz A/D, DDC, DUC 2-Ch. 800 MHz D/A, Kintex FPGA - 6U/3U cPCI  
1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, Wideband DDC, Kintex FPGA - 6U/3U cPCI  
2-Ch. 500 MHz A/D, DDC, DUC, 2-Ch. 800 MHz D/A, Kintex FPGA - 6U/3U cPCI  
4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 6U/3U cPCI  
4-Channel 200 MHz A/D with Multiband DDCs, Kintex Ultrascale FPGA - 6U/3U cPCI  
Kintex UltraScale FPGA Coprocessor - 3U/6U cPCI  
Two- or Four-Channel Analog RF Wideband Downconverter - 6U/3U cPCI

Model 74620 Model 73620

### General Information

Models 72620, 73620 and 74620 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71620 XMC modules mounted on a cPCI carrier board.

Model 72620 is a 6U cPCI board while the Model 73620 is a 3U cPCI board; both are equipped with one Model 71620 XMC. Model 74620 is a 6U cPCI board with two XMC modules rather than one.

These models include three or six A/Ds, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data

clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

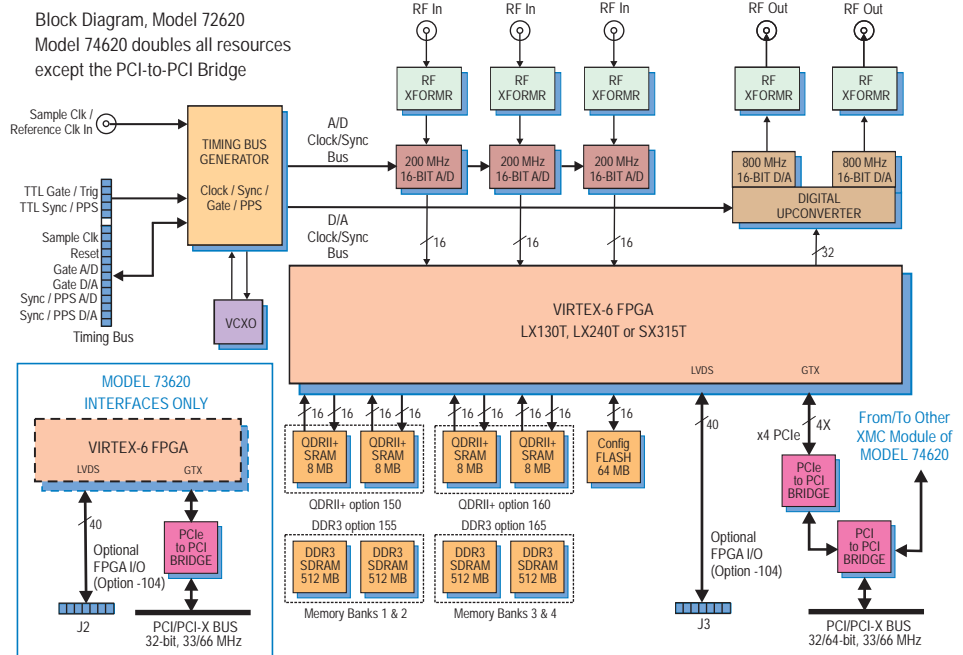

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73620; J3 connector, Model 72620; J3 and J5 connectors, Model 74620. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three or six 200 MHz 16-bit A/Ds
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Modules

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

### A/D Converter Stage

The front end accepts three or six full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes, the DAC5688 provides interpolation factors of 2x, 4x and 8x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

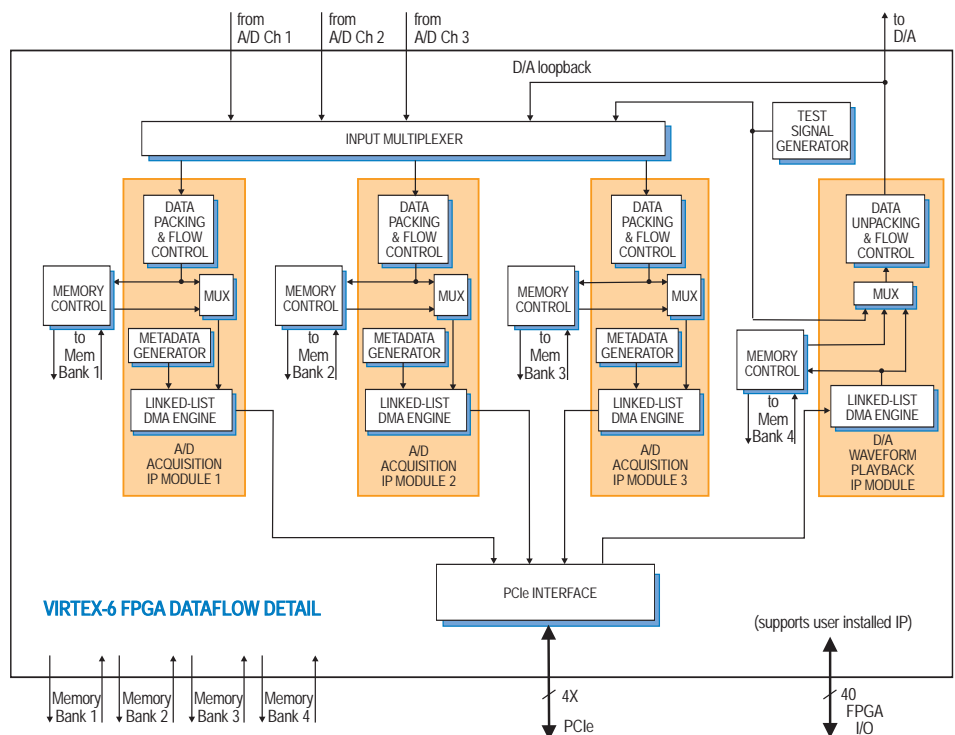

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. ➤

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73620: 32 bits only.

### Specifications

**Model 72620 or Model 73620: 3 A/Ds,  
1 DUC, 2 D/As**

**Model 74620: 6 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73620; J3 connector, Model 72620; J3 and J5 connectors, Model 74620

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73620: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

### Ordering Information

Model	Description
72620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - 6U cPCI
73620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - 3U cPCI
74620	6-Channel 200 MHz A/D and 4-Channel 800 MHz D/A and two Virtex-6 FPGAs - 6U cPCI
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73620; J3 connector, Model 72620; J3 and J5 connectors, Model 74620
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model 74621 Model 73621

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

**General Information**

Models 72621, 73621 and 74621 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71621 XMC modules mounted on a cPCI carrier board.

Model 72621 is a 6U cPCI board while the Model 73621 is a 3U cPCI board; both are equipped with one Model 71621 XMC. Model 74621 is a 6U cPCI board with two XMC modules rather than one.

These models include three or six A/Ds, three or six multiband DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core,

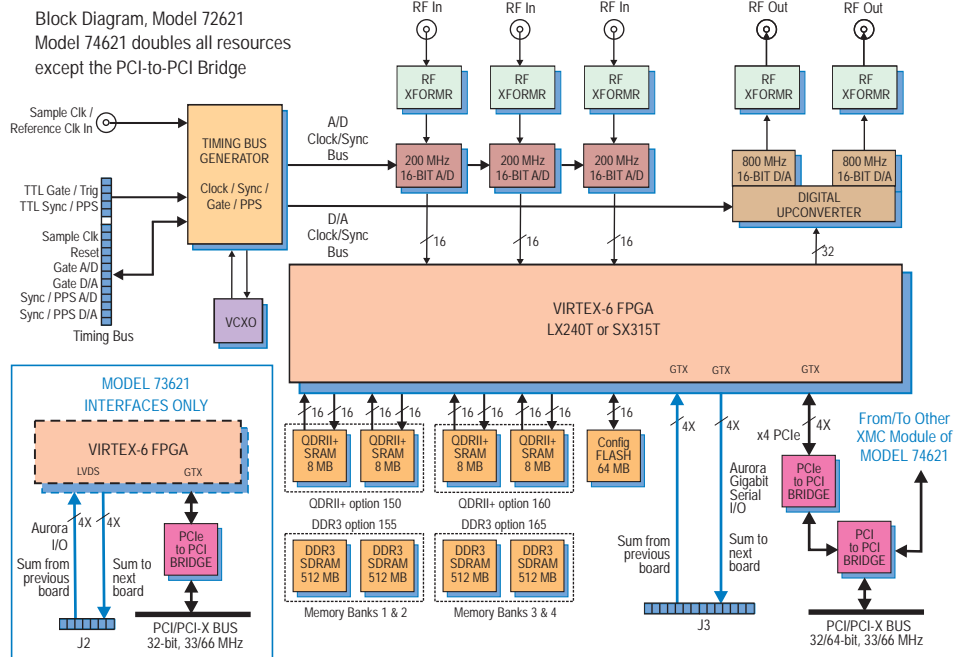

ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed. ▶

### ► A/D Acquisition IP Modules

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Cores

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

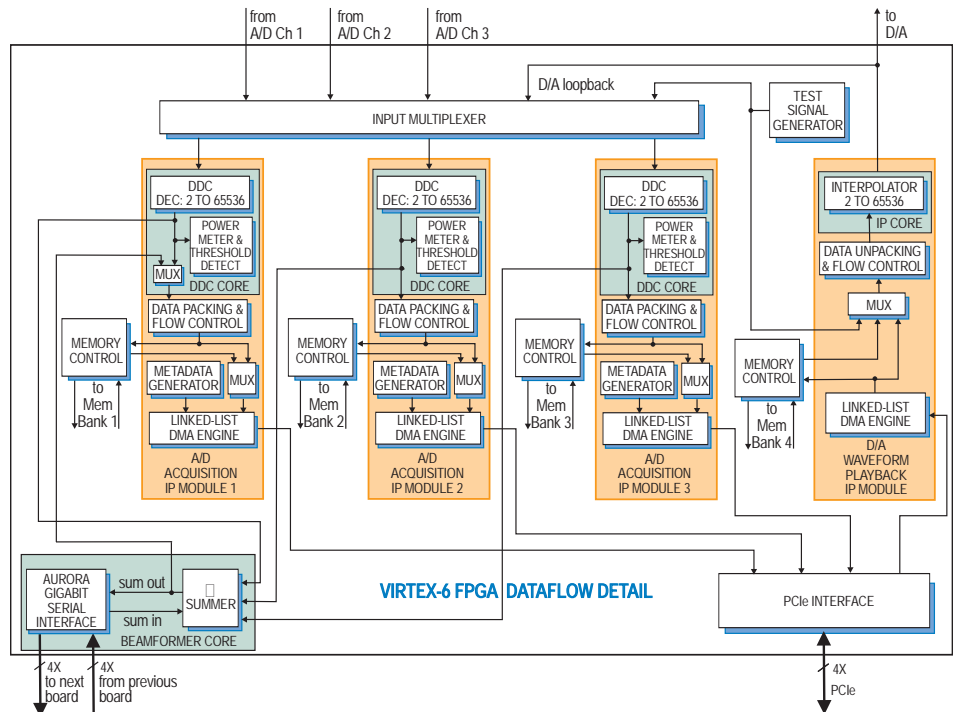

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via the built-in Xilinx Aurora gigabit serial interfaces through the J3 and J5 connectors. This allows summation across channels on multiple boards.

### D/A Waveform Playback IP Modules

The factory-installed functions include sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming. ►

### ► A/D Converter Stage

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73621: 32 bits only. ►

► **Specifications**

**Model 72621 or Model 73621:** 3 A/Ds,  
3 DDCs, 1 DUC, 2 D/As

**Model 74621:** 6 A/Ds, 6 DDCs, 2 DUCs,  
4 D/As

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer Type:** Coil Craft  
WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**

**Decimation Range:** 2x to 65,536x in two  
stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits,  
0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output,  
with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3  
dB passband ripple, >100 dB stopband  
attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or  
1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.  
with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in  
two stages of 2x to 256x

**Beamformers (1 or 2)**

**Summation:** Three channels on-board;  
multiple boards can be summed via  
Summation Expansion Chain

**Summation Expansion Chain:** One  
chain in and one chain out link via J3

connector using Aurora protocol;  
via J3 and J5 for Model 74621

**Phase Shift Coefficients:** I & Q with  
16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:**  
32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates  
two clocks: one A/D clock and one  
D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16, inde-  
pendently for the A/D clock and D/A  
clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector  
LVPECL bus includes, clock/sync/gate/  
PPS inputs and outputs; TTL signal for  
gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VVSX315T

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+  
SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3  
SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73621: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72621	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 6U cPCI
73621	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 3U cPCI
74621	6-Channel 200 MHz A/D with DDCs, DUCs with 4-Channel 800 MHz D/A, and two Virtex-6 FPGAs - 6U cPCI

**Options:**

-062	XC6VLX240T
-064	XC6VVSX315T
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

New!

# Models 72624 73624 and 74624

## 2- or 4-Channel, 34- or 68-Signal Adaptive IF Relay - cPCI

### Features

- Modifies 34 or 68 IF signals between input and output
- Up to 80 MHz IF bandwidth
- Two/four 200 MHz 16-bit A/Ds
- Two/four 800 MHz 16-bit D/A's
- 34/68 DDCs and 34/68 DUCs (digital downconverters and digital upconverters)
- Signal drop/add/replace
- Frequency shifting and hopping
- Amplitude boost and attenuation
- PCI-X system interface

### General Information

Models 72624, 73624 and 74624 are members of the Cobalt® family of high-performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71624 XMC modules mounted on a cPCI carrier board. Model 72624 is a 6U cPCI board while the Model 73624 is a 3U cPCI board; both are equipped with one Model 71624 XMC. Model 74624 is a 6U cPCI board with two XMC modules rather than one.

As IF relays, they accept two or four IF analog input channels, modify up to 34 or 68 signals, and then deliver them to two or four analog IF outputs. Any signal within each IF band can be independently enabled or disabled, and changed in both frequency and amplitude as it passes through the board.

These models support many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation. Applications include countermeasures, active tracking and monitoring, channel security, interception, adaptive spectral management, jamming, and encryption.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCI-X system interface supports control, status and data transfers.

### Adaptive Relay Input Overview

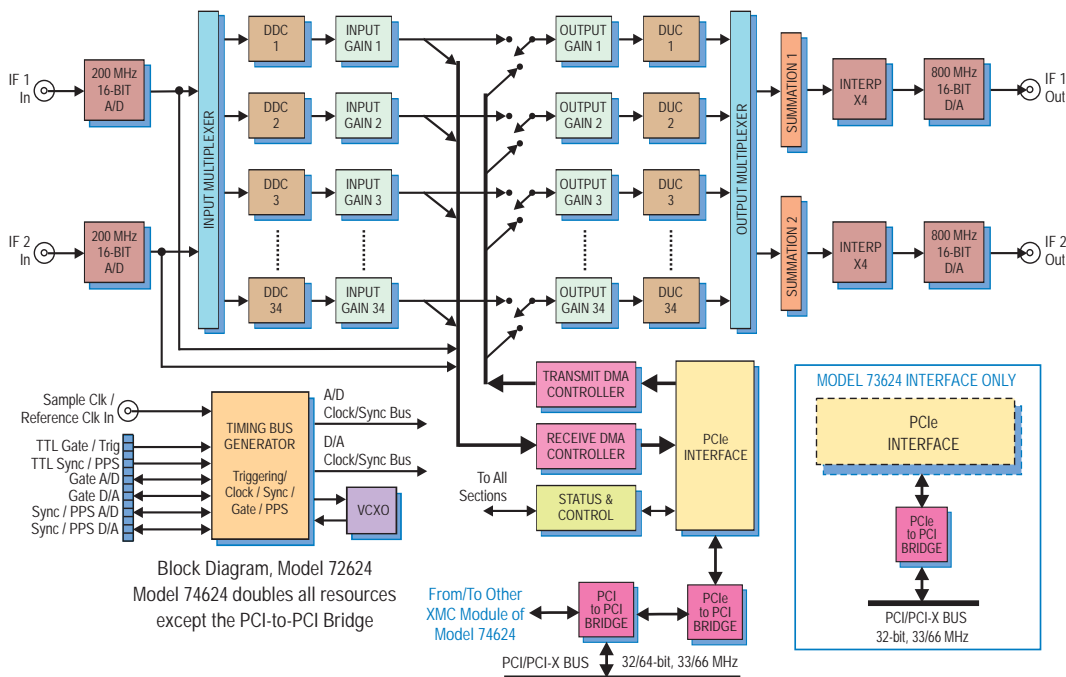

These models digitize two or four analog IF inputs using 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency. An array of 34 or 68 DDCs (digital downconverters) can be independently programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz. Each DDC can independently source IF data from either of two A/Ds.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCI-X system interface to target memory, typically associated with a system processor. Here, the signals can be analyzed, classified, demodulated, decrypted or decoded, depending on the application.

Samples from each A/D converter can also be delivered across PCI-X to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

### Adaptive Relay Output Overview

The output stage of these models consists of 34 or 68 DUCs (digital upconverters) and two or four 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q

► signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stages. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two or four summation blocks, each associated with one of the two or four D/A converters using a final interpolation factor of  $\times 4$ . After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 or 68 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the adaptive relay of these models. Because of the complexity and proprietary nature of these functions, the FPGAs cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two or four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into one or two Virtex-6 FPGAs for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 or 68 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controllers

Two or four output DMA engines deliver data across the PCI-X interface into user-specified memory locations in PCI-X target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs of the first XMC module. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2. This sequence repeats for the second XMC module of Model 74624.

When a target memory buffer is filled, these models issue an interrupt to the system processor and then begin filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 or 68 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCI-X target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, these models signal the processor with an interrupt and move to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB. ►

### ► Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz.

A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two or four summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

One or two TI DAC5688 dual-channel D/As accept the summed upconverted data streams, one from each summation block, and operate in their non-translating dual, real baseband mode. Their built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two or four transformer-coupled analog IF outputs are delivered through one or two pairs of front panel SSMC connectors.

### Clocking and Synchronization

Two or four internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from one or two on-board programmable VCXOs (voltage-controlled crystal oscillators). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the internal oscillator.

One or two front panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73624: 32 bits only.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com). ►

► **Specifications**

**Models 72624 & 73624:** 2 A/Ds, 34 DDCs, 34 DUCs, 2 D/As

**Model 74624:** 4 A/Ds, 68 DDCs, 68 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Quantity:** 2 or 4

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** 34 or 68

**Decimation Range:** 512 to 8192, in steps of 8

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >100 dB

**Phase Offset:** 1 bit, 0 or 180 degrees

**FIR Filter:** 18-bit coefficients

**Output:** Complex, 16-bit I + 16-bit Q

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Input Gain Blocks**

**Quantity:** 34 or 68

**Data:** Complex, 16-bit I + 16-bit Q

**Gain Range:** 16-bit Q8.8 format, approximately +/-48 dB

**Output Gain Blocks**

**Quantity:** 34 or 68

**Data:** Complex, 16-bit I + 16-bit Q

**Gain Range:** 16-bit Q8.8 format, approximately +/-48 dB

**Digital Upconverters**

**Quantity:** 34 or 68

**Interpolation Range:** 512 to 8192, in steps of 8

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**FIR Filter:** 18-bit coefficients, 16-bit output

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Analog Output Channels:** 2 or 4

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 200 MHz max.

**Output Signal:** Real

**Output Sampling Rate:** 800 MHz max. with 4x interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizers generate two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connectors, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accept 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

**Type:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Required:** Xilinx Virtex-6 XC6VVSX315T

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73624: 32 bits only

**Environmental**

**Standard:**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Option 702 L2 Extended Temp (air-cooled):**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-cond.

**Option 712 L2 Extended Temp (conduction-cooled):**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

Model 74630 Model 73630

### General Information

Models 72630, 73630 and 74630 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71630 XMC modules mounted on a cPCI carrier board.

Model 72630 is a 6U cPCI board while the Model 73630 is a 3U cPCI board; both are equipped with one Model 71630 XMC. Model 74630 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two 1 GHz A/D and D/A converters and four or eight banks of memory

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition and one or two D/A waveform playback IP module. IP modules for either DDR3 or QDRII+ memories, controllers for all data

clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

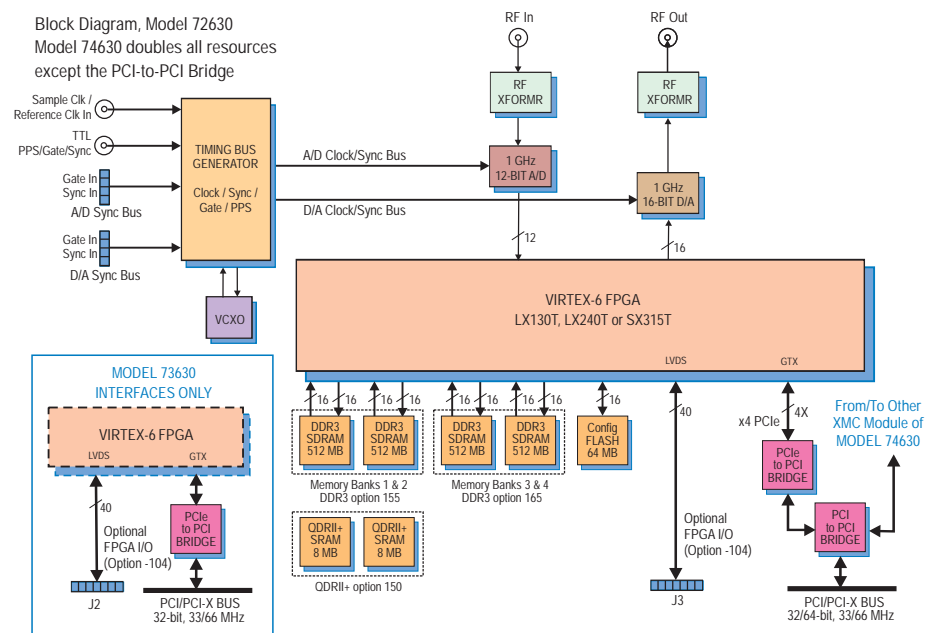

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73630; J3 connector, Model 72630; J3 and J5 connectors, Model 74630. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One or two 1 GHz 12-bit A/D
- One or two 1 GHz 16-bit D/A
- Up to 2 or 4 GB of DDR3 SDRAM; or: 16 MB or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual-µSync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Module

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

The factory-installed functions include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

### A/D Converter Stage

The front end accepts one or two analog HF or IF input on front panel SSMC connectors with transformer coupling into one or two Texas Instruments ADS5400 1 GHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

### D/A Converter Stage

The 71630 features one or two TI DAC5681Z 1 GHz, 16-bit D/As. The converters have an input sample rate of 1 GSPS, allowing them to accept full rate data from the FPGA. Additionally, the D/As include a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

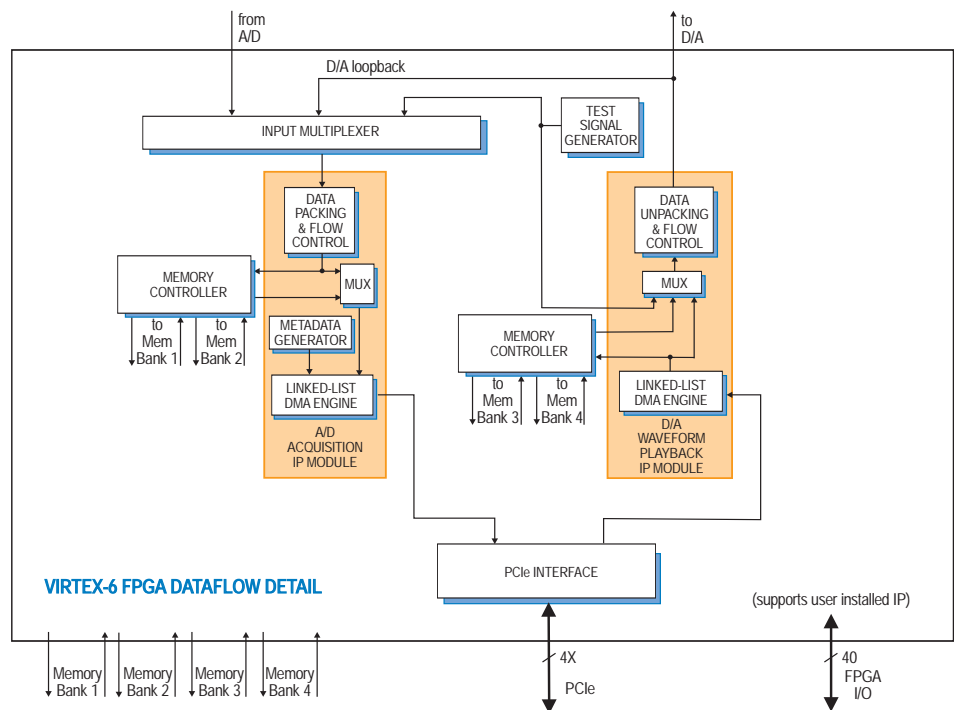

A pair of front panel  $\mu$ Sync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7292 and Model 9192 Cobalt Synchronizers can drive multiple  $\mu$ Sync connectors enabling large, multi-channel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

► **PCI-X Interface**

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73630: 32 bits only.

**Specifications**

**Model 72630 or Model 73630: 1 A/D, 1 D/A**

**Model 74630: 2 A/Ds, 2 D/As**

**Front Panel Analog Signal Inputs (1 or 2)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADS5400

**Sampling Rate:** 100 MHz to 1 GHz

**Resolution:** 12 bits

**D/A Converters (1 or 2)**

**Type:** Texas Instruments DAC5681Z

**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (1 or 2)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VVSX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73630; J3 connector, Model 72630; J3 and J5 connectors, Model 74630

**Memory Banks (1 or 2)**

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73630: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72630	1 GHz A/D and D/A, Virtex-6 FPGA - 6U cPCI
73630	1 GHz A/D and D/A, Virtex-6 FPGA - 3U cPCI
74630	Two 1 GHz A/D and D/A, Virtex-6 FPGA - 6U cPCI

**Options:**

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VVSX315T FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73630; J3 connector, Model 72630; J3 and J5 connectors, Model 74630
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Model 74640 Model 73640

### General Information

Models 72640, 73640 and 74640 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71640 XMC modules mounted on a cPCI carrier board.

Model 72640 is a 6U cPCI board while the Model 73640 is a 3U cPCI board; both are equipped with one Model 71640 XMC. Model 74640 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two 3.6 GHz, 12-bit A/D converters and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition IP modules. In addition, IP modules for DDR3 memories, controllers for all data clocking and synchronization functions, a test signal

generator and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turn-key solutions, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

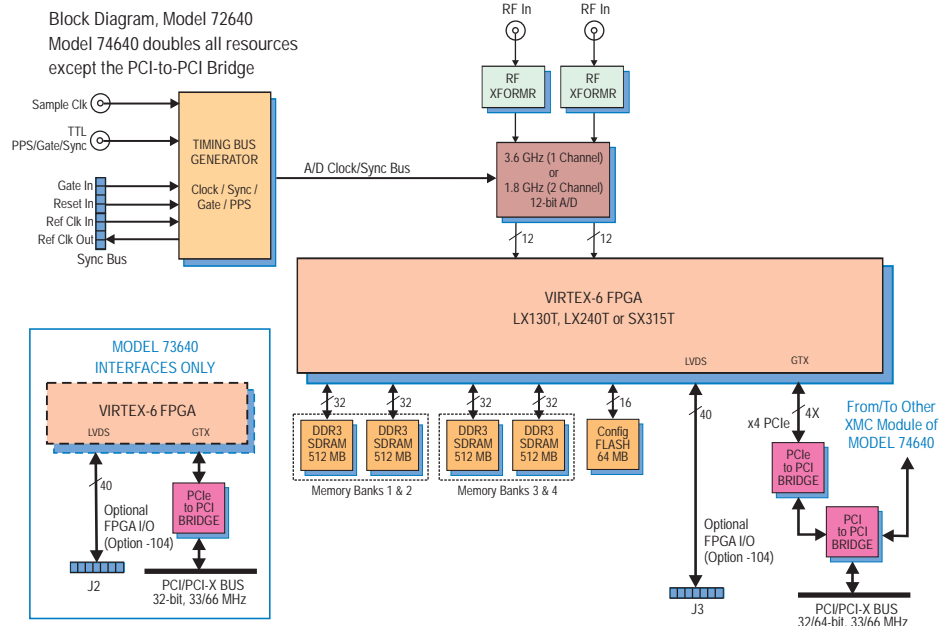

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73640; J3 connector, Model 72640; J3 and J5 connectors, Model 74640. ➤

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One or two 1-channel mode with 3.6 GHz, 12-bit A/Ds
- Two or four 2-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 or 4 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Modules

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### ► A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing these models to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

### Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via front panel SSMC connectors. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple boards to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple boards can be synchronized using the Cobalt high speed sync board to drive the sync bus.

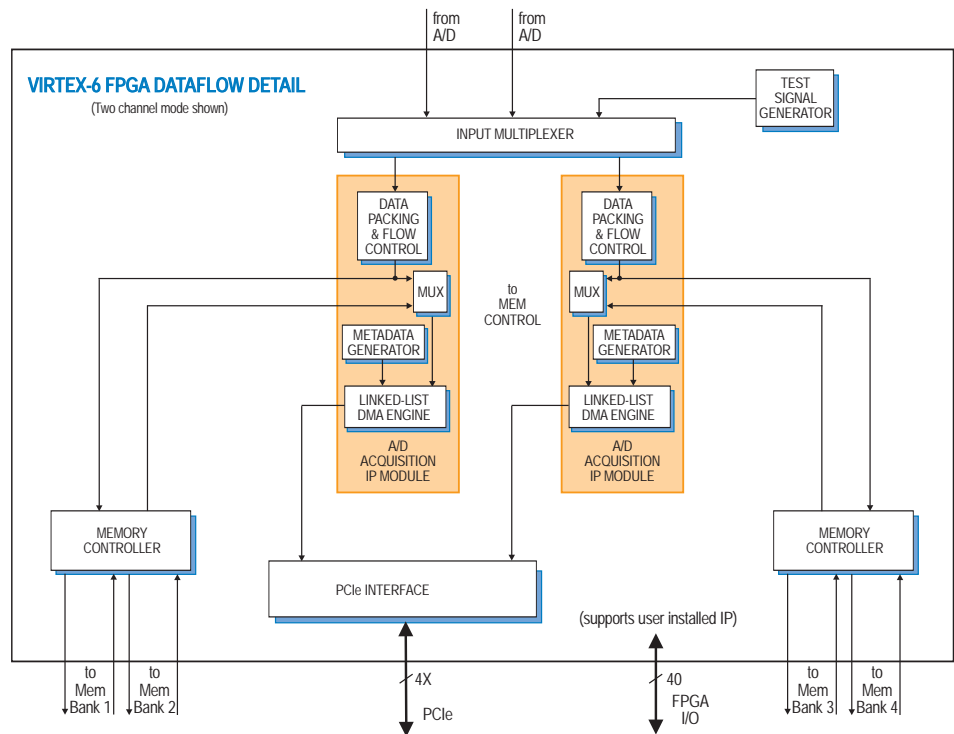

### Memory Resources

The Cobalt architecture supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73640: 32 bits only. ►

### A/D Converter Stage

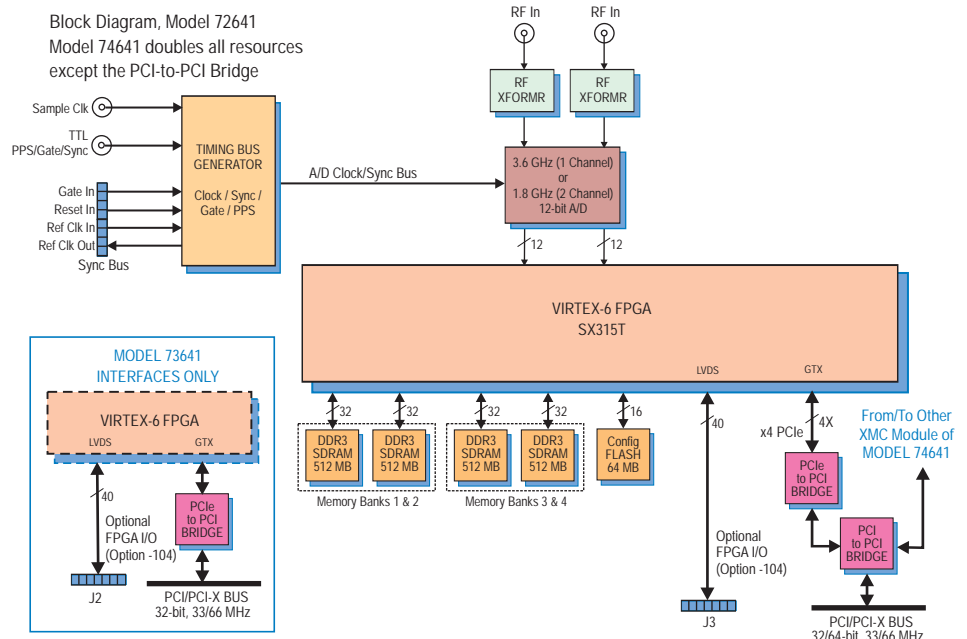

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 71641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources. ➤

### Features

- Ideal radar and software radio interface solution
- One or two 1-channel mode with 3.6 GHz, 12-bit A/Ds
- Two or four 2-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 2 or 4 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Modules

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

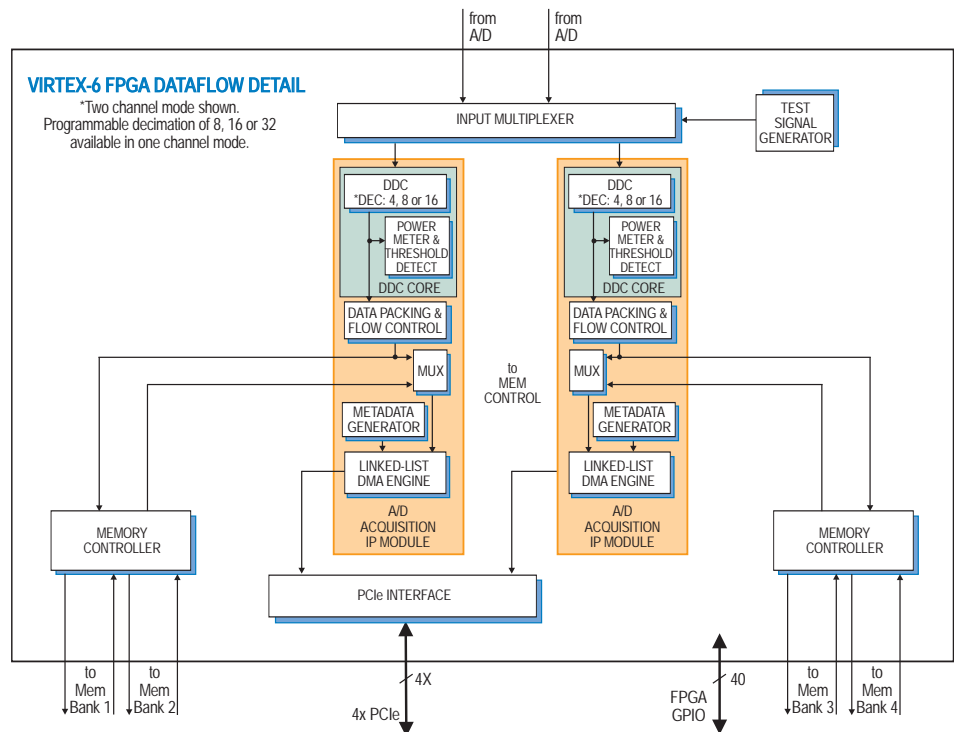

### Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via front panel SSMC connectors. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple boards can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

### Memory Resources

The Cobalt architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ➤

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73641: 32 bits only.

### Specifications

**Model 72641 or Model 73641: One A/D**

**Model 74641: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters (2 or 4)**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources (1 or 2)**

Front panel SSMC connector

**Sync Bus (1 or 2)**

Multi-pin connectors, bus includes gate, reset and in and out ref clock

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions

include: trigger, gate, sync and PPS

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two or four 500 MHz 12-bit A/Ds
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Modules

These models feature two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

### A/D Converter Stage

The front end accepts two or four full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs and D/As accept a baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

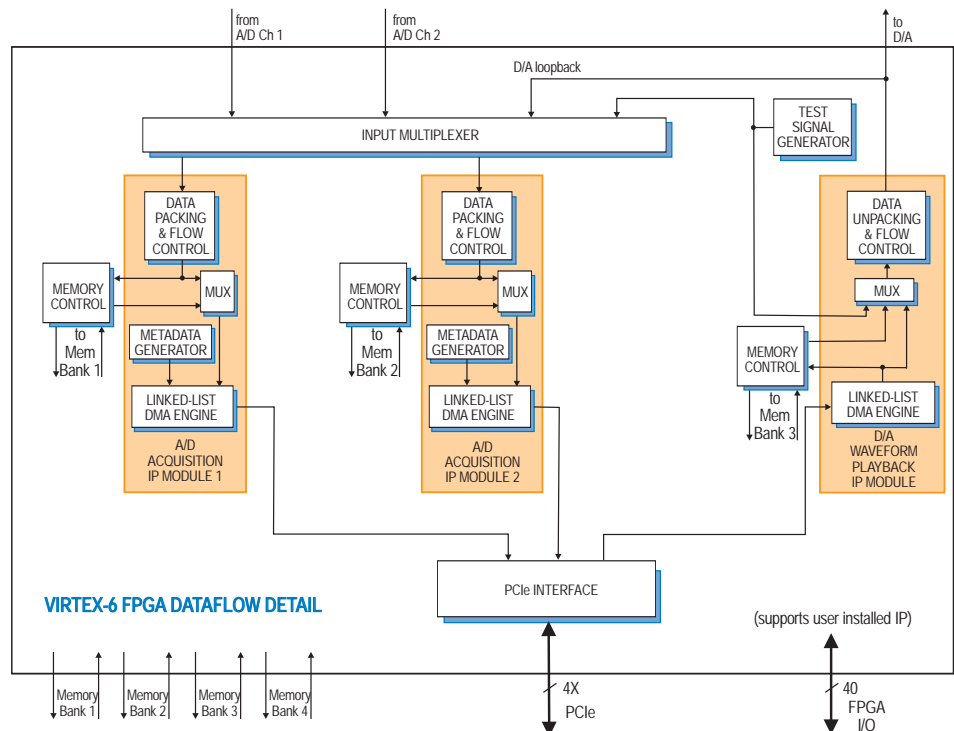

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

► board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73650: 32 bits only.

### Specifications

**Models 72650 and 73650: 2 A/Ds, 1 DUC, 2 D/As**

**Model 74650: 4 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option 014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Sample Clock Sources (2 or 4)

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizers (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clocks (1 or 2)

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Inputs (1 or 2)

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

### Custom I/O

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73650; J3 connector, Model 72650; J3 and J5 connectors, Model 74650

### Memory Banks (1 or 2)

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73650: 32 bits only

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

### Ordering Information

Model	Description
72650	Two 500 MHz A/Ds, One DUC, Two 800 MHz D/As with Virtex-6 FPGA - 6U cPCI
73650	Two 500 MHz A/Ds, One DUC, Two 800 MHz D/As with Virtex-6 FPGA - 3U cPCI
74650	Four 500 MHz A/Ds, Two DUCs, Four 800 MHz D/As with Virtex-6 FPGA - 6U cPCI

Options:	Description
-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73650; J3 connector, Model 72650; J3 and J5 connectors, Model 74650

Model 74651 Model 73651

### General Information

Models 72651, 73651 and 74651 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71651 XMC modules mounted on a cPCI carrier board.

Model 72651 is a 6U cPCI board while the Model 73651 is a 3U cPCI board; both are equipped with one Model 71651 XMC. Model 74651 is a 6U cPCI board with two XMC modules rather than one.

These models include two or four A/Ds, two or four multiband DDCs, one or two DUCs, two or four D/As and three or six banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include two or four A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core,

ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

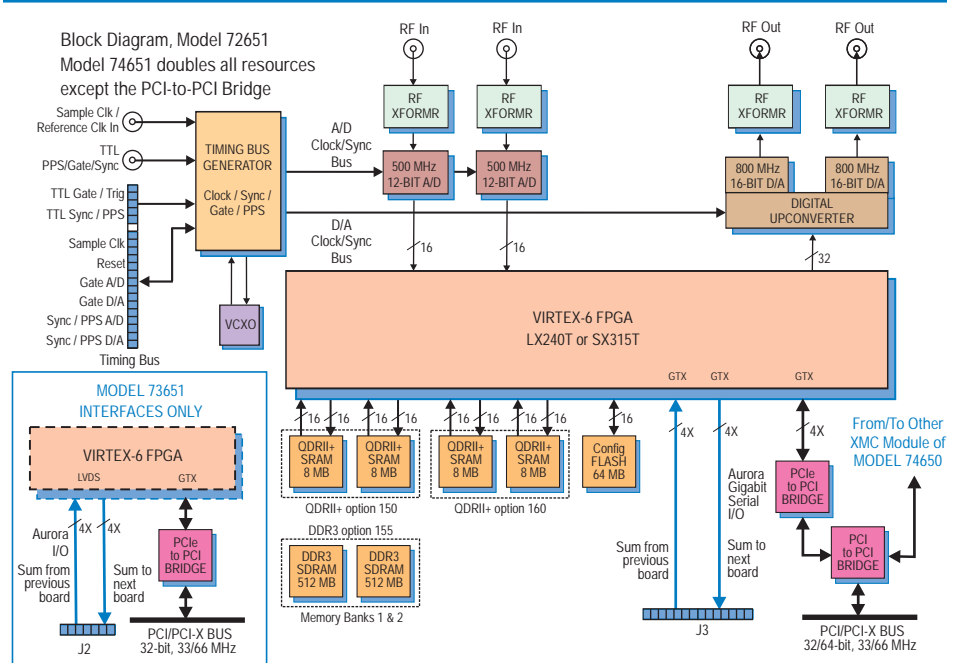

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- Two or four 800 MHz 16-bit D/As
- One or two DUCs (digital upconverters)
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or 16 or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

### A/D Acquisition IP Modules

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two or four different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Core

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

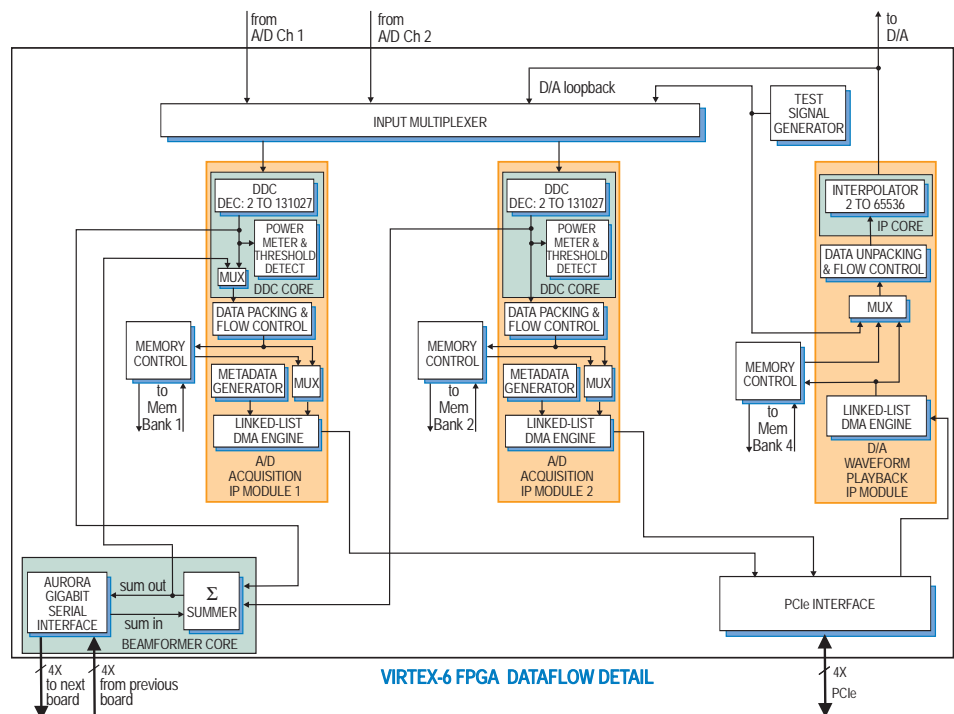

A programmable summation block provides summing of any of the DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple models can be chained together via a built-in Xilinx Aurora gigabit serial interface through the dual 4X serial connector. This allows summation across channels on multiple boards.

### D/A Waveform Playback IP Modules

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs (digital upconverters) and D/As accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to three or six independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the boards's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73651: 32 bits only. ►

► **Specifications**

**Model 72651 or Model 73651:** 2 A/Ds,  
2 DDCs, 1 DUC, 2 D/As

**Model 74651:** 4 A/Ds, 4 DDCs, 2 DUCs,  
4 D/As

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer Type:** Coil Craft  
WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (Option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters (2 or 4)**

**Decimation Range:** 2x to 131,072x in  
two programmable stages of 2x to 256x  
and one fixed 2x stage

**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits,  
0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output,  
with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3  
dB passband ripple, >100 dB stopband  
attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or  
1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.  
with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in  
two stages of 2x to 256x

**Beamformers (1 or 2)**

**Summation:** Two channels on-board;  
multiple boards can be summed via  
Summation Expansion Chain

**Summation Expansion Chain:** One  
chain in and one chain out link via a  
dual 4X connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with  
16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:**  
32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates  
two clocks: one A/D clock and one D/  
A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16, inde-  
pendently for the A/D clock and D/A  
clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/  
PPS inputs and outputs; TTL signal for  
gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX240T-2  
**Optional:** Xilinx Virtex-6 XC6VVSX315T-2

**Memory (1 or 2)**

**Option -150:** Two 8 MB QDRII+ SRAM  
memory banks, 400 MHz DDR

**Option -155 or -165:** Two 512 MB DDR3  
SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73651: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 6U cPCI
73651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 3U cPCI
74651	4-Channel 500 MHz A/D with DDCs, DUCs with 4-Channel 800 MHz D/A, and two Virtex-6 FPGAs - 6U cPCI

**Options:**

002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA
-064	XC6VVSX315T FPGA
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model 74660 Model 73660

### General Information

Models 72660, 73660 and 74660 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71660 XMC modules mounted on a cPCI carrier board.

Model 72660 is a 6U cPCI board while the Model 73660 is a 3U cPCI board; both are equipped with one Model 71660 XMC. Model 74660 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight A/Ds and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features Virtex-6 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module. Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal

generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

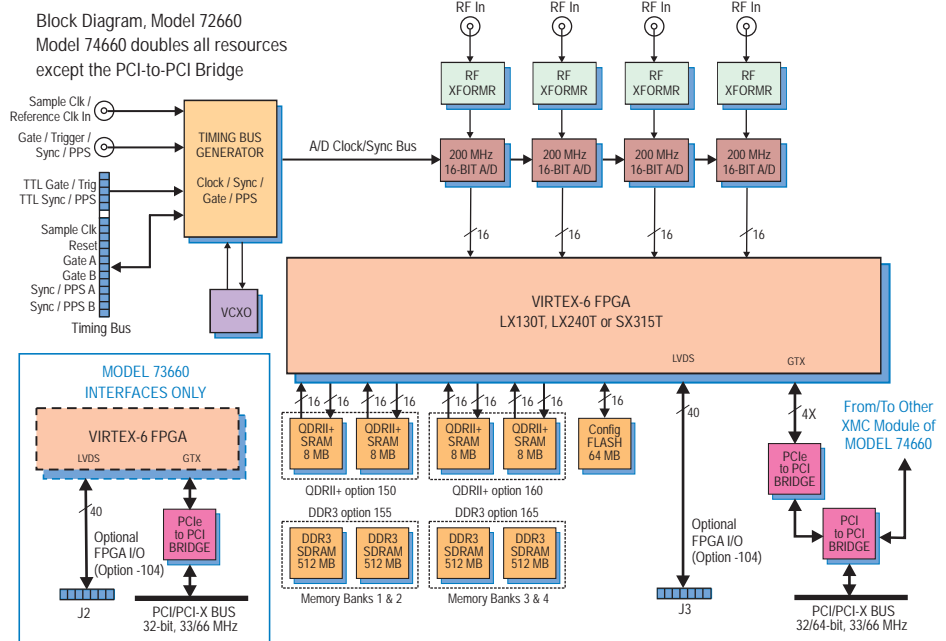

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73660; J3 connector, Model 72660; J3 and J5 connectors, Model 74660. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 or 64 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### ► A/D Converter Stage

The front end accepts four or eight full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

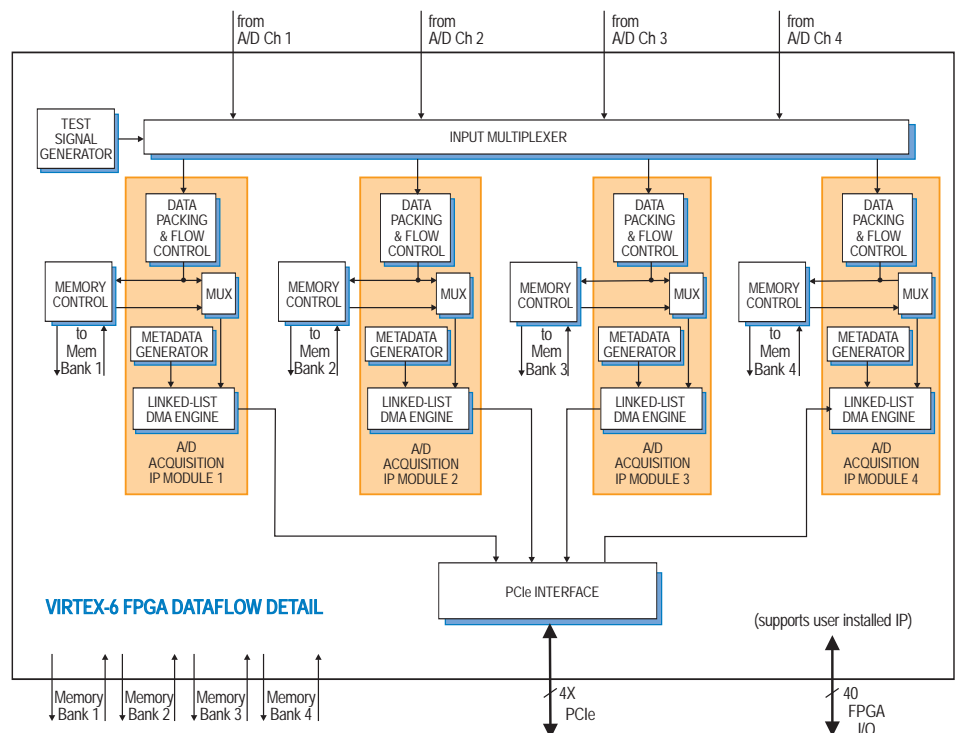

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73660: 32 bits only. ►

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► **Specifications**

**Model 72660 or Model 73660: 4 A/Ds**

**Model 74660: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources (1 or 2)**

On-board clock synthesizers

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

**Custom I/O**

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73660; J3 connector, Model 72660; J3 and J5 connectors, Model 74660

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73660: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72660	4-Channel 200 MHz 16-bit A/D with Virtex-6 FPGA - 6U cPCI
73660	4-Channel 200 MHz 16-bit A/D with Virtex-6 FPGA - 3U cPCI
74660	8-Channel 200 MHz 16-bit A/D with two Virtex-6 FPGAs - 6U cPCI

**Options:**

-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73660; J3 connector, Model 72660; J3 and J5 connectors, Model 74660
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model 74661 Model 73661

### General Information

Models 72661, 73661 and 74661 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71662 XMC modules mounted on a cPCI carrier board.

Model 72661 is a 6U cPCI board while the Model 73661 is a 3U cPCI board; both are equipped with one Model 71661 XMC. Model 74661 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight A/Ds, four or eight multiband DDCs and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for either DDR3 or

QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

### Extendable IP Design

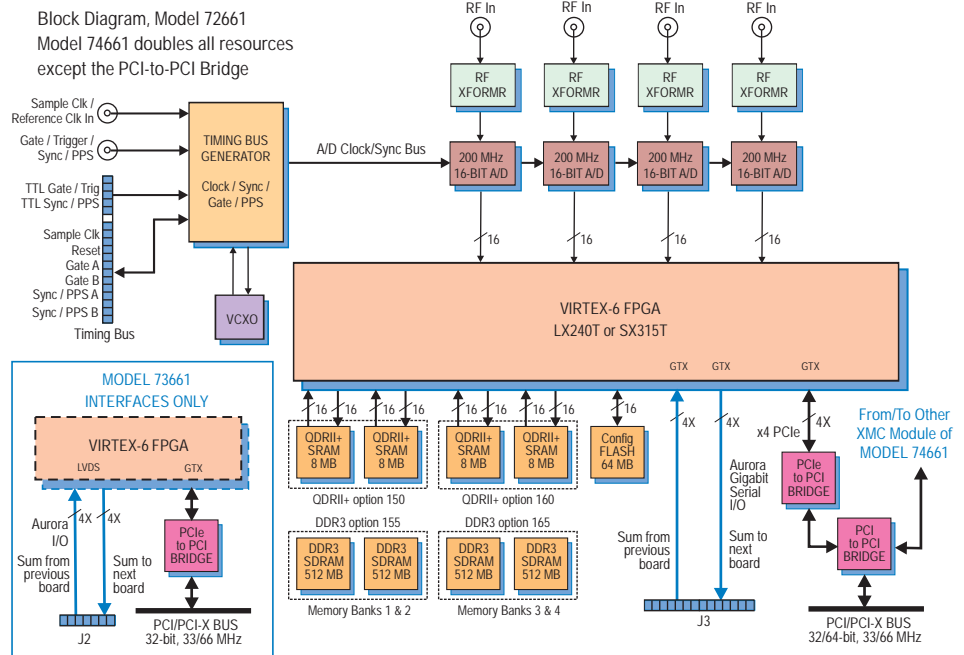

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs (digital downconverters)
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Cores

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

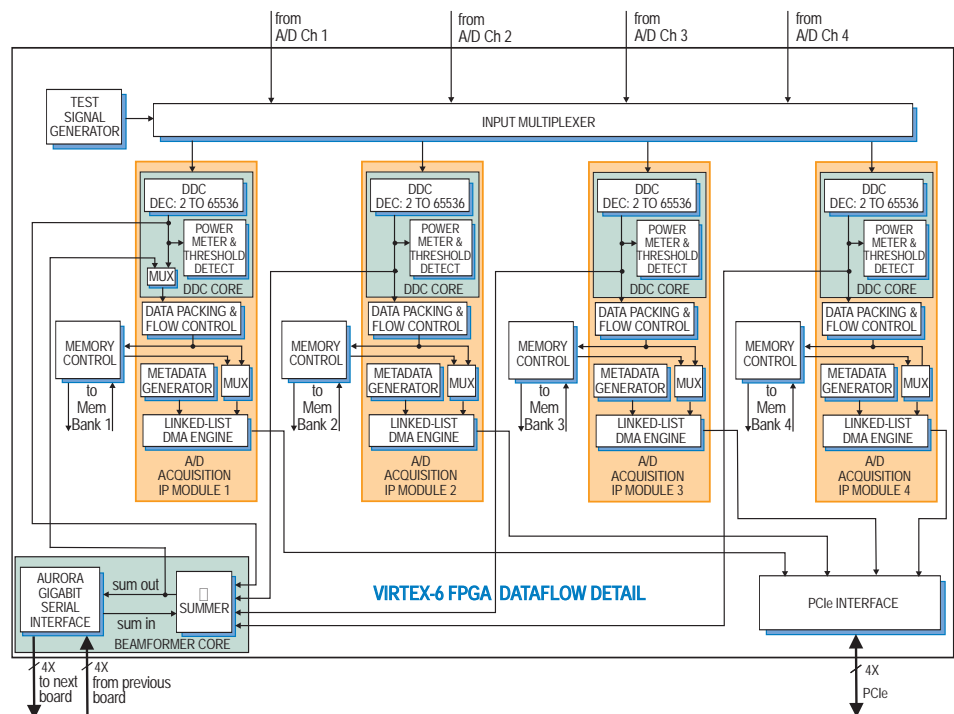

### A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage

## PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73661: 32 bits only.

## Ordering Information

Model	Description
72661	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - 6U cPCI
73661	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - 3U cPCI
74661	8-Channel 200 MHz A/D with DDCs and Virtex-6 FPGAs - 6U cPCI
<b>Options:</b>

-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

► controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

## Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## Specifications

**Model 72661 or Model 73661: 4 A/Ds**

**Model 74660: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled,

front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Quantity:** Four channels

**Decimation Range:** 2x to 65,536x in

two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformers (1 or 2)**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

Model 74662 Model 73662

### General Information

Models 72662, 73662 and 74662 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71662 XMC modules mounted on a cPCI carrier board.

Model 72662 is a 6U cPCI board while the Model 73662 is a 3U cPCI board; both are equipped with one Model 71662 XMC. Model 74662 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight A/Ds, 32 or 64 multiband DDCs and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules.

Each of the acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and

trigger functions, a test signal generator, voltage and temperature monitoring, DDR3 SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

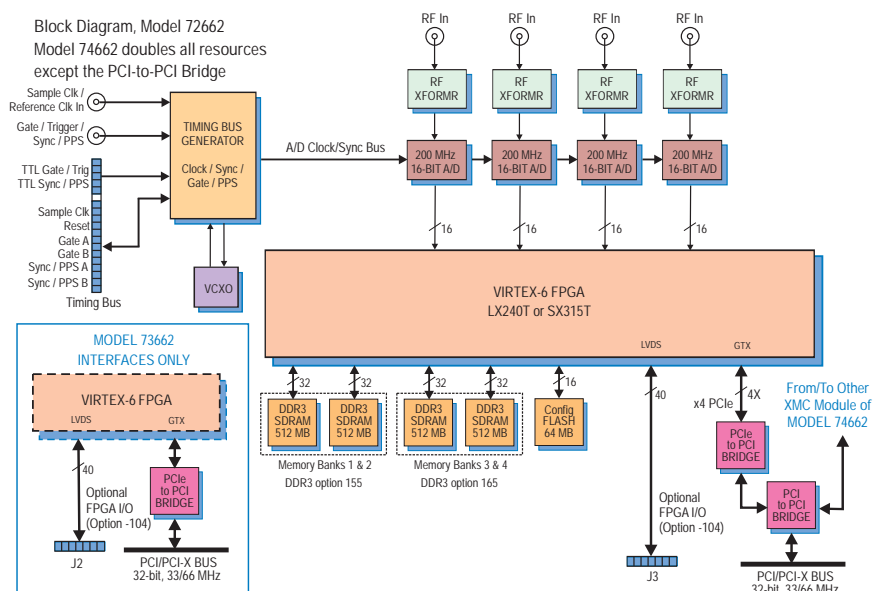

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73662; J3 connector, Model 72662; J3 and J5 connectors, Model 74662. ▶

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- 32 or 64 channels of multiband DDCs (digital downconverters)
- Up to 2 or 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range

is programmable in steps of 8 from 16 to 1024 and steps of 64 from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

### ► A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Clocking and Synchronization

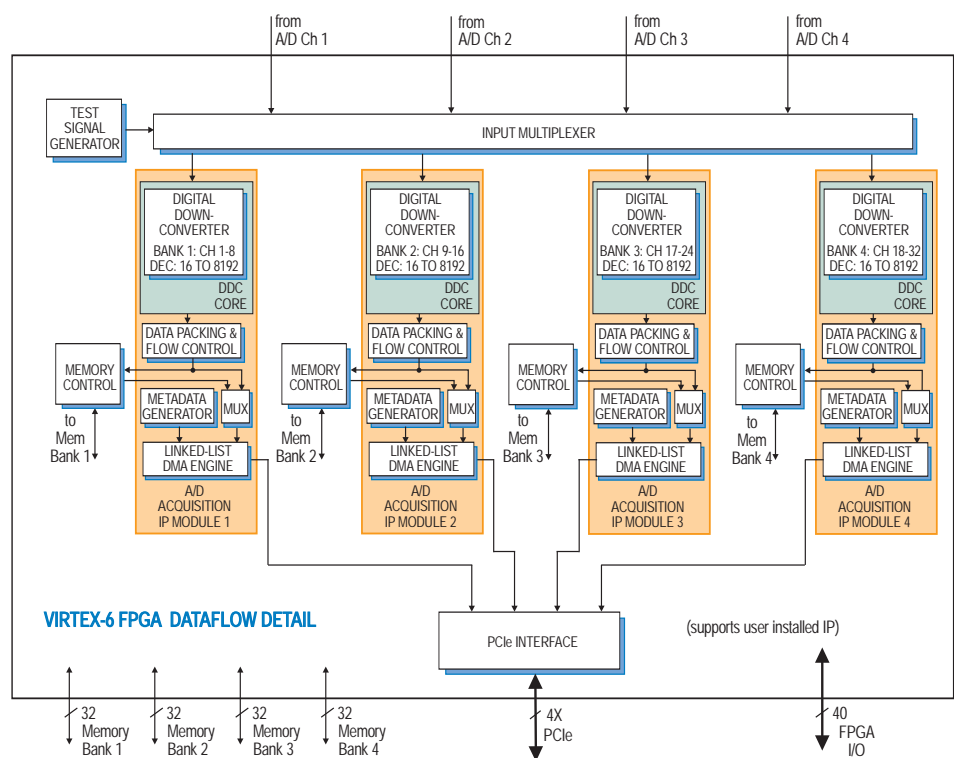

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with DDR3 SDRAM. ►

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the Board's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73662: 32 bits only.

### Specifications

**Model 72662 or Model 73662:** 4 A/Ds, 32 DDCs

**Model 74660:** 8 A/Ds, 64 DDCs

#### Front Panel Analog Signal Inputs (4 or 8)

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (4 or 8)

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

#### Digital Downconverters (32 or 64)

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

#### Sample Clock Sources (1 or 2)

On-board clock synthesizer

#### Clock Synthesizers (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clocks (1 or 2)

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

#### Timing Bus (1 or 2):

26-pin connector  
LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Inputs (1 or 2)

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array (1 or 2)

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VVSX315T

#### Custom I/O

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73662; J3 connector, Model 72662; J3 and J5 connectors, Model 74662

#### MemoryBanks (1 or 2)

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73662: 32 bits only

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

Model 74663 Model 73663

### Features

- Complete GSM channelizer with analog IF interface
- Four or eight 180 MHz 16-bit A/Ds
- Two or four banks of 375 DDCs for upper GSM band
- Two or four banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

### General Information

Models 72663, 73663 and 74663 are members of the Cobalt® family of high-performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71663 XMC modules mounted on a cPCI carrier board.

Model 72663 is a 6U cPCI board while the Model 73663 is a 3U cPCI board; both are equipped with one Model 71663 XMC. Model 74663 is a 6U cPCI board with two XMC modules rather than one.

This quad or octal, high-speed A/D converter with 1100 or 2200 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

### The Cobalt Architecture

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four or eight factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four or eight DMA controllers, PCIe interface, gating, and triggering.

These models are complete, full-featured subsystems, ready to use with no additional FPGA development required.

### A/D Converter Stage

The front end accepts four or eight analog IF inputs on front panel SSMC connectors with transformer coupling into four or eight

Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

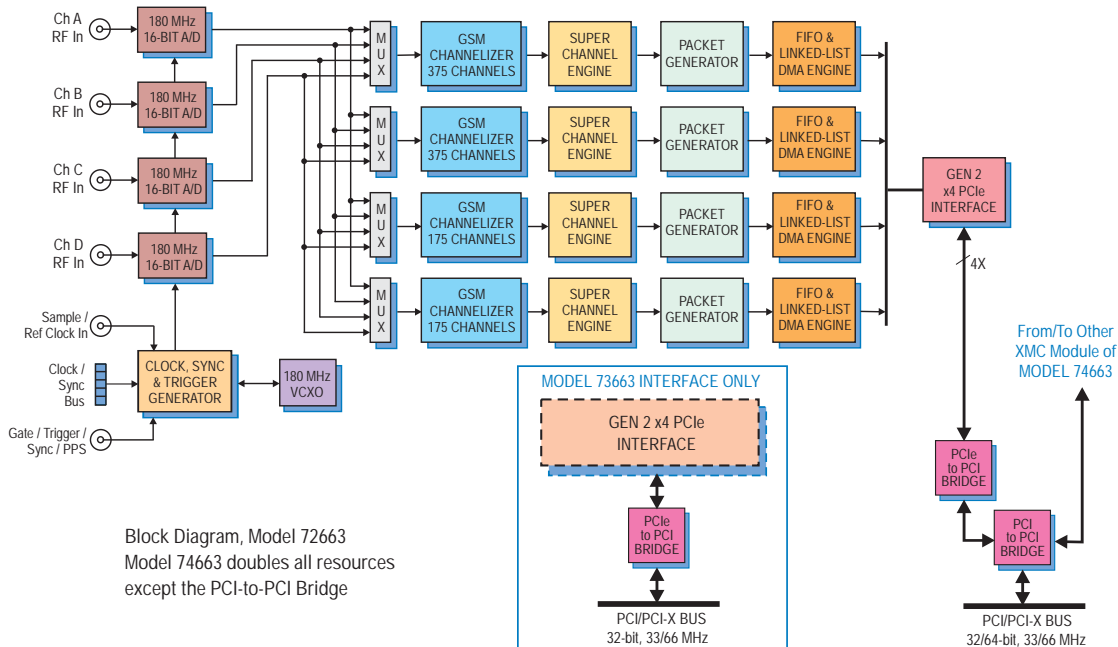

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

### Clocking and Synchronization

The internal timing bus provides all timing and synchronization required by the A/D converters. It includes clock, sync and gate or trigger signals. One or two on-board clock generators accept external 180 MHz sample clocks from the front panel SSMC connectors. The clocks can be used directly by the A/Ds or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ➤

Block Diagram, Model 72663  
Model 74663 doubles all resources except the PCI-to-PCI Bridge

## ► GSM Channelizer Cores

These models contain four or eight powerful GSM channelizer cores, two or four with 375 DDCs and two or four with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of four GSM channelizers.

The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to these models, the GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the four or eight A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must insure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13/2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

## Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x over sampling, and results

in a reduction of the aggregate traffic by a factor of 4 to 2.383 GB/sec.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bits I + 26-bits Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank only contains three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCI-X bus. There are four superchannel mask words, one for each bank.

## Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once compete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

## PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73663: 32 bits only.

The PCI-X interface is also used as the programming interface for all status and control between these models and host. ►

**Specifications**

**Model 72663 or Model 73663:** 4 A/Ds

**Model 74663:** 8 A/Ds

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus (1 or 2):** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**GSM Channel Banks (1 or 2)**

**DDCs per bank:** two banks of 175

DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

**DDC Channels**

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

**DDC Channel Filter Characteristics**

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  KHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz\*13/2160 = 1.0833333 MS/sec

**DDC Data Output Format:**

24 bits I + 24 bits Q

**Superchannels**

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

**Frequency Offsets for each DDC:**

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

**Superchannel Output Format:**

26 bits I + 26 bits Q

**Number of Superchannels per Bank:**

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Arrays (1 or 2)**

Xilinx Virtex-6 XC6VSX315T

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz

Model 73663: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

# Models 72664, 73664 and 74664

# 4- or 8-Channel 200 MHz A/D with DDCs, VITA 49.0, Virtex-6 FPGA - cPCI

Model 74664 Model 73664

## General Information

Models 72664, 73664 and 74664 are members of the Cobalt family of high-performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71664 XMC modules mounted on a cPCI carrier board.

Model 72664 is a 6U cPCI board while the Model 73664 is a 3U cPCI board; both are equipped with one Model 71664 XMC. Model 74664 is a 6U cPCI board with two XMC modules rather than one.

The output of these models supports fully the VITA 49.0 Radio Transport (VRT) Standard.

These models include four or eight A/Ds, four or eight multiband DDCs and four or eight banks of memory.

## The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC

IP core. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

## Extendable IP Design

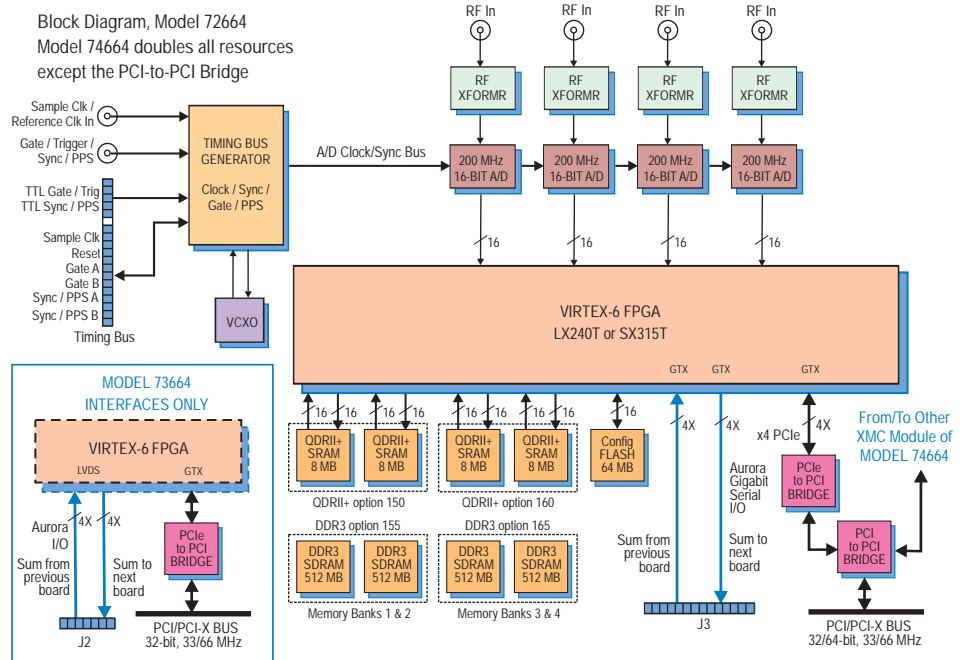

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed. ➤

## Features

- Complete radar and software radio interface solutions
- Support VITA 49.0 Radio Transport (VRT) Standard
- Support Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs (digital downconverters)
- One or two multiboard programmable beamformers
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Cores

In addition to the DDCs, these models feature one or two complete beamforming subsystems. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and

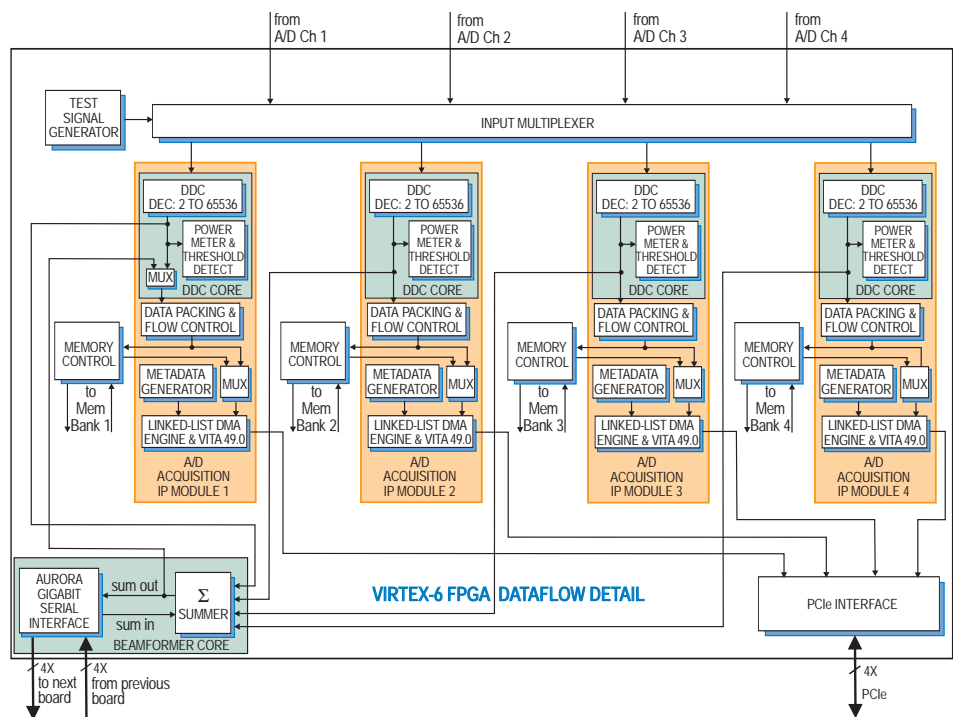

threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 71661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

### ► VITA 49.0

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA 49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

These models support fully the VITA 49.0 specification. ►

### ► A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73664: 32 bits only. ►

## Specifications

Model 72664 or Model 73664: 4 A/Ds

Model 74664: 8 A/Ds

### Front Panel Analog Signal Inputs (4 or 8)

**Input Type:** Transformer-coupled,  
front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (4 or 8)

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters (4 or 8)

**Quantity:** Four channels

**Decimation Range:** 2x to 65,536x in  
two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to  
360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit  
output, with user programmable  
coefficients

**Default Filter Set:** 80% bandwidth,  
<0.3 dB passband ripple, >100 dB  
stopband attenuation

### Beamformers (1 or 2)

**Summation:** Four channels on-board;  
multiple boards can be summed via  
Summation Expansion Chain

**Summation Expansion Chain:** One  
chain in and one chain out link via  
XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with  
16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:**  
32-bit

### Sample Clock Sources (1 or 2)

On-board clock synthesizer

### Clock Synthesizers (1 or 2)

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16 for the  
A/D clock

### External Clocks (1 or 2)

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector  
LVPECL bus includes, clock/sync/gate/  
PPS inputs and outputs; TTL signal for  
gate/trigger and sync/PPS inputs

### External Trigger Inputs (1 or 2)

**Type:** Front panel female SSMC connector,  
LVTTTL

**Function:** Programmable functions  
include: trigger, gate, sync and PPS

### Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VVSX315T

### Memory Banks (1 or 2)

**Option 150 or 160:** Two 8 MB QDRII+  
SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3  
SDRAM memory banks, 400 MHz DDR

### PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73664: 32 bits only

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

## Ordering Information

Model	Description

The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73670; J3 connector, Model 72670; J3 and J5 connectors, Model 74670. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 1.25 GHz 16-bit D/As
- Four or eight digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 or 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual- or Quad  $\mu$ Sync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

► Digital Upconverter and D/A Stage

Two or four Texas Instruments DAC3484s provide four or eight DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by

2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 7292, 7392 and 7492 or the 9192 Cobalt Synchronizers can drive multiple µSync connectors enabling large, multichannel synchronous configurations.

Memory Resources

The architecture of these models supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73670: 32 bits only. ►

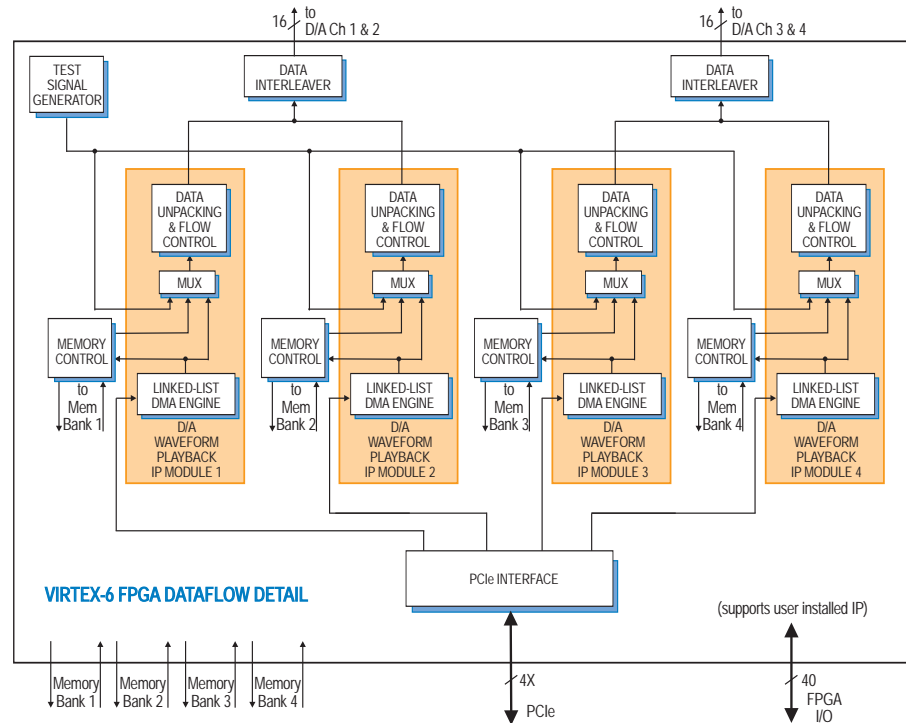

D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. Four or eight linked list controllers support waveform generation to the four or eight D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4, as well as to the other four channels of Model 74670.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 or 128 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

► Specifications

**Models 72670 and 73670: 4-Channel DUC, 4-channel D/A**

**Model 74670: 8-Channel DUC, 4-channel D/A D/A Converters (4 or 8)**

**Type:** TI DAC3484

**Input Data Rate:** 312.5 MHz max.

**Output Bandwidth:** 250 MHz max.

**Output Sampling Rate:** 1.25 GHz max. with interpolation

**Interpolation:** 2x, 4x, 8x or 16x

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (4 or 8)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps

**Full Scale Output Programming:**  $1.0 \times (G+1) / 16$  Vp-p, where 4-bit integer G = 0 to 15

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus (1 or 2):** 19-pin  $\mu$ Sync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73670; J3 connector, Model 72670; J3 and J5 connectors, Model 74670

**Memory Banks (1 or 2)**

Four or eight 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73670: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

### General Information

Models 72671, 73671 and 74671 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71671 XMC modules mounted on a cPCI carrier board.

Model 72671 is a 6U cPCI board while the Model 73671 is a 3U cPCI board; both are equipped with one Model 71671 XMC. Model 74671 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight D/As with a wide range of programmable interpolation factors, four or eight DUCs, and four or eight banks of memory.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include four or eight D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP

modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

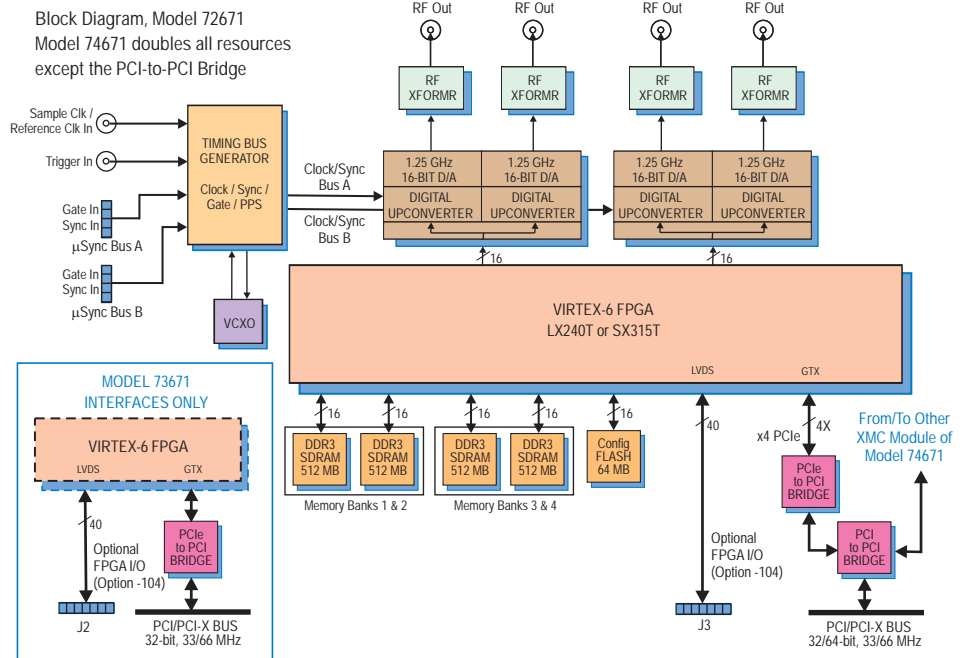

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73671; J3 connector, Model 72671; J3 and J5 connectors, Model 74671. ▶

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four or eight 1.25 GHz 16-bit D/As
- Four or eight digital upconverters
- Extended interpolation range from 2x to 1,048,576x
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 or 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-or Quad  $\mu$ Sync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

► Digital Upconverter and D/A Stage

Two or four Texas Instruments DAC3484s provide four or eight DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, these models feature an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog outputs are through front panel SSMC connectors.

on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and trigger/gate signals. The Pentek Models 7292, 7392 and 7492 or the 9192 Cobalt Synchronizers can drive multiple µSync connectors enabling large, multichannel synchronous configurations.

Memory Resources

The architecture of these models supports four or eight independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. Four or eight linked-list controllers support waveform generation to the four or eight D/As from tables stored in either on-board memory or off-board host memory.

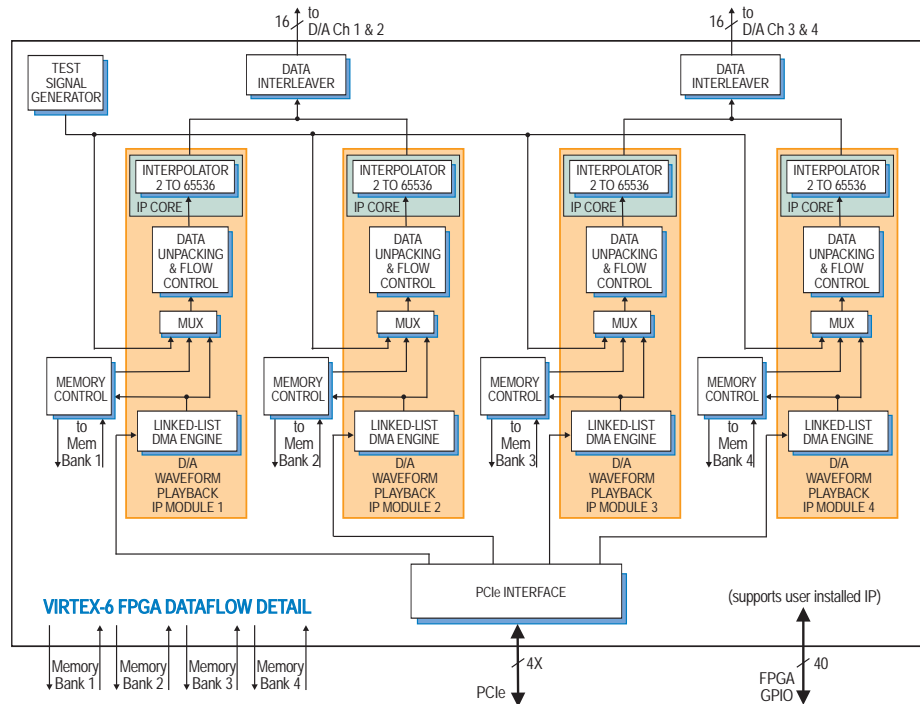

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4, as well as to the other four channels of Model 74671.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 or 128 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An

► **PCI-X Interface**

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73671: 32 bits only.

**Specifications**

**Models 72671 and 73671: 4-Channel DUC, 4-channel D/A**

**Model 74671: 8-Channel DUC, 8-channel D/A D/A Converters (4 or 8)**

**Type:** TI DAC3484

**Input Data Rate:** 312.5 MHz max.

**Output Bandwidth:** 250 MHz max.

**Output Sampling Rate:** 1.25 GHz max. with interpolation

**Interpolation:** 2x, 4x, 8x or 16x

**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Front Panel Analog Signal Outputs (4 or 8)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps

**Full Scale Output Programming:** 1.0x(G+1)/16 Vp-p, where 4-bit integer G = 0 to 15

**Clock Synthesizers (1 or 2)**

Model 74690 Model 73690

**Features**

- One or two L-Band tuners accept RF signals from 925 MHz to 2175 MHz
- One or two programmable LNAs boost LNB (low-noise block) antenna signal levels with up to 60 dB gain
- One or two programmable analog downconverters provide I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two or four 200 MHz 16-bit A/Ds
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Up to 2 or 4 GB of DDR3 SDRAM; or: 32 MB or 64MB of QDRII+ SRAM
- Clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Models 72690, 73690 and 74690 are members of the Cobalt® family of high performance CompactPCI boards based on the Xilinx Virtex-6 FPGA. They consist of one or two Model 71690 XMC modules mounted on a cPCI carrier board.

Model 72690 is a 6U cPCI board while the Model 73690 is a 3U cPCI board; both are equipped with one Model 71690 XMC. Model 74690 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two L-Band RF tuners, two or four A/Ds and four or eight banks of memory.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include two or four A/D acquisition IP modules. IP modules for either DDR3 or QDRII+ memories, controllers for all data clocking and synchronization functions, a

test signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop any FPGA IP.

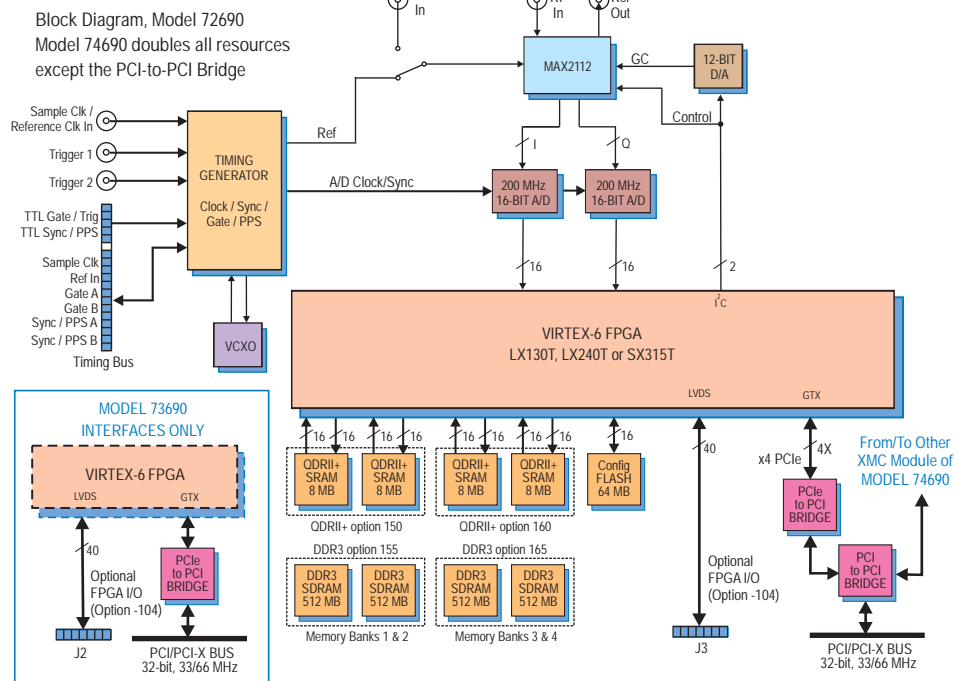

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73690; J3 connector, Model 72690; J3 and J5 connectors, Model 74690. ➤

► RF Tuner Stage

One or two front panel SSMC connectors accept L-Band signals between 925 MHz and 2175 MHz from the antenna LNAs (low noise blocks). The Maxim MAX2112 tuners directly convert these L-Band signals to baseband using broadband I/Q downconverters.

The devices include RF variable-gain LNAs (low noise amplifiers), PLL (phase-locked loops) synthesized local oscillators, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizers lock their VCOs to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

The integrated lowpass filters with variable bandwidths provide bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

A/D Converter Stage

The analog baseband I and Q analog tuner outputs are then applied to two or four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

A/D Clocking and Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

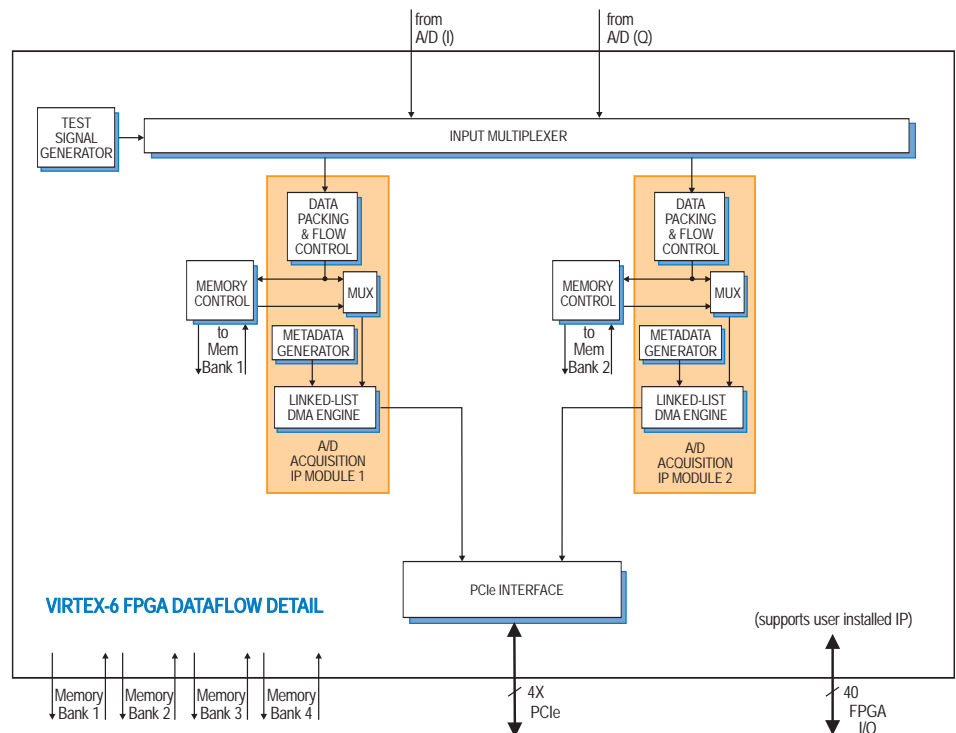

The Cobalt architecture supports up to four or eight independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

A/D Acquisition IP Modules

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA.

### PCI-X Interface

The models include an industry-standard interface compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73690: 32 bits only.

### Specifications

**Model 72690 or Model 73690: 1 RF tuner, 2 A/Ds**

**Model 74690: 2 RF tuners, four A/Ds  
Front Panel Analog Signal Inputs (1 or 2)**

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

**L-Band Tuners (1 or 2)**

**Type:** Maxim MAX2112

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$\text{freq}_{\text{VCO}} = (\text{N.F}) \times \text{freq}_{\text{REF}}$  where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

\*Usable Full-Scale Input Range: -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

**A/D Converters (2 or 4)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources (1 or 2)**

On-board timing generator/synthesizer

**A/D Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus (1 or 2):** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (2 or 4)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73690; J3 connector, Model 72690; J3 and J5 connectors, Model 74950

**Memory Banks (1 or 2)**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73690: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

### General Information

Models 72720, 73720 and 74720 are members of the Onyx<sup>®</sup> family of high-performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71720 XMC modules mounted on a cPCI carrier board.

Model 72720 is a 6U cPCI board while the Model 73720 is a 3U cPCI board; both are equipped with one Model 71720 XMC. Model 74720 is a 6U cPCI board with two XMC modules rather than one.

These models include three or six A/Ds, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include three A/D acquisition and a D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCI-X interface complete the factory-installed functions and enable these models to operate as a complete turnkey solutions, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

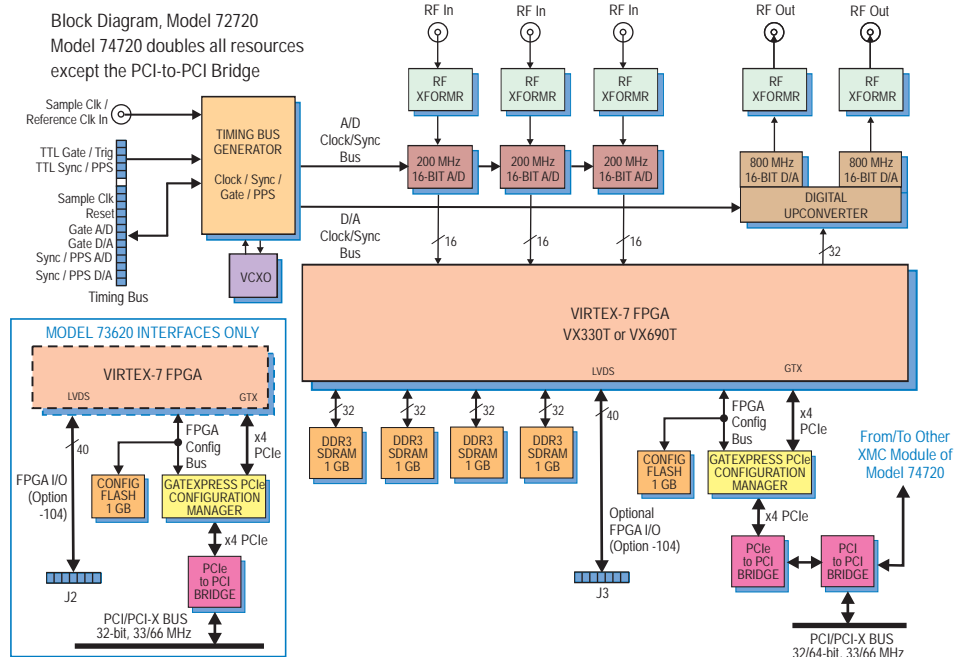

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73720; J3 connector, Model 72720; J3 and J5 connectors, Model 74720. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCI/PCI-X bus
- Three or six 200 MHz 16-bit A/Ds
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- Four or eight GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Modules**

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Modules**

These models include one or two factory-installed sophisticated D/A Waveform Playback IP modules. Linked-list controllers allow users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCI-X discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCI-X interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCI-X interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCI-X configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

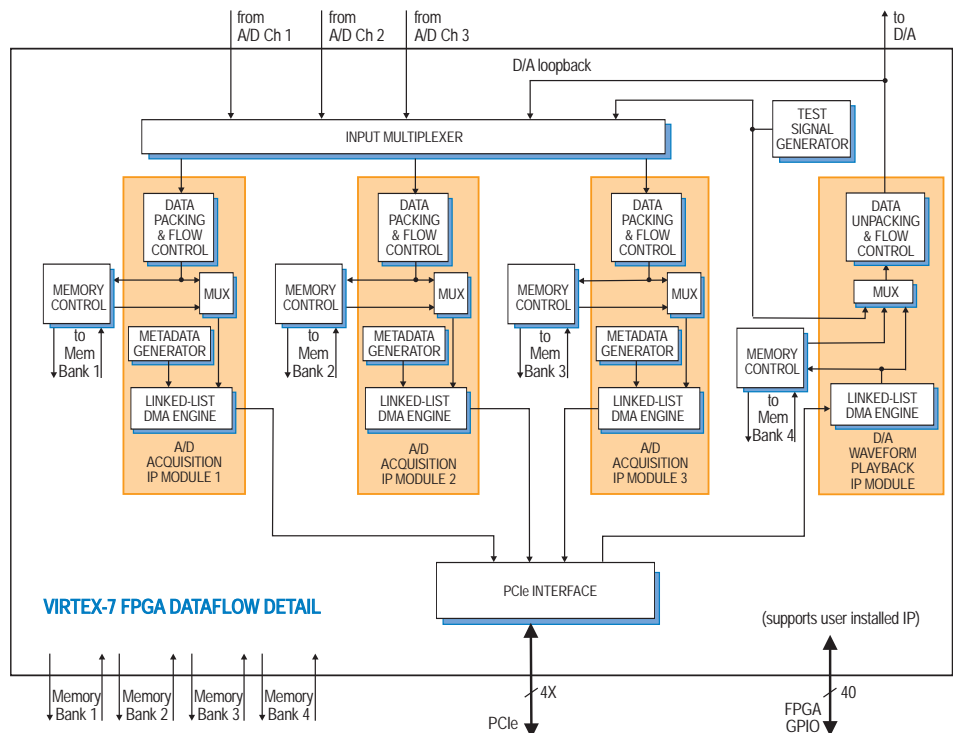

**A/D Converter Stage**

The front end accepts three or six full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept baseband real or complex data streams from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages. ►

## Memory Resources

The architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73620: 32 bits only.

## Ordering Information

Model	Description
72720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex7 FPGA - 6U cPCI
73720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - 3U cPCI
74720	6-Channel 200 MHz A/D and 4-Channel 800 MHz D/A and two Virtex-7 FPGAs - 6U cPCI

### Options:

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73720; J3 connector, Model 72720; J3 and J5 connectors, Model 74720

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes, the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

## Specifications

**Model 72620 or Model 73620: 3 A/Ds,  
1 DUC, 2 D/As**

**Model 74620: 6 A/Ds, 2 DUCs, 4 D/As**

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs (2 or 4)**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector

LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73720; J3 connector, Model 72720; J3 and J5 connectors, Model 74720

**Memory Banks (1 or 2)**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73620: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

# Models 72721 73721 and 74721

# 3- or 6-Channel 200 MHz A/D with DDC, DUC with 2- or 4-Channel 800 MHz D/A, Virtex-7 FPGA - cPCI

Model 74721 Model 73721

## General Information

Models 72721, 73721 and 74721 are members of the Onyx® family of high-performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71721 XMC modules mounted on a cPCI carrier board.

Model 72721 is a 6U cPCI board while the Model 73721 is a 3U cPCI board; both are equipped with one Model 71721 XMC. Model 74721 is a 6U cPCI board with two XMC modules rather than one.

These models include three or six A/Ds, programmable DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

## The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include three or six A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules

contains a powerful, programmable DDC IP core. The waveform playback IP module contains one or two interpolation IP cores, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, one or two test signal generators, one or two programmable beamforming IP cores, and one or two Aurora gigabit serial interfaces complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop FPGA IP.

## Extendable IP Design

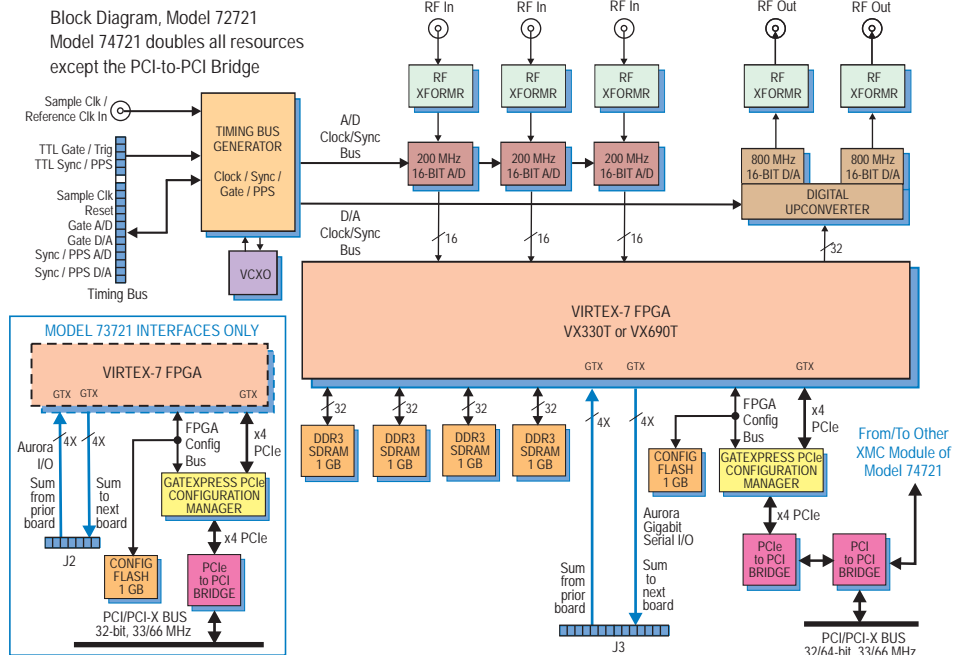

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs
- Two or four 800 MHz 16-bit D/As
- One or two DUCs
- Multiboard programmable beamformer
- Four or eight GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization

### A/D Acquisition IP Modules

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Cores

In addition to the DDCs, these models feature one or two beamforming subsystems. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

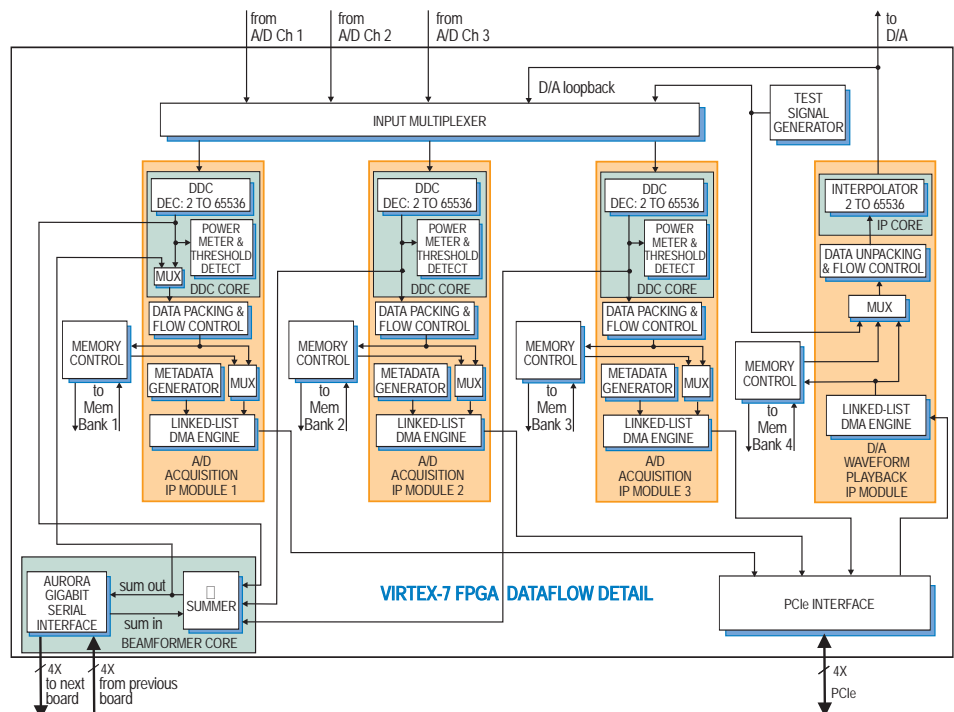

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

### D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer coupling into Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUC (digital upconverters) and D/As accept baseband real or complex data stream from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73721: 32 bits only. ►

### ► Memory Resources

The architecture supports four or eight independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### Specifications

**Model 72721 or Model 73721:** 3 A/Ds,  
1 DUC, 2 D/As

**Model 74721:** 6 A/Ds, 2 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (3 or 6)**

**Input:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformers (1 or 2)**

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2):** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

- One or two 1 GHz 12-bit A/D
- One or two 1 GHz 16-bit D/A
- Four or eight GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-µSync clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

Block Diagram, Model 72730

Model 74730 doubles all resources except the PCI-to-PCI Bridge

### A/D Acquisition IP Module

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Playback IP Modules

The factory-installed functions include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 or 128 individual link entries can be chained together to create complex waveforms with a minimum of programming.

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCI-X discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCI-X interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCI-X interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCI-X configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

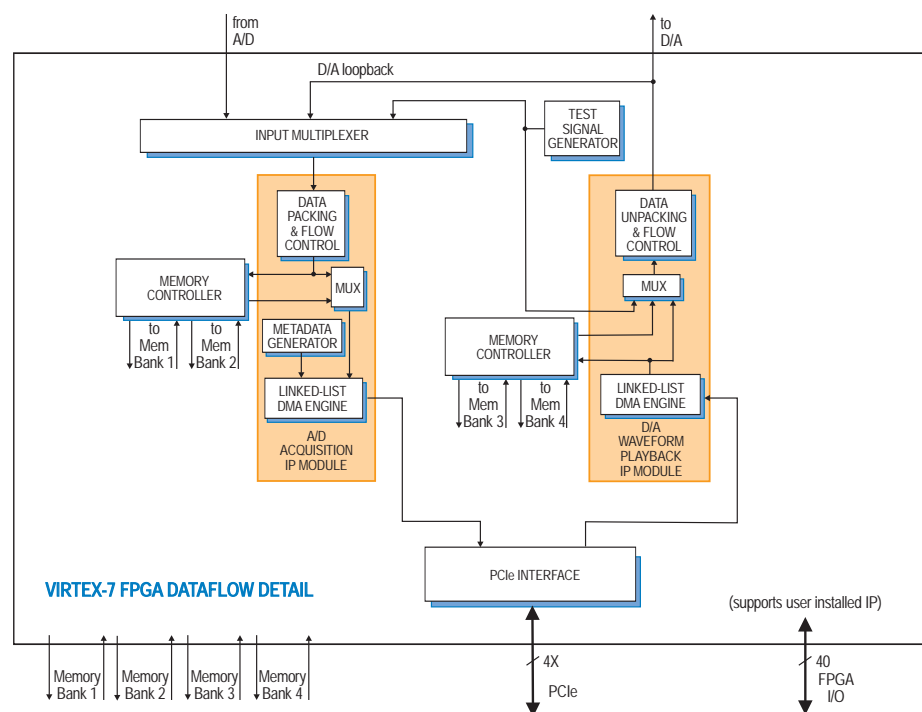

### A/D Converter Stage

The front end accepts one or two analog HF or IF input on front panel SSMC connectors with transformer coupling into one or two Texas Instruments ADS5400 1 GHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

### D/A Converter Stage

These models feature one or two TI DAC5681Z 1 GHz, 16-bit D/As. The converters have an input sample rate of 1 GSPS, allowing them to accept full rate data from the FPGA. Additionally, the D/As include a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through front panel SSMC connectors. ►

## PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73730: 32 bits only.

## Ordering Information

Model	Description
72730	1 GHz A/D and D/A, Virtex-7 FPGA - 6U cPCI
73730	1 GHz A/D and D/A, Virtex-7 FPGA - 3U cPCI
74730	Two 1 GHz A/D and D/A, Virtex-7 FPGA - 6U cPCI
<b>Options:</b>	
-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73730; J3 connector, Model 72730; J3 and J5 connectors, Model 74730

## ► Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel  $\mu$ Sync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7192 and Model 9192 Cobalt Synchronizers can drive multiple 71630  $\mu$ Sync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

## Memory Resources

The Onyx architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## Specifications

Model 72730 or Model 73730: 1 A/D, 1 D/A

Model 74730: 2 A/Ds, 2 D/As

Front Panel Analog Signal Inputs (1 or 2)

**Input Type:** Transformer-coupled, front panel female SSMC connectors

A/D Converters (1 or 2)

**Type:** Texas Instruments ADS5400

**Sampling Rate:** 100 MHz to 1 GHz

**Resolution:** 12 bits

D/A Converters (1 or 2)

**Type:** Texas Instruments DAC5681Z

**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

Front Panel Analog Signal Outputs (1 or 2)

**Output Type:** Transformer-coupled, front panel female SSMC connectors

Sample Clock Sources (1 or 2)

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizers (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clocks (1 or 2)

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73730; J3 connector, Model 72730; J3 and J5 connectors, Model 74730

Memory Banks (1 or 2)

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73730: 32 bits only

Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

# Models 72741, 73741 and 74741

# 1- or 2-Channel 3.6 GHz and 2- or 4-Channel 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Virtex-7 FPGA - cPCI

Model 74741 Model 73741

## General Information

Models 72741, 73741 and 74741 are members of the Onyx® family of high performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71741 XMC modules mounted on a cPCI carrier board.

Model 72741 is a 6U cPCI board while the Model 73741 is a 3U cPCI board; both are equipped with one Model 71741 XMC. Model 74741 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two 3.6 GHz, 12-bit A/D converters, four or eight banks of memory, and one or two wideband DDCs

## The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include one or two A/D acquisition IP modules and one or two wideband DDCs.

In addition, IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turn-key solutions, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

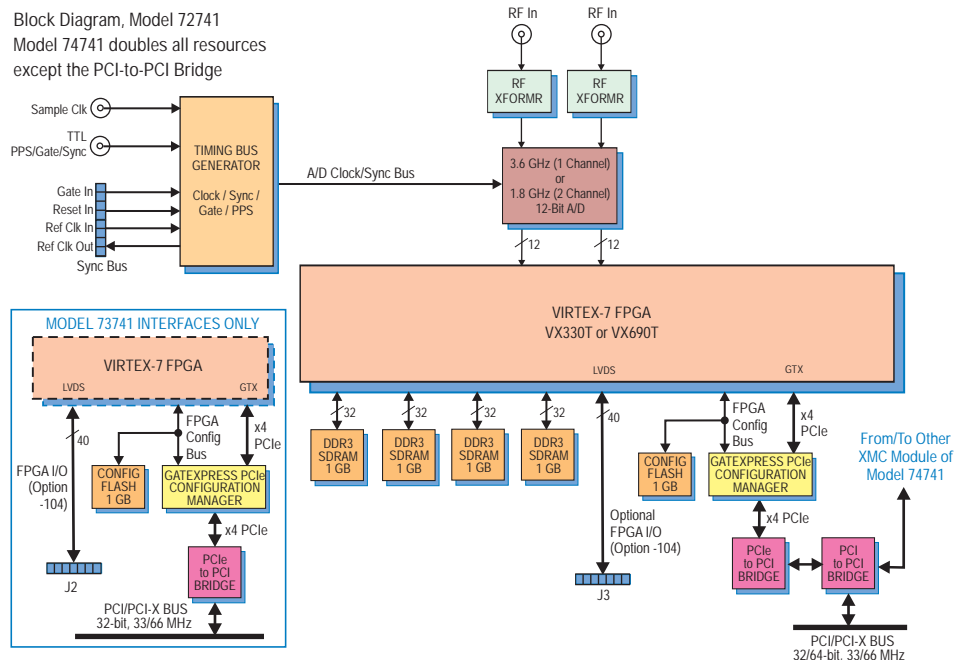

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73741; J3 connector, Model 72741; J3 and J5 connectors, Model 74741. ▶

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDCs (Digital Downconverters)
- 4 or 8 GB of DDR3 SDRAM
- µSync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

Block Diagram, Model 72741

Model 74741 doubles all resources except the PCI-to-PCI Bridge

### A/D Acquisition IP Module

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/D, or a test signal generator. The IP modules have associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

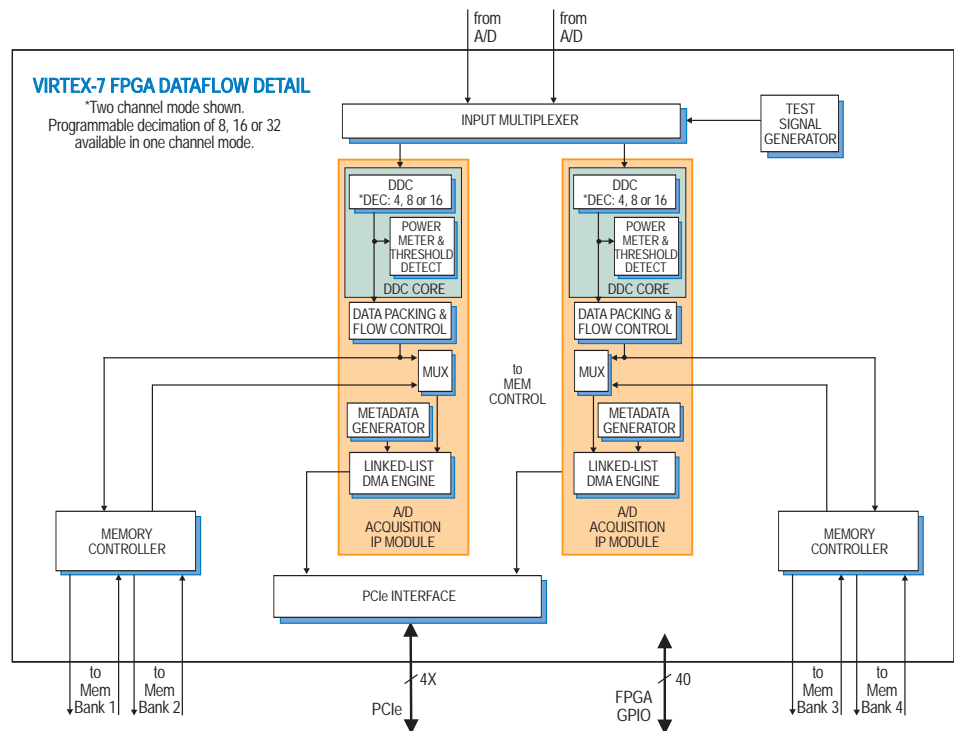

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored ►

## Memory Resources

The Onyx architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

## PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73741: 32 bits only.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing these models to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

## Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two boards can be synchronized with a simple cable. For larger systems, multiple boards can be synchronized using the Models 7292, 7392 or 7492 high-speed sync boards to drive the sync bus.

## Specifications

**Model 72741 or Model 73741: One A/D**

**Model 74741: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

## A/D Converters (1 or 2)

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

## Digital Downconverters (2 or 4)

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

## Sample Clock Sources (1 or 2)

Front panel SSMC connector

## Timing Bus (1 or 2)

19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

## External Trigger Input (1 or 2)

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Arrays (1 or 2)

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

## Custom I/O

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73741; J3 connector, Model 72741; J3 and J5 connectors, Model 74741

## Memory Banks (1 or 2)

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

## PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73741: 32 bits only

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

Model 74751 Model 73751

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds

### General Information

Models 72650, 73650 and 74650 are members of the Onyx® family of high performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71751 XMC modules mounted on a cPCI carrier board.

Model 72751 is a 6U cPCI board while the Model 73751 is a 3U cPCI board; both are equipped with one Model 71751 XMC. Model 74751 is a 6U cPCI board with two XMC modules rather than one.

These models include two or four A/Ds, two or four multiband DDCs, one or two DUCs, two or four D/As and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include two or four A/D acquisition and one or two D/A waveform playback IP modules. Each of the acquisition IP modules contains a powerful, programmable DDC

IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as a complete turnkey solutions, without the need to develop any FPGA IP.

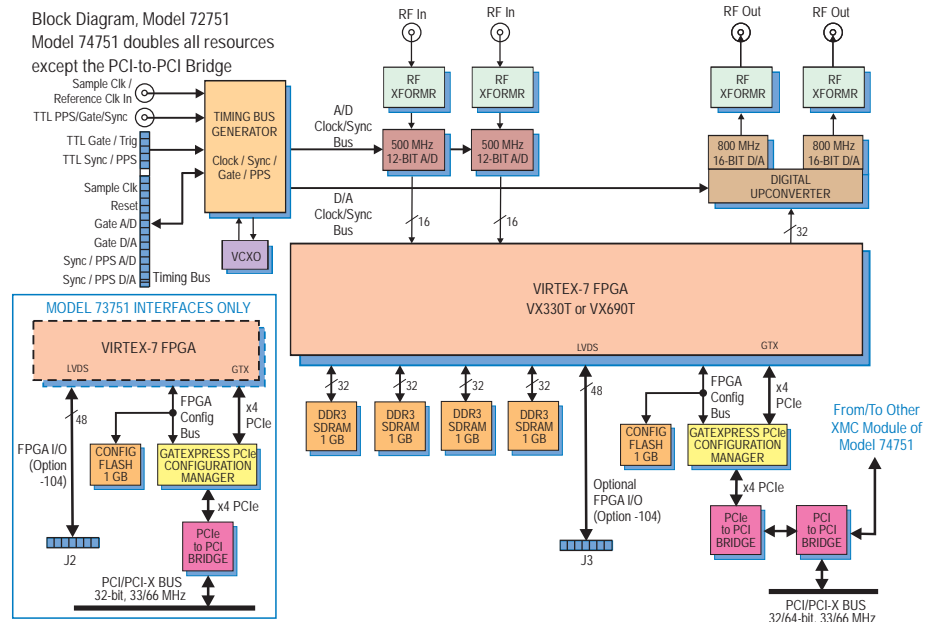

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 24 LVDS pairs between the FPGA and the J2 connector, Model 73751; J3 connector, Model 72751; J3 and J5 connectors, Model 74751. ▶

### A/D Acquisition IP Modules

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation set-

ting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

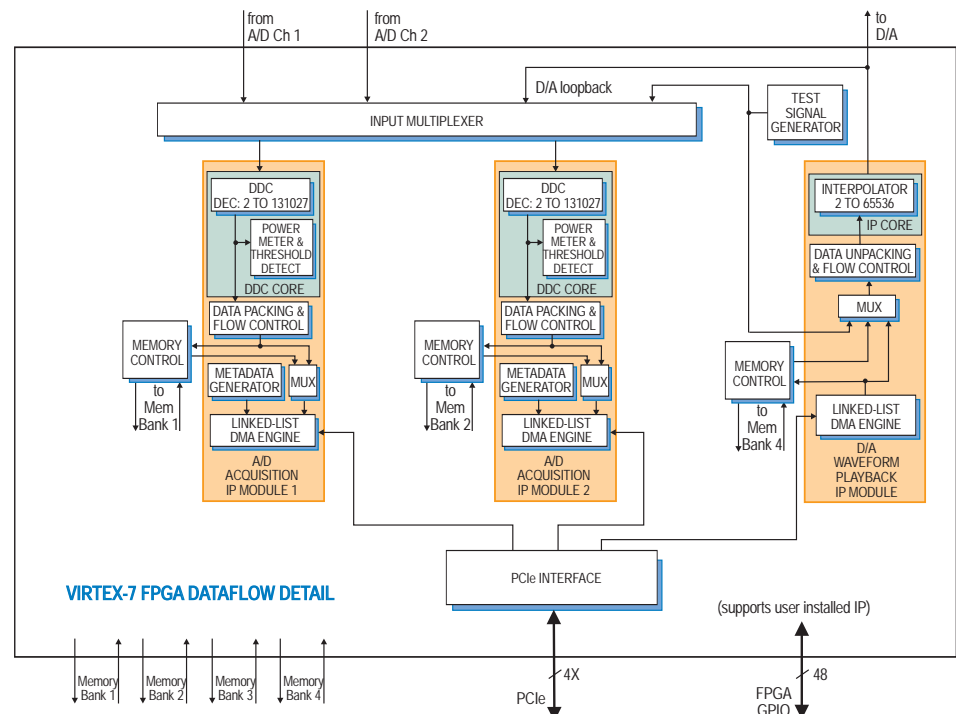

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two or four Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, Texas Instruments ADS5474 400 MHz, 14-bit A/Ds may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

One or two TI DAC5688 DUCs (digital upconverters) and D/As accept the baseband real or complex data stream from the FPGA and provide that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog outputs are through front-panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73751: 32 bits only. ►

► **Specifications**

**Model 72751 or Model 73751:** 2 A/Ds,  
2 DDCs, 1 DUC, 2 D/As

**Model 74751:** 4 A/Ds, 4 DDCs, 2 DUCs,  
4 D/As

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer Type:** Coil Craft  
WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters (2 or 4)**

**Decimation Range:** 2x to 131,072x in  
two programmable stages of 2x to 256x  
and one fixed 2x stage

**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits,  
0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output,  
with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3  
dB passband ripple, >100 dB stopband  
attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or  
1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.  
with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolators (1 or 2)**

**Interpolation Range:** 2x to 65,536x in  
two stages of 2x to 256x

**Total Interpolation Range (D/A and Digital  
combined):** 2x to 524,288x

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources (2 or 4)**

On-board clock synthesizer generates  
two clocks: one A/D clock and one D/A  
clock

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16, inde-  
pendently for the A/D clock and D/A  
clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus: (1 or 2)** 26-pin connector

LVPECL bus includes, clock/sync/  
gate/PPS inputs and outputs; TTL sig-  
nal for gate/trigger and sync/PPS  
inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 24 LVDS pairs  
between the FPGA and the J2 connector,  
Model 73751; J3 connector, Model 72751;  
J3 and J5 connectors, Model 74751

**Memory (1 or 2)**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73751: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 6U cPCI
73751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 3U cPCI
74751	4-Channel 500 MHz A/D with DDCs, DUCs with 4-Channel 800 MHz D/A, and two Virtex-7 FPGAs - 6U cPCI

**Options:**

-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-104	LVDS I/O between the FPGA and J2 connector, Model 73751; J3 connector, Model 72751; J3 and J5 connectors, Model 74751

Model 74760 Model 73760

### General Information

Models 72760, 73760 and 74760 are members of the Onyx<sup>®</sup> family of high-performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71760 XMC modules mounted on a cPCI carrier board.

Model 72760 is a 6U cPCI board while the Model 73760 is a 3U cPCI board; both are equipped with one Model 71760 XMC. Model 74760 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight A/Ds and four or eight banks of memory.

### The Onyx Architecture

The Pentek Onyx Architecture features Virtex-7 FPGAs. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions of these models include four or eight A/D acquisition IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions without the need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

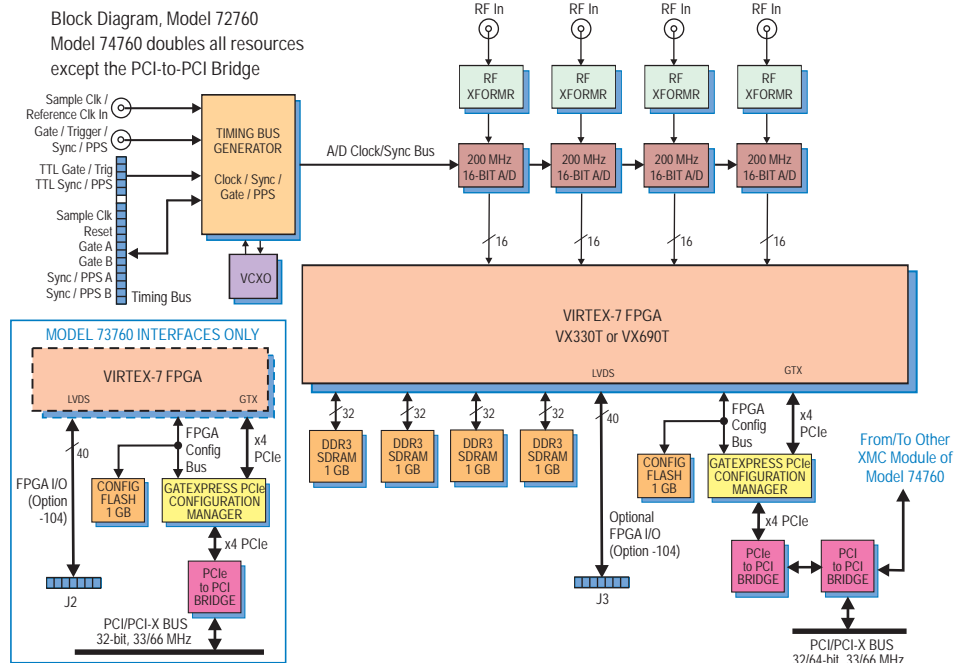

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73760; J3 connector, Model 72760; J3 and J5 connectors, Model 74760. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCI/PCI-X bus
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCI-X discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCI-X interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCI-X interface. This is important in security situations where there can be no latent user image left in nonvola-

tile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCI-X configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four or eight full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four or eight Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

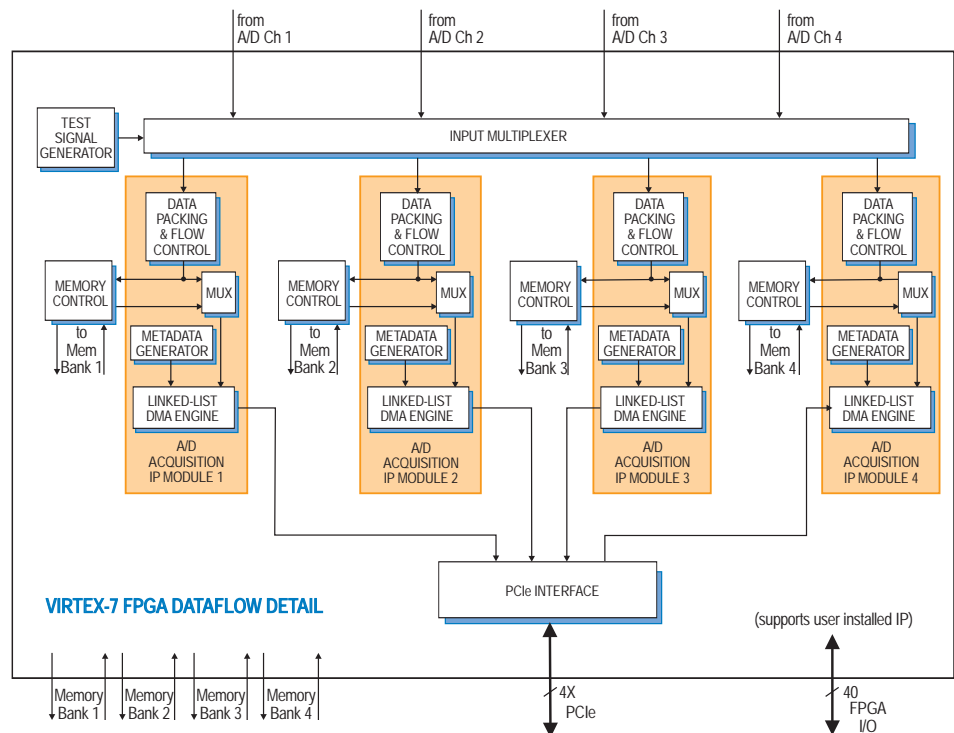

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources. ►

A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of four A/Ds or the test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### ► Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The Onyx architecture supports four or eight independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73760: 32 bits only.

### Specifications

**Model 72760 or Model 73760: 4 A/Ds**

**Model 74760: 8 A/Ds**

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

# Models 72761 73761 and 74761

## 4- or 8-Channel 200 MHz A/D with DDCs, Virtex-7 FPGA - cPCI

Model 74761 Model 73761

### General Information

Models 72761, 73761 and 74761 are members of the Onyx® family of high-performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71761 XMC modules mounted on a cPCI carrier board.

Model 72761 is a 6U cPCI board while the Model 73761 is a 3U cPCI board; both are equipped with one Model 71761 XMC. Model 74761 is a 6U cPCI board with two XMC modules rather than one.

These models include four or eight A/Ds, programmable DDCs and four or eight banks of memory.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions in these models include four or eight A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, controllers for all data clocking and synchronization functions, one or two test signal generators, one or two programmable beamforming IP cores, and one or two Aurora gigabit serial interfaces complete the factory-installed functions and enable these models to operate as complete turnkey solutions, without the need to develop FPGA IP.

### Extendable IP Design

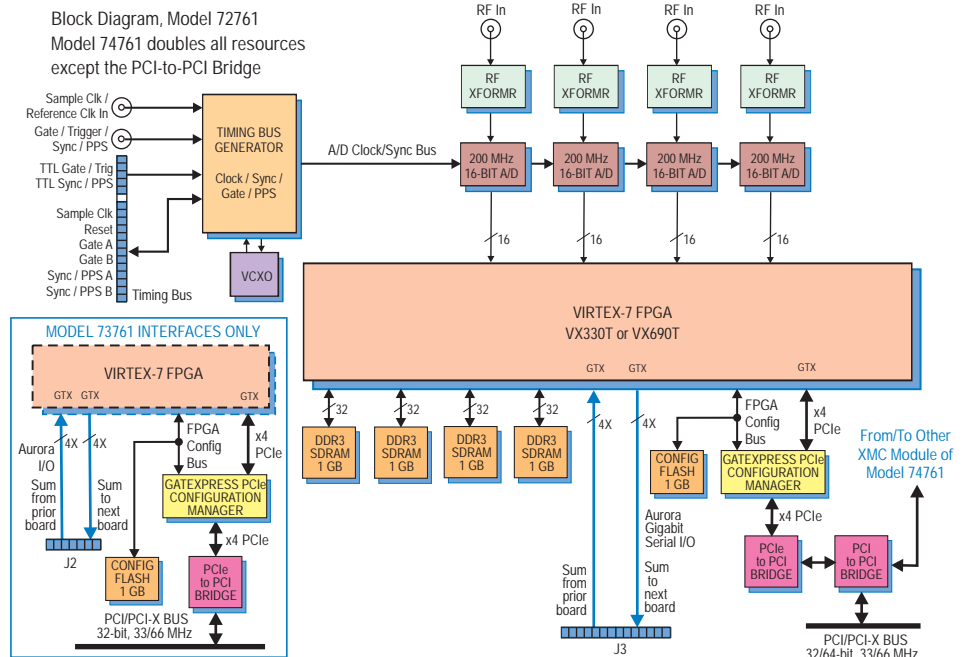

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs
- Multiboard programmable beamformer
- Four or eight GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Beamformer IP Core

In addition to the DDCs, these models feature a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple boards can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

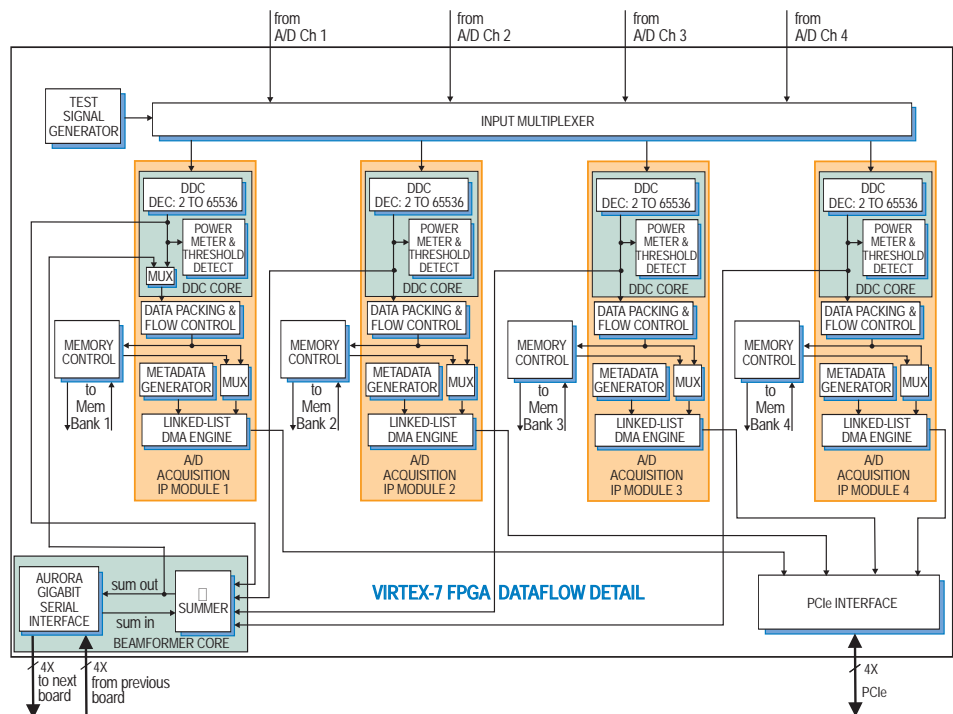

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from ►

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports four or eight independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73761: 32 bits only. ►

► **Specifications**

**Model 72761 or Model 73761:** 4 A/Ds,  
**Model 74761:** 8 A/Ds

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled,  
front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 65,536x in  
two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to  
360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit out-  
put, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth,  
<0.3 dB passband ripple, >100 dB  
stopband attenuation

**Beamformers (1 or 2)**

**Summation:** Four channels on-board;  
multiple boards can be summed via  
Summation Expansion Chain  
**Summation Expansion Chain:** One  
chain in and one chain out link via  
XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with  
16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources (1 or 2)**

On-board clock synthesizer

**Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16 for the  
A/D clock

**External Clocks (1 or 2)**

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus: (1 or 2)** 26-pin connector  
LVPECL bus includes, clock/sync/  
gate/PPS inputs and outputs; TTL sig-  
nal for gate/trigger and sync/PPS  
inputs

**External Trigger Inputs (1 or 2)**

**Type:** Front panel female SSMC connector,  
LVTTTL

**Function:** Programmable functions  
include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Memory Banks (1 or 2)**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73761: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72761	4-Channel 200 MHz A/D with DDCs, Virtex-7 FPGA - 6U cPCI
73761	4-Channel 200 MHz A/D with DDCs, Virtex-7 FPGA - 3U cPCI
74761	8-Channel 200 MHz A/D with DDCs, Virtex-7 FPGAs - 6U cPCI

**Option:**

-076 XC7VX690T-2 FPGA

*New!*

# Models 72791, 73791 and 74791

# 1 or 2 L-Band RF Tuners, 2- or 4-Channel 500 MHz A/Ds, Virtex-7 FPGAs - cPCI

Model 74791      Model 73791

## Features

- Accepts RF signals from 925 MHz to 2175 MHz
- One or two programmable LNAs handle L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverters provide IF or I+Q baseband signals at frequencies up to 123 MHz
- Two or four 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two or four FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 or 8 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

## General Information

Models 72791, 73791 and 74791 are members of the Onyx® family of high performance CompactPCI boards based on the Xilinx Virtex-7 FPGA. They consist of one or two Model 71791 XMC modules mounted on a cPCI carrier board.

Model 72791 is a 6U cPCI board while the Model 73791 is a 3U cPCI board; both are equipped with one Model 71791 XMC. Model 74791 is a 6U cPCI board with two XMC modules rather than one.

These models include one or two L-Band RF tuners, two or four A/Ds, two or four DDCs and four or eight banks of memory, one or two general purpose connectors for application-specific I/O.

## The Onyx Architecture

The Pentek Onyx Architecture features one or two Virtex-7 FPGAs. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The factory-installed functions include two or four A/D acquisition IP modules, four or eight DDR3 memory controllers, two or four DDCs, RF tuner controllers,

clock and synchronization generators, and one or two test signal generators.

Thus, these models can operate as complete turnkey solutions with no need to develop FPGA IP.

## Extendable IP Design

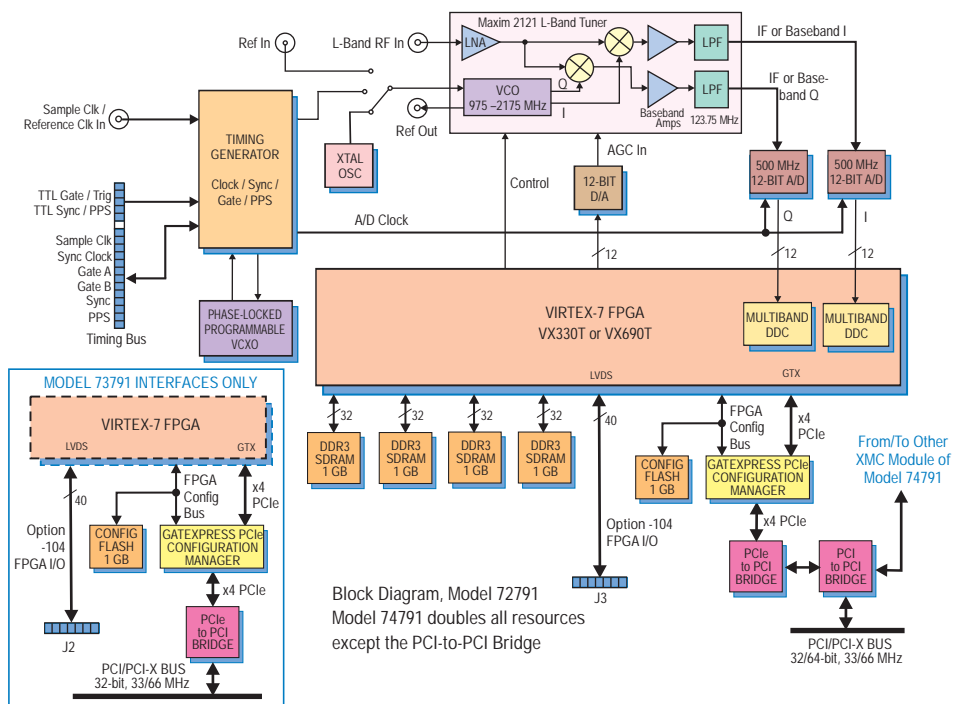

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73791; J3 connector, Model 72791; J3 and J5 connectors, Model 74791. ➤

### A/D Acquisition IP Modules

These models feature two or four A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### RF Tuner Stage

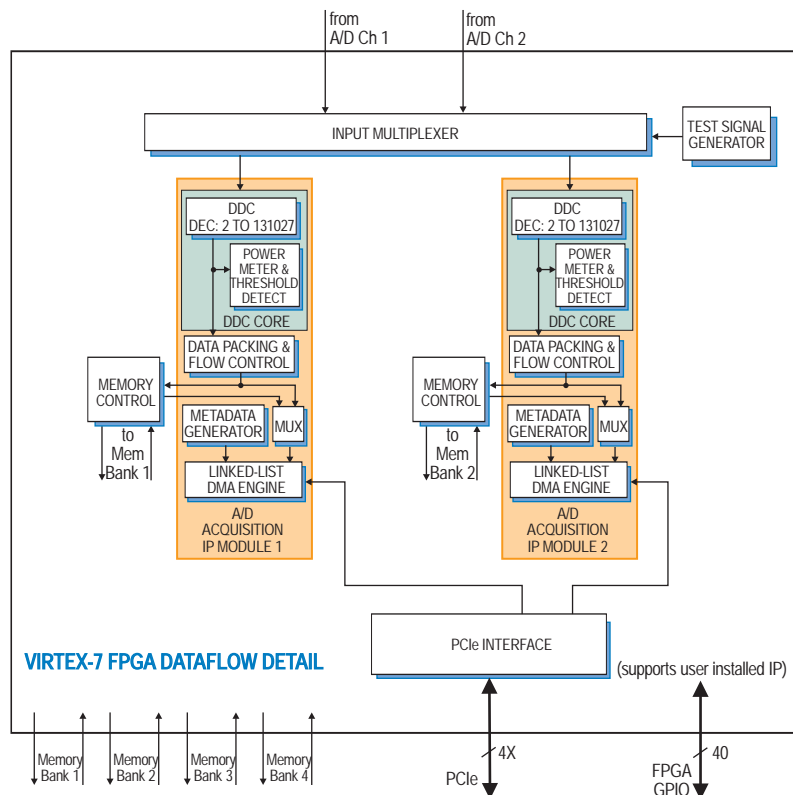

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ▶

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The analog tuner outputs are digitized by two or four Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two or four independent A/D and DDC channels are now available for digitizing and downconverting signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

One or two internal timing generators provide all timing, gating, triggering and synchronization functions required by the A/D converters. They also serve as optional sources for the L-Band tuner references.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports four or eight independent 1 GB DDR3 SDRAMs for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be used to support custom user-installed IP within the FPGA .

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73791: 32 bits only. ►

► **Specifications**

**Model 72791 or Model 73791:** 1 L-band Tuner, 2 A/Ds, 2 DDCs, 1 FPGA

**Model 74751:** 2 L-Band Tuners, 4 A/Ds, 4 DDCs, 2 FPGAs

**Front Panel Analog Signal Inputs (1 or 2)**

**Connector:** Front panel female SSMC

**Impedance:** 50 ohms

**L-Band Tuner (1 or 2)**

**Type:** Maxim MAX2121

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$\text{freq}_{\text{VCO}} = (\text{N.F.}) \times \text{freq}_{\text{REF}}$

where integer N = 19 to 251 and

fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**

-50 dBm to +10 dBm

**Baseband Low Pass Filter:**

3 dB cutoff frequency: 123.75 MHz

**A/D Converters (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 10 MHz to 500 MHz

**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources (1 or 2)**

On-board timing generator/synthesizer

**A/D Clock Synthesizers (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Input (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm,

AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus (1 or 2)**

26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (2 or 4)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73791; J3 connector, Model 72791; J3 and J5 connectors, Model 74791

**Memory Banks (4 or 8)**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73791: 32 bits only

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 6U or 3U cPCI board

**Ordering Information**

Model	Description
72791	L-Band RF Tuner with 2-Channel 500 MHz A/D with DDCs and Virtex-7 FPGA - 6U cPCI
73791	L-Band RF Tuner with 2-Channel 500 MHz A/D with DDCs and Virtex-7 FPGA - 3U cPCI
74791	2 L-Band RF Tuners with 4-Channel 500 MHz A/D with DDCs and two Virtex-7 FPGAs - 6U cPCI

**Options:**

-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-100	27 MHz crystal for MAX2121
-104	LVDS I/O between the FPGA and J2 connector, Model 73791; J3 connector, Model 72791; J3 and J5 connectors, Model 74791

# Models 72131 73131 & 74131

# 8- or 16-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGAs - cPCI

Model 74131 Model 73131

## General Information

Models 72131, 73131 and 74131 are members of the Jade™ family of high-performance CompactPCI (cPCI) boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71131 XMC modules mounted on a cPCI carrier board. Model 72131 is a 6U board while Model 73131 is a 3U board; both have one Model 71131 module. Model 74131 is equipped with two XMC modules rather than one.

They include eight or 16 A/Ds, complete multiboard clock and sync sections and the option for a large DDR4 memory.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each

function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include eight or 16 A/D acquisition IP modules for simplifying data capture and transfer.

Each of the acquisition IP modules contains a powerful, multiband DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCI-X interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

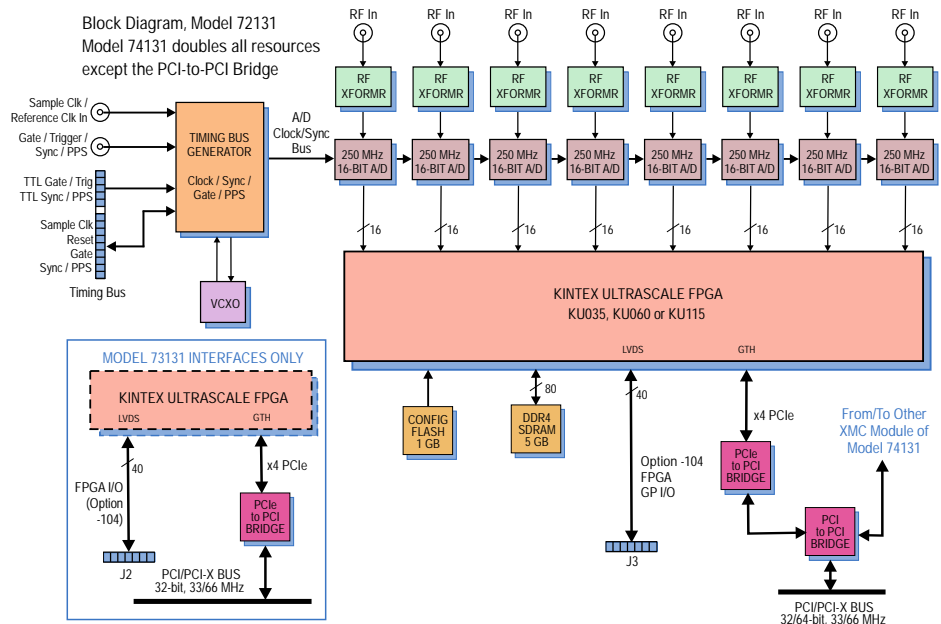

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, ➤

## Features

- Ideal radar and software radio interface solution
- Supports one or two Xilinx Kintex UltraScale FPGAs
- Eight or 16 200 MHz 16-bit A/Ds
- Eight or 16 multiband DDCs (digital downconverters)
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized versions available

### A/D Acquisition IP Modules

These models feature eight or 16 A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight associated A/Ds or a test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients.

The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73131; J3 connector, Model 72131; J3 and J5 connectors, Model 74131.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal-processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly

by the A/D or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

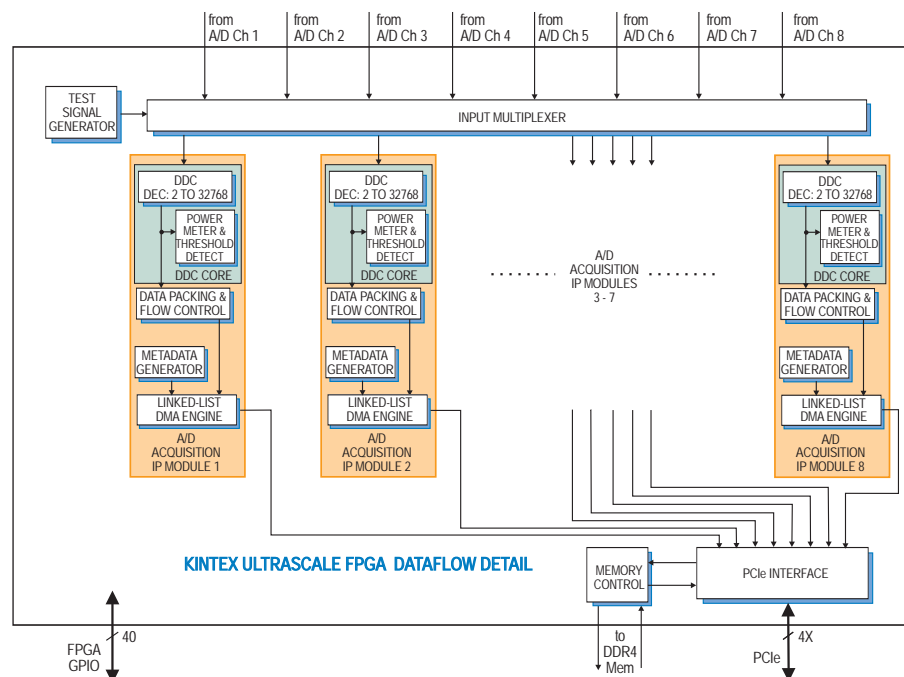

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73131: 32 bits only. ►

► Specifications

**Models 72131 and 73131:** 8 A/Ds

**Model 74131:** 16 A/Ds

**Front Panel Analog Signal Inputs (8 or 16)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (8 or 16)**

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

**Digital Downconverters (8 or 16)**

**Quantity:** Four channels

**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** LVDS I/O between the FPGA and J2 connector, Model 73131; J3 connector, Model 72131; J3 and J5 connectors, Model 74131

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB Models 72131 and 73131; 10 GB Model 74131

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz Model 73131: 32 bits only

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Standard 6U or 3U cPCI board

# Models 72132 73132 & 74132

# 8- or 16-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGAs - cPCI

Model 74132 Model 73132

## General Information

Models 72132, 73132 and 74132 are members of the Jade™ family of high-performance CompactPCI (cPCI) boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71132 XMC modules mounted on a cPCI carrier board. Model 72132 is a 6U board while Model 73132 is a 3U board; both have one Model 71132 module. Model 74132 is equipped with two XMC modules rather than one.

They include eight or 16 A/Ds, complete multiboard clock and sync sections and a large DDR4 memory.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include eight or 16 A/D acquisition IP modules for simplifying data capture and transfer.

Each of the acquisition IP modules contains a powerful, multiband DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCI-X interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

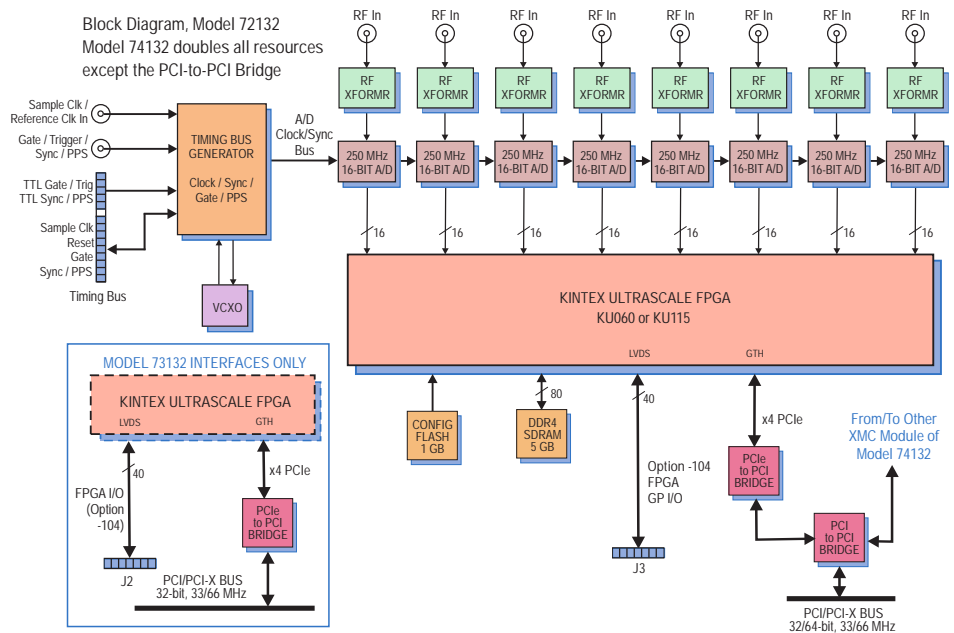

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU115. ▶

## Features

- Ideal radar and software radio interface solution
- Supports one or two Xilinx Kintex UltraScale FPGAs
- Eight or 16 250 MHz 16-bit A/Ds
- Eight or 16 wideband DDCs (digital downconverters)
- 64 or 128 multiband DDCs
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized version available

### A/D Acquisition IP Modules

These models feature eight or 16 A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight associated A/Ds or one or two test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each acquisition module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73132; J3 connector, Model 72132; J3 and J5 connectors, Model 74132.

### A/D Converter Stage

The front end accepts eight or 16 analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four or eight TI ADS42LB69 dual 250 MHz, 16-bit A/D s.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC

connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

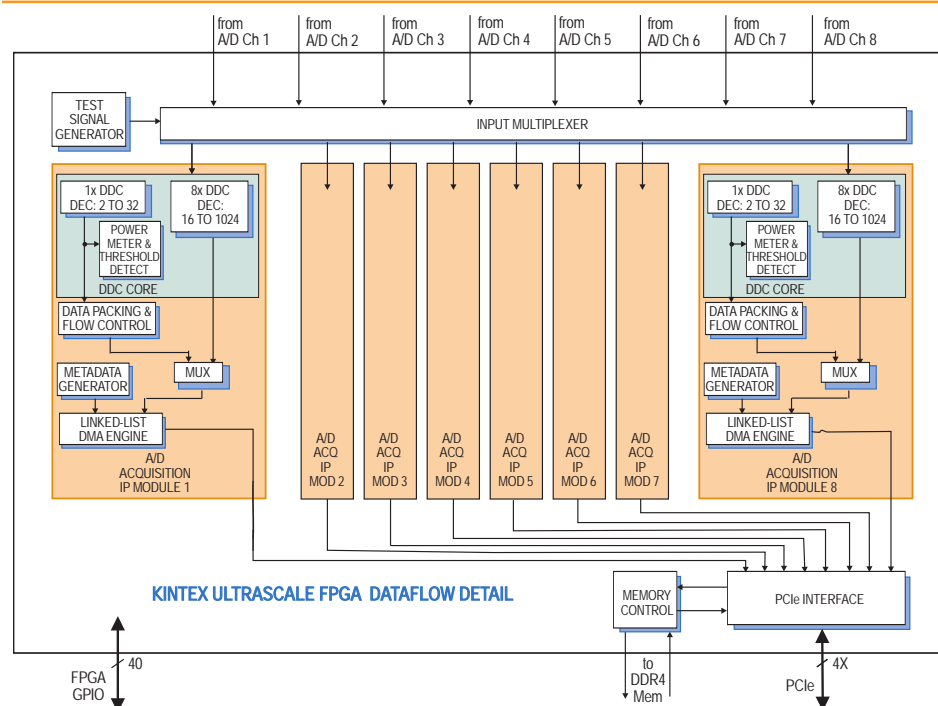

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller cores within the FPGA can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73132: 32 bits only. ►

► Specifications

Models 72132 and 73132: 8 A/Ds

Model 74132: 16 A/Ds

Front Panel Analog Signal Inputs (8 or 16)

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters (8 or 16)

**Type:** Texas Instruments ADS42LB69

**Sampling Rate:** 10 MHz to 250 MHz

**Resolution:** 16 bits

Wideband Digital Downconverters (8 or 16)

**Decimation Range:** 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

Multiband Digital Downconverters (64 or 128)

**Decimation Range:** 16x to 1024x in steps of 8

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

Sample Clock Sources: (1 or 2)

On-board clock synthesizer

Clock Synthesizer (1 or 2)

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

External Clock (1 or 2)

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

Timing Bus (1 or 2)

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

External Trigger Input (1 or 2)

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

Field Programmable Gate Array (1 or 2)

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

Custom I/O

**Option -104:** LVDS I/O between the FPGA and J2 connector, Model 73132; J3 connector, Model 72132; J3 and J5 connectors, Model 74132

Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB Models 72132 and 73132; 10 GB Model 74132

**Speed:** 1200 MHz (2400 MHz DDR)

PCI-X Interface

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz; Model 73132: 32 bits only

Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U board: 6.299 in x 9.173 in (160.00 mm x 233.00 mm)  
3U board: 3.937 in x 6.299 in (100.00 mm x 160.00 mm)

## General Information

Models 72141, 73141 and 74141 are members of the Jade™ family of high-performance cPCI boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71141 XMC modules mounted on a cPCI carrier board. Model 72141 is a 6U cPCI board while the Model 73141 is a 3U cPCI board; both are equipped with one Model 71141 XMC. Model 74141 is a 6U cPCI board with two XMC modules rather than one.

They include two or four A/Ds, complete multiboard clock and sync sections, large DDR4 memories, two or four DDCs, two or four DUCs and two or four D/As. These models include optional high-bandwidth connections to the Kintex UltraScale FPGAs for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include two or four A/D acquisition IP modules.

Each of the acquisition IP modules contains a programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCI-X interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

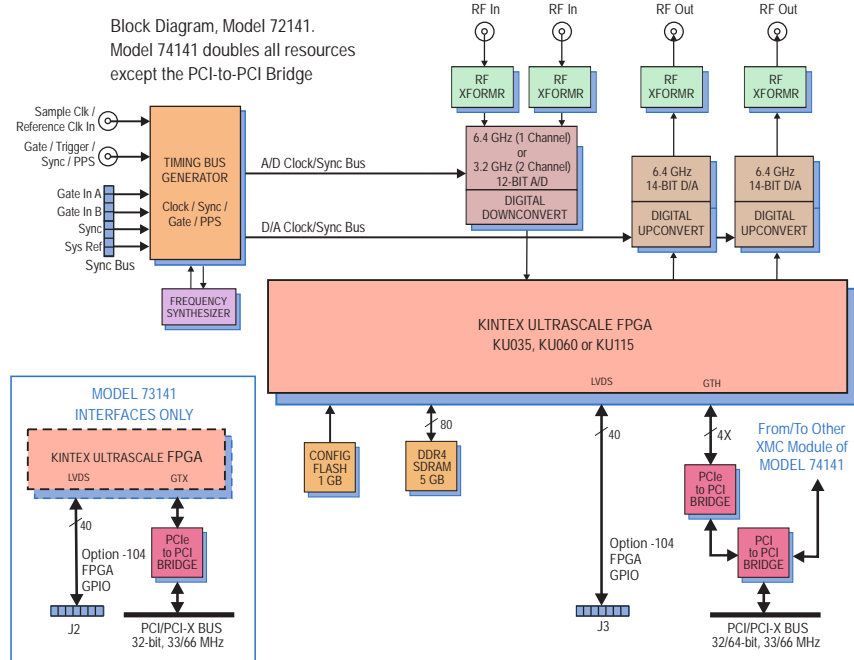

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One or two-channel mode with one or two 6.4 GHz, 12-bit A/Ds
- Two or four-channel mode with two or four 3.2 GHz, 12-bit A/Ds
- Two or four-channel mode with two or four 6.4 GHz, 14-bit D/As
- Programmable DDCs (Digital Downconverters)
- 5 or 10 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O

### A/D Acquisition IP Module

These models feature two or four A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP modules have associated 5 or 10 GB of DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### D/A Waveform Generator IP Module

These models support factory-installed functions which include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the D/As waveforms stored in either on-board memory or off-board host memory.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the J3 (or J2 connector, Model 73141) for custom I/O.

### A/D Converter Stage

The front end accepts analog HF or IF inputs on front panel SSMC connectors with transformer coupling into Texas Instruments ADC12D1800 12-bit A/Ds. The converters operate in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Kintex UltraScale FPGAs for signal processing, data capture or for routing to other board resources.

### Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

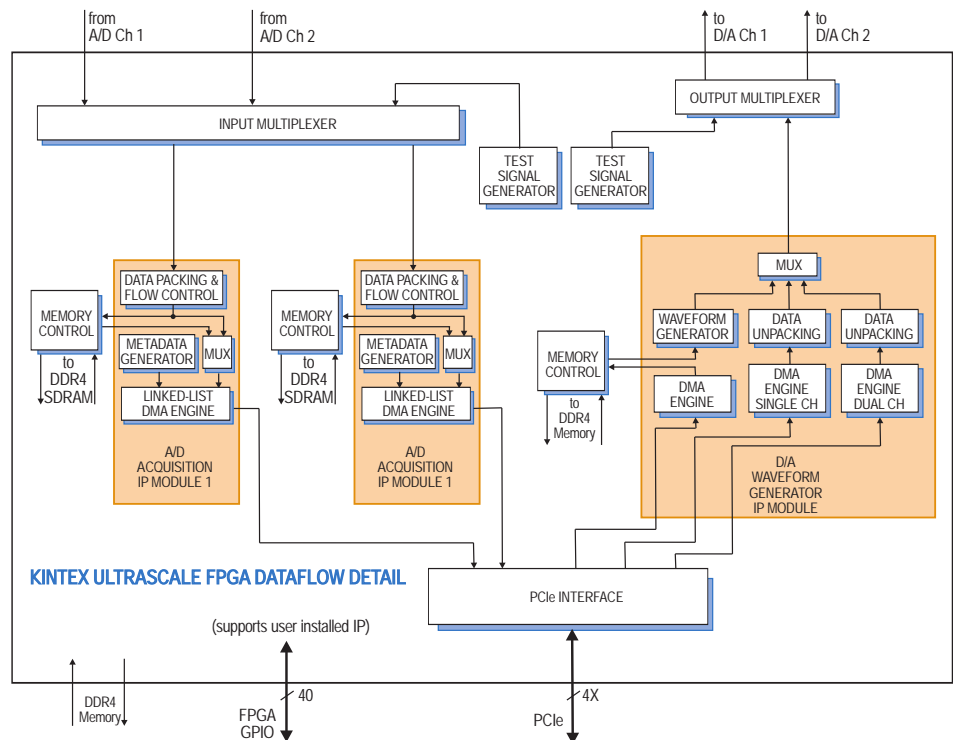

A front panel µSync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. Two units can be synchronized with a simple cable. For larger systems, multiple units can be synchronized using the Model 7292 high-speed sync boards to drive the sync bus.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core(s) within the FPGA(s) can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73141: 32 bits only. ►

**Specifications**

Model 74821 Model 73821

### General Information

Models 72821, 73821 and 74821 are members of the Jade™ family of high-performance CompactPCI boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71821 XMC modules mounted on a cPCI carrier board. Model 72821 is a 6U cPCI board while the Model 73821 is a 3U cPCI board; both are equipped with one Model 71821 XMC. Model 74821 is a 6U cPCI board with two XMC modules rather than one.

They include three or six A/Ds, complete multiboard clock and sync sections, large DDR4 memory, three or six DDCs, one or two DUCs and two or four D/As. In addition to supporting PCI-X as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGAs for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to

all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The factory-installed functions for these models include three or six A/D acquisition and one or two waveform playback IP modules for simplifying data capture and playback, and data transfer between the board and a host computer.

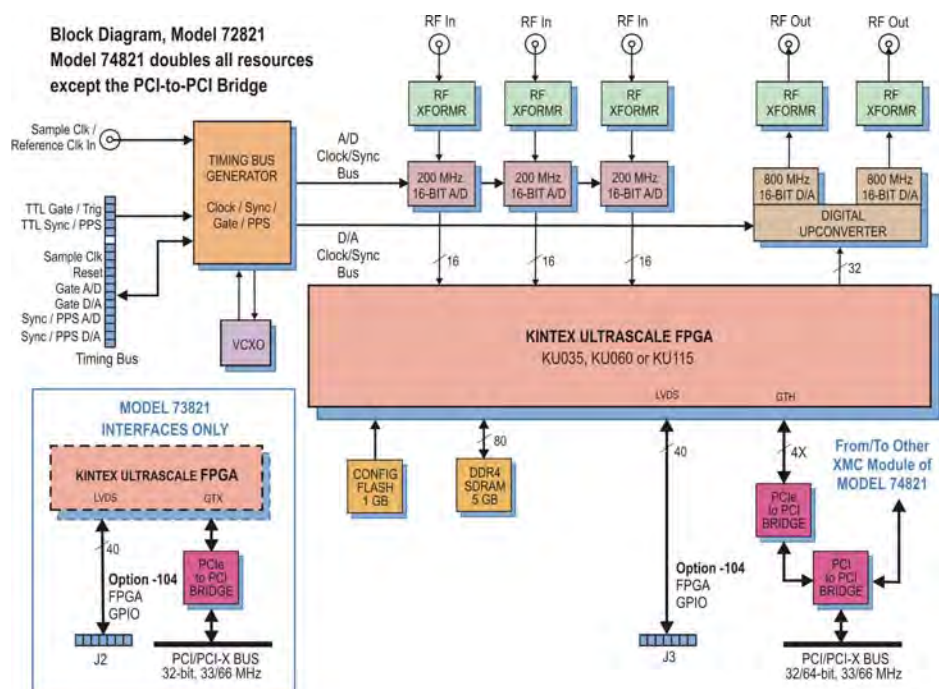

Additional IP includes: three or six powerful, programmable DDC IP cores; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; programmable interpolators, and a PCI-X interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three or six 200 MHz 16-bit A/Ds
- Three or six multiband DDCs (digital downconverters)
- One or two DUCs (digital upconverters)
- Two or four 800 MHz 16-bit D/As
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized version available

### A/D Acquisition IP Modules

These models feature three or six A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from three A/Ds, or the test signal generators.

Each acquisition module has a DMA engine for easily moving A/D data through the PCI-X interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### D/A Waveform Playback IP Module

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. A linked-list controller allows users to easily play back to the D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition rate etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

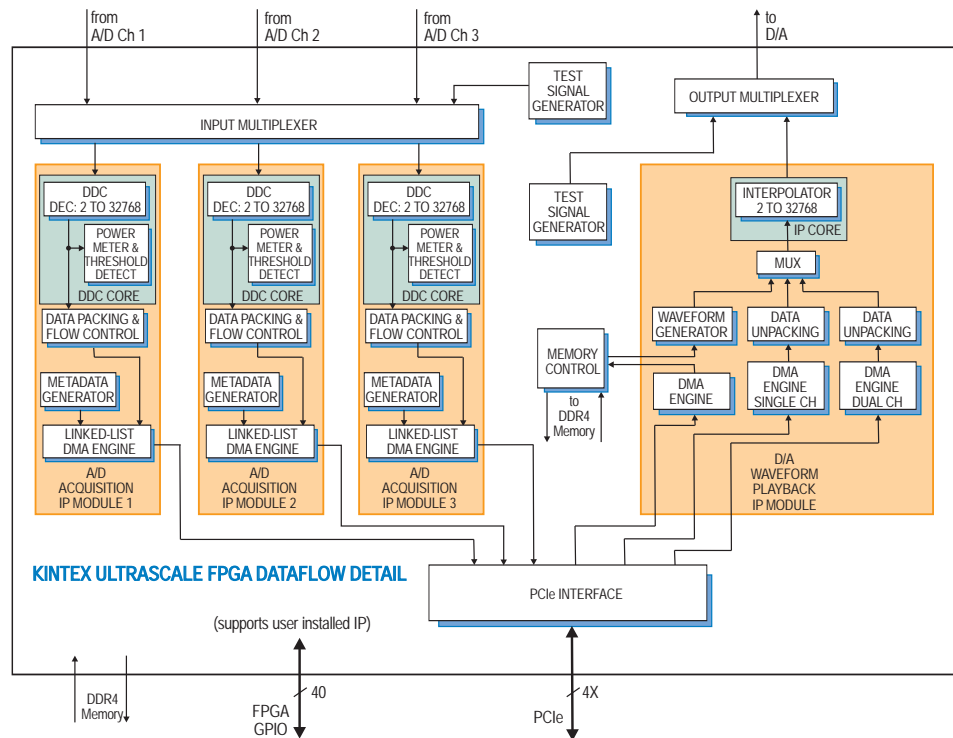

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73821; J3 connector, Model 72821; J3 and J5 connectors, Model 74821.

### A/D Converter Stage

The front end accepts three or six analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three or six Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources. ➤

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide

different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73821: 32 bits only. ►

► Specifications

**Model 72821 or Model 73821:** 3 A/Ds,  
1 DUC, 2 D/As

**Model 74721:** 6 A/Ds, 2 DUCs, 4 D/As

**Front Panel Analog Signal Inputs (3 or 6)**

**Input Type:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer Type:** Coil Craft  
WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (3 or 6)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (3 or 6)**

**Decimation Range:** 2x to 32,768x in  
three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits,  
0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits,  
0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output,  
with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3  
dB passband ripple, >100 dB stopband  
attenuation

**D/A Converters (1 or 2)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or

1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.

with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolator Core (1 or 2)**

**Interpolation Range:** 2x to 32,768x in  
three stages of 2x to 32x

**Total Interpolation Range (D/A and inter-  
polator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front  
panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer generates  
two clocks: one A/D clock and one D/  
A clock

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board  
programmable VCXO (10 to 810 MHz),  
front panel external clock or LVPECL  
timing bus

**Synchronization:** VCXO can be locked  
to an external 4 to 180 MHz PLL system  
reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO  
can be divided by 1, 2, 4, 8, or 16, inde-  
pendently for the A/D clock and D/A  
clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector,  
sine wave, 0 to +10 dBm, AC-coupled,  
50 ohms, accepts 10 to 800 MHz divider  
input clock or PLL system reference

**Timing Bus: (1 or 2)**

26-pin connector LVPECL bus includes,  
clock/sync/gate/PPS inputs and out-  
puts; TTL signal for gate/trigger and  
sync/PPS inputs

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale  
XCKU035-2

**Option -084:** Xilinx Kintex UltraScale  
XCKU060-2

**Option -087:** Xilinx Kintex UltraScale  
XCKU115-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs  
between the FPGA and the J2 connector,  
Model 73821; J3 connector, Model 72821;  
J3 and J5 connectors, Model 74821

**Memory (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73821: 32 bits only

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-  
condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-  
condensing

**Size:** 6U board 9.187 in x 6.717 in  
(233.3 mm x 170.6 mm)

3U board 3.937 in. x 6.717 in.

(100.00 mm x 170.61 mm)

Model 74841    Model 73841

## General Information

Models 72841, 73841 and 74841 are members of the Jade™ family of high-performance cPCI boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71841 XMC modules mounted on a cPCI carrier board. Model 72841 is a 6U cPCI board while the Model 73841 is a 3U cPCI board; both are equipped with one Model 71841 XMC. Model 74841 is a 6U cPCI board with two XMC modules rather than one.

They include one or two A/Ds, programmable DDCs, complete multiboard clock and sync sections, and a large DDR4 memory.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each

function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include one or two A/D acquisition IP modules.

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCI-X interface complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

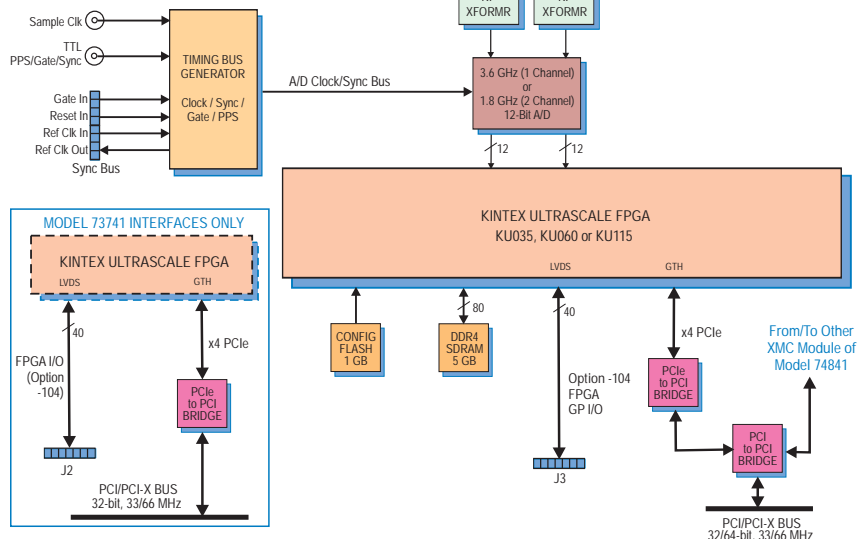

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with one or two 3.6 GHz, 12-bit A/Ds
- Two-channel mode with two or four 1.8 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- 5 or 10 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization\
- Optional LVDS connections to the FPGA for custom I/O

Block Diagram, Model 72841  
Model 74841 doubles all resources except the PCI-to-PCI Bridge

### A/D Acquisition IP Modules

These models feature one or two A/D Acquisition IP Modules for easy capture and data moving. The IP modules can receive data from the A/Ds, or the test signal generators. The IP modules have associated a 5 or 10 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of the SDRAM is used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory is supported with a DMA engine for moving A/D data through the PCI-X interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode: In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the J3 (or J2 connector, Model 73841) for custom I/O.

### A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

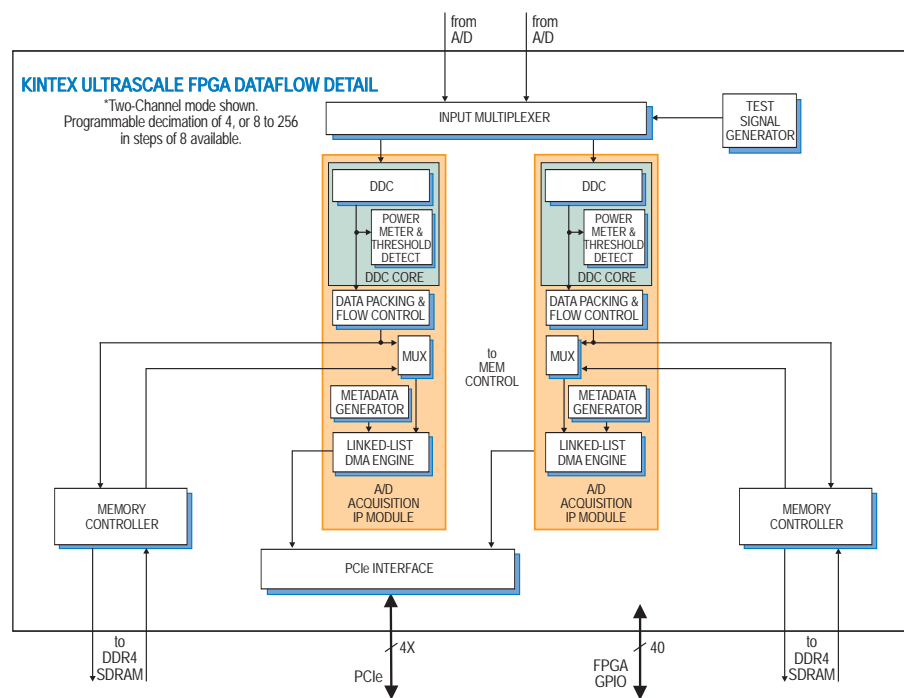

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other board resources.

### Clocking and Synchronization

These models accept a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two units can be synchronized with a simple cable. For larger systems, multiple units can be synchronized using the Model 7192 high-speed sync boards to drive the sync bus. ►

### ► Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73841: 32 bits only.

### Specifications

**Model 72841 or Model 73841: One A/D**

**Model 74841: Two A/Ds**

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converters (1 or 2)**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz  
**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

**Digital Downconverters (2 or 4)**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources (1 or 2)**

Front panel SSMC connector

**Timing Bus (1 or 2)**

19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O (1 or 2)**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73841; J3 connector, Model 72841; J3 and J5 connectors, Model 74841

**Memory Banks (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** One or two banks, 5 GB each

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73741: 32 bits only

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Standard 6U or 3U cPCI board

## 2- or 4-Channel 500 MHz A/D, DDCs, DUC, 2- or 4-Channel 800 MHz D/A and Kintex UltraScale FPGAs - cPCI

Model 74851      Model 73851

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two or four 500 MHz 12-bit A/Ds
- Two or four multiband DDCs (digital downconverters)
- One or two DUC (digital upconverter)
- Two or four 800 MHz 16-bit D/As
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- Ruggedized version available

### General Information

Models 72851, 73851 and 74851 are members of the Jade™ family of high-performance CompactPCI boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71851 XMC modules mounted on a cPCI carrier board. Model 72851 is a 6U cPCI board while the Model 73851 is a 3U cPCI board; both are equipped with one Model 71851 XMC. Model 74851 is a 6U cPCI board with two XMC modules rather than one.

They include two or four A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two or four DDCs, one or two DUC, and two or four D/As. In addition to supporting PCI-X as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to

all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

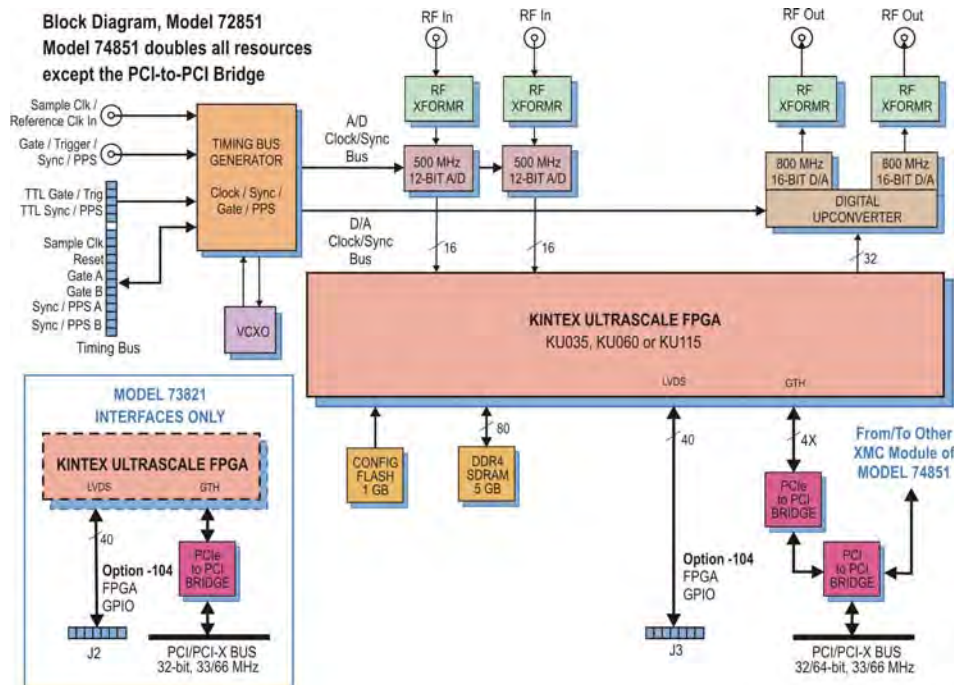

The factory-installed functions of these models include two or four A/D acquisition and two or four waveform playback IP modules for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: two or four powerful, programmable DDC IP cores; IP modules for DDR4 SDRAM memory; controllers for data clocking and synchronization functions; test signal generators; programmable interpolators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions thereby saving the time of IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their

### A/D Acquisition IP Modules

These models feature two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### D/A Waveform Playback IP Modules

The factory-installed functions in these models include one or two sophisticated D/A Waveform Playback IP modules. They allow users to easily play back to the dual or quad D/As waveforms stored in either on-board memory or off-board host memory.

► own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73851; J3 connector, Model 72851; J3 and J5 connectors, Model 74851.

### A/D Converter Stage

The front end accepts two or four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

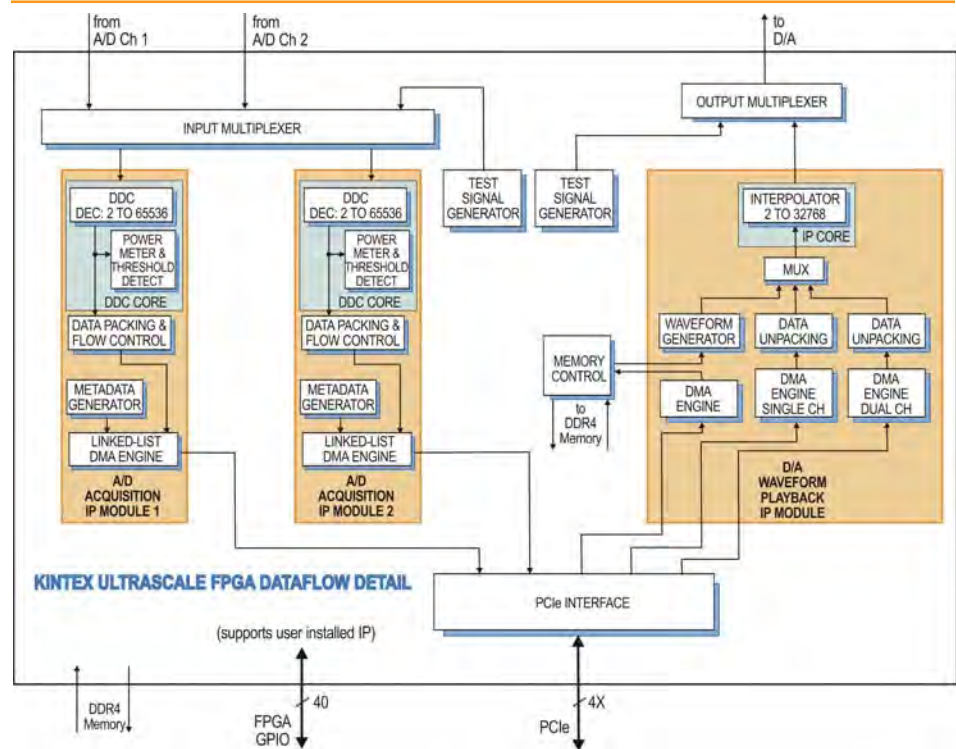

Optionally, the Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources. ►

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 52851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture of these models supports 5 or 10 GB of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller cores within the FPGA can take advantage of the memory for custom applications.

### PCI-X Interface

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73851: 32 bits only. ►

► **Specifications**

Model 72851: 2 A/Ds

Model 73851: 2 A/Ds

Model 74851: 4 A/Ds

**Front Panel Analog Signal Inputs (2 or 4)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (standard) (2 or 4)**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

**A/D Converters (option -014) (2 or 4)**

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

**Digital Downconverters (2 or 4)**

**Quantity:** Two channels

**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters (2 or 4)**

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

**Digital Interpolator Core (1 or 2)**

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs (2 or 4)**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus: (1 or 2)**

26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Arrays (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73851; J3 connector, Model 72851; J3 and J5 connectors, Model 74851

**Memory (1 or 2)**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73851: 32 bits only

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size: 6U Board** 9.187 in x 6.717 in

(233.35 mm x 170.61 mm)

**3U Board** 3.937 in. x 6.717 in.

(100.00 mm x 170.61 mm)

**Ordering Information**

Model	Description
72851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 6U cPCI
73851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 3U cPCI
74851	4-Channel 500 MHz A/D with DDCs, DUC with 4-Channel 800 MHz D/A, and Kintex UltraScale FPGAs - 6U cPCI

**Options:**

-014	400 MHz, 14-bit A/Ds
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-702	Air cooled, Level L2

# 4- or 8-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - cPCI

Model 74861 Model 73861

### General Information

Models 72861, 73861 and 74861 are members of the Jade™ family of high-performance CompactPCI (cPCI) boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71861 XMC modules mounted on a cPCI carrier board. Model 72861 is a 6U board while Model 73861 is a 3U board; both have one Model 71861 module. Model 74861 is equipped with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade

architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include four or eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

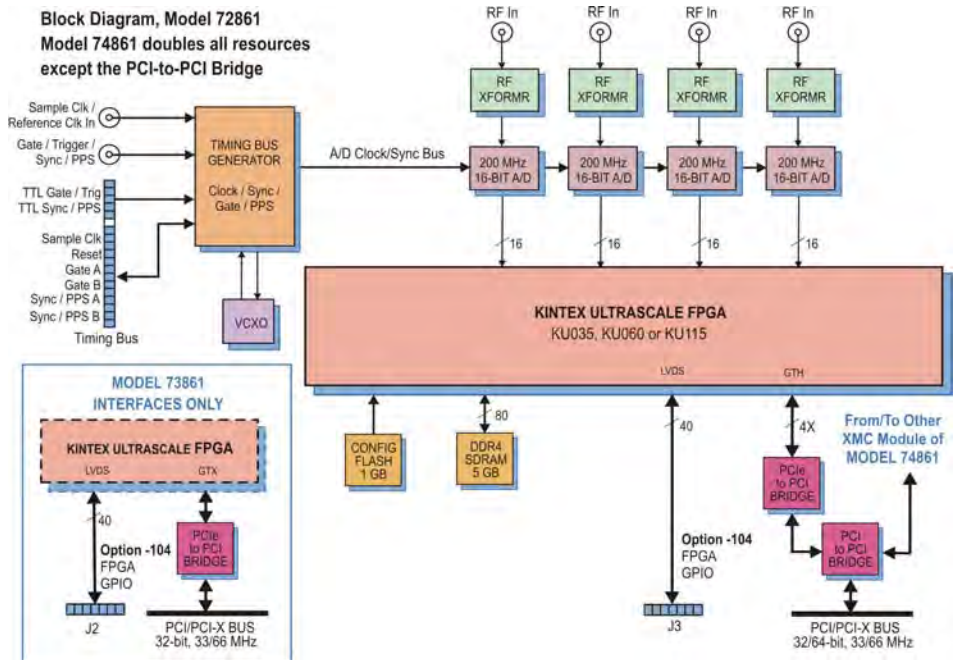

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ▶

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight multiband DDCs
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized version available

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the A/Ds or test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### ► Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73861; J3 connector, Model 72861; J3 and J5 connectors, Model 74861.

### A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGAs for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

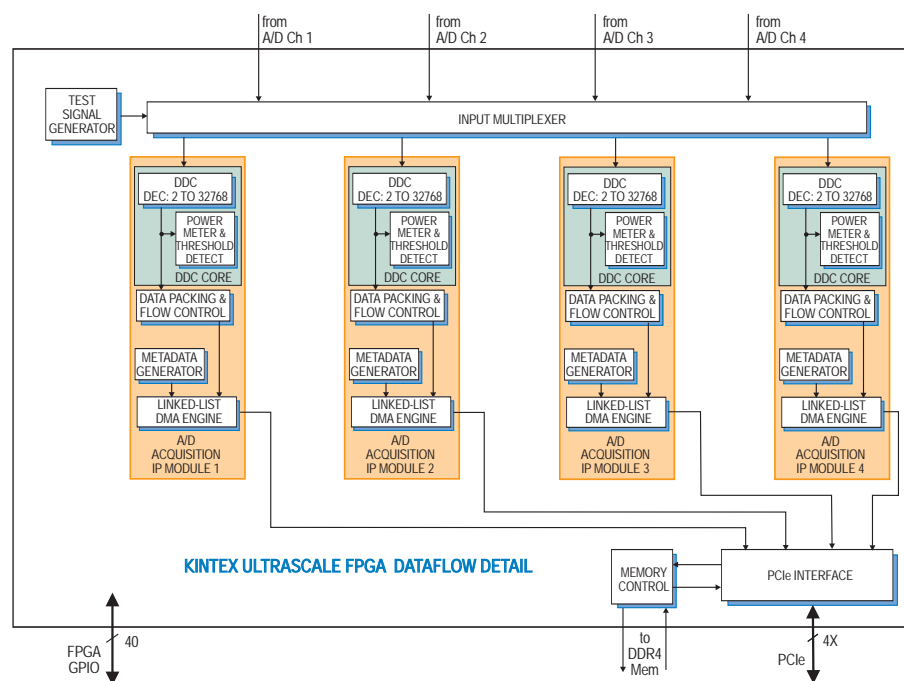

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

► **PCI-X Interface**

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73861: 32 bits only.

**Specifications**

**Models 72861 and 73861:** 4 A/Ds

**Model 74861:** 8 A/Ds

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Digital Downconverters (4 or 8)**

**Quantity:** Four channels

**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** LVDS I/O between the FPGA and J2 connector, Model 73861; J3 connector, Model 72861; J3 and J5 connectors, Model 74861

**Memory (1 or 2 banks)**

**Type:** DDR4 SDRAM

**Size:** 5 GB or 10 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73861: 32 bits only

Model 74862 Model 73862

## General Information

Models 72862, 73862 and 74862 are members of the Jade™ family of high-performance CompactPCI (cPCI) boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71862 XMC modules mounted on a cPCI carrier board. Model 72862 is a 6U board while Model 73862 is a 3U board; both have one Model 71862 module. Model 74862 is equipped with two XMC modules rather than one.

They include four or eight A/Ds, complete multiboard clock and sync sections, and a large DDR4 memory.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade

architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The factory-installed functions include four or eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the acquisition IP modules contains a powerful, programmable DDC IP core; IP modules for DDR4 SDRAM memory; controllers for all data clocking and synchronization functions; test signal generators; and a PCIe interface. These complete the factory-installed functions and enable these models to operate as complete turnkey solutions for many applications, thereby saving the cost and time of custom IP development.

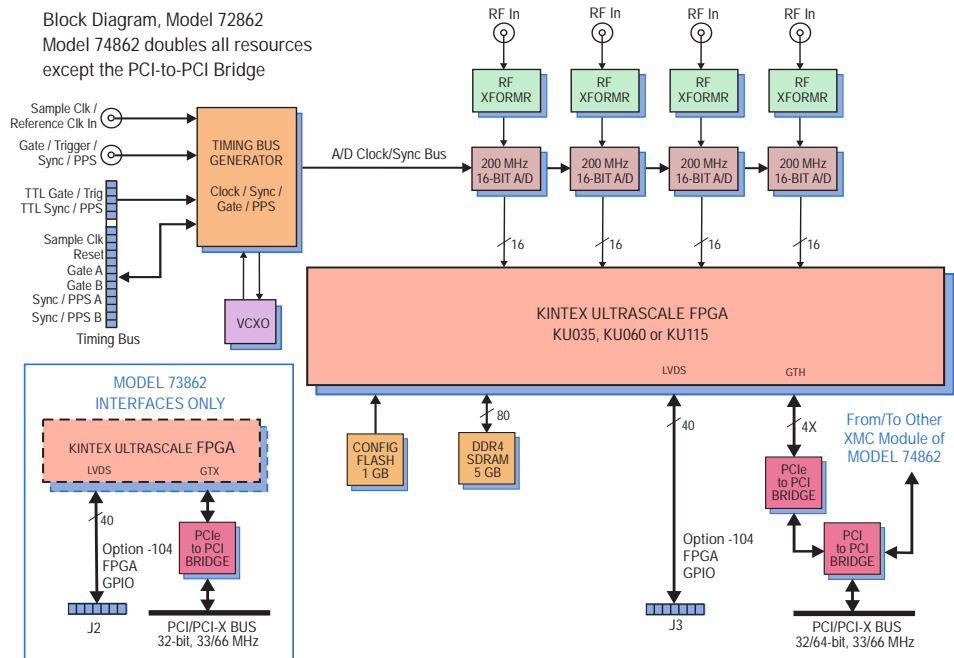

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four or eight 200 MHz 16-bit A/Ds
- Four or eight wideband DDCs and
- 32 or 64 multiband DDCs (digital downconverters)
- 5 or 10 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized version available

### A/D Acquisition IP Modules

These models feature four or eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the A/Ds or test signal generators.

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### DDC IP Cores

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### ► Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73862; J3 connector, Model 72862; J3 and J5 connectors, Model 74862.

### A/D Converter Stage

The front end accepts four or eight analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four or eight TI ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Kintex UltraScale FPGAs for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

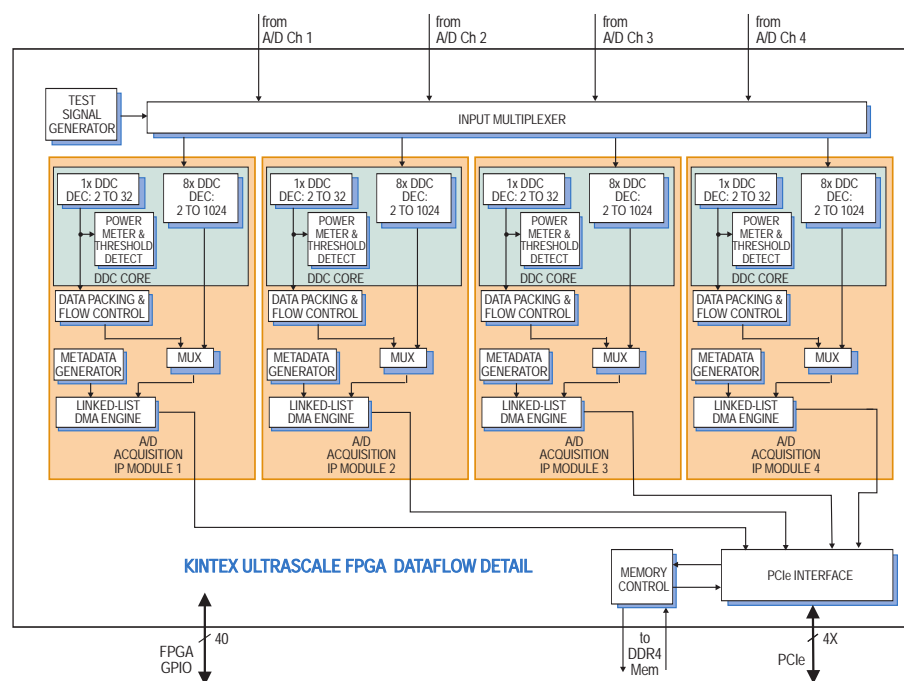

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

Front-panel 26-pin LVPECL Clock/Sync connectors allow multiple boards to be synchronized. In the slave mode, they accept LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The architecture supports 5 or 10 GB banks of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

► **PCI-X Interface**

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73862: 32 bits only.

**Specifications**

**Models 72861 and 73861:** 4 A/Ds

**Model 74861:** 8 A/Ds

**Front Panel Analog Signal Inputs (4 or 8)**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters (4 or 8)**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Wideband Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Multiband Digital Downconverters (4 or 8)**

**Decimation Range:** 2x to 1024x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources: (1 or 2)**

On-board clock synthesizer

**Clock Synthesizer (1 or 2)**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock (1 or 2)**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input (1 or 2)**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array (1 or 2)**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** LVDS I/O between the FPGA and J2 connector, Model 73862; J3 connector, Model 72862; J3 and J5 connectors, Model 74862

**Memory (1 or 2 banks)**

**Type:** DDR4 SDRAM

**Size:** 5 GB or 10 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73862: 32 bits only

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 6U board 6.299 in x 9.173 in (160.00 mm x 233.00 mm)  
3U board 3.937 in x 6.299 in (100.00 mm x 160.00 mm) ►

# Models 72800 73800 and 74800

## Kintex UltraScale FPGA Coprocessor - cPCI

Model 74800      Model 73800

### General Information

Models 72800, 73800 and 74800 are members of the Jade™ family of high-performance CompactPCI boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

These models consist of one or two Model 71800 XMC modules mounted on a cPCI carrier board. Model 72800 is a 6U cPCI board while the Model 73800 is a 3U cPCI board; both are equipped with one Model 71800 XMC. Model 74800 is a 6U cPCI board with two XMC modules rather than one.

In addition to supporting PCI-X as a native interface, these models include optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The factory-installed functions in these models include one or two test signal generators, one or two metadata generators, one or two DDR4 SDRAM controllers, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

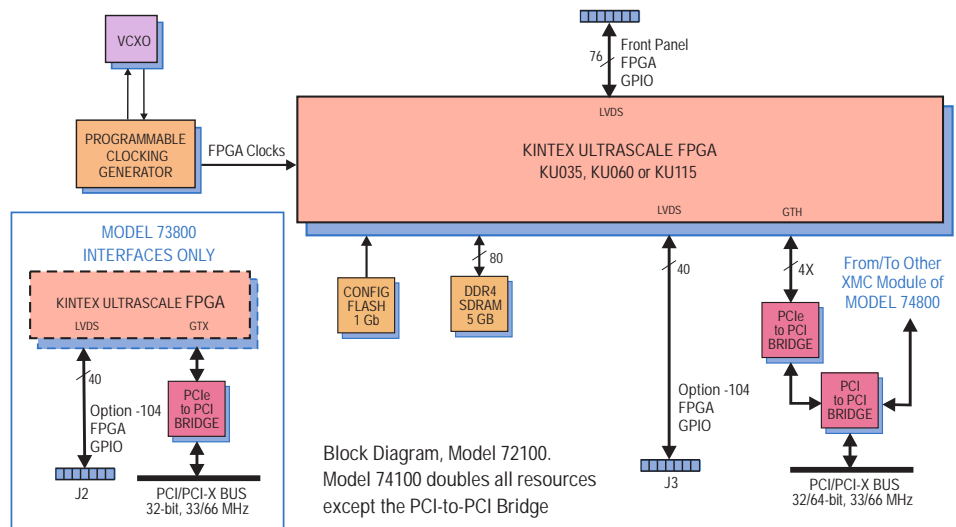

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73800; J3 connector, Model 72800; J3 and J5 connectors, Model 74800.➤

### Features

- High-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- 5 or 10 GB of DDR4 SDRAM
- Optional LVDS connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled version available

**PCI-X Interface**

These models include an industry-standard interface fully compliant with PCI-X bus specifications. The interface includes multiple DMA controllers for efficient transfers to and from the board. Data widths of 32 or 64 bits and data rates of 33 and 66 MHz are supported. Model 73800: 32 bits only.

**Front-Panel Digital I/O Interface**

These models include one or two 80-pin front panel connectors that provide 38 or 76 LVDS pairs connected to one or both of the FPGAs. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path.

**Memory Resources (1 or 2)**

The architecture of these models supports 5 or 10 GB of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller cores within the FPGA can take advantage of the memory for custom applications.

**Specifications**

**Front Panel Digital I/O (1 or 2)**

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 or 76 pairs
- Signal Type:** LVDS

**Field Programmable Gate Array (1 or 2)**

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O (1 or 2)**

**Option -104:** Provides 20 LVDS pairs between the FPGA and the J2 connector, Model 73800; J3 connector, Model 72800; J3 and J5 connectors, Model 74800

**Memory (1 or 2)**

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-X Interface**

**PCI-X Bus:** 32 or 64 bits at 33 or 66 MHz  
Model 73800: 32 bits only

**Environmental**

- Standard: L0 (air cooled)**
- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C

Model 7420 Model 7320

**Features**

- Accept RF signals from 400 MHz to 4000 MHz
- Accept RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

**General Information**

These Bandit® models are two- or four-channel, high-performance, stand-alone analog RF wideband downconverters. Packaged in small, shielded cPCI boards with front-panel connectors for easy integration into RF systems, they offer programmable gain, high dynamic range and a low noise figure.

Model 7320 is a 3U cPCI board while Model 7220 is a 6U cPCI board; both provide two channels, while Model 7420 is a double-density 6U cPCI board that provides four channels.

With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, these models are ideal solutions for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

**Programmable Input Level**

The models accept RF signals on two or four front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB.

**Input Filter Options**

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

**Quadrature Mixers**

These models feature Analog Devices ADL5380 quadrature mixers. The ADL5380's

are capable of excellent accuracy with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

**Tuning Accuracy**

These models use the Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

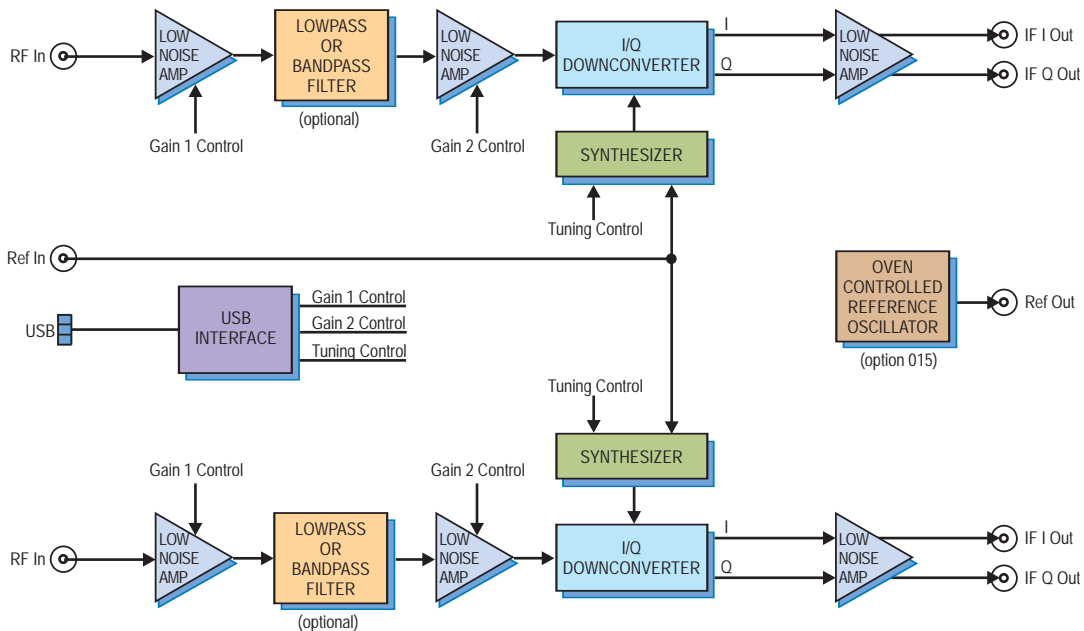

**On-board Reference Clock**

In addition to accepting a 10 MHz reference signal on the front panel, these models include on-board 10 MHz crystal oscillators which can be used as the reference to lock the internal LO frequency synthesizers.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

**Wideband Output**

Outputs are provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

**► Specifications**

**RF Input**

**Connector Type:** SSMC  
**Input Impedance:** 50 ohms  
**Input Level Range:** -60 dBm to -20 dBm  
**Flatness:** ±2 dB from 400 MHz to 1 GHz,  
 ±3 dB from 1 GHz to 3 GHz, ±5 dB from  
 3 GHz to 4 GHz

**RF Attenuator:** Programmable from 0 to  
 63 dB in 0.5 dB steps

**LO Synthesizer Tuning**

**Frequency range:** 400-4000 MHz,  
**Resolution:** < 10 kHz  
**Tuning Speed:** < 500 µsec  
**Phase-Locked Loop Bandwidth:** 100 kHz

**Phase Noise**

**1 kHz:** -90 dBc/Hz  
**100 kHz:** -110 dBc/Hz  
**1 MHz:** -130 dBc/Hz

**Noise Figure (referred to input)**

**60 dB gain:** 2.6 dB

**Inband Output IP3**

**20 dB gain:** +10 dBm  
**60 dB gain:** +42 dBm

**Reference Input/Output**

Last updated: March 2018

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78620 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78620 includes optional general-purpose and gigabit serial card edge connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78620 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules, ideally matched to the board's analog interfaces. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator,

and a PCIe interface complete the factory-installed functions and enable the 78620 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

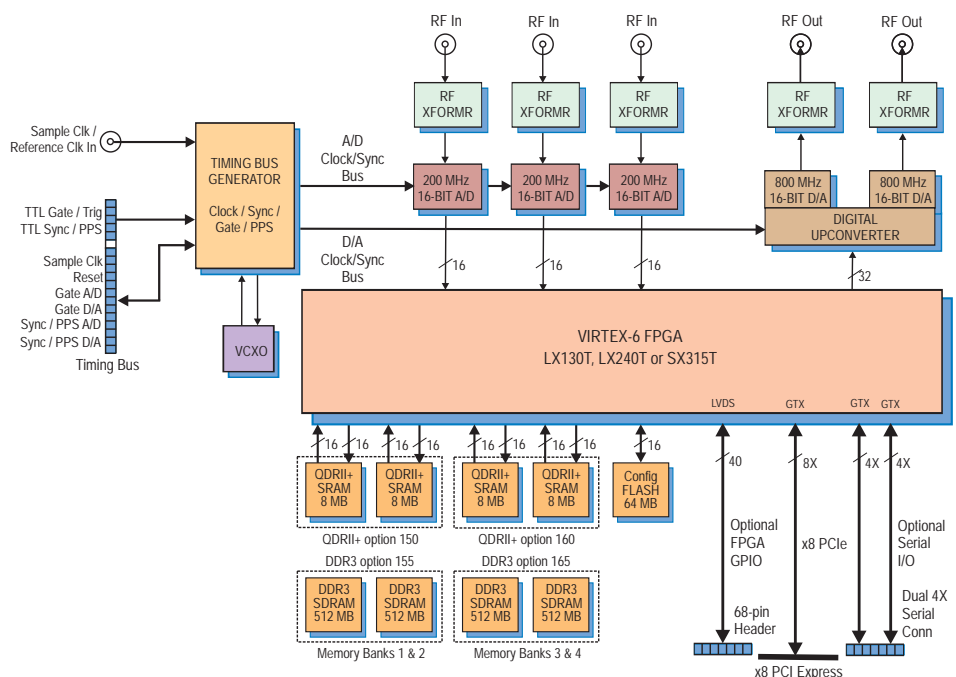

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Modules**

The 78620 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 78620 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/A waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

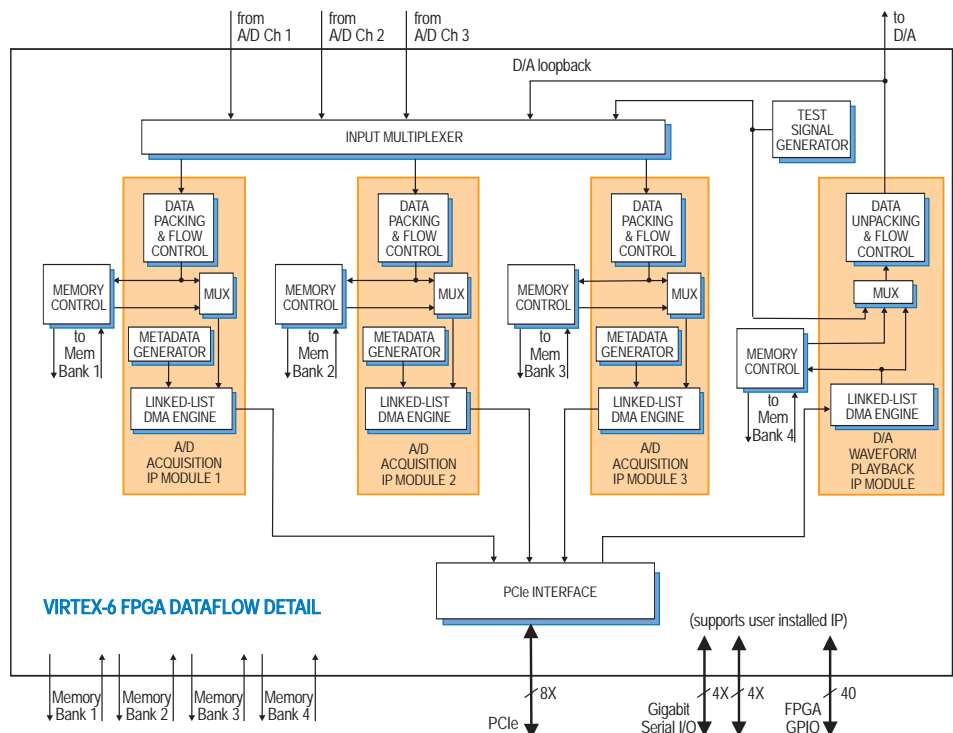

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78620's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 78620 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

8266	PC Development System. See 8266 Datasheet for Options

► board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 78620 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8;  
 Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78621 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78621 includes an optional general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78621 factory installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78621 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

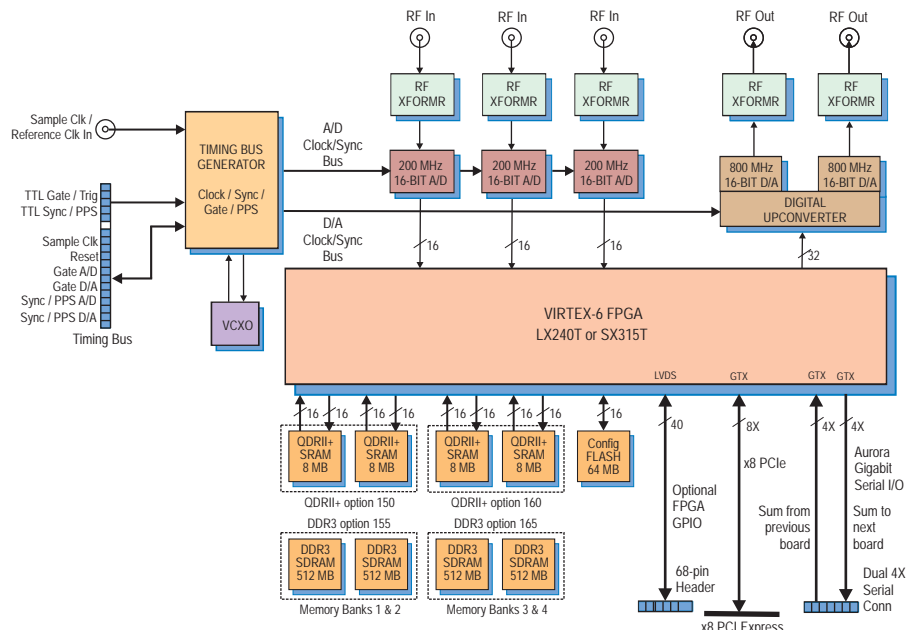

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O. ▶

## A/D Acquisition IP Modules

The 78621 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

## DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

## Beamformer IP Core

In addition to the DDCs, the 78621 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

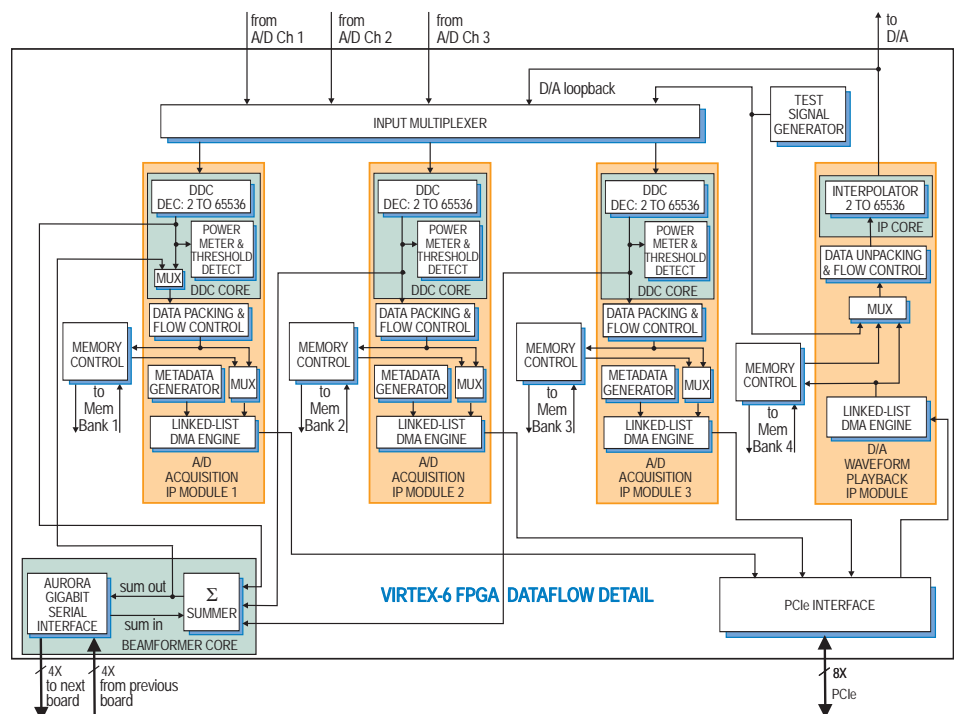

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78621's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

## D/A Waveform Playback IP Module

The Model 78621 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ▶

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78621's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78621 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78621 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
78621	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - x8 PCIe

### Options:

-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through 68-pin ribbon cable connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Three channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8;  
 Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

New!

General Information

Model 78624 is a member of the Cobalt® family of high-performance PCI Express boards based on the Xilinx Virtex-6 FPGA. As an IF relay, it accepts two IF analog input channels, modifies up to 34 signals, and then delivers them to two analog IF outputs.

The 78624 supports many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCIe Gen. 1 system interface supports control, status and data transfers.

Adaptive Relay Input Overview

The Model 78624 digitizes two analog IF inputs using two 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency.

programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCIe system interface to target memory, typically associated with a system processor.

Samples from each A/D converter can also be delivered across PCIe to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

Adaptive Relay Output Overview

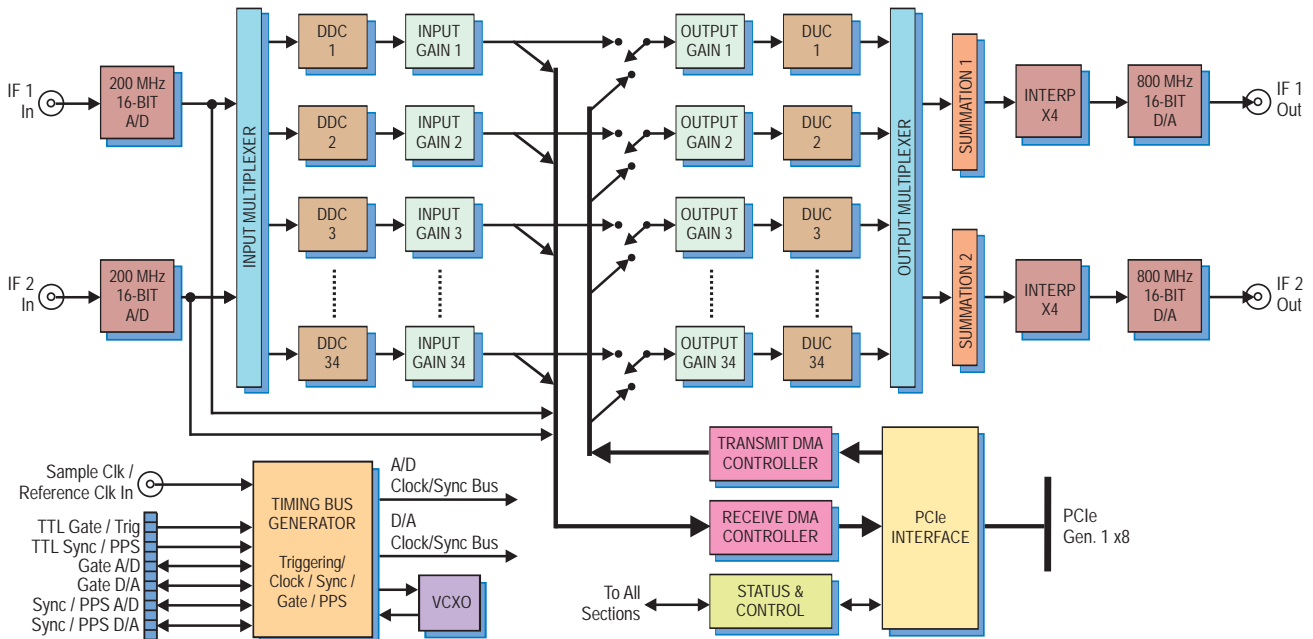

The Model 78624 output stage consists of 34 DUCs (digital upconverters) and two 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stage. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two summation blocks, each

Features

- Modifies 34 IF signals between input and output
Up to 80 MHz IF bandwidth
Two 200 MHz 16-bit A/Ds
Two 800 MHz 16-bit D/As
34 DDCs and 34 DUCs (digital downconverters and digital upconverters)
Signal drop/add/replace
Frequency shifting and hopping
Amplitude boost and attenuation
PCI Express Gen. 1: x4 or x8

► associated with one of the two D/A converters using a final interpolation factor of x4. After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the Model 78624 adaptive relay. Because of the complexity and proprietary nature of these functions, the FPGA cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in

gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controller

Two output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2.

When a target memory buffer is filled, the 78624 issues an interrupt to the system processor and then begins filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, the 78624 signals the processor with an interrupt and moves to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz. ►

► A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts two summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two transformer-coupled analog IF outputs are delivered through a pair of front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz

reference clock to phase-lock the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78624's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI Express Interface

The Model 78624 includes an industry-standard interface fully compliant with PCIe Gen. 1 x8 bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the board.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com). ►

**Quantity:** 34

**Data:** Complex, 16-bit I + 16-bit Q

**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

**Digital Upconverters**

**Quantity:** 34

**Interpolation Range:** 512 to 8192, in steps of 8

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**FIR Filter:** 18-bit coefficients, 16-bit output

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Analog Output Channels:** 2

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 200 MHz max.

**Output Signal:** Real

**Output Sampling Rate:** 800 MHz max. with 4x interpolation

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Required:** Xilinx Virtex-6 XC6VSX315T

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8

**Environmental****Standard:**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78630 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and 1 GHz D/A converters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78630 includes optional general-purpose and gigabit serial card connectors for application specific I/O protocols.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory installed applications ideally matched to the board's analog interfaces. The 78630 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal

generator and a PCIe interface complete the factory-installed functions and enable the 78630 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

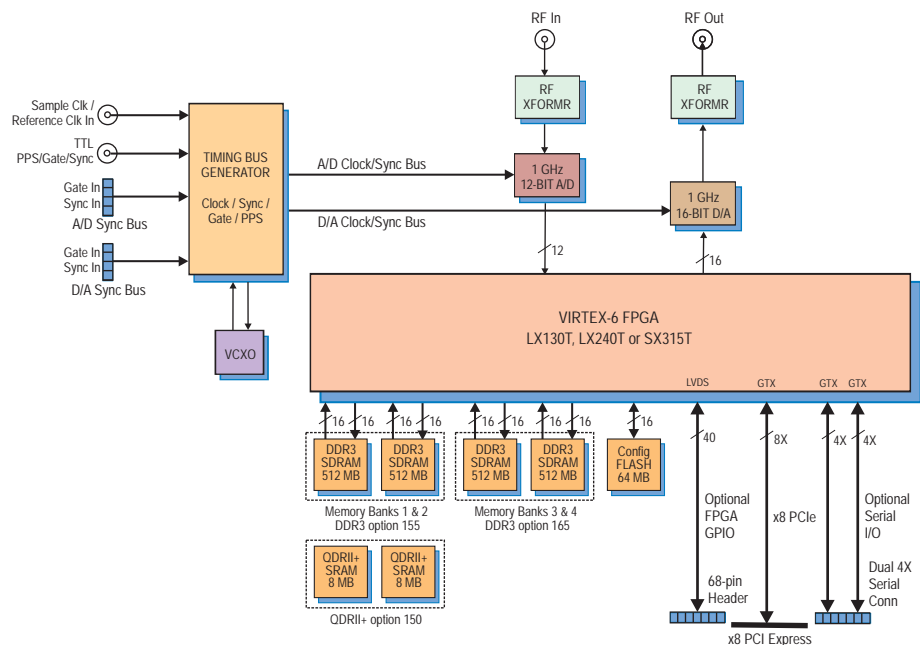

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Module**

The 78630 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 78630 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**D/A Converter Stage**

The 78630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

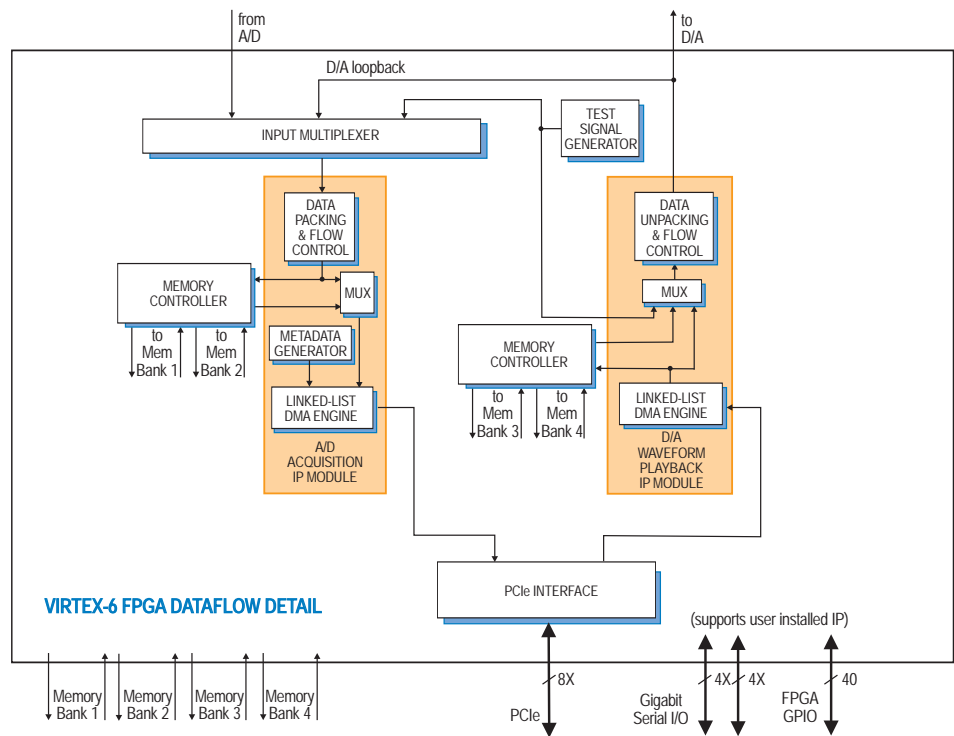

A pair of front panel μSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7892 and Model 9192 Cobalt Synchronizers can drive multiple 78630 μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 78630 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
78630	1 GHz A/D and D/A, Virtex-6 FPGA - x8 PCIe
<b>Options:</b>	
-002*	-2 FPGA speed grade
-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through 68-pin ribbon cable connector
-105	Gigabit serial FPGA I/O through two 4X top edge connectors
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

► **PCI Express Interface**

The Model 78630 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2, or XC6VSX315T-2

**Custom I/O**

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

**Memory**

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen.1: x4 or x8  
 Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78640 is a member of the Cobalt® family of high performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The 78640 includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78640 includes optional general-purpose and gigabit serial connectors for application-specific I/O protocols.

All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78640 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator

and a PCIe interface complete the factory-installed functions and enable the 78640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

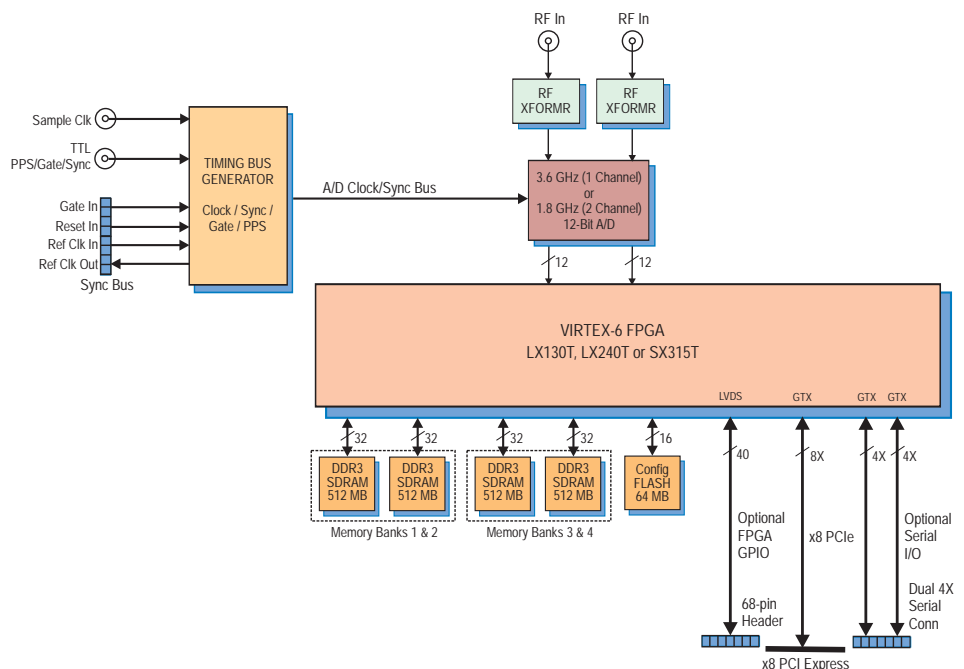

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► **A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 78640 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

The 78640 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple boards to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 78640s can be synchronized using the Cobalt high speed sync board to drive the sync bus.

**Memory Resources**

The 78640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

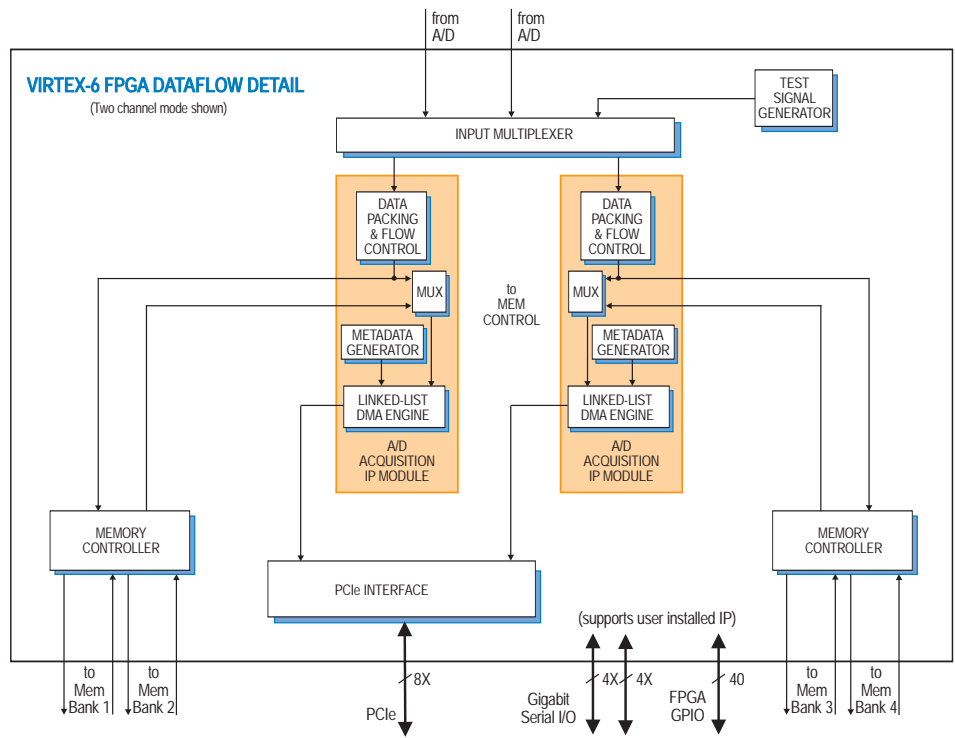

The Model 78640 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links of x4 or x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**A/D Acquisition IP Module**

The 78640 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**General Information**

Model 78641 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter, with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78641 includes an optional connection to the Virtex-6 FPGA for custom I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 78641 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchro-

nization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 78640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

For applications that require additional control and status signals, option -104 provides 20 pairs of LVDS connections from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**A/D Converter Stage**

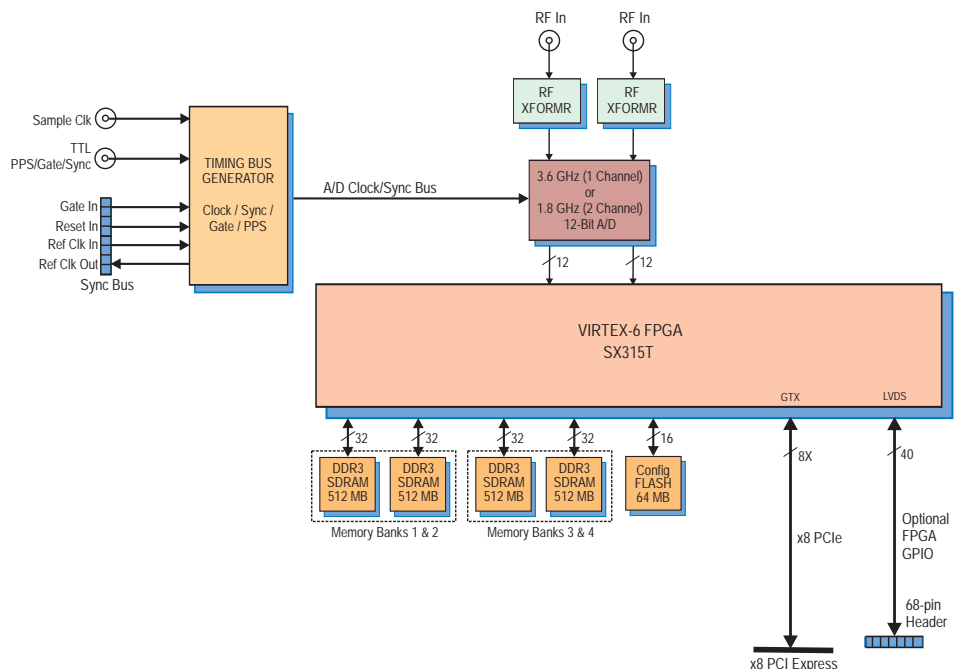

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 78641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources. ➤

**Features**

- Ideal radar and software radio interface solution
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Programmable one- or two-channel DDC (Digital Downconverter)
- 2 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Module**

The 78641 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

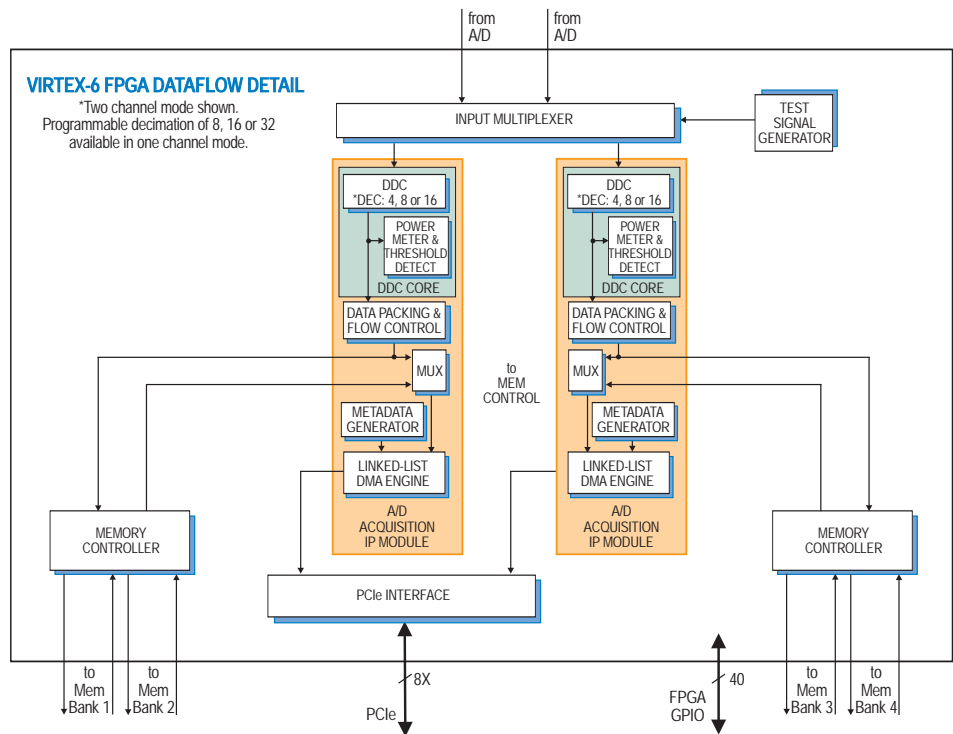

**▶ Clocking and Synchronization**

The 78641 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple boards to be synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 78641's can be synchronized using the Cobalt high speed sync board to drive the sync bus.

**Memory Resources**

The 78640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ▶

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► **PCI Express Interface**

The Model 78641 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links of x4 or x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multi-pin connectors, bus includes gate, reset and in and out ref clock

**External Trigger Input**

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

Xilinx Virtex-6 XC6VSX315T-2

**Custom I/O**

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78650 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes two A/Ds, one DUC (Digital Upconverter), two D/As, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78650 includes optional general-purpose and gigabit serial card connectors for application specific I/O protocols.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory installed applications ideally matched to the board's analog interfaces. The 78650 factory-installed functions include two A/D acquisition and one D/A waveform playback IP modules. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete

the factory-installed functions and enable the 78650 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

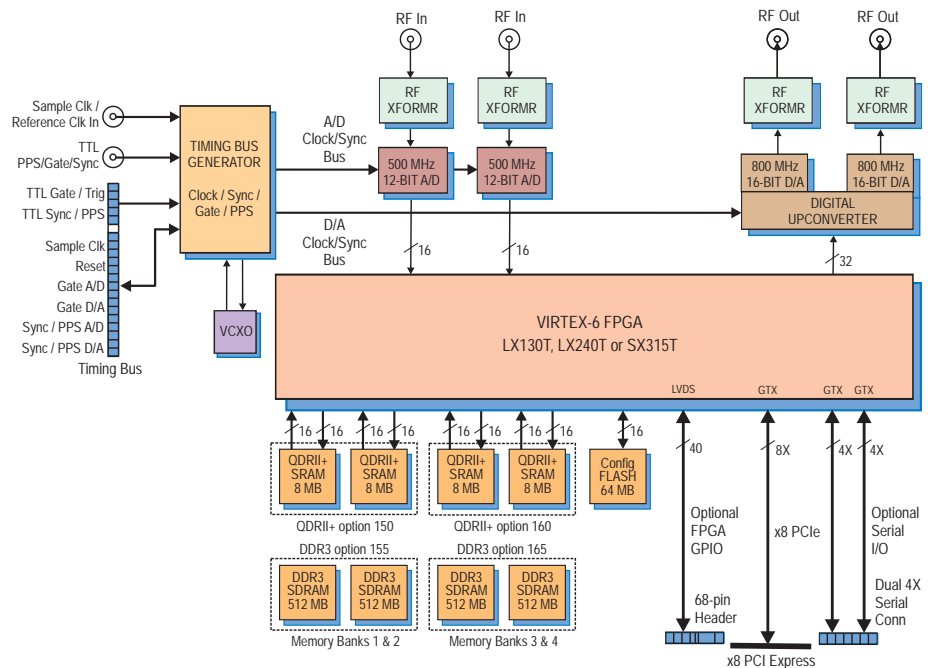

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Modules**

The 78650 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfers, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 78650 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts two full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

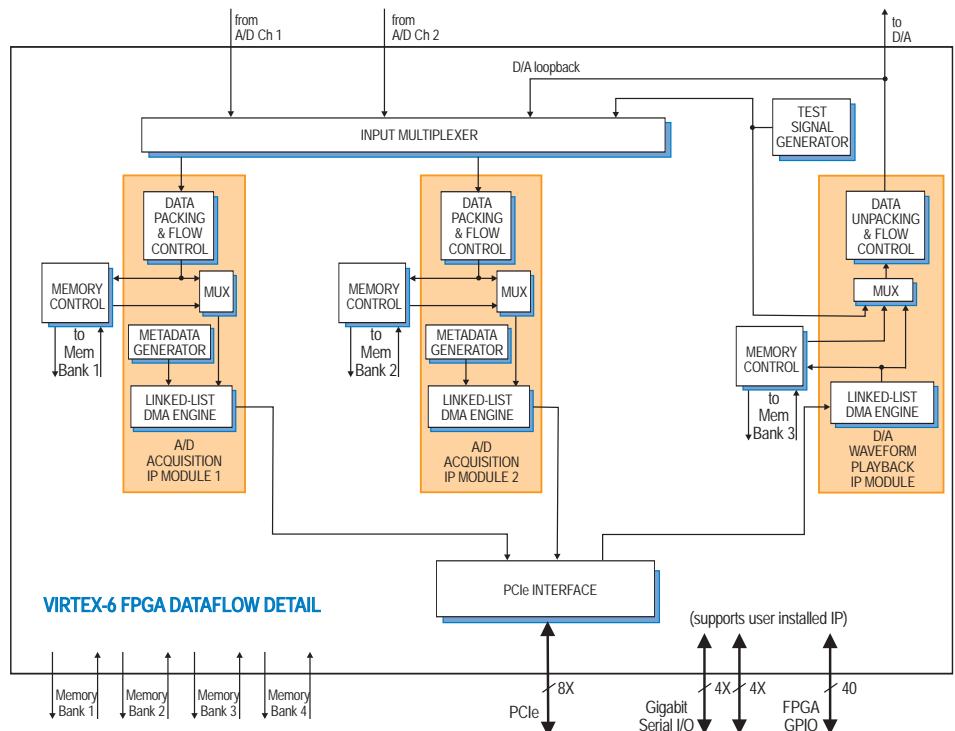

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78650's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 78650 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
78650	Two 500 MHz A/Ds, one DUC, two 800 MHz D/As with Virtex-6 FPGA - x8 PCIe
<b>Options:</b>	
-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA

► board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 78650 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

### A/D Converters (option 014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### Sample Clock Sources:

On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

## Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen.1: x4 or x8

Gen. 2: x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- PCI Express (Gen. 2) interface up to x8
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78651 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A two-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 78651 includes two A/Ds, two D/As and four banks of memory. It features native support for PCI Express Gen 2.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78651 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core.

The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ are available.

memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78651 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

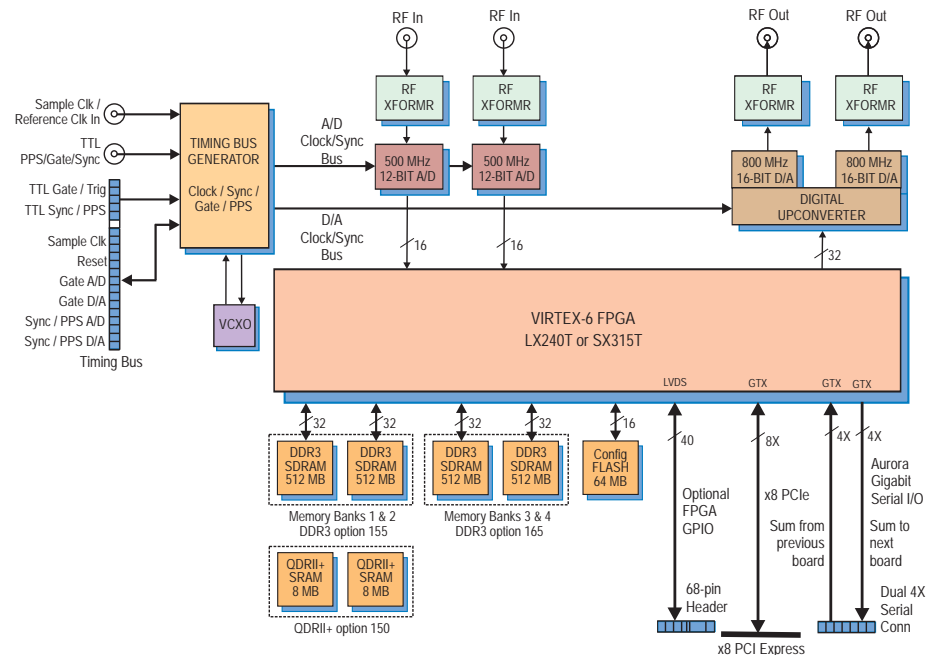

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O. ▶

**A/D Acquisition IP Modules**

The 78651 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 78651 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

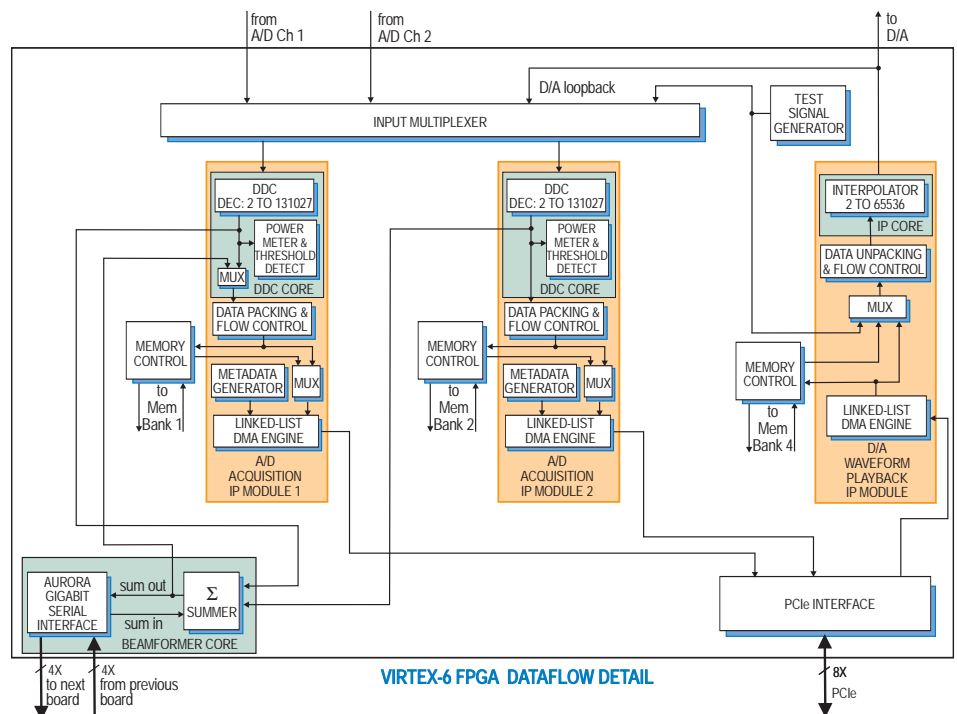

A programmable summation block provides summing of any of the two DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78651's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the dual 4X serial connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 78651 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78651's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78651 architecture supports up to three independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the boards's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78651 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**PCI-Express Interface**

**PCI Express Bus:** Gen. 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDR11+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78660 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multichannel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78660 includes optional general-purpose and gigabit serial connectors for application-specific I/O protocols.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory installed applications ideally matched to the board's analog interfaces. The 78660 factory-installed functions include four A/D acquisition IP modules.

IP modules for either DDR3 or QDR11+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the

78660 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

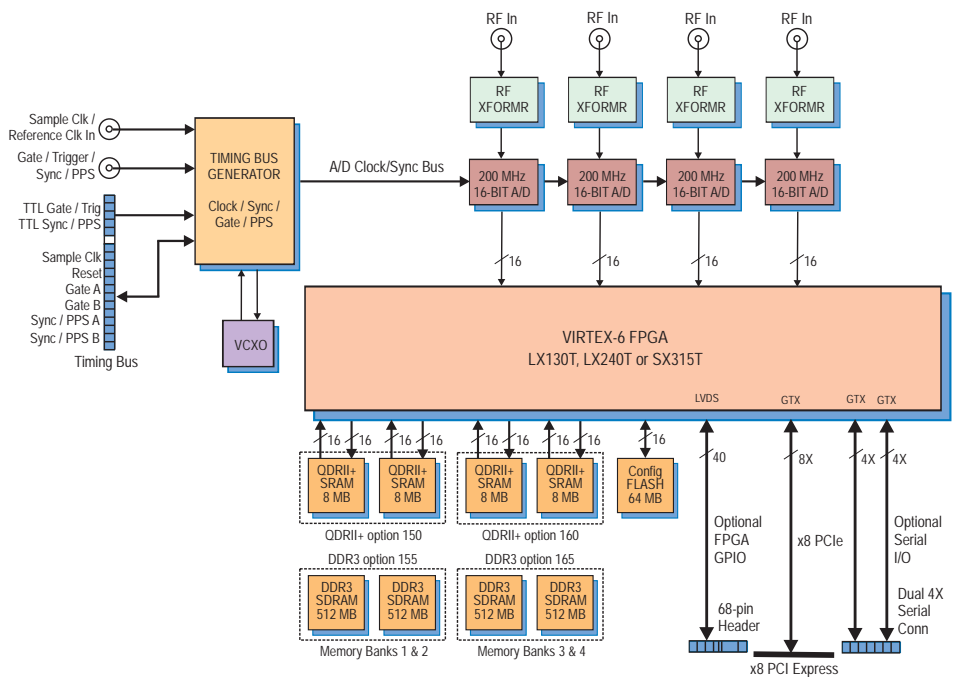

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78660's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

The 78660 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

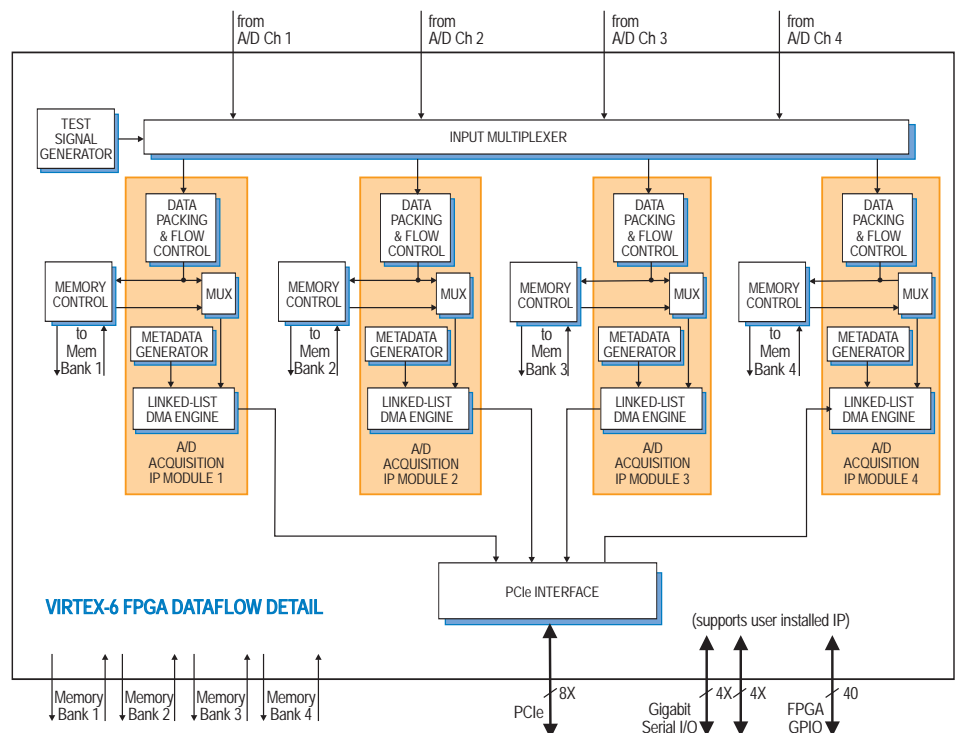

The Model 78660 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

A/D Acquisition IP Modules

The 78660 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
78660	4-Channel 200 MHz A/D with Virtex-6 FPGA - PCIe

### Options:

-062	XC6VLX240T FPGA
-064	XC6VVSX315T FPGA
-104	LVDS FPGA I/O through 68-pin ribbon cable connector
-105	Gigabit serial FPGA I/O through two 4X top edge connectors
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model	Description
8266	PC Development System See 8266 Datasheet for Options

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VVSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78661 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs (digital downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution.

It includes four A/Ds, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78661 includes an optional general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78661 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (Digital Downconverter) IP core. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchro-

nization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78661 to operate as a complete turnkey solution without the need to develop any FPGA IP.

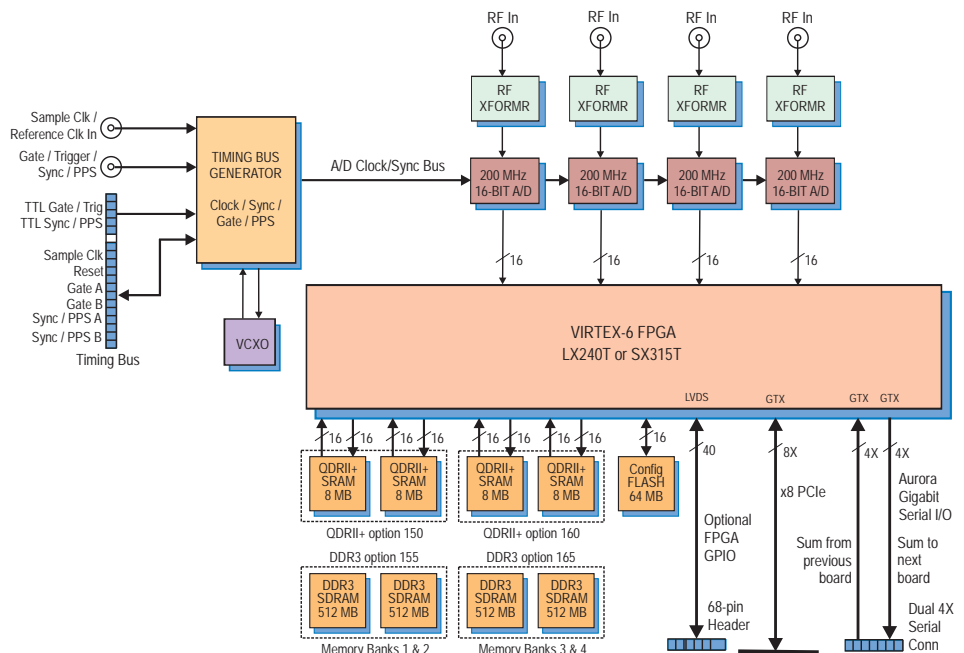

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O. ➤

**A/D Acquisition IP Modules**

The 78661 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 78661 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

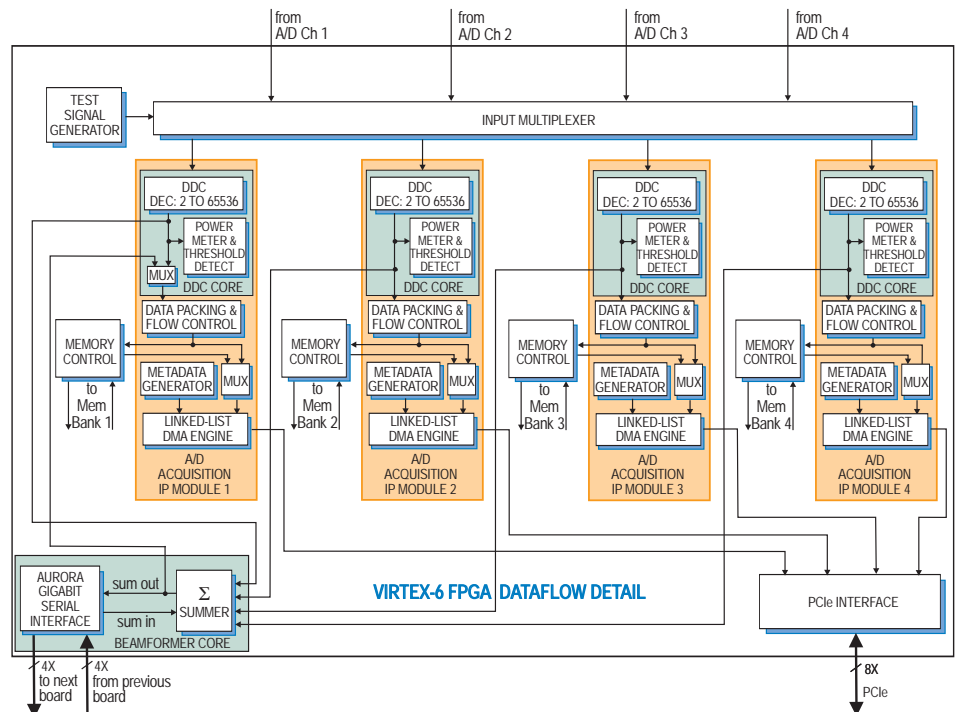

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage

## PCI Express Interface

The Model 78661 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe Links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

## Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Up to 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable serial gigabit interfaces
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78662 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed data converter with programmable DDCs (digital downconverters) is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78662 includes optional general-purpose and gigabit serial connectors for application-specific I/O protocols.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78662 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and trigger functions, a test signal generator,

voltage and temperature monitoring, DDR3 SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable the 78662 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

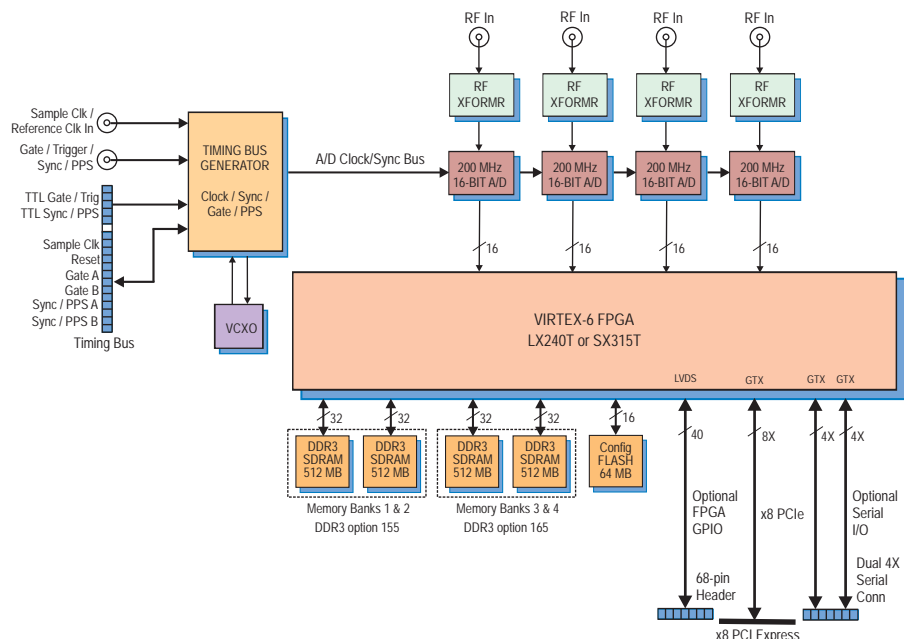

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Modules**

The 78662 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range is programmable in steps of 8 from 16 to 1024 and steps of 64

from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

**► A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

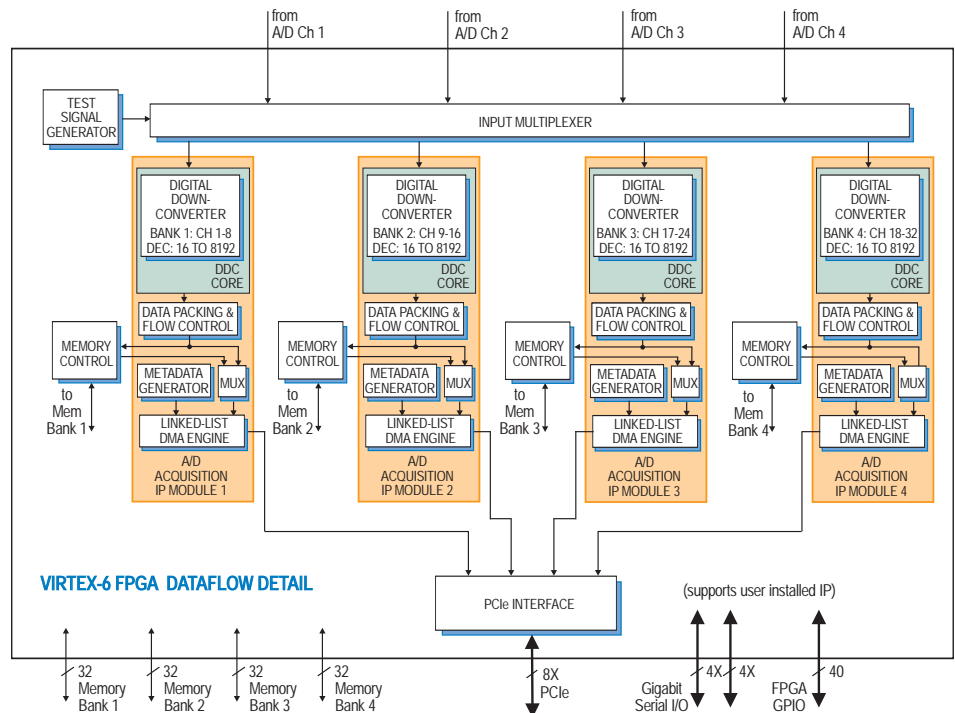

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78662's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 78662 architecture supports up to four independent memory banks which can be configured with DDR3 SDRAM. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 78662 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6V SX315T

## Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

## Memory

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

New!

Features

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x8

General Information

Model 78663 is a member of the Cobalt® family of high-performance PCIe boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

The Cobalt Architecture

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 78663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

A/D Converter Stage

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

Clocking and Synchronization

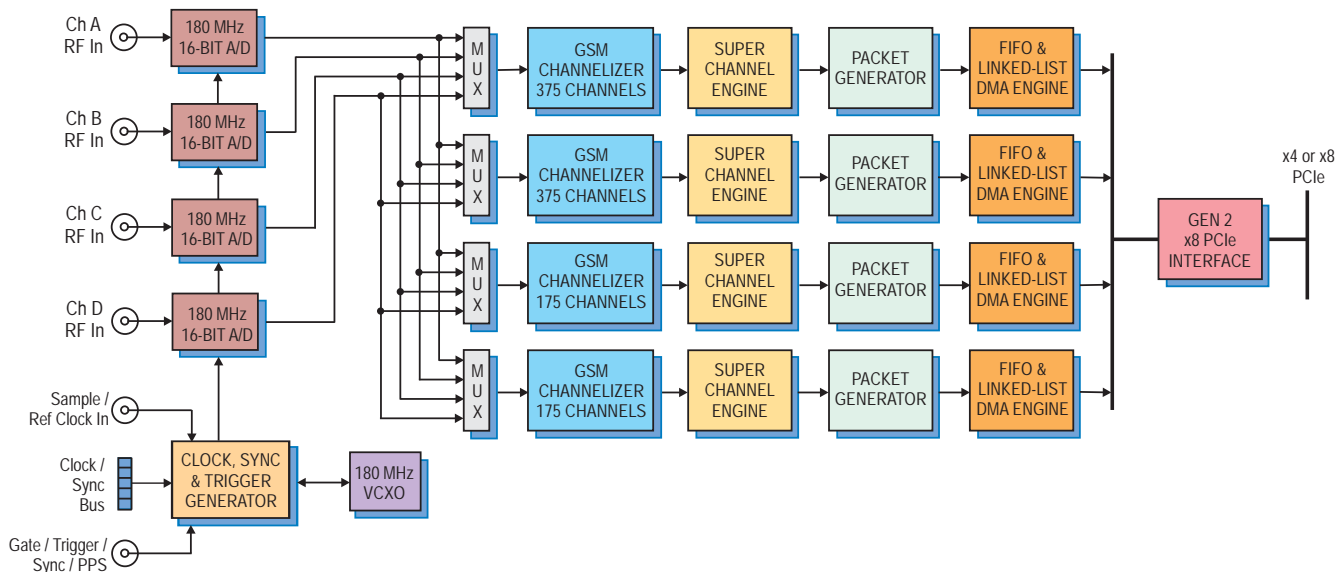

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

GSM Channelizer Cores

The 78663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ▶

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 78663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 78663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely 180 MHz\*13/2160, or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 78663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 78663 and host. ►

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**► Specifications****Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**GSM Channel Banks**

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

**DDC Channels**

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

**DDC Channel Filter Characteristics**

< 0.1 dB passband flatness across

$\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz \* 13 / 2160 = 1.0833333 MS/sec

**DDC Data Output Format:**

24 bits I + 24 bits Q

**Superchannels**

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

**Frequency Offsets for each DDC:**

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

**Superchannel Output Format:**

26 bits I + 26 bits Q

**Number of Superchannels per Bank:**

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6VSX315T

**PCI Express Interface**

**PCI Express Bus:** Gen. 2 x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 x 7.13 in.

**Ordering Information**

Model	Description
78663	1100-Channel GSM Channelizer with Quad A/D- PCIe

Model	Description
8266	PC Development System See 8266 Datasheet for Options

New!

Features

- Complete radar and software radio interface solution
- PCIe output supports VITA 49.0 Radio Transport (VRT) Standard
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

General Information

Model 78664 is a member of the Cobalt family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs (digital downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution. The 78664 PCIe output supports fully the VITA 49.0 Radio Transport (VRT) Standard.

It includes four A/Ds, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78664 includes an optional general-purpose connector for application-specific I/O.

The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78664 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (Digital Downconverter) IP core. IP modules

for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78664 to operate as a complete turnkey solution without the need to develop any FPGA IP.

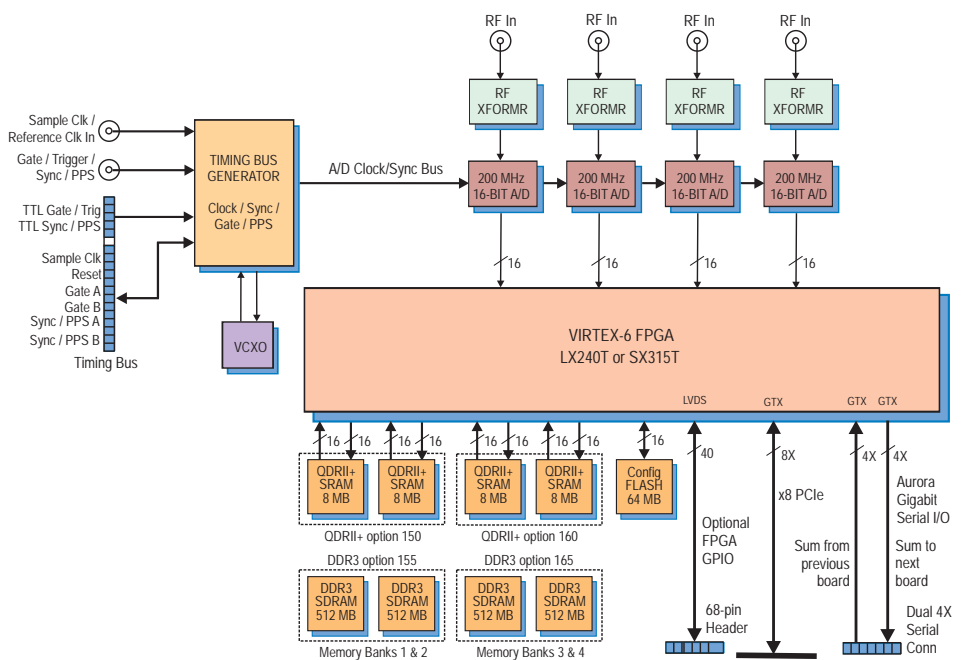

Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**A/D Acquisition IP Modules**

The 78664 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 78664 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

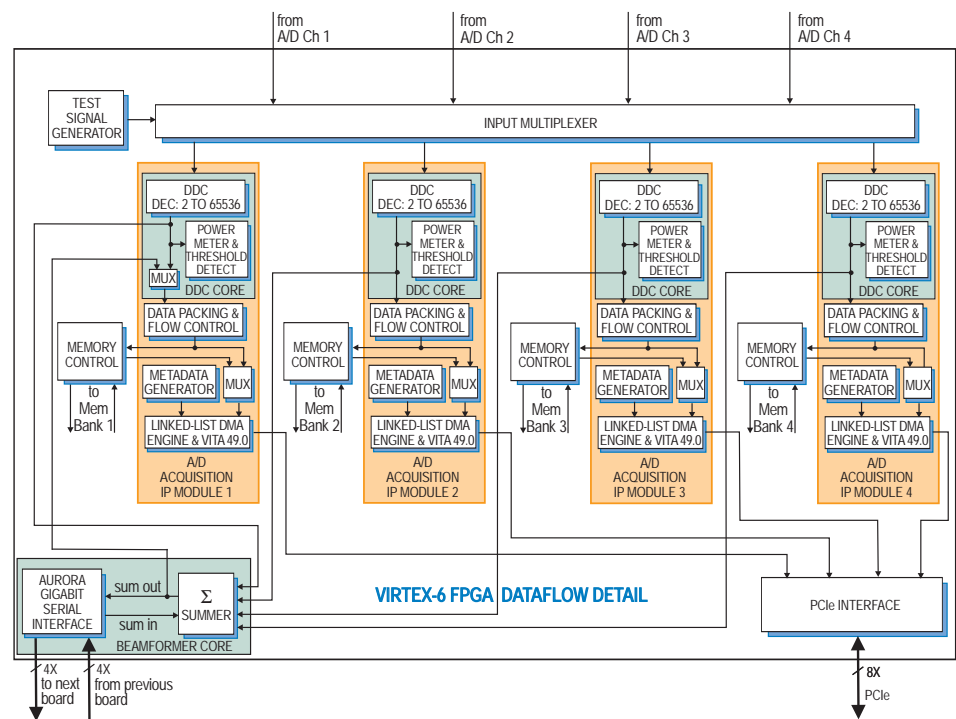

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78664's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**► VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA 49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

The 78664 supports fully the VITA 49.0 specification. ►

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78664's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78664 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78664 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe Links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8;  
 Gen. 2: x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in. ►

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78670 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78670 includes optional general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78670 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface

complete the factory-installed functions and enable the 78670 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

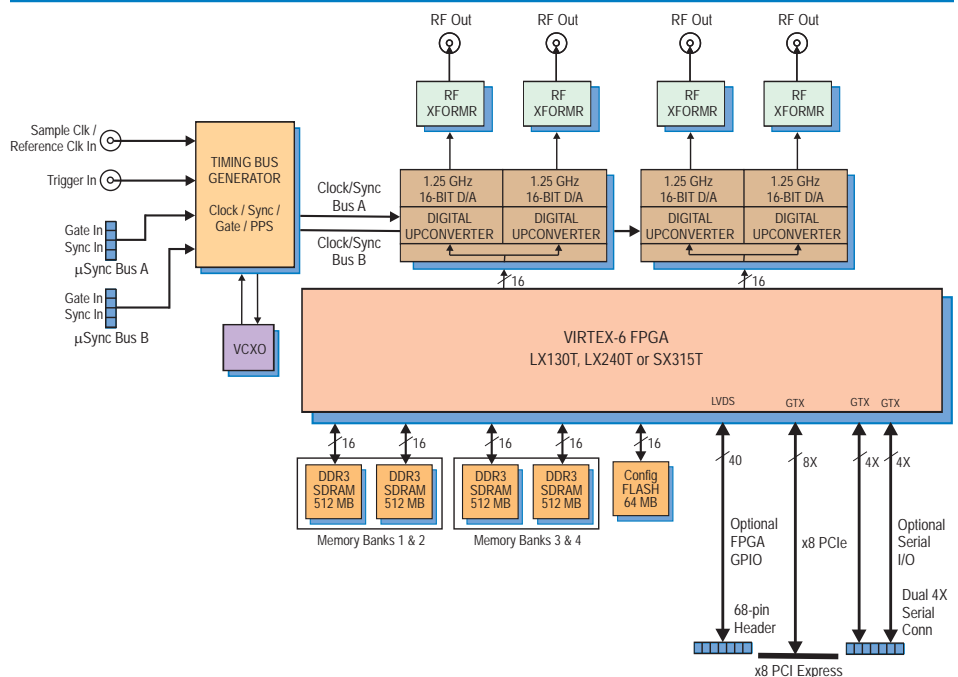

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by

2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 7892 or 9192 Cobalt Synchronizers can drive multiple 78670 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 78670 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

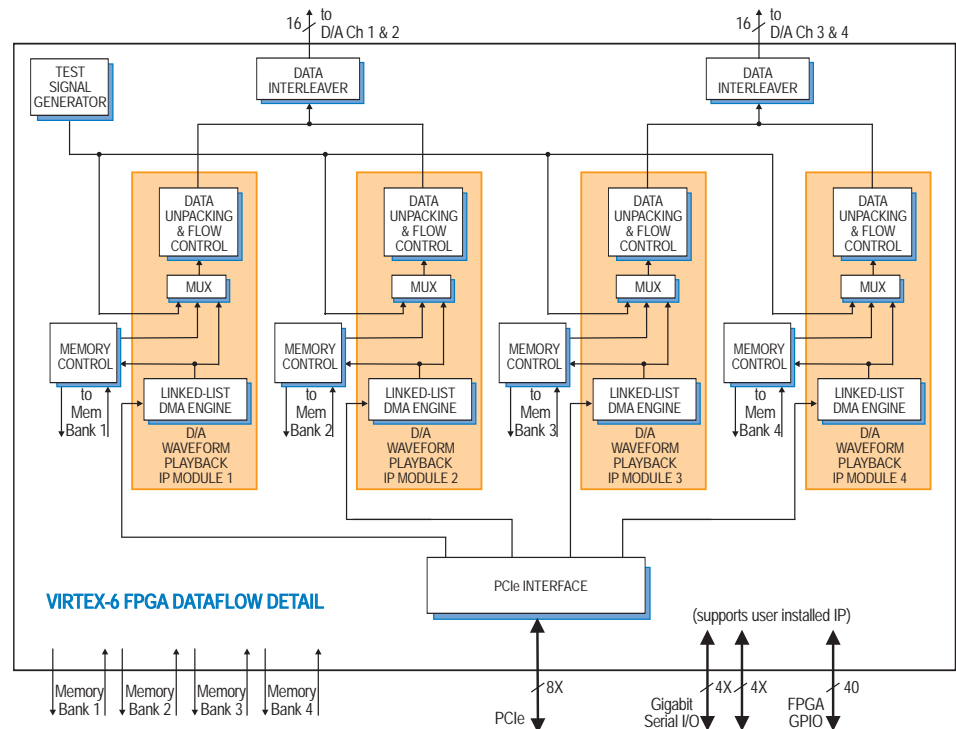

The Model 78670 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the board. ►

D/A Waveform Playback IP Module

The Model 78670 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4. Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

## ► Specifications

### D/A Converters

**Type:** TI DAC3484  
**Input Data Rate:** 312.5 MHz max.  
**Output Bandwidth:** 250 MHz max.  
**Output Sampling Rate:** 1.25 GHz max. with interpolation  
**Interpolation:** 2x, 4x, 8x or 16x  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Quantity:** Four D/A outputs  
**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps  
**Full Scale Output Programming:**  $1.0 \times (G+1) / 16$  Vp-p, where 4-bit integer  $G = 0$  to 15

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock  
**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz  
**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

### External Trigger Input

**Type:** Front panel female SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Extended interpolation range from 2x to 1,048,576x
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78671 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As with a wide range of programmable interpolation factors, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78671 includes optional general-purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78671 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions,

a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 78671 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

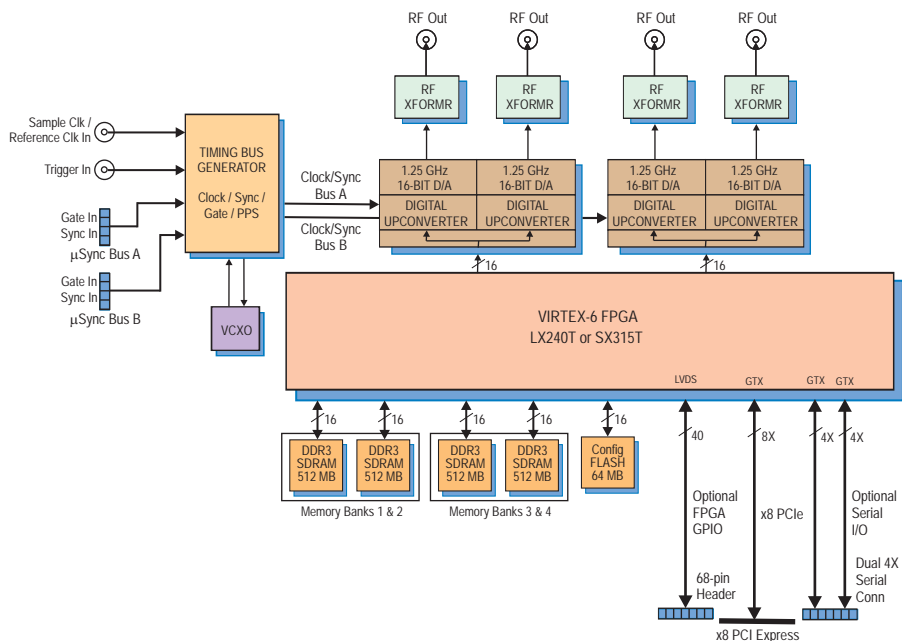

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user-selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, the 78671 features an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An

on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and trigger/gate signals. The Pentek Models 7892 or 9192 Cobalt Synchronizers can drive multiple 78671 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 78671 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

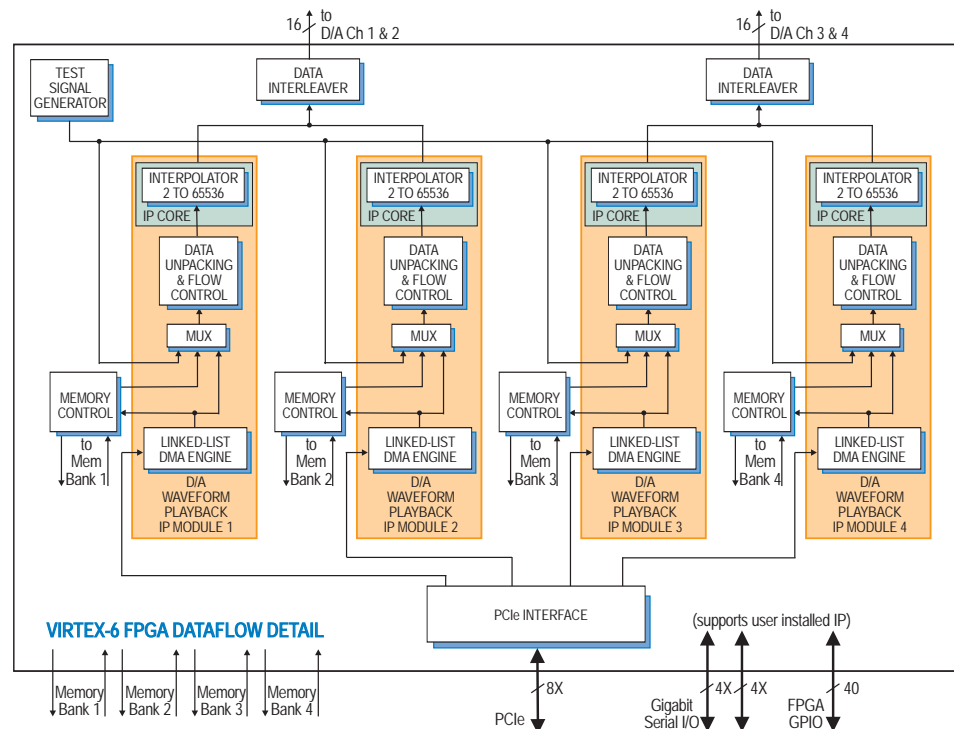

D/A Waveform Playback IP Module

The Model 78671 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked-list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA boosts LNB (low-noise block) antenna signal levels with up to 60 dB gain
- Programmable analog downconverter provides I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two 200 MHz 16-bit A/Ds
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1 & 2) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78690 is a member of the Cobalt® family of high performance PCIe boards based on the Xilinx Virtex-6 FPGA. A 2-Channel high-speed data converter, it is suitable for connection directly to the RF port of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 78690 includes optional general-purpose and gigabit serial connectors for application-specific I/O protocols.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78690 factory-installed functions include two A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the

78690 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

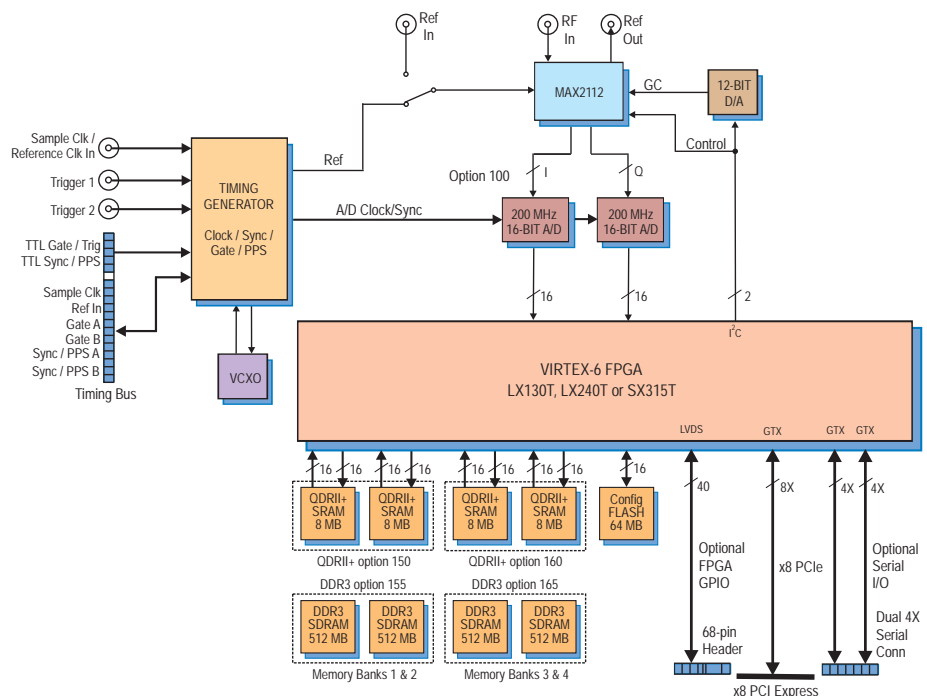

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► RF Tuner Stage

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz from an antenna LNB (low noise block). A Maxim MAX2112 tuner directly converts these L-Band signals to baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA (low noise amplifier), a PLL (phase-locked loop) synthesized local oscillator, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

An integrated lowpass filter with variable bandwidth provides bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

A/D Converter Stage

The analog baseband I and Q analog tuner outputs are then applied to two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

A/D Clocking and Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

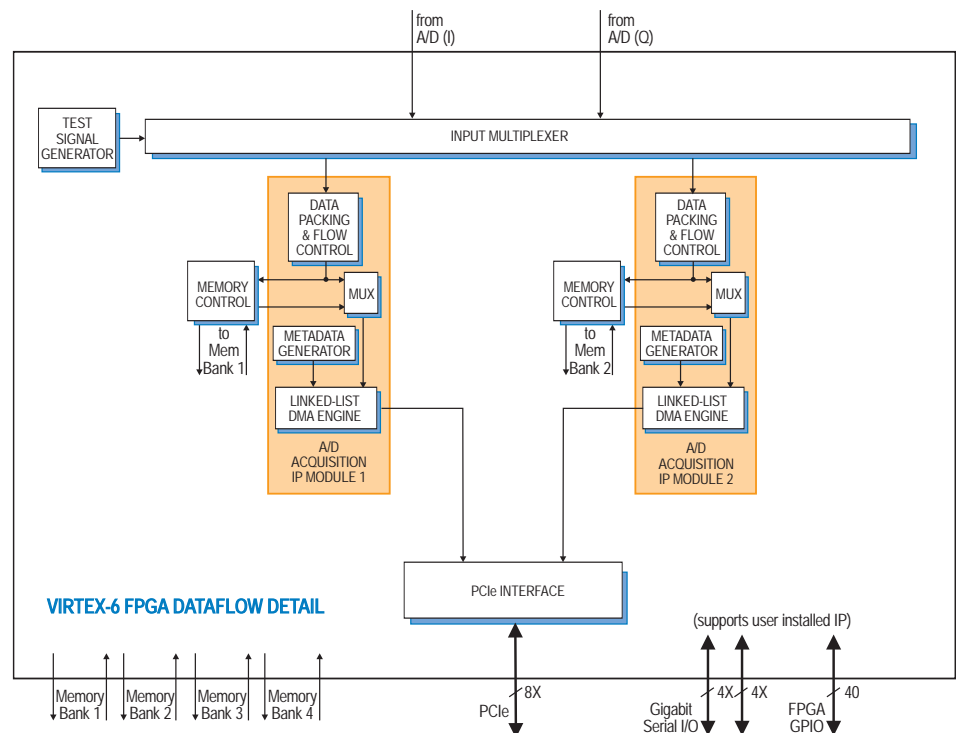

The 78690 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

A/D Acquisition IP Modules

The 78690 features two A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D Acquisition Modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## PCI Express Interface

The Model 78690 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC

**Impedance:** 50 ohms

### L-Band Tuner

**Type:** Maxim MAX2112

**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:** -97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$f_{req\_VCO} = (N.F) \times f_{req\_REF}$   
where integer N = 19 to 251 and

fractional F is a 20-bit binary value

**PLL Reference** ( $f_{req\_REF}$ ): Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

\*Usable Full-Scale Input Range: -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board timing generator/synthesizer

### A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

### Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VSX315T

### Custom I/O

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8;

Gen. 2 x4

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

**General Information**

Model 7809 is a PCIe module that provides gigabit serial transceiver network cable links for Pentek’s Cobalt® family of high performance 786xx PCIe boards based on the Xilinx Virtex-6 FPGA.

The 7809 and the Cobalt board are installed in adjacent slots in a PCIe motherboard or backplane and joined with a gigabit serial flex circuit cable.

The 7809 takes advantage of the small form-factor pluggable (SFP) or Mini-GBIC standard, supporting a variety of hot-pluggable transceiver modules for optical and copper network cables. Up to four modules can be installed.

Since the 7809 is protocol transparent, it is compatible with many protocols including Serial FPDP, PCIe, Xilinx Aurora, Serial-RapidIO, Gigabit Ethernet, SONET, Fibre Channel, and others.

Each of the four gigabit serial links within a 4X port consists of a transmit pair and a receive pair connected to one SFP module through an equalizer circuit to improve transceiver performance. The Virtex-6 FPGA in the Cobalt module is used to implement the required protocol engine for the P16 4X links to the 7809.

Some Cobalt boards (such as the 78621 and 78661) are equipped with factory-installed FPGA IP supporting Xilinx Aurora links for cascade beamforming summation across multiple boards.

Pentek’s GateFlow FPGA Design Kit allows users to implement custom protocols for other applications. GateFlow is compatible with the Xilinx ISE Foundation Tool Suite, and includes a complete project file and VHDL source code.

**SFP Modules**

SFP transceiver modules support a variety of different transmitter and receiver types. These modules simply plug into the SFP sockets so they can be easily installed or replaced by users.

Users can choose the appropriate transceiver for each link to support the required distance and data rates. Both single-mode and multi-mode optical fibre devices are available for cable interconnection distances up to 550 m and 10 km, respectively.

Pentek offers the 7809 with options for either two or four 850 nm multi-mode fibre optical SFP modules installed.

Each 7809 is supplied with the gigabit serial flex circuit cable assembly for connection to a suitably equipped 786xx series PCIe Cobalt module.

**Features**

- Compatible with Pentek 786xx PCI Express Cobalt boards
- Extends range of gigabit serial I/O links
- Four SFP modules drive cable lengths up to 10 km
- Support for both optical and copper cables
- Single-mode and multi-mode fibre optical
- Data rates to 5 Gbits/sec
- Payload data rates to 500 MB/sec for each cable

**The Cobalt Connection**

The 786xx series PCIe Cobalt boards feature two optional 4X gigabit serial connectors along the top edge of the circuit board. These two 4X ports are wired directly to P16 of the XMC module.

The 7809 circuit board has one 4X gigabit serial connector along its top edge. A short flex circuit cable is installed between the 7809 4X connector and one of the two Cobalt 4X connectors.

This provides a full-duplex 4X gigabit serial path between the modules that can operate at serial bit rates to 5 GHz. A second 7809 can be installed adjacent to the Cobalt board to support a second 4X transceiver link.

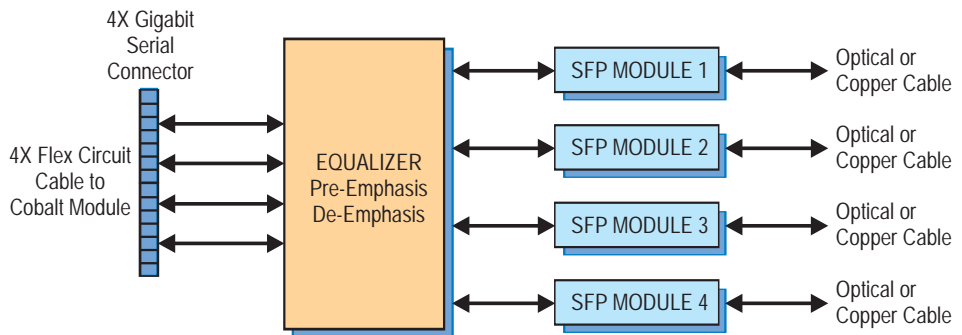

**Ordering Information**

**Model Description**

7809 4-Channel SFP Transceiver PCIe Module

**Options:**

- 002 Two 850 nm multi-mode fiber optical channel SFPs (500 m distance)
- 004 Four 850 nm multi-mode fiber optical channel SFPs (500 m distance)

Contact Pentek for availability of other interfaces

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 78720 is a member of the Onyx® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78720 includes optional general-purpose and gigabit-serial card edge connectors for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 78720 factory-installed functions include three A/D acquisition and a D/A waveform capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchro-

nization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 78720 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

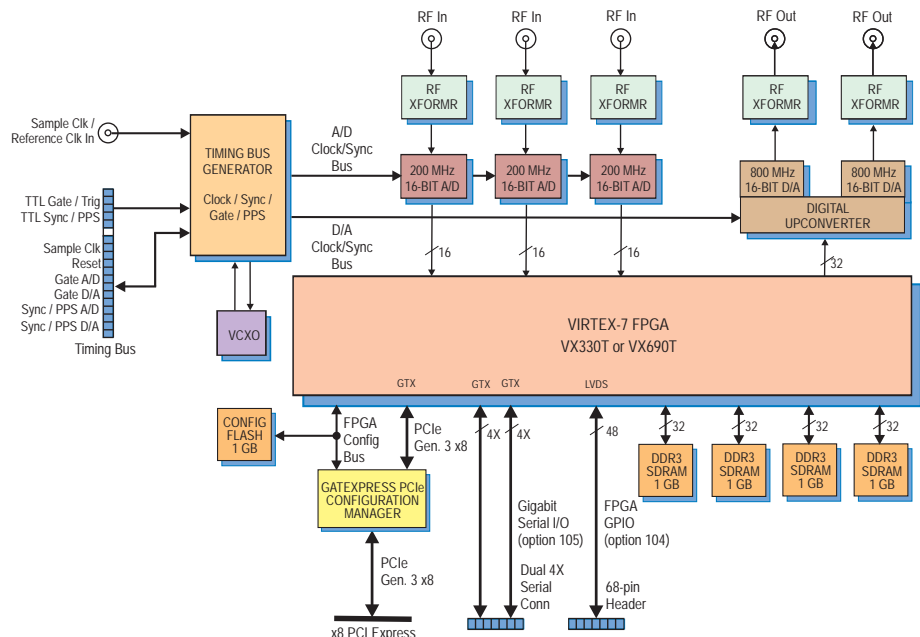

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Modules**

The 78720 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 78720 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/A waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board’s configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board’s PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

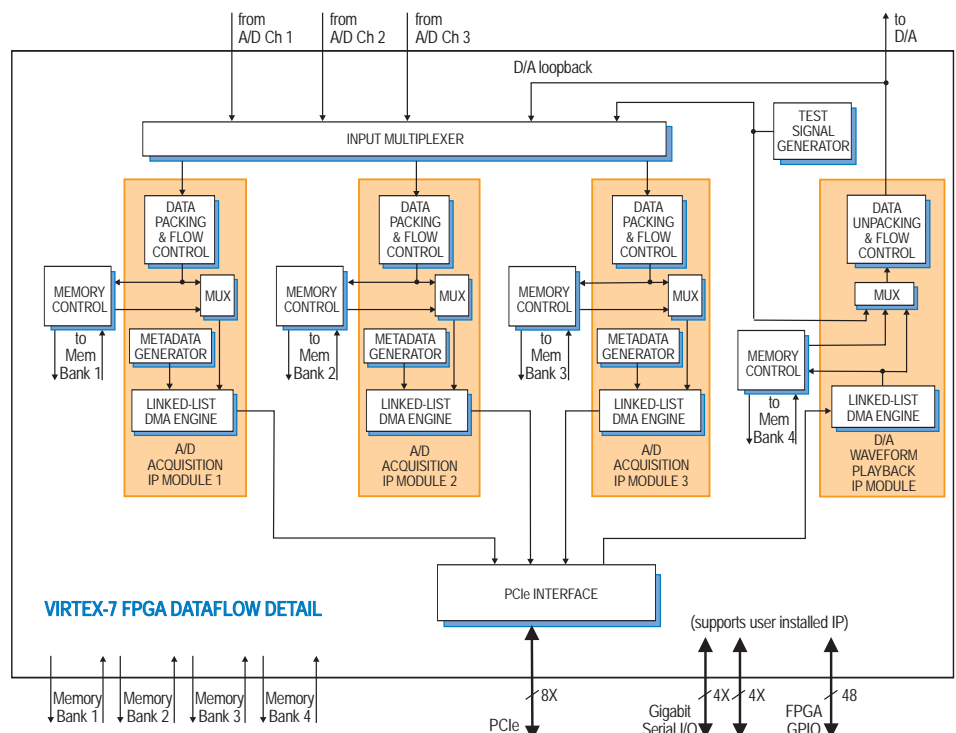

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

## Memory Resources

The 78720 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
78720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - PCIe

### Options:

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through 68-pin ribbon cable connector
-105	Gigabit serial FPGA I/O through two 4X top edge connectors

Model	Description
8266	PC Development System See 8266 Datasheet for Options

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

## PCI Express Interface

The Model 78720 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8; Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

New!

# Model 78721

## 3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - x8 PCIe

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

### General Information

Model 78721 is a member of the Onyx<sup>®</sup> family of high performance PCIe boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78721 includes an optional connection to the Virtex-7 FPGA for custom I/O.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78721 factory-installed functions include three A/D acquisition and a D/A waveform playback IP module. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78721 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

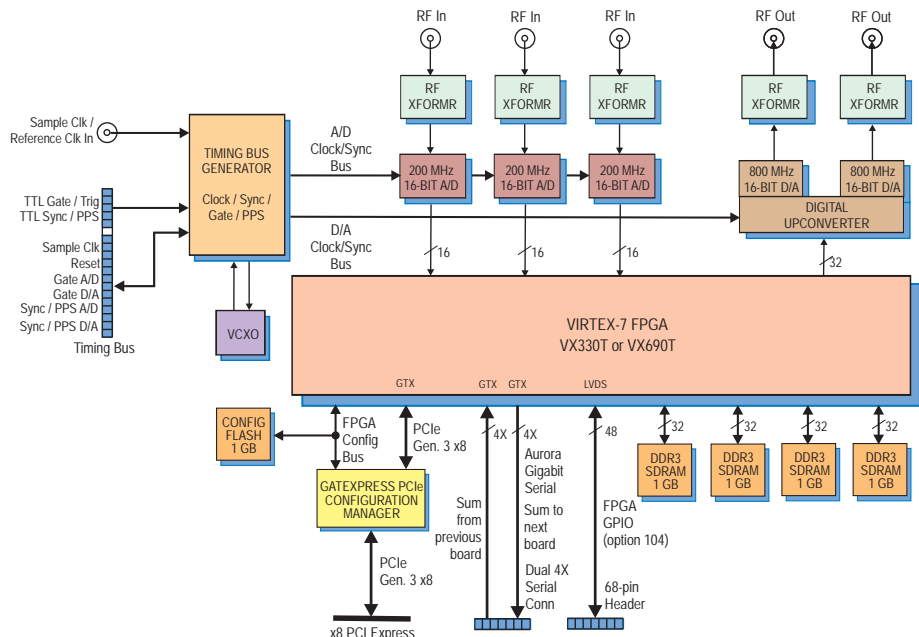

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O. ▶

**A/D Acquisition IP Modules**

The 78721 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 78721 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

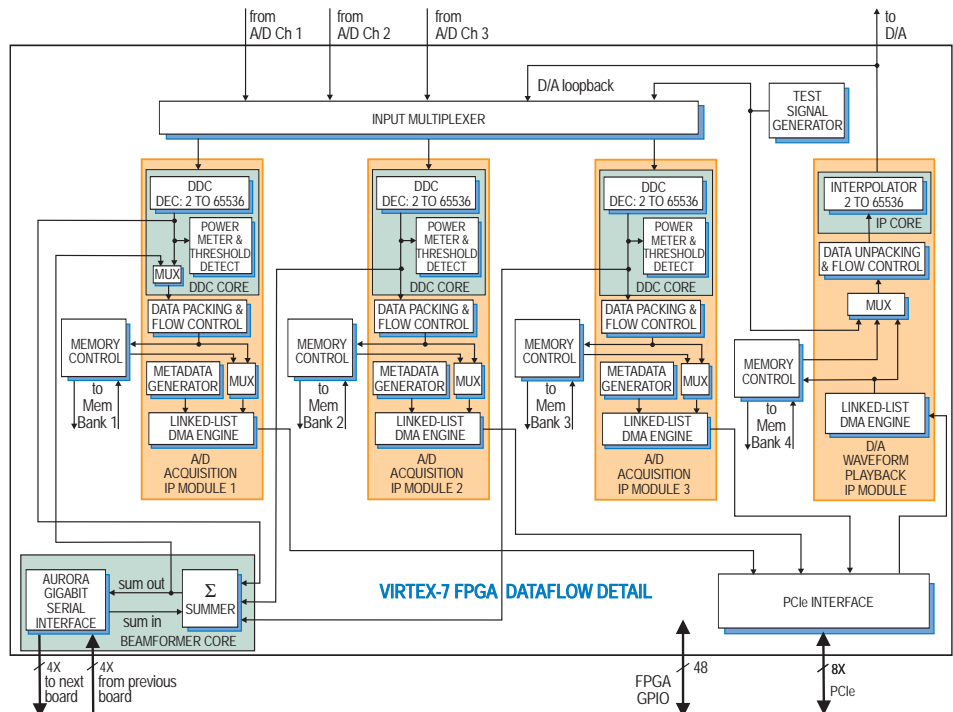

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78721's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 78721 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78721's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Three channels

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 78730 is a member of the Onyx® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and 1 GHz D/A converters and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78730 includes optional general-purpose and gigabit serial card connectors for application specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 78730 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 78730 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

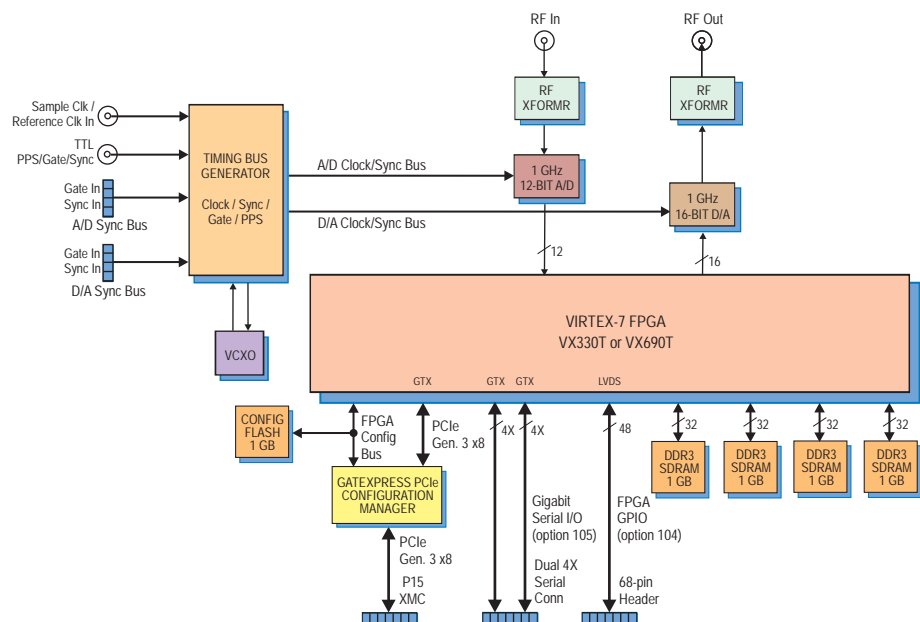

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

**A/D Acquisition IP Module**

The 78730 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 78730 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

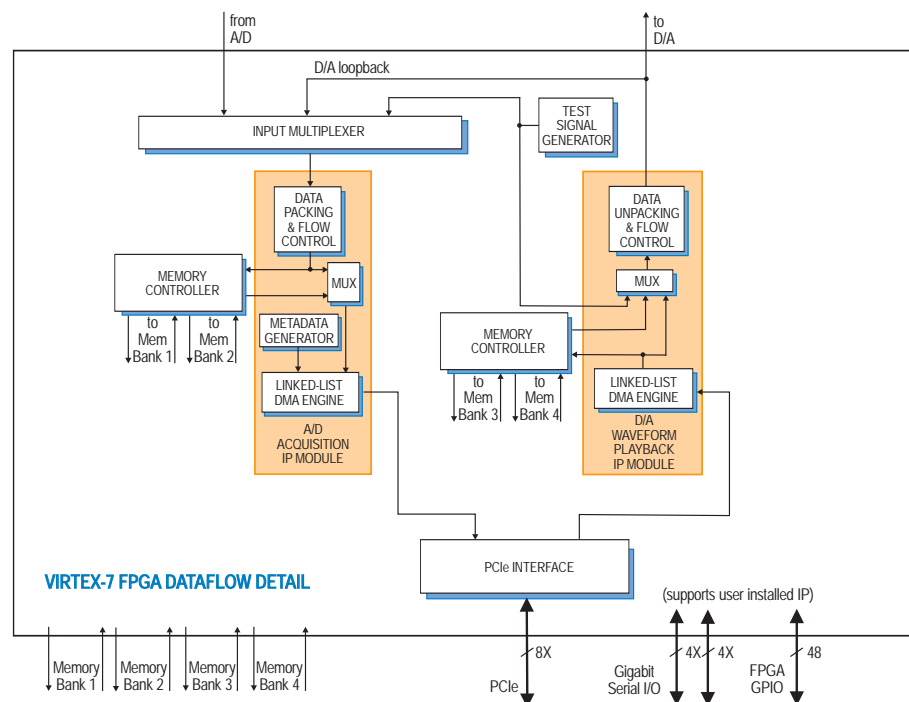

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**D/A Converter Stage**

The 78630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector. ➤

► **Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel µSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 7892 and Model 9192 Cobalt Synchronizers can drive multiple 78730 µSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 78730 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

The Model 78630 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Connects 20 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
78730	1 GHz A/D and D/A, Virtex-7 FPGA - x8 PCIe

New!

# Model 78741

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Virtex-7 FPGA - x8 PCIe

## General Information

Model 78741 is a member of the Onyx® family of high-performance PCIe modules based on the Xilinx Virtex-7 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 78741 includes an optional connection to the Virtex-7 FPGA for custom I/O.

## The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78741 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR3 SDRAM memories, a controller for all data clocking

and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 78741 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

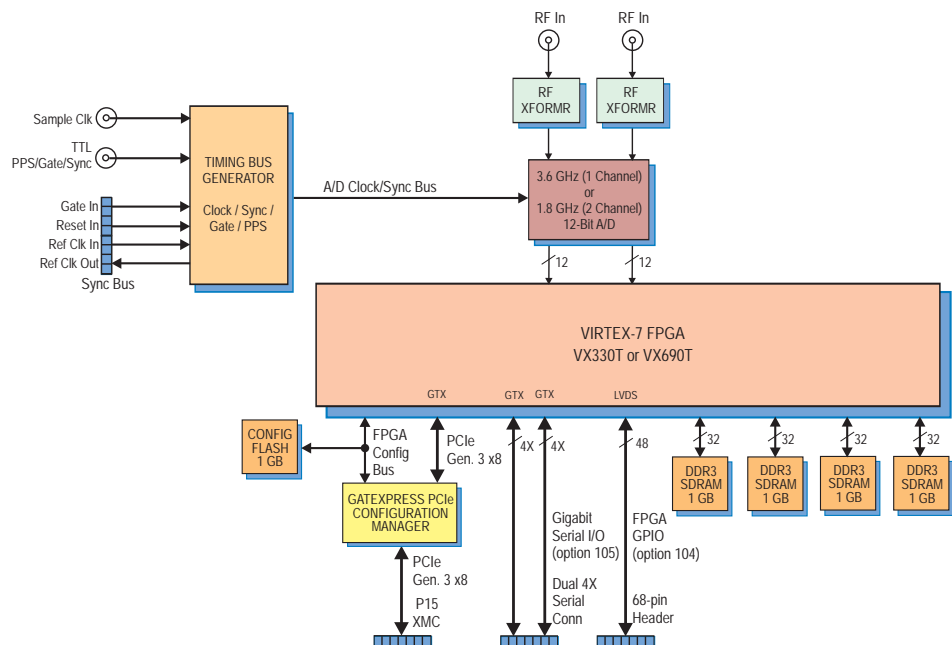

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 4 GB of DDR3 SDRAM
- µSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**A/D Acquisition IP Module**

The 78741 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

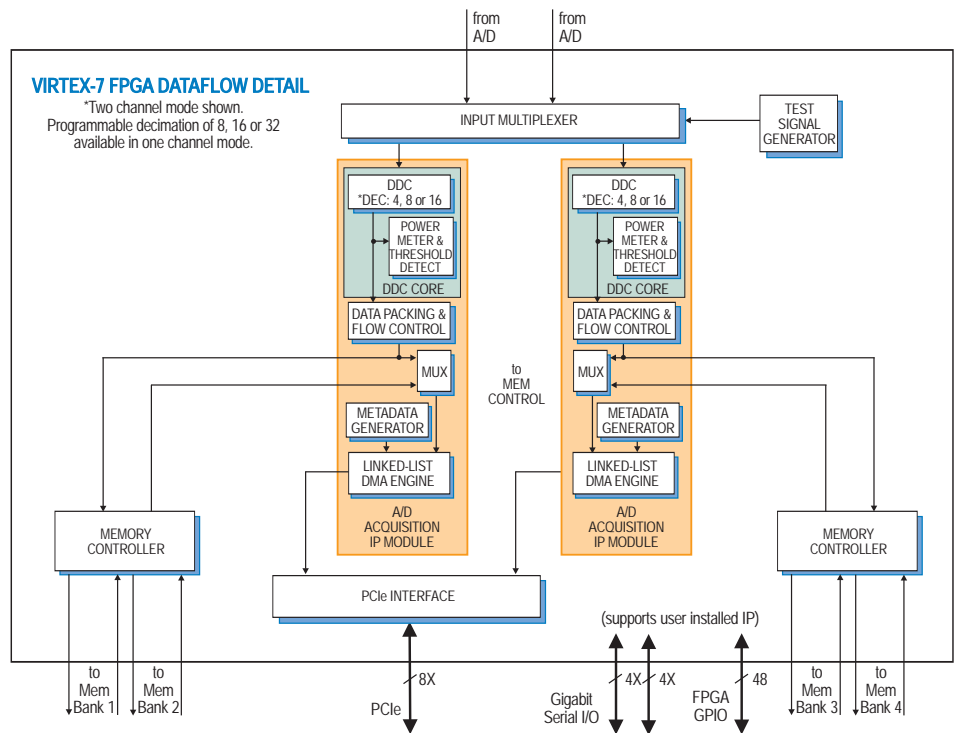

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored

**Memory Resources**

The 78741 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

**Model 8266**

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

► on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 78741 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

**PCI Express Interface**

The Model 78741 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board

**Clocking and Synchronization**

The 78741 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 78741's can be synchronized with a simple cable. For larger systems, multiple 78741's can be synchronized using the Model 7892 high-speed sync board to drive the sync bus.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

New!

# Model 78751

## 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and a Virtex-7 FPGA - x8 PCIe

### General Information

Model 78751 is a member of the Onyx® family of high performance PCIe boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78751 includes a general purpose connector for application-specific I/O.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78751 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 78751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

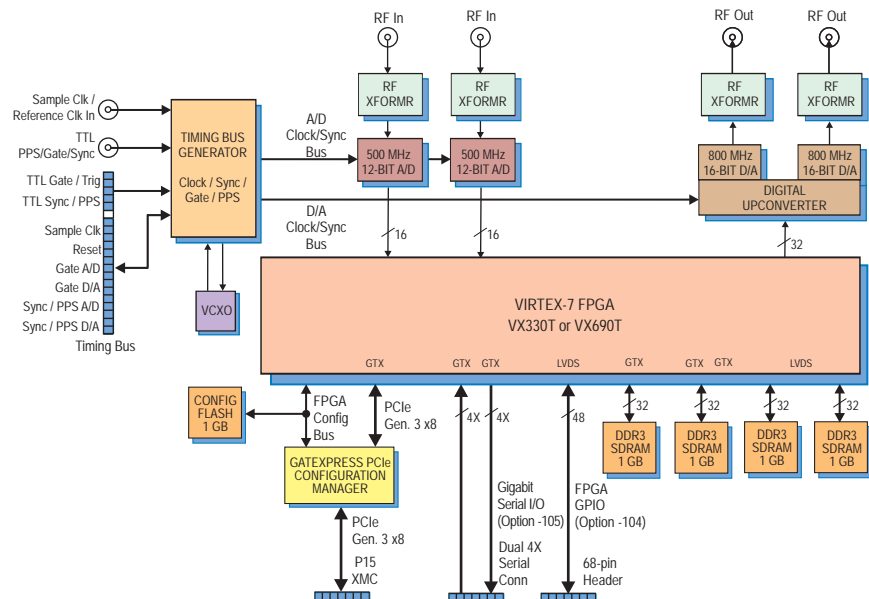

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA to two gigabit serial connectors along the top edge of the board. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds

**A/D Acquisition IP Modules**

The 78751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as

two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 78751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

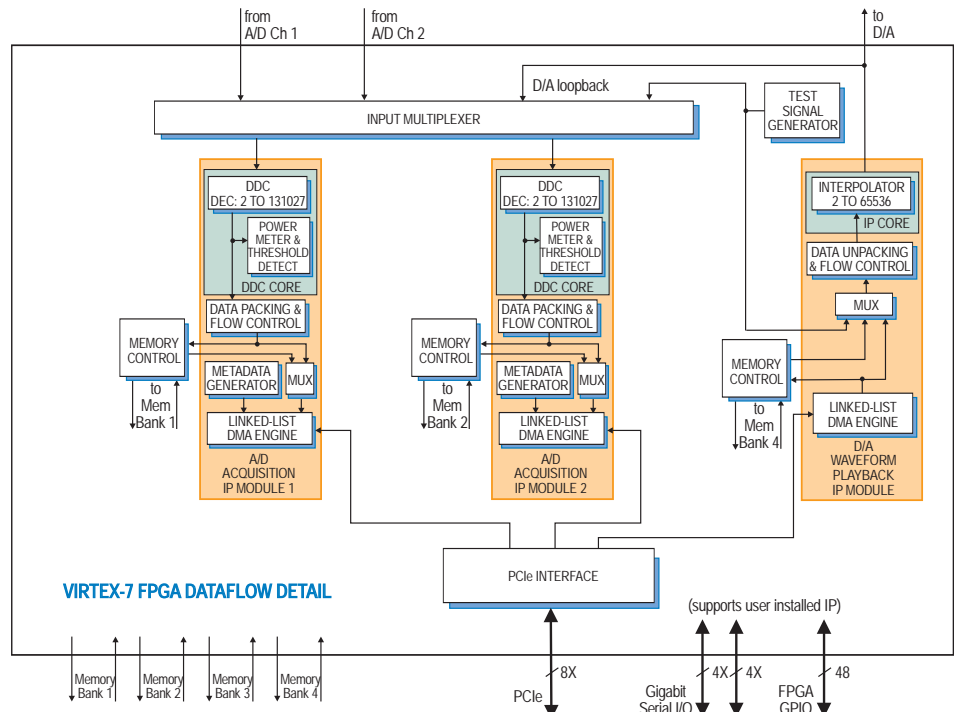

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 71751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78751 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt and Onyx PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

### Ordering Information

Model	Description
71751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - XMC

#### Options:

-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8266	PC Development System See 8266 Datasheet for Options

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

#### Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA  
**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** Standard XMC module, 2.91 in. x 5.87 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Advanced reconfigurability features
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 78760 is a member of the Onyx® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78760 includes optional general-purpose and gigabit-serial connectors for application-specific I/O protocols.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt Family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78760 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer. IP modules for DDR3 SDRAM memories, a controller for all data clocking

and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 78760 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

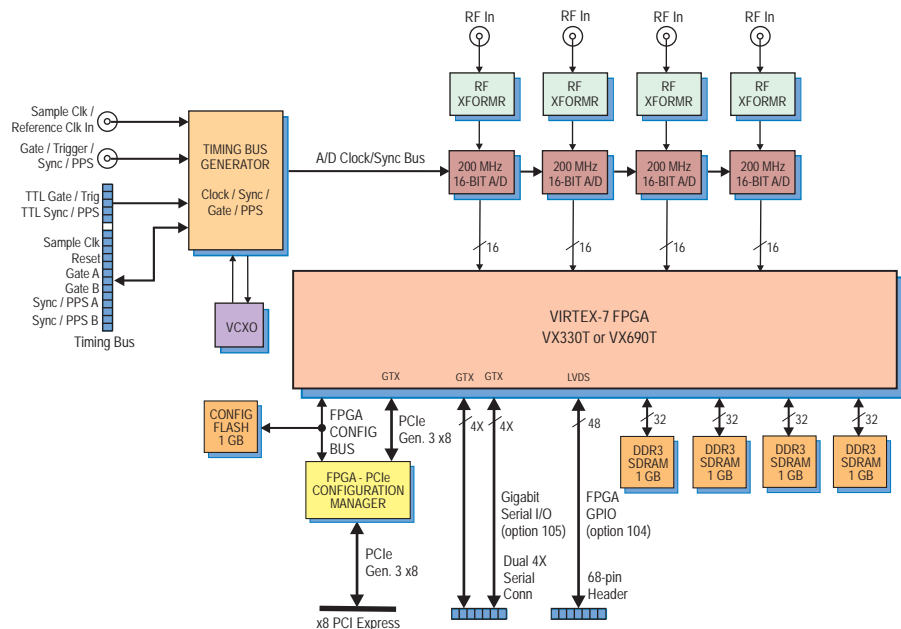

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board. ➤

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an ►

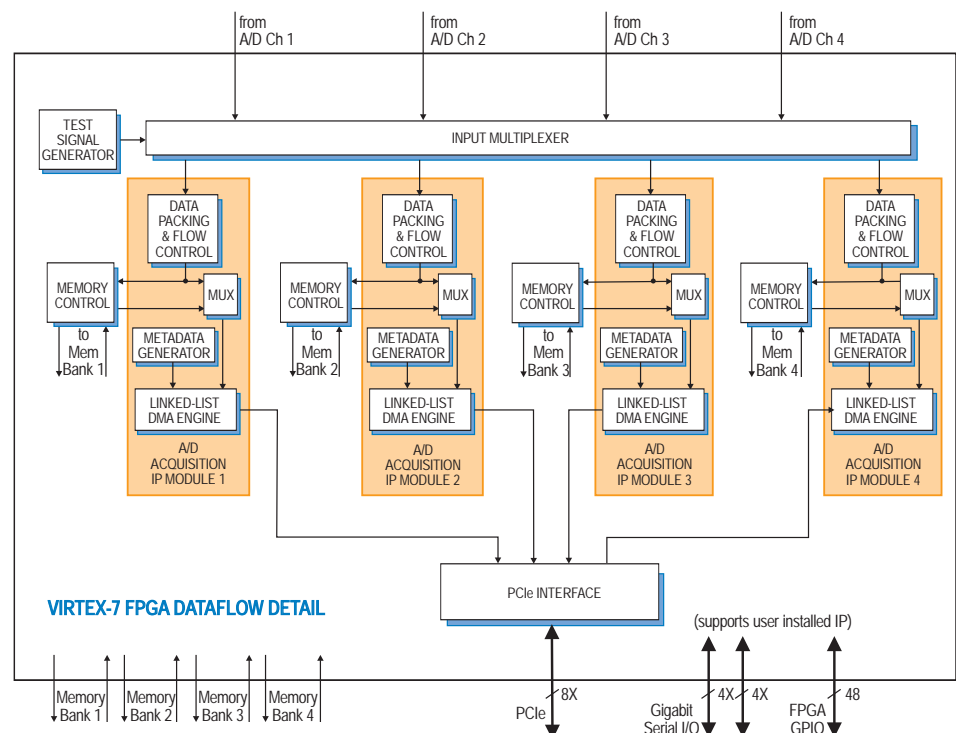

A/D Acquisition IP Modules

The 78760 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78760's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78760 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78760 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA on PMC P14 to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA on XMC P16 to two 4X gigabit serial connectors along the top edge of the PCIe board

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8  
Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

### Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

General Information

Model 78761 is a member of the Onyx® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with programmable DDCs (Digital Downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78761 includes an optional connection to the Virtex-7 FPGA for custom I/O.

The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78761 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 78761 to operate as a complete turnkey solution without the need to develop any FPGA IP.

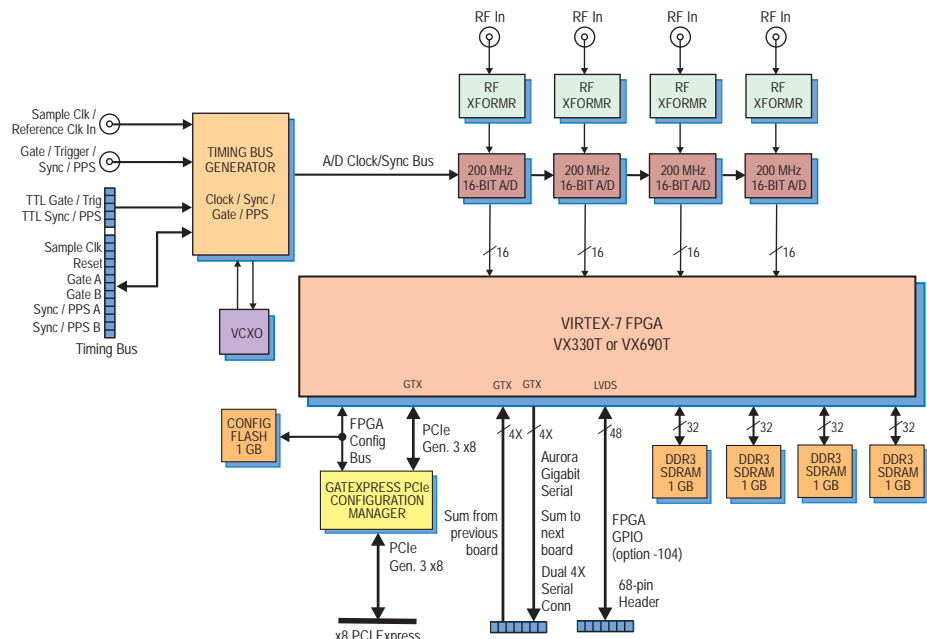

Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**A/D Acquisition IP Modules**

The 78761 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_{sr}$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 78761 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

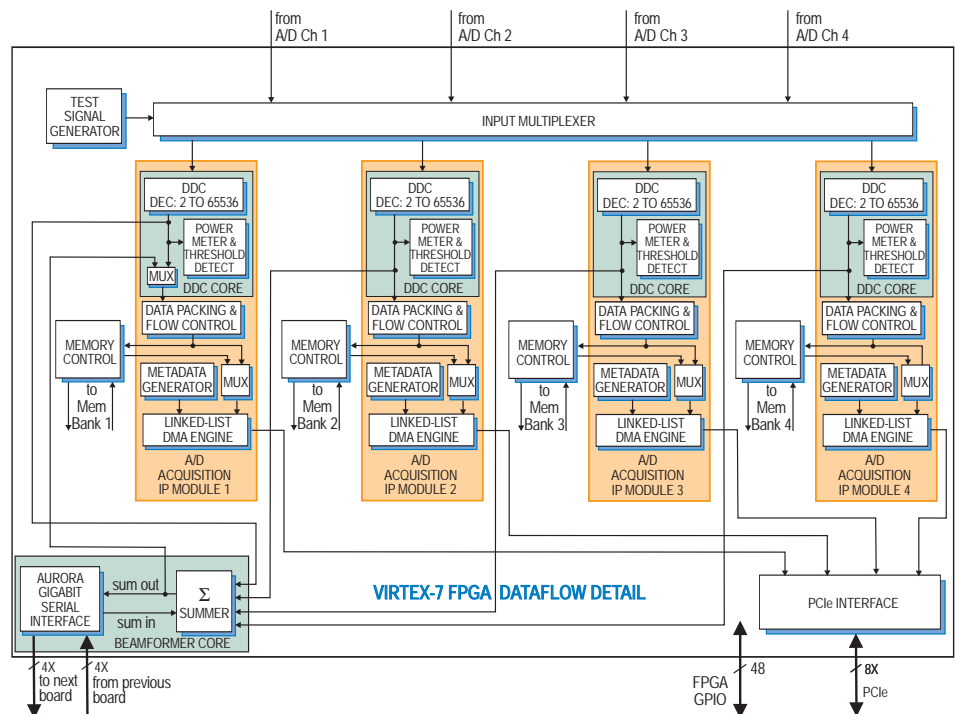

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 78761's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous

sampling and sync functions across all connected boards.

### Memory Resources

The 78761 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 78761 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit  
**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O

### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

## Ordering Information

Model	Description
78761	4-Channel 200 MHz A/D with DDCs and Virtex-7 FPGA - x8 PCIe

### Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through 68-pin ribbon cable connector

Model	Description
8266	PC Development System See 8266 Datasheet for Options

New!

# Model 78791

# L-Band RF Tuner, 2-Chan. 500 MHz A/D, Virtex-7 FPGA - x8 PCIe

### Features

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA handles L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverter provides IF or I+Q baseband signals at frequencies up to 123 MHz
- Two 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, 2, & 3) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

### General Information

Model 78791 is a member of the Onyx® family of high-performance PCIe boards based on the Xilinx Virtex-7 FPGA. It is suitable for connection directly to an L-band signal for SATCOM and communications systems. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78791 includes general purpose and gigabit serial connectors for application-specific I/O.

### The Onyx Architecture

The Pentek Onyx Architecture features a Virtex-7 FPGA. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The 78791 factory-installed functions include two A/D acquisition IP modules, four DDR3 memory controllers, two DDCs (digital downconverters), an RF tuner controller, a clock and synchronization generator, a test signal generator, and a Gen 3 PCIe interface.

Thus, the 78791 can operate as a complete turnkey solution with no need to develop FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

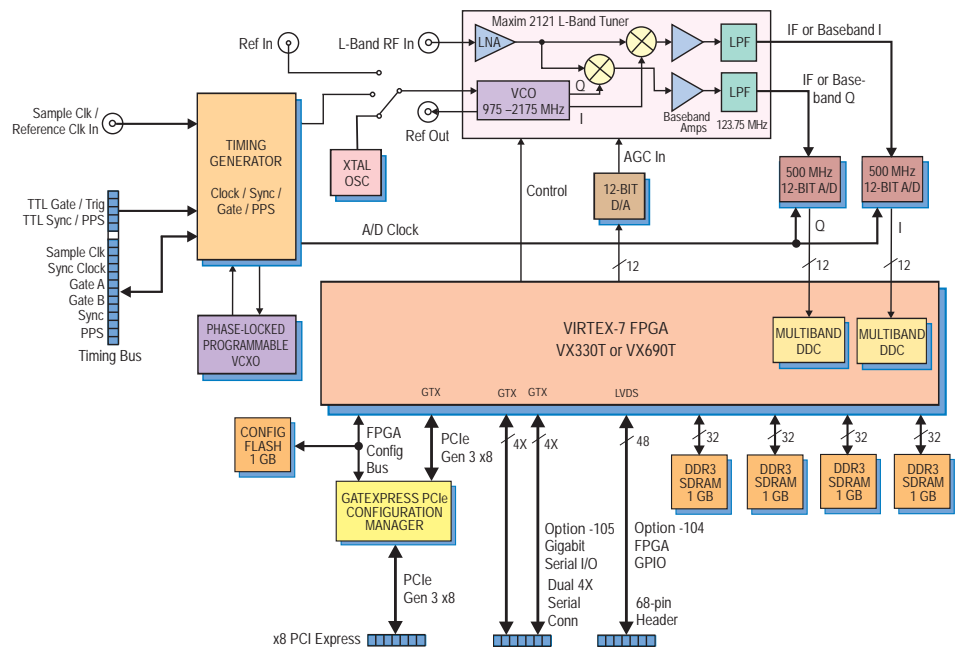

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header for custom I/O.

Option -105 connects two 4X gigabit serial links from the FPGA to two gigabit serial connectors along the top edge of the board. ▶

**A/D Acquisition IP Modules**

The 78791 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

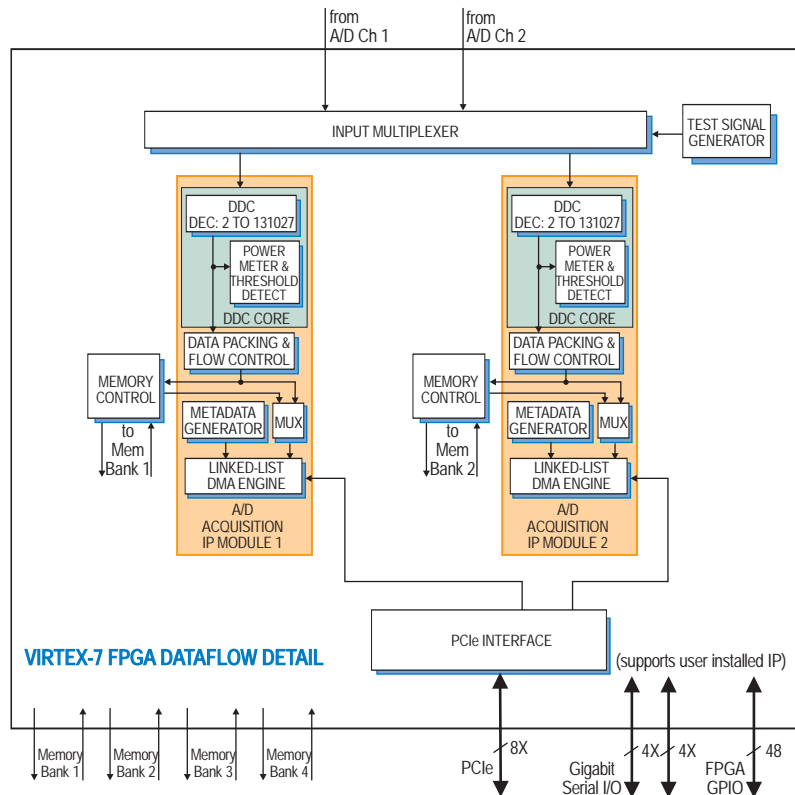

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ➤

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The two analog tuner outputs are digitized by two Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two independent A/D and DDC channels are now available for digitizing and downconverting two signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78791 architecture supports four independent 1 GB DDR3 SDRAM for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 and 2. Banks 3 and 4 can be used to support custom user-installed IP within the FPGA.

### PCI Express Interface

The Model 78791 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## Model 8266

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt, Onyx and Flexor PCI Express boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description

## ► Specifications

### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

### L-Band Tuner

**Type:** Maxim MAX2121  
**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**  
 -97 dBc/Hz at 10 kHz

### Fractional-N PLL Synthesizer:

$\text{freq}_{\text{VCO}} = (\text{N.F.}) \times \text{freq}_{\text{REF}}$   
 where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference** ( $\text{freq}_{\text{REF}}$ ): Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**  
 -50 dBm to +10 dBm

**Baseband Low Pass Filter:**  
 3 dB cutoff frequency: 123.75 MHz

### A/D Converters

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 10 MHz to 500 MHz  
**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources:** On-board timing generator/synthesizer

### A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

### Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105:** Connects two 4X gigabit serial links from the FPGA to two 4X gigabit serial connectors along the top edge of the PCIe board

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Half length PCIe card, 4.38 in. x 7.13 in.

New!

# Model 78131

# 8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - PCIe

## General Information

Model 78131 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78131 is a multichannel, high-speed data converter with multiband DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multi-board clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78131 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78131 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, multiband DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 78131 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

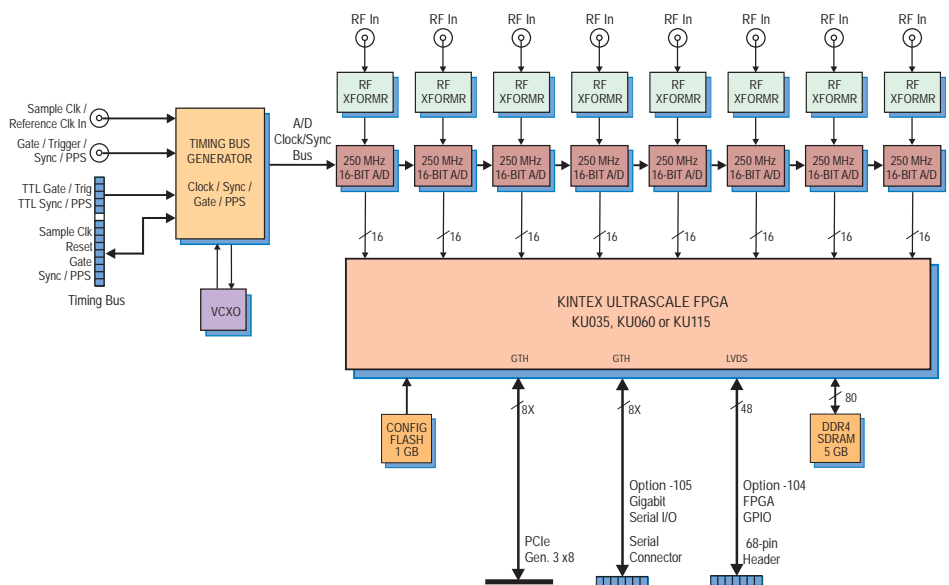

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through ▶

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized versions available

**A/D Acquisition IP Modules**

The 78131 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an

output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **KU115.** The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

Option -105 connects one 8X gigabit serial link from the FPGA to an 8X gigabit serial connector along the top edge of the PCIe board.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the

A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

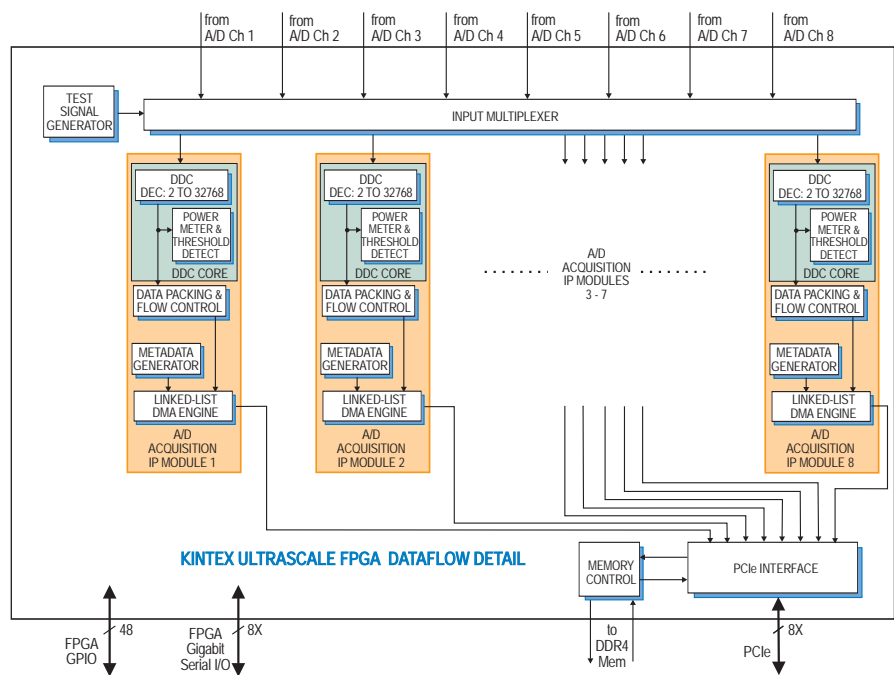

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The 78131 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
78131	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - PCIe

### Options:

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-105	Gigabit serial FPGA I/O
-702	Air cooled, Level L2

Contact Pentek for complete specifications of rugged and conduction-cooled versions

## ► PCI Express Interface

The Model 78131 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >108 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104** connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

**Option -105** connects one 8X gigabit serial link from the FPGA to an 8X gigabit serial connector along the top edge of the PCIe board.

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

New!

# Model 78132

# 8-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - x8 PCIe

### General Information

Model 78132 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78132 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78132 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78132 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 78132 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

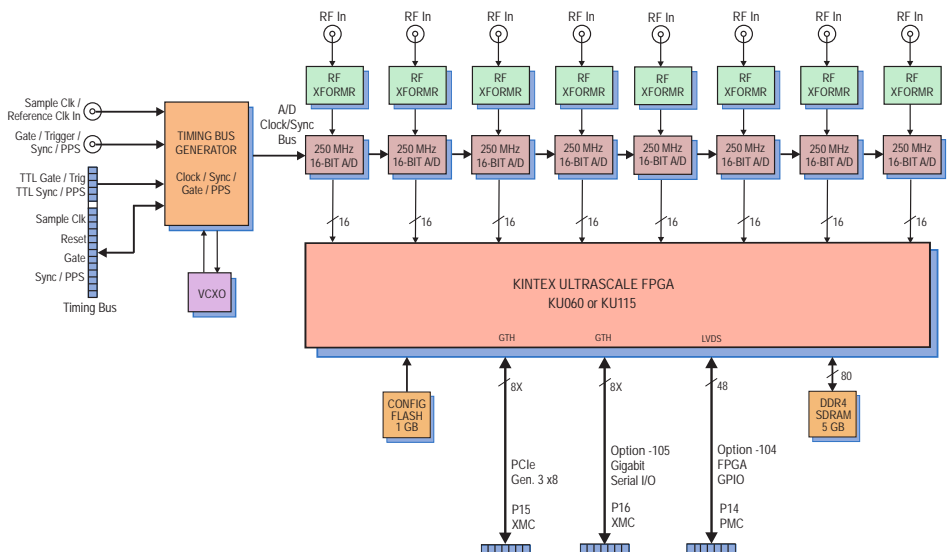

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU 115. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight wideband DDCs (digital downconverters)
- 64 multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized version available

**A/D Acquisition IP Modules**

The 78132 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each acquisition module can choose between the two cores allowing for a very flexible down-conversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 installs the P14 PMC connector with 24 pairs of LVDS connections to the FPGA for custom I/O.

Option -105 installs the P16 XMC connector with eight full duplex gigabit links to the FPGA to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

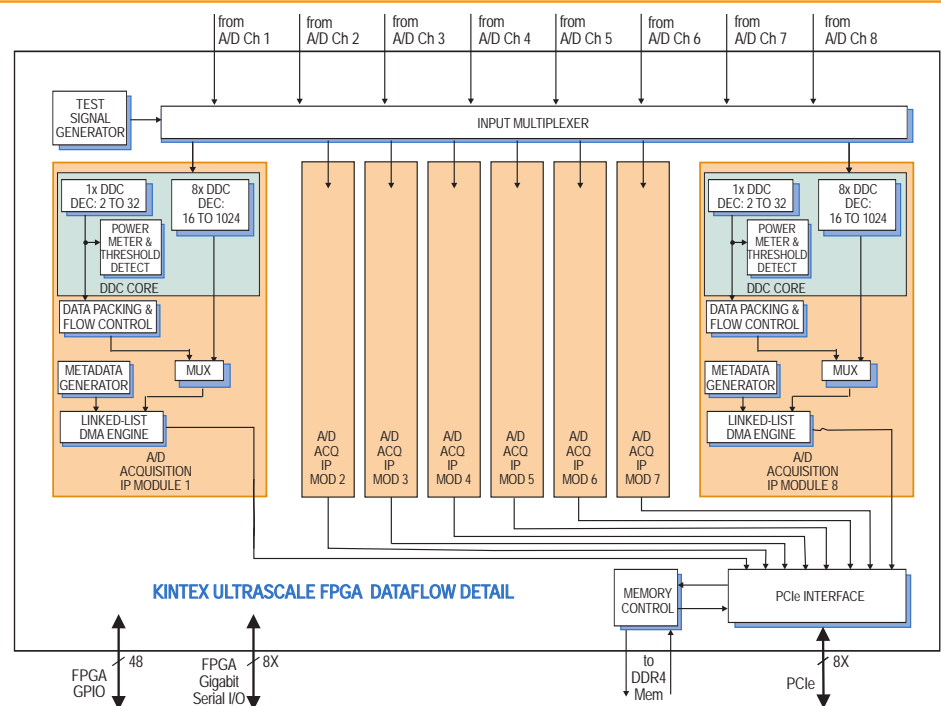

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of it for custom applications. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
78132	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - PCIe

### Options:

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
-702	Air cooled, Level L2

Contact Pentek for complete specifications of rugged and conduction-cooled versions

## ► PCI Express Interface

The Model 78132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

### Wideband Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Multiband Digital Downconverters

**Quantity:** Eight banks, 8 channels per bank  
**Decimation Range:** 16x to 1024x in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs the PMC P14 connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs the XMC P16 connector providing 8X serial links to the FPGA

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** XMC module 2.910 in x 5.870 in (74.00 mm x 149.00 mm)

New

# Model 78141

# 1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - PCIe

## General Information

Model 78141 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78141 is a high-speed analog-to-digital and digital-to-analog converter with programmable DDCs (digital downconverters) and DUCs (digital upconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and generator features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 6.4 GHz, 12-bit A/D converter, dual 6.4 GHz, 14-bit D/As and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 78141 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78141 factory-installed functions include two A/D acquisition and two D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 78141 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

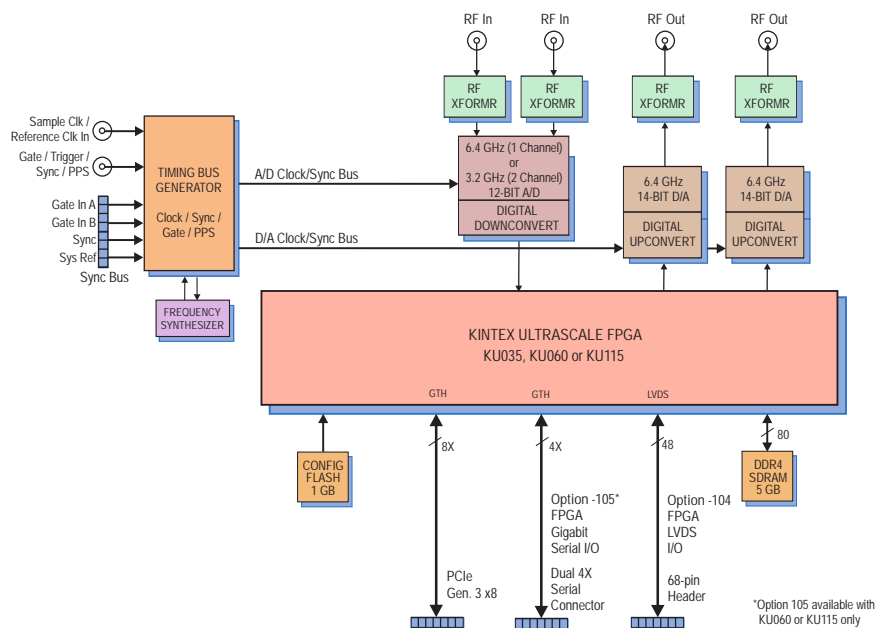

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 6.4 GHz, 12-bit A/D
- Two-channel mode with 3.2 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- Two 6.4 GHz, 14-bit D/As
- Programmable DUCs (Digital Upconverters)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O

**A/D Acquisition IP Module**

The 78141 features two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The Model 78141 factory installed functions include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the dual D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D’s built-in digital down-converters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real

or complex baseband input signals. It delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The 78141 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

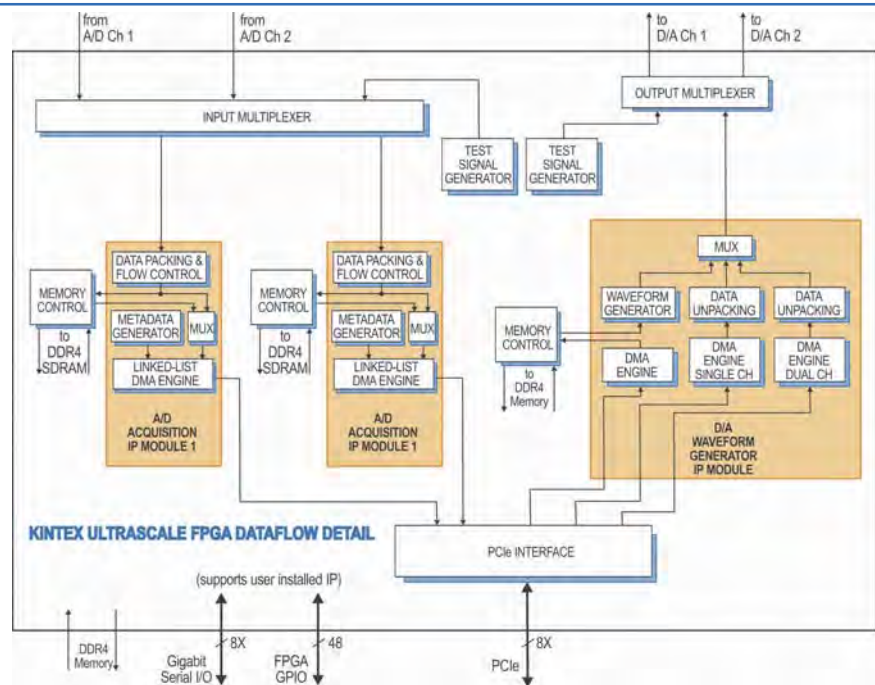

**PCI Express Interface**

The Model 78141 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

The 78141 accepts a sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. The Model 7892 high-speed sync board can be used to drive the sync bus to synchronize multichannel systems. ►

## Model 78141

# 1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - PCIe

### Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

#### A/D Converter

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode: 6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 7.9 GHz; dual-channel mode: 8.1 GHz

#### D/A Converters

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104:** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O

**Option -105 (only available with option -084 or -087):** provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** PCIe card 4.380 in x 7.130 in (111.25 mm x 181.10 mm)

### Ordering Information

Model	Description
78141	1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - PCIe

- 702	Air cooled, Level L2

Note: Not all combinations of sample rates, decimations and interpolations are available due to JESD204B and PCIe rate limitations.

New!

# Model 78821

## 3-Channel 200 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - x8 PCIe

### General Information

Model 78821 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78821 is a 3-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes three A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, three DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78821 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 78821 factory-installed functions include three A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: three powerful, programmable DDC IP cores; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 78821 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

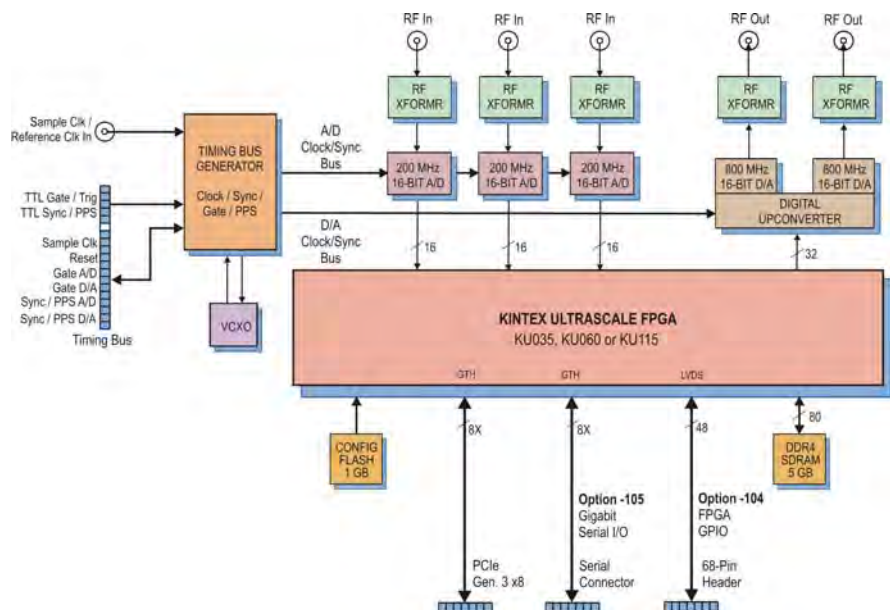

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized version available

**A/D Acquisition IP Modules**

The 78821 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 78821 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

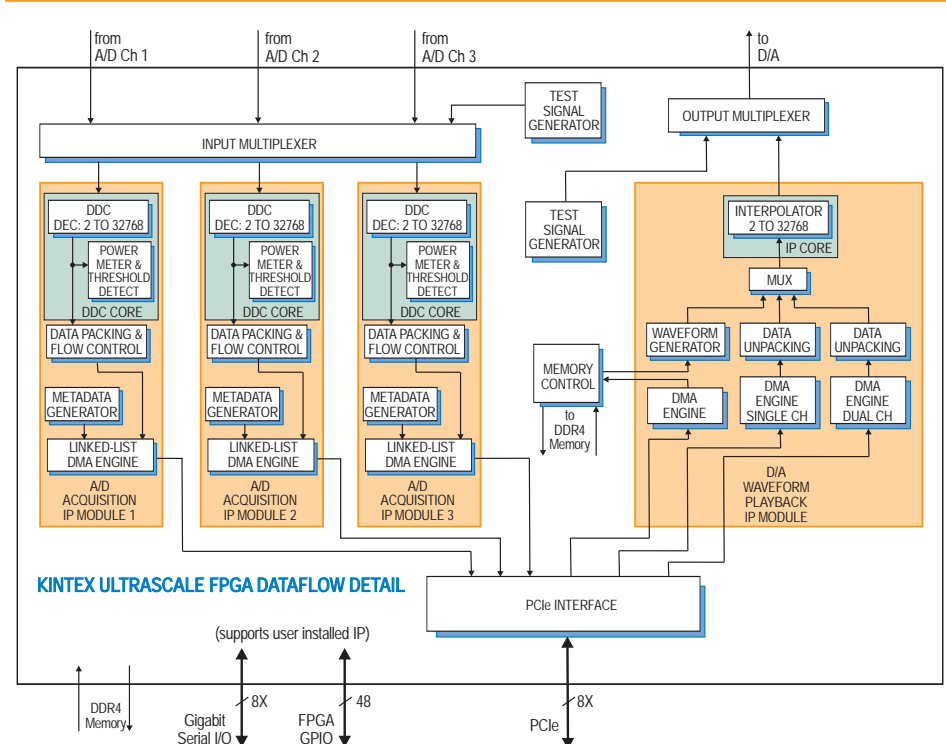

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78821's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78821 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 78821 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
78821	3-Channel 200 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - x8 PCIe

### Options:

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-105	Gigabit serial FPGA I/O
-702	Air cooled, Level L2

Contact Pentek for complete specifications of rugged versions

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Two channels

**Decimation Range:** 2x to 32,768x in

three stages of 2x to 32x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or

1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max.

with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

### Digital Interpolator Core

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** PCIe card 2.910 in x 5.870 in (74.00 mm x 149.00 mm)

New!

# Model 78841

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Kintex UltraScale FPGA - PCIe

## General Information

Model 78841 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78841 is a high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 78841 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78841 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 78841 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

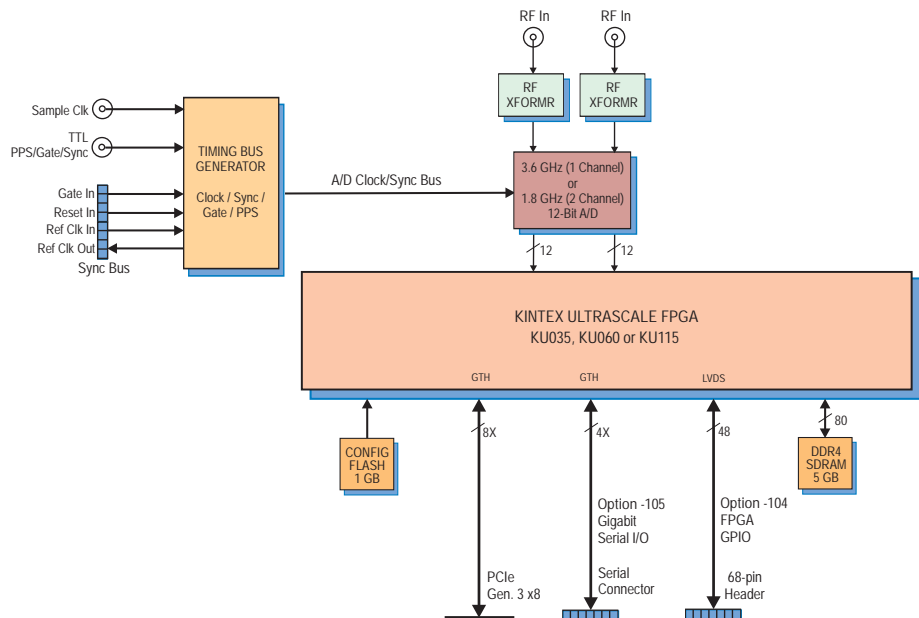

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, ➤

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 5 GB of DDR4 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O

**A/D Acquisition IP Module**

The 78841 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS signals from the FPGA to a 68-pin DIL ribbon-cable header on the PCIe board for custom I/O.

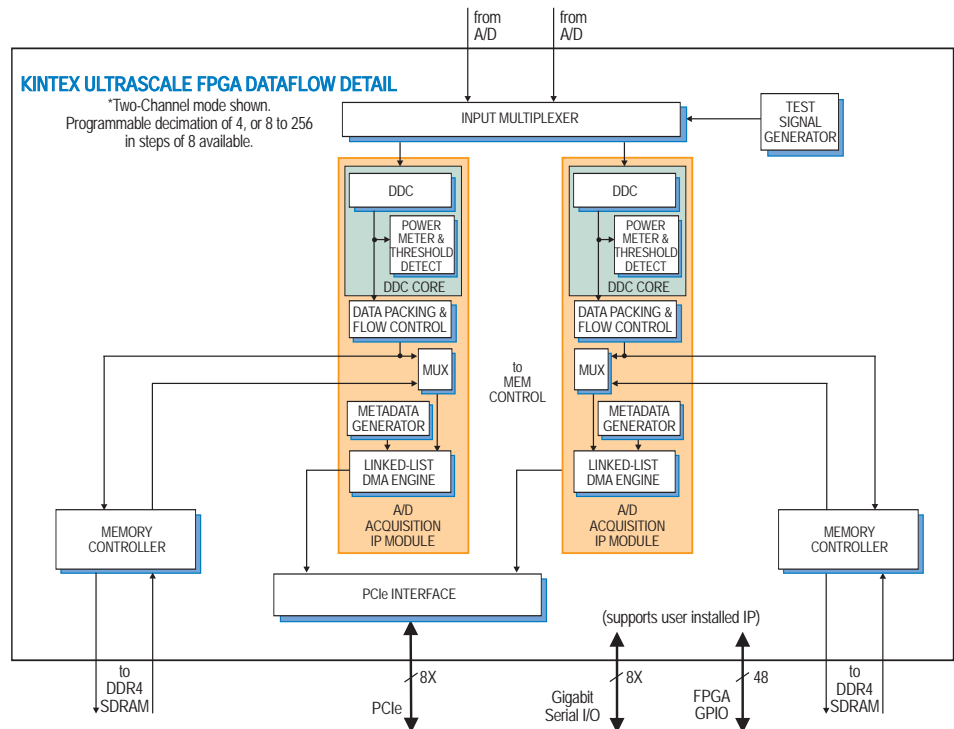

Option -105 connects one 8X gigabit serial link from the FPGA to an 8X gigabit serial connector along the top edge of the PCIe board.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other board resources. ►

## Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
78841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - x8 PCIe

### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O
- 105	Gigabit serial FPGA I/O
- 702	Air cooled, Level L2

## Memory Resources

The 78861 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

## PCI Express Interface

The Model 78841 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Clocking and Synchronization

The 78841 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 78841's can be synchronized with a simple cable. For larger systems, multiple 78841's can be synchronized using the Model 7192 high-speed sync module to drive the sync bus.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104:** Installs a connector with 24 LVDS pairs to the FPGA

**Option -105:** Installs a connector for one 8X gigabit serial link to the FPGA

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Half-length PCIe card, 4.38 in. x 7.13 in.

New!

# Model 78851

# 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - x8 PCIe

### General Information

Model 78851 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78851 is a 2-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes two A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78851 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 78851 factory-installed functions include two A/D acquisition and a waveform playback IP modules for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 78851 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

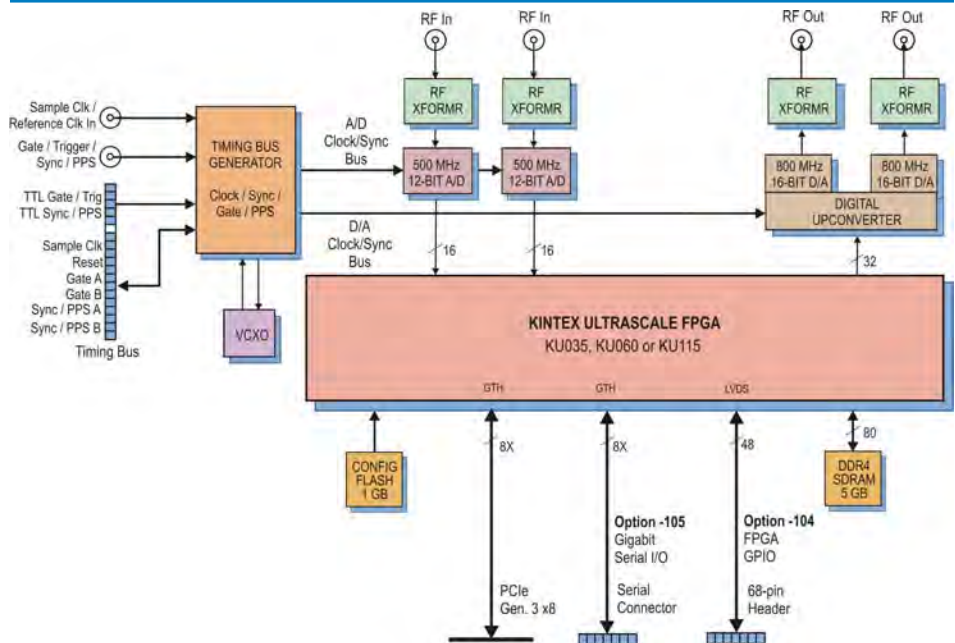

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- Ruggedized version available

**A/D Acquisition IP Modules**

The 78851 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 78851 factory-installed functions include a sophisticated D/A Waveform Playback IP module. It allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

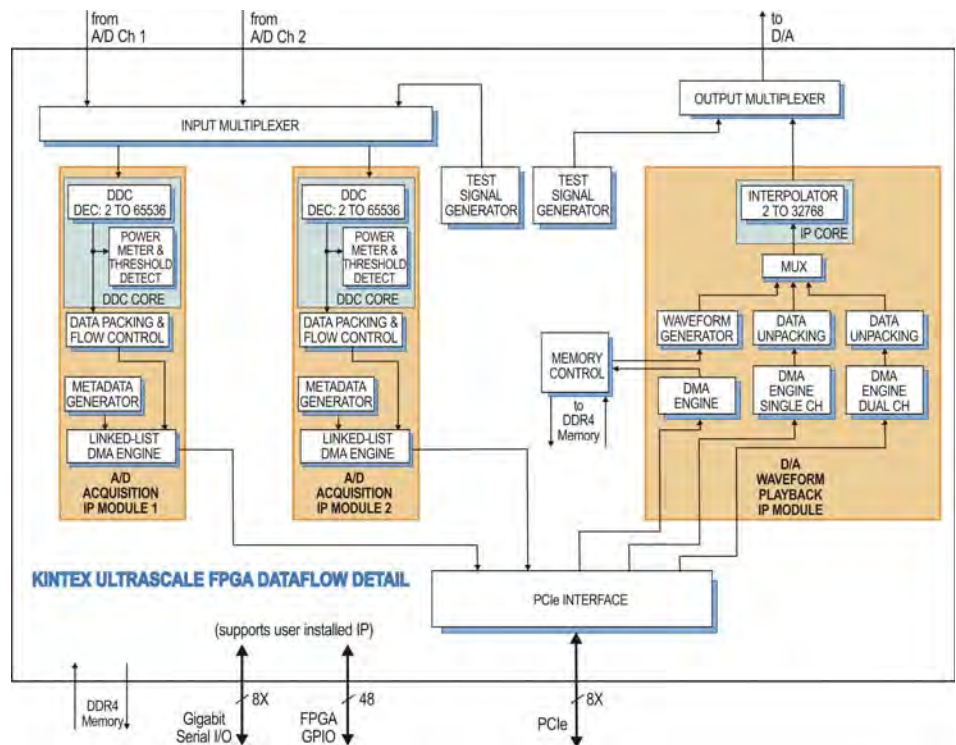

Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alter-

nate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 78851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 78851 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 78851 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount ([Model 8266](#)), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
71851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - x8 PCIe

### Options:

-014	400 MHz, 14-bit A/Ds
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-105	Gigabit serial FPGA I/O
-702	Air cooled, Level L2

Contact Pentek for complete specifications of rugged version

## ► Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

### Digital Downconverters

**Quantity:** Two channels

**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

### Digital Interpolator Core

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

### Total Interpolation Range (D/A and interpolator core combined): 2x to 262,144x

### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

**Option -104** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** PCIe card 4.380 in x 7.130 in (111.25 mm x 181.10 mm)

New!

# Model 78861

# 4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - x8 PCIe

### General Information

Model 78861 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78861 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78861 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78861 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

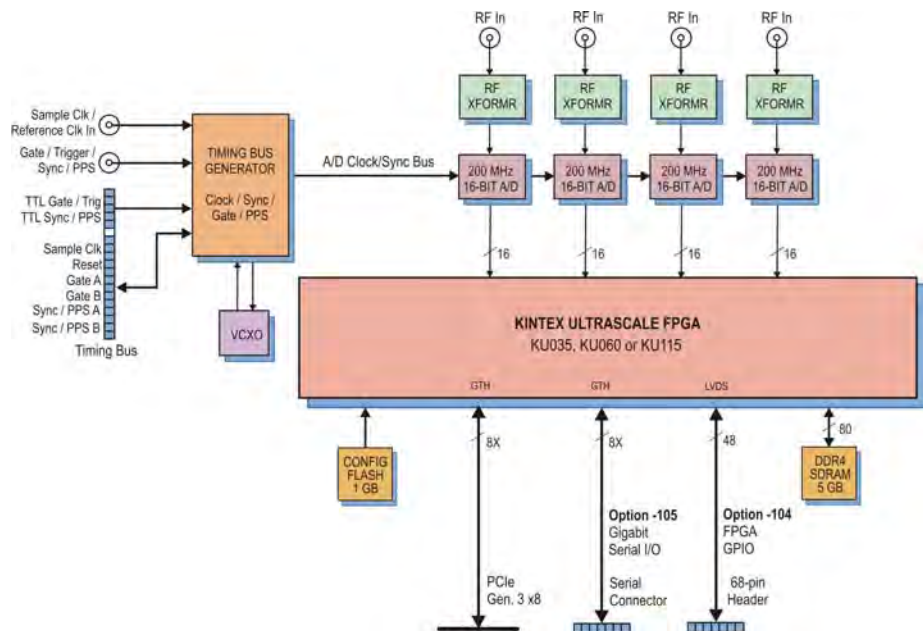

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 78861 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized version available

**A/D Acquisition IP Modules**

The 78861 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**► Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

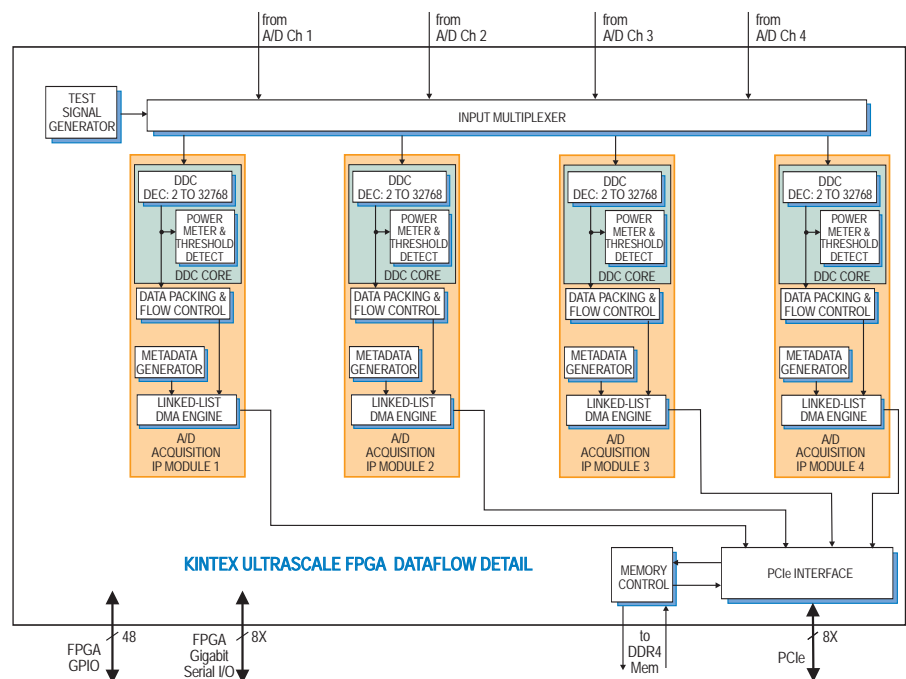

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 78861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

### SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount ([Model 8266](#)), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### Ordering Information

78861	4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - x8 PCIe

#### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through 68-pin ribbon cable connector
- 105	Gigabit serial FPGA I/O through serial connector
- 702	Air cooled, Level L2

### ► PCI Express Interface

The Model 78861 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104:** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

**Option -105:** provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** PCIe card, 4.380 in x 7.130 in (111.25 mm x 181.10 mm)

New!

# Model 78862

# 4-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - PCIe

## General Information

Model 78862 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 78862 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78862 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 78862 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

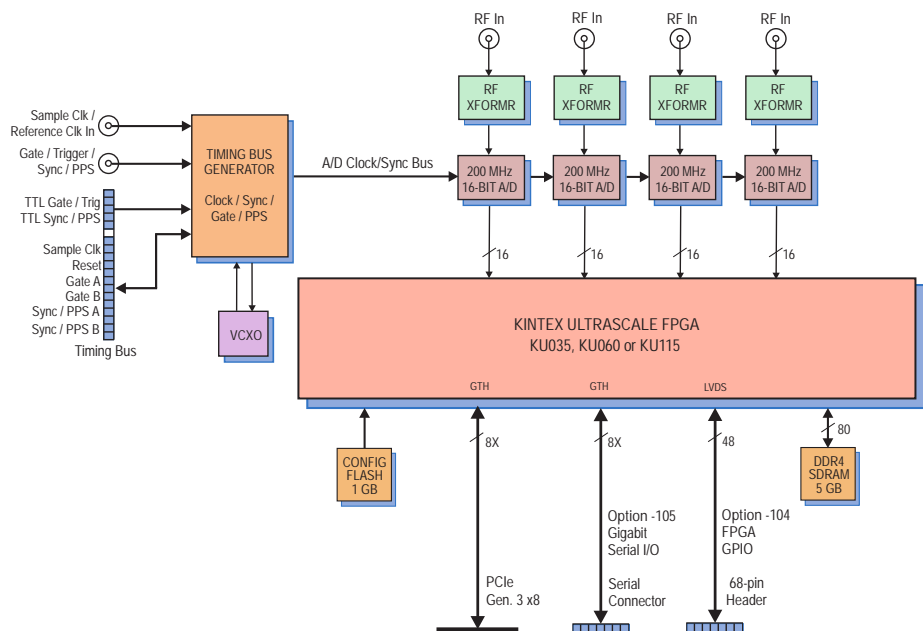

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 78862 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ▶

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four wideband DDCs and
- 32 multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized version available

**A/D Acquisition IP Modules**

The 78862 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Kintex

UltraScale FPGA for signal-processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

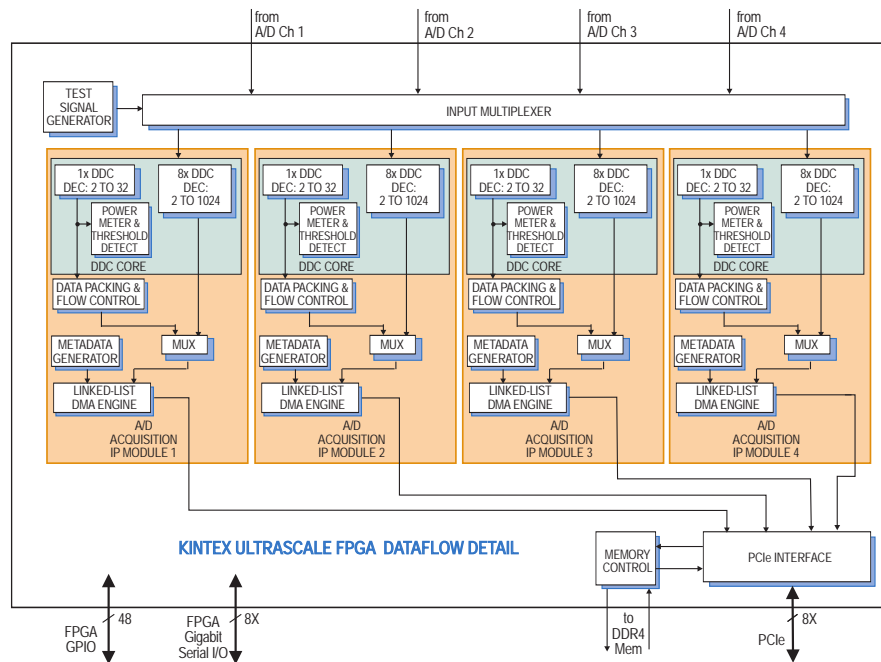

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 78862 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount ([Model 8266](#)), a 3U VPX chassis ([Model 8267](#)) or a 6U VPX chassis ([Model 8264](#)), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

## Ordering Information

Model	Description
78862	4-Channel 200 MHz A/D with multiband DDCs and Kintex UltraScale FPGA - x8 PCIe

### Options:

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O through 68-pin ribbon cable connector
- 105	Gigabit serial FPGA I/O through serial connector
- 702	Air cooled, Level L2

## ► PCI Express Interface

The Model 78862 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Wideband Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

### Multiband Digital Downconverters

**Quantity:** Four banks, 8 channels per bank  
**Decimation Range:** 2x to 1024x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

## Custom I/O

**Option -104:** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

**Option -105:** provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

## Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

## PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** PCIe card, 4.380 in x 7.130 in (111.25 mm x 181.10 mm) ►

New!

### General Information

Model 78800 is a member of the Jade™ family of high-performance PCIe boards. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 78800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 78800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.

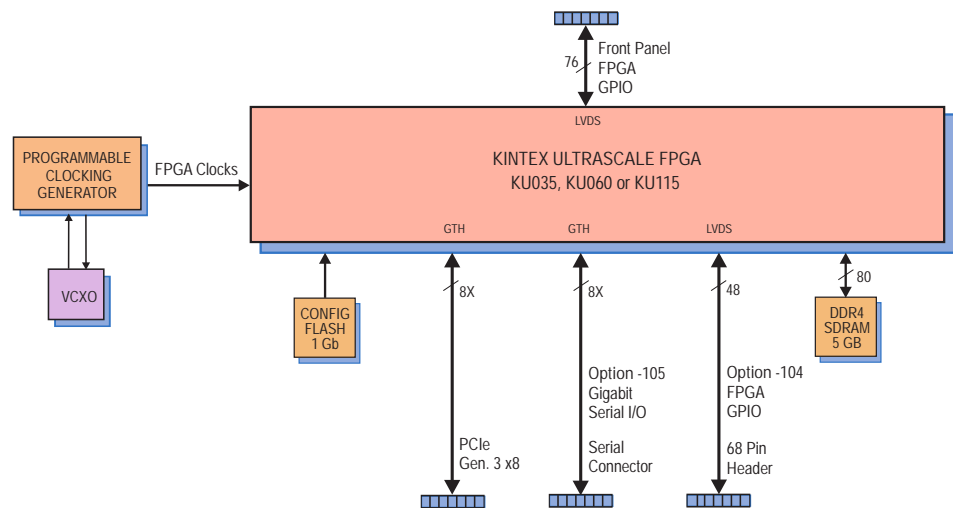

Option -105 provides an 8X gigabit link between the FPGA and a serial connector to support serial protocols.

### Front Panel Digital I/O Interface

The 78800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path. ➤

### Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- VITA 42.0 XMC compatible with switched fabric interfaces
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

New!

# Model 78800

# Kintex UltraScale FPGA Coprocessor- x8 PCIe

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

### ► PCI Express Interface

The Model 78800 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Memory Resources

The 78800 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### Specifications

#### Front Panel Digital I/O

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 pairs
- Signal Type:** LVDS

#### Field Programmable Gate Array

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

- Option -104** installs 24 pairs of LVDS connections from the FPGA to a 68-pin header for custom I/O.
- Option -105** provides an 8X gigabit link between the FPGA and a serial connector to support serial protocols.

### Memory

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

- Standard: L0 (air cooled)**
    - Operating Temp:** 0° to 50° C
    - Storage Temp:** -20° to 90° C
    - Relative Humidity:** 0 to 95%, non-condensing
  - Option -702: L2 (air cooled)**
    - Operating Temp:** -20° to 65° C
    - Storage Temp:** -40° to 100° C
    - Relative Humidity:** 0 to 95%, non-condensing
- Size:** PCIe card 4.375 in x 8.125 in (111.13 mm x 206.38 mm)

Kintex UltraScale FPGA Resources

## Ordering Information

Model	Description
78800	Kintex UltraScale FPGA Coprocessor - x8 PCIe

### Options:

- 084 XCKU060-2 FPGA
- 087 XCKU115-2 FPGA
- 104 LVDS FPGA I/O
- 105 Gigabit serial FPGA I/O
- 702 Air cooled, Level L2

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Features**

- Accepts RF signals from 400 MHz to 4000 MHz
- Accepts RF input levels from -60 dBm to -20 dBm
- Baseband IF output with up to 390 MHz bandwidth
- Internal OCXO or external 10 MHz frequency reference

**General Information**

The Bandit® Model 7820 is a two-channel, high-performance, stand-alone analog RF wideband downconverter. Packaged in a small, shielded PCIe board with front-panel connectors for easy integration into RF systems, the board offers programmable gain, high dynamic range and a low noise figure. With an input frequency range from 400 to 4000 MHz and a wide IF bandwidth of up to 390 MHz, the 7820 is an ideal solution for amplifying and downconverting antenna signals for communications, radar and signal intelligence systems.

**Programmable Input Level**

The 7820 accepts RF signals on two front-panel SSMC connectors. LNAs (Low Noise Amplifiers) are provided, along with two programmable attenuators allowing downconversion of input signals ranging from -60 dBm to -20 dBm in steps of 0.5 dB. Higher level signals can be attenuated prior to input.

**Input Filter Options**

An optional five-stage lowpass or bandpass input filter can be included with several available frequency and attenuation characteristics for RF image rejection and harmonic suppression.

**Quadrature Mixers**

The 7820 features a pair of Analog Devices ADL5380 quadrature mixers. The ADL5380's are capable of excellent accuracy

with amplitude and phase balances of ~0.07 dB and ~0.2°, respectively.

**Tuning Accuracy**

The 7820 uses an Analog Devices ADF4351 low-noise, on-board frequency synthesizer as the LO (Local Oscillator). Locked to an external input reference for accuracy with a fractional-N phase-locked loop, its frequency is programmable across the 400 to the 4000 MHz band with a tuning resolution of better than 100 kHz.

**On-board Reference Clock**

In addition to accepting a 10 MHz reference signal on the front panel, the 7820 includes an on-board 10 MHz crystal oscillator which can be used as the reference to lock the internal LO frequency synthesizer.

This reference is an OCXO (Oven Controlled Crystal Oscillator), which provides an exceptionally precise frequency standard with excellent phase noise characteristics.

**Wideband Output**

Output is provided as baseband I and Q signals at bandwidths up to 390 MHz. Alternatively, either I or Q output can be used at some intermediate offset frequency convenient to the application. User-provided in-line output IF filters allow customizing the output bandwidth and offset frequency to the specific application requirements. This output is suitable for A/D conversion using Pentek high-performance signal acquisition products, such as those in the Cobalt and Onyx families. ➤

### ► Specifications

#### RF Input

Connector Type: SSMC

Input Impedance: 50 ohms

Input Level Range: -60 dBm to -20 dBm

Flatness:  $\pm 2$  dB from 400 MHz to 1 GHz,  
 $\pm 3$  dB from 1 GHz to 3 GHz,  $\pm 5$  dB from  
3 GHz to 4 GHz

RF Attenuator: Programmable from 0 to  
63 dB in 0.5 dB steps

#### LO Synthesizer Tuning

Frequency range: 400-4000 MHz,

Resolution: < 10 kHz

Tuning Speed: < 500  $\mu$ sec

Phase-Locked Loop Bandwidth: 100 kHz

#### Phase Noise

1 kHz: -90 dBc/Hz

100 kHz: -110 dBc/Hz

1 MHz: -130 dBc/Hz

#### Noise Figure (referred to input)

60 dB gain: 2.6 dB

#### Inband Output IP3

20 dB gain: +10 dBm

60 dB gain: +42 dBm

#### Reference Input/Output

Connector Type: SSMC

Input/Output Impedance: 50 ohms

#### Reference Input Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

#### Reference Output Signal

Frequency: 10 MHz

Level: 0 dBm, sine wave

#### OCXO Reference

Center Frequency: 10 MHz

Frequency Stability vs. Change in

Temperature:  $\pm 50.0$  ppb

Frequency Calibration:  $\pm 1.0$  ppm

#### Aging

Daily:  $\pm 10$  ppb/day

First Year:  $\pm 300$  ppb

#### Total Frequency Tolerance

(20 years):  $\pm 4.60$  ppm

#### Phase Noise

1 Hz Offset: -67 dBc/Hz

10 Hz Offset: -100 dBc/Hz

100 Hz Offset: -130 dBc/Hz

1 KHz Offset: -148 dBc/Hz

10 KHz Offset: -154 dBc/Hz

100 KHz Offset: -155 dBc/Hz

#### IF Output

Connector Type: SSMC

Output Impedance: 50 ohms

Center Frequency: User definable

Output Level: 0 dBm, nominal

#### Programming

Functions: RF Atten, IF Atten, Int/Ext

Reference Select, LO Synthesizer Frequency

Interface: USB

Connector Type: MicroUSB

#### Power

Voltage: +12 VDC

Current: 1.5 A

#### PCI-Express Interface

PCI Express Bus: x4 or x8, power only

#### Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: Half length PCIe card, 4.38 in. x 7.13 in.

### Ordering Information

Model	Description
7820	Bandit Two-Channel Analog RF Wideband Downconverter - PCIe

Option	Description
-015	Oven Controlled Reference Oscillator
-145	1.45 GHz lowpass input filter
-280	2.80 GHz lowpass input filter

## Features

- 4U 19-inch rackmount PC server chassis, 21-inch deep
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box test examples

## Ordering Information

Model	Description
8266	PC Development System for PCIe Cobalt, Onyx and Flexor Boards

### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS

The addition of third-party PCIe cards may affect system performance. Please consult with us before doing so.

## General Information

The Model 8266 is a fully-integrated PC development system for Pentek Cobalt®, Onyx® and Flexor™ PCI Express software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8266 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

## ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8266. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

## System Implementation

Built on a professional 4U rackmount workstation, the 8266 is equipped with the latest Intel processor, DDR3 SDRAM and a high-performance motherboard. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces.

The 8266 can be configured with 64-bit Windows or Linux operating systems.

The 8266 uses a 19" 4U rackmount chassis that is 21" deep. Enhanced forced-air ventilation assures adequate cooling for Pentek Cobalt, Onyx and Flexor boards.

The chassis is designed to draw cool air from the front and push warm air out the back. A 1000 W, 80+ Gold Power Supply guarantees more than enough power for additional boards.

## Configuration

Pentek uses a variety of motherboards to provide the flexibility for operation and cooling of each system. Up to four Pentek Cobalt, Onyx or Flexor boards in the 8266 can be supported. Please contact Pentek to configure a system that requires additional PCIe slots for 3rd party hardware.

## Options

Available options include high-end multi-core CPUs and choice of Windows or Linux.

## Specifications

**Operating System:** 64-bit Windows 7 Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB standard

**Dimensions:** 4U Chassis, 19" W x 21" D x 7" H

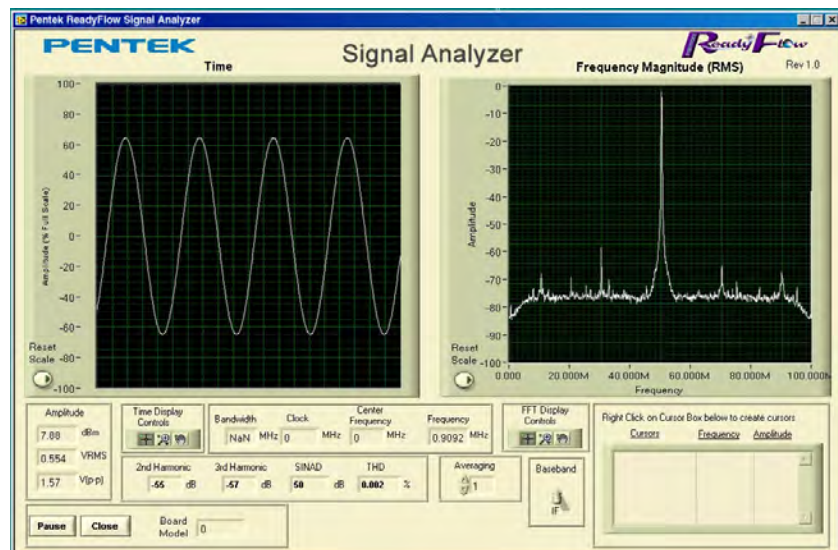

**Weight:** 35 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

# Model 53800

# Kintex UltraScale FPGA Coprocessor- 3U VPX

Model 5380 COTS (left) and rugged version

## General Information

Model 53800 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 53800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 connects an 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

## Front Panel Digital I/O Interface

The 53800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path.

## Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

New!

# Model 53800

# Kintex UltraScale FPGA Coprocessor- 3U VPX

## Interfaces and Memory

The Model 53800 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

The 53800 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

## Crossbar Switch

The 53800 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable input equalization and output pre-emphasis settings enable optimization.

## SPARK Development Systems

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267), or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system.

## Specifications

### Front Panel Digital I/O

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 pairs
- Signal Type:** LVDS

### Field Programmable Gate Array

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

- Option -104** connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.
- Option -105** connects an 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

### Memory

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

- PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

- Standard:** L0 (air cooled)
- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C

### Option -702: L2 (air cooled)

- Operating Temp:** -20° to 65° C
- Storage Temp:** -40° to 100° C

### Option -713: L3 (conduction cooled)

- Operating Temp:** -40° to 70° C
- Storage Temp:** -50° to 100° C

**Relative Humidity in all options:** 0 to 95%, non-condensing

**Size:** 3U VPX card 3.937 in x 6.717 in (100.00 mm x 149.00 mm)

## VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	24 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

	XCKU035	XCKU060	XCKU115

Block RAM (Mb)	19.0	38.0	75.9

**General Information**

Model 5308 is a front panel PCI Express adapter for 3U VPX systems. It provides a convenient interface from a 3U VPX system to an external host computer, to simplify development.

The 5308 features built-in support for PCI Express (PCIe) Gen. 2 over the 3U VPX backplane. A unique fabric-transparent crossbar switch configuration allows selection of the desired VPX-P1 port.

**Front Panel Connection**

The 5308 provides a front panel interface to the 3U VPX system for connection to a host computer. It supports x4 or x8 PCIe protocol in compliance with PCI-SIG PCI Express® External Cabling 1.0 Specification. It can also be used to connect to an additional VPX system when ordered with Cascade Mode (option -002).

Model 5308 contains built-in PCI Express ReDriver™ circuitry. This circuitry provides signal conditioning that allows the user to correct for signal loss or data errors due to cable length.

**PC Connection**

The most common use for Model 5308 is for connection to an external host computer. In order to make this connection, the PC requires a PCIe host adapter which is also compliant to PCI-SIG PCI Express External Cabling 1.0 Specification. Adapters supporting either PCIe x8 Gen. 1 or Gen. 2 are available from Pentek under Model 4235.

**Fabric-Transparent Crossbar Switch**

Two ports from the front panel PCI Express connector are attached to a Fabric-Transparent Crossbar switch. This switch bridges numerous interfaces on the board using gigabit serial data paths with no latency. This allows the user to select the desired port on VPX-P1.

Data paths can be selected as single (x1) lanes, or groups of four lanes (x4). Programmable signal input equalization and output pre-emphasis settings enable optimization. A USB interface is provided for switch programming, and 4 MB onboard FLASH memory allows storage of up to 16 user configurations. Several useful configurations are pre-installed at the factory.

**PCI Express Switch**

The 5308 includes a multiport PCIe Gen. 2 switch. The switch provides a total of 24 PCIe lanes to the fabric-transparent crossbar switch. Dynamic lane width negotiation within the PCIe switch allows for x1, x4, x8 or x16 widths. These can be selected in any combination.

Data to or from the panel cable can be selected as x4 or x8 width. Both PCIe Gen. 1 and Gen. 2 are supported.

**3U VPX Interface**

The 5308 provides full-duplex links to the VPX P1 connector, each capable of peak rates up to 1 gigabyte per sec. Four sets of x4 links support PCI Express.

**Features**

- Front Panel x8 PCI Express connection to host PC
- 3U VPX form factor provides a compact, rugged platform
- Cascade mode provides connection to an additional VPX system
- Compatible with several VITA standards including:  
*VITA-46 (VPX Baseline Standard)*  
*VITA-48 (VPX REDI)*  
*VITA-65 (OpenVPX™ System Specification)*
- Ruggedized and conduction-cooled versions available

**Ordering Information**

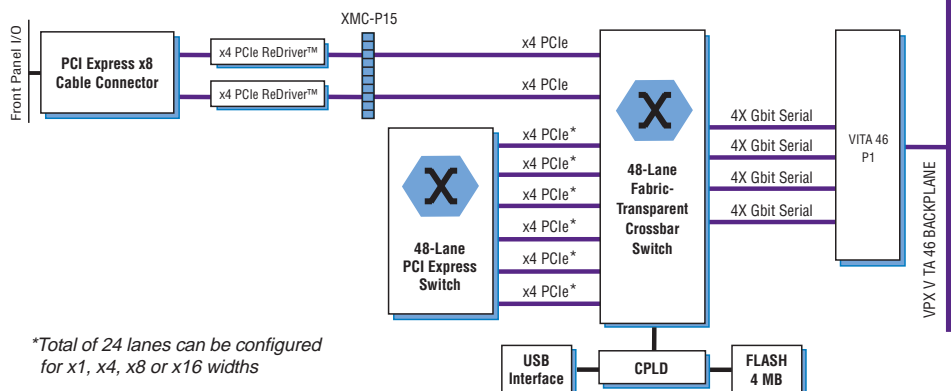

Model	Description
5308	Front Panel x8 PCI Express Adapter - 3U VPX

**Options:**

- 001 Host Adapter Mode (for connection to external host computer)
- 002 Cascade Mode (for connection to additional VPX system)
- 703 Level L3 Conduction-Cooled Version

**Accessories:**

Model	Description
4235	PCI Express x8 Host Card for PC
2180	PCI Express x8 Cable

Model 53620 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53620 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53620 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53620 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules, ideally matched to the board's analog interfaces. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator,

and a PCIe interface complete the factory-installed functions and enable the 53620 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

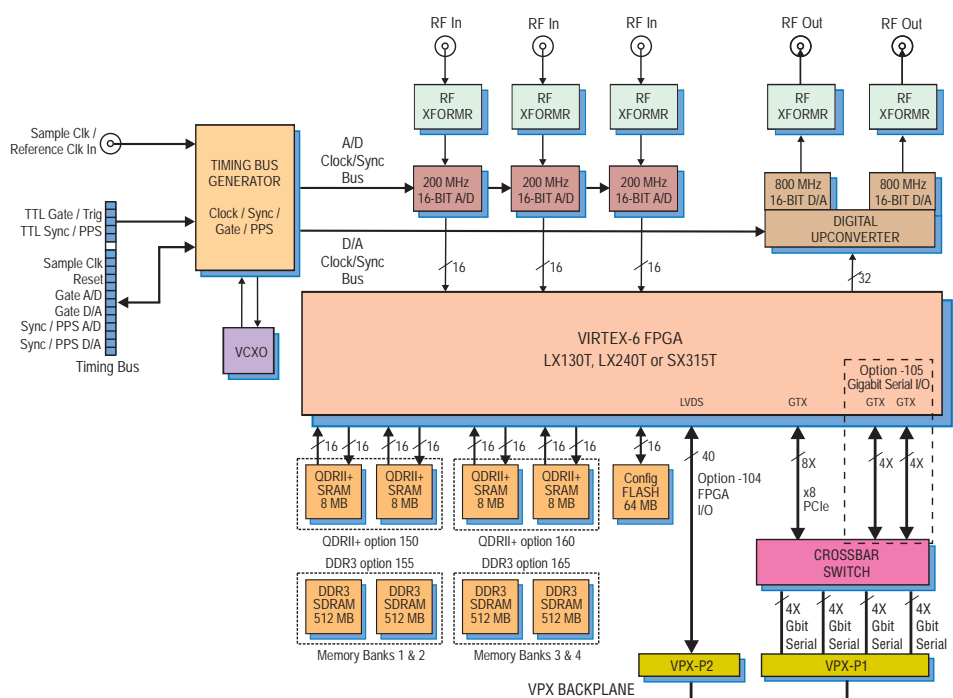

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53620 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 53620 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

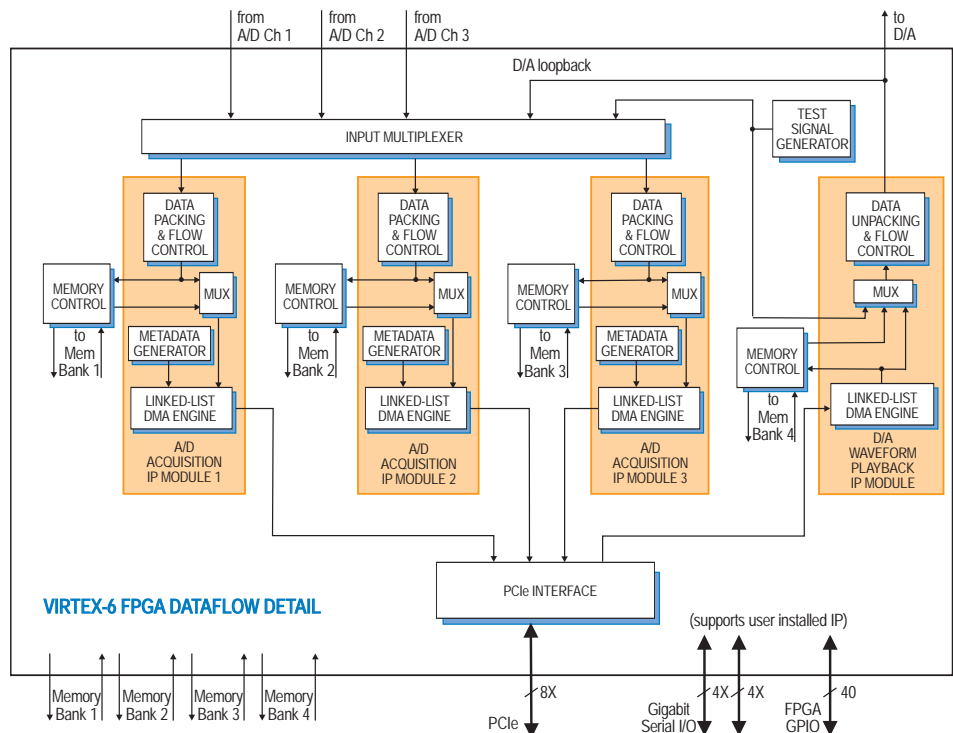

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53620's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 53620 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

**PCI Express Interface**

The Model 53620 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description

► board’s DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Fabric-Transparent Crossbar Switch**

The 53620 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6V SX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Option 150 or 160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 x4 or x8; Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53621 COTS (left) and rugged version

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Optional LVPECL clock/sync bus for multiboard synchronization
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 53621 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53621 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

## The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53621 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53621 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

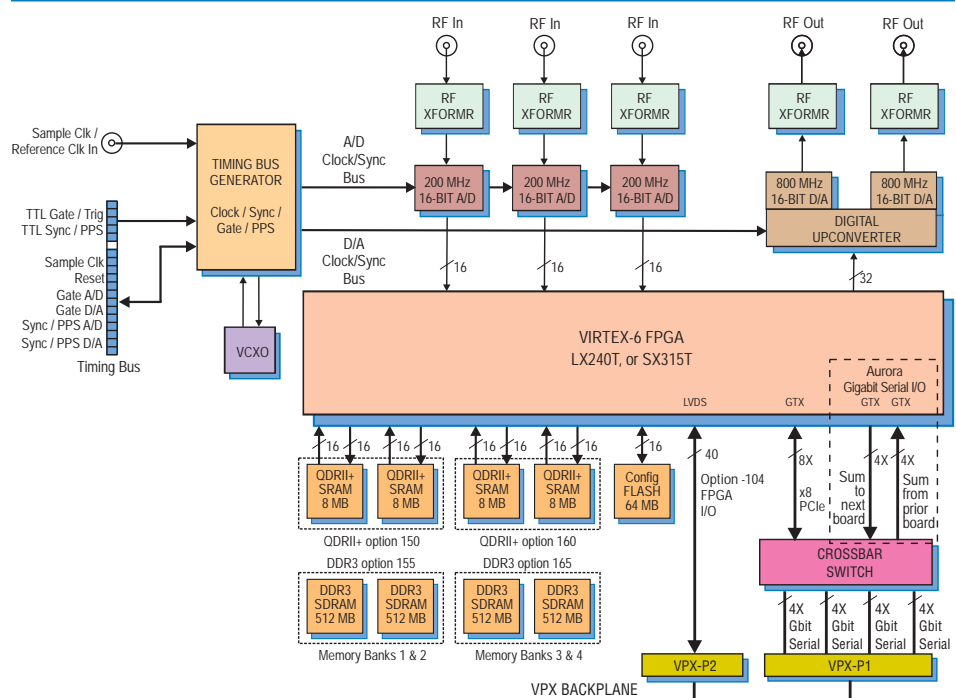

## Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

**A/D Acquisition IP Modules**

The 53621 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency

setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53621 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

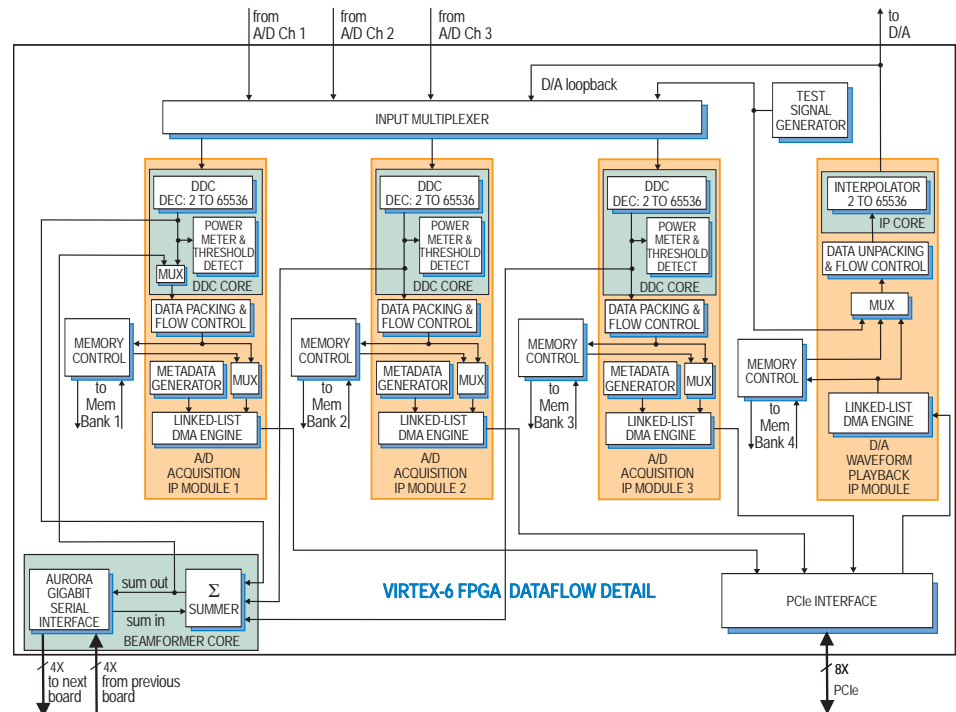

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53621's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 53621 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53621's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53621 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 53621 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Fabric-Transparent Crossbar Switch

The 53621 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformer**

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VXSX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8;  
 Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53624

# Dual-Channel, 34-Signal Adaptive IF Relay - 3U OpenVPX

Model 53624 COTS (left) and rugged version

### Features

- Modifies 34 IF signals between input and output
- Up to 80 MHz IF bandwidth
- Two 200 MHz 16-bit A/Ds
- Two 800 MHz 16-bit D/As
- 34 DDCs and 34 DUCs (digital downconverters and digital upconverters)
- Signal drop/add/replace
- Frequency shifting and hopping
- Amplitude boost and attenuation
- PCI Express Gen. 1: x4 or x8

### General Information

Model 53624 is a member of the Cobalt® family of high-performance 3U OpenVPX boards based on the Xilinx Virtex-6 FPGA. As an IF relay, it accepts two IF analog input channels, modifies up to 34 signals, and then delivers them to two analog IF outputs. Any signal within each IF band can be independently enabled or disabled, and changed in both frequency and amplitude as it passes through the module.

The 53624 supports many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation. Applications include countermeasures, active tracking and monitoring, channel security, interception, adaptive spectral management, jamming, and encryption.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCIe Gen. 1 system interface supports control, status and data transfers.

### Adaptive Relay Input Overview

The Model 53624 digitizes two analog IF inputs using two 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency. An array of 34 DDCs (digital downconverters) can be independently

programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz. Each DDC can independently source IF data from either of the two A/Ds.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCIe system interface to target memory, typically associated with a system processor. Here, the signals can be analyzed, classified, demodulated, decrypted or decoded, depending on the application.

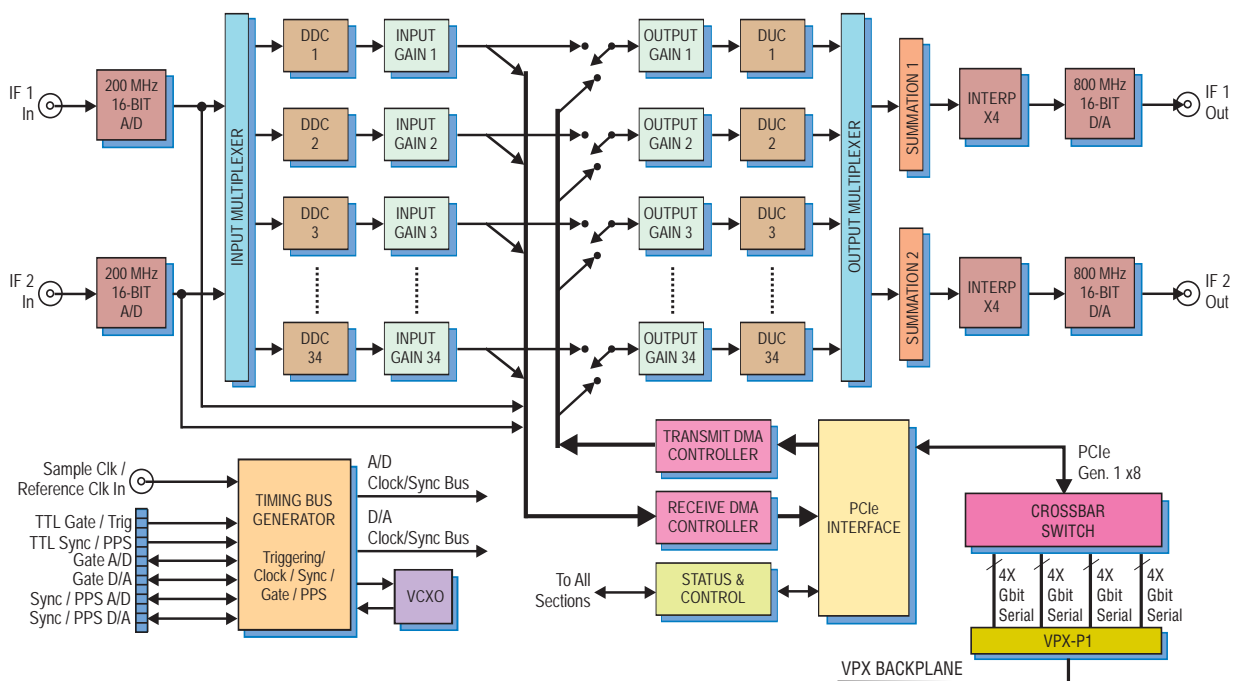

Samples from each A/D converter can also be delivered across PCIe to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

### Adaptive Relay Output Overview

The Model 53624 output stage consists of 34 DUCs (digital upconverters) and two 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stage. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two summation blocks, ►

► each associated with one of the two D/A converters using a final interpolation factor of x4. After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the Model 53624 adaptive relay. Because of the complexity and proprietary nature of these functions, the FPGA cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8*f_s/N$ , where N is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s/N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in

gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controller

Two output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2.

When a target memory buffer is filled, the 53624 issues an interrupt to the system processor and then begins filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, the 53624 signals the processor with an interrupt and moves to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz. ►

➤ A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts two summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two transformer-coupled analog IF outputs are delivered through a pair of front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz

reference clock to phase-lock the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53624's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### PCI Express Interface

The Model 53624 includes an industry-standard interface fully compliant with PCIe Gen. 1 x8 bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the board.

### Fabric-Transparent Crossbar Switch

The 53624 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Quantity:** Two

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

► **Digital Downconverters**

**Quantity:** 34  
**Decimation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >100 dB  
**Phase Offset:** 1 bit, 0 or 180 degrees  
**FIR Filter:** 18-bit coefficients  
**Output:** Complex, 16-bit I + 16-bit Q  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Input Gain Blocks**

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

**Output Gain Blocks**

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

**Digital Upconverters**

**Quantity:** 34  
**Interpolation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**FIR Filter:** 18-bit coefficients, 16-bit output  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Analog Output Channels:** 2  
**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 200 MHz max.  
**Output Signal:** Real  
**Output Sampling Rate:** 800 MHz max. with 4x interpolation  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Required:** Xilinx Virtex-6 XC6V5X315T

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8;

**Environmental Standard:**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Option 702 L2 Extended Temp (air-cooled):**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Option 712 L2 Extended Temp (conduction-cooled):**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Standard 3U VPX board, 100 x 160 mm (3.937 x 6.299 in.)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53630 COTS (left) and rugged version

## Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual- $\mu$ Sync clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 53630 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes 1 GHz A/D and D/A converters and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

## The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53630 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the

factory-installed functions and enable the 53630 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

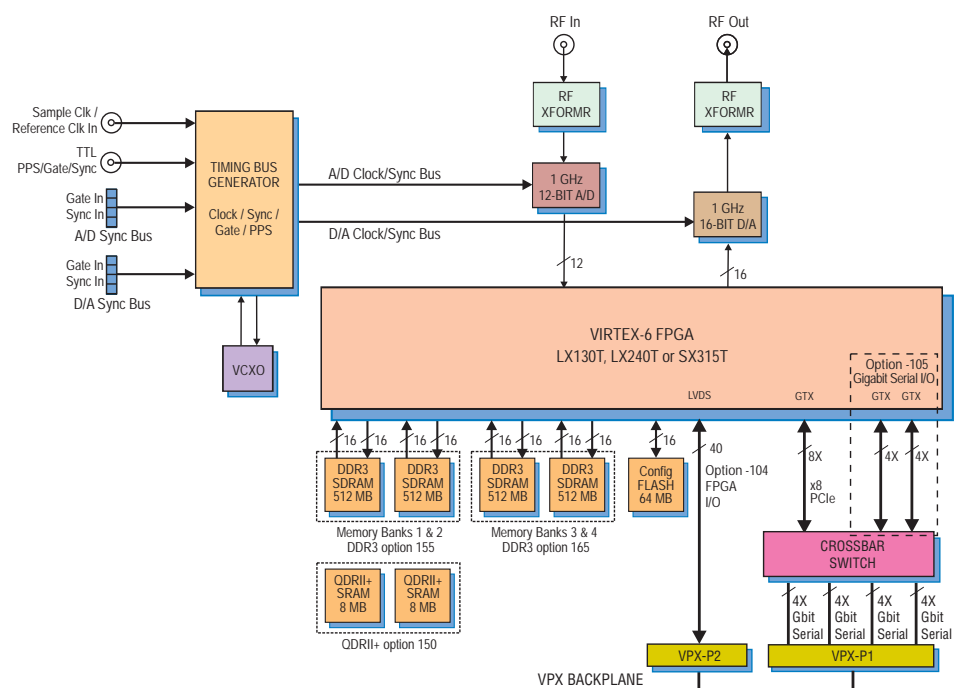

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 53630 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 53630 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 53630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

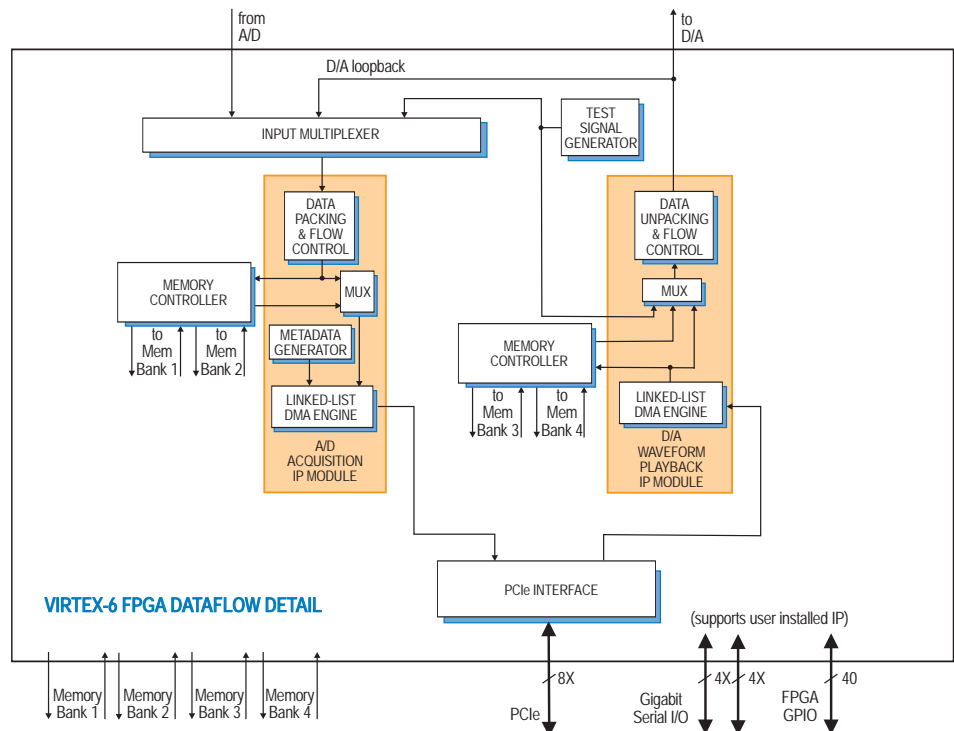

A pair of front panel μSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 5392 and Model 9192 Cobalt Synchronizers can drive multiple 53630 μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 53630 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock  
**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz  
**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen.1: x4 or x8; Gen 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53640 COTS (left) and rugged version

### General Information

Model 53640 is a member of the Cobalt® family of high-performance XMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The 53640 includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53640 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-

installed functions and enable the 53640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

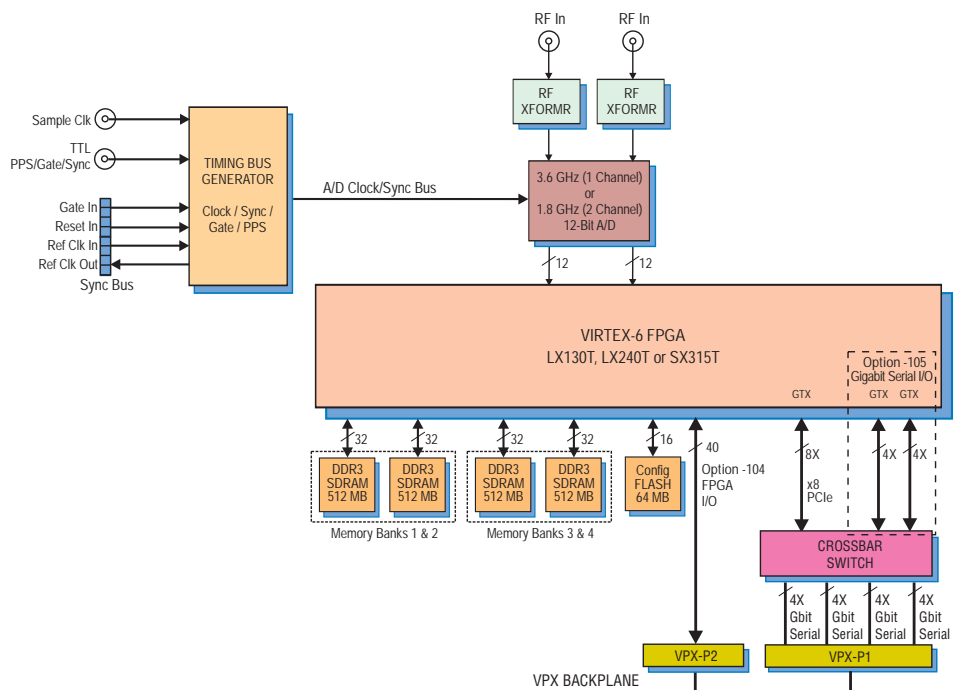

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides dual 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

► **A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 53640 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

The 53640 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 53640's can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

**Memory Resources**

The 53640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**PCI Express Interface**

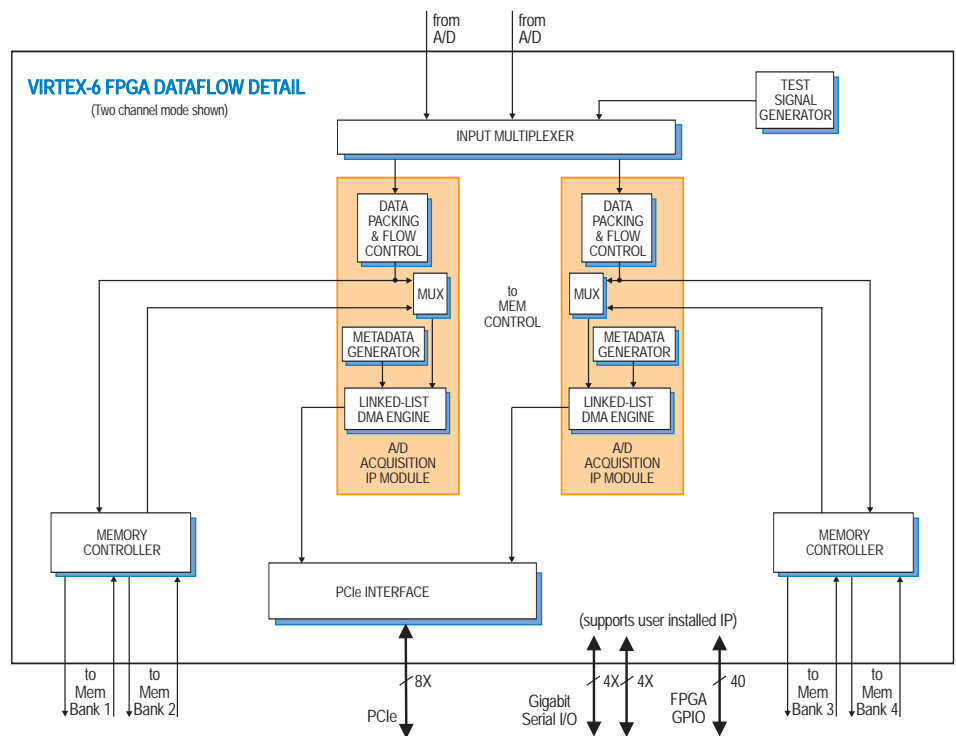

The Model 53640 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links of x4 or x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**A/D Acquisition IP Module**

The 53640 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53640	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► **Fabric-Transparent Crossbar Switch**

The 53640 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency.

Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multi-pin connectors, bus includes gate, reset and in and out reference clock

**External Trigger Input**

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53641 COTS (left) and rugged version

**General Information**

Model 53641 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

The 53641 includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 53641 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a controller for all data clocking and synchro-

nization functions, a test signal generator and a PCI interface complete the factory-installed functions and enable the 53641 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

For applications that require additional control and status signals, option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**A/D Converter Stage**

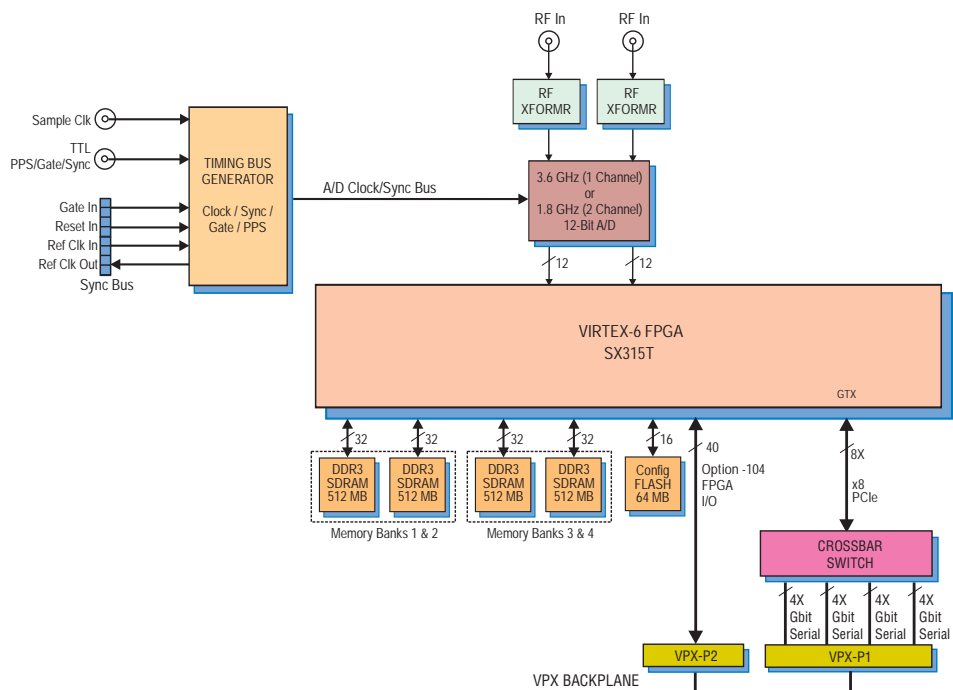

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 53641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources. ➤

**Features**

- Ideal radar and software radio interface solution
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Programmable one- or two-channel DDC (Digital Downconverter)
- PCI Express (Gen. 1 & 2) interface, up to x8
- Sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**A/D Acquisition IP Module**

The 53641 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

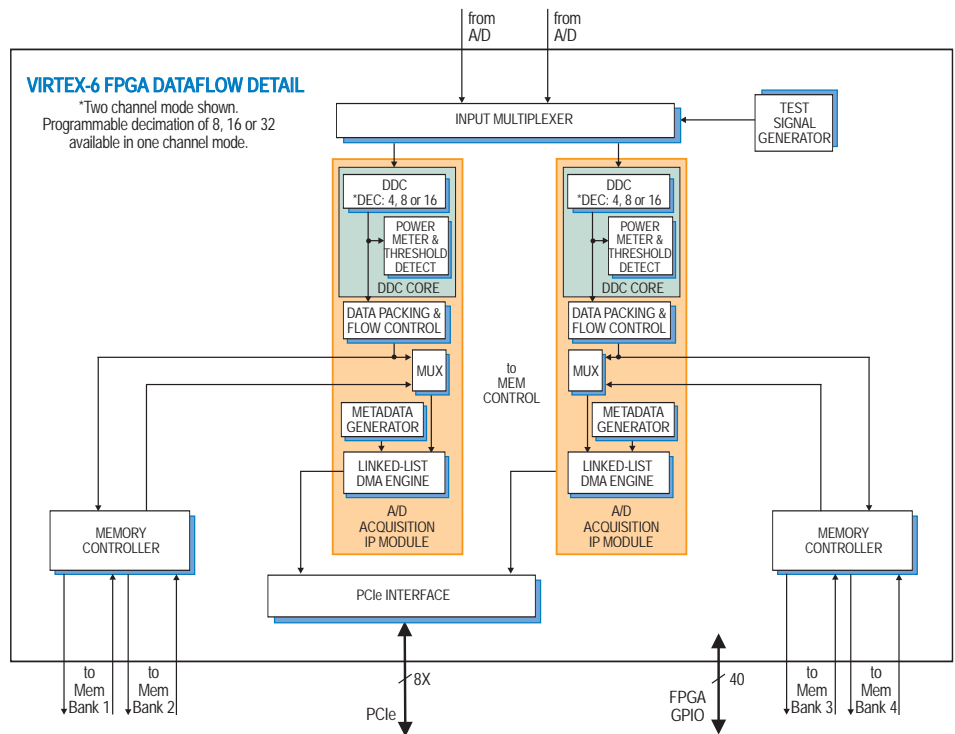

**Clocking and Synchronization**

The 53641 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple boards to be synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 53641's can be synchronized using the Cobalt high-speed sync board to drive the sync bus.

**Memory Resources**

The 53641 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description

Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53650 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Two 500 MHz 12-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53650 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A two-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53650 includes two A/Ds, one DUC (digital upconverter), two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53650 factory-installed functions include two A/D acquisition and one D/A waveform playback IP modules. In addition, IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete

the factory-installed functions and enable the 53650 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

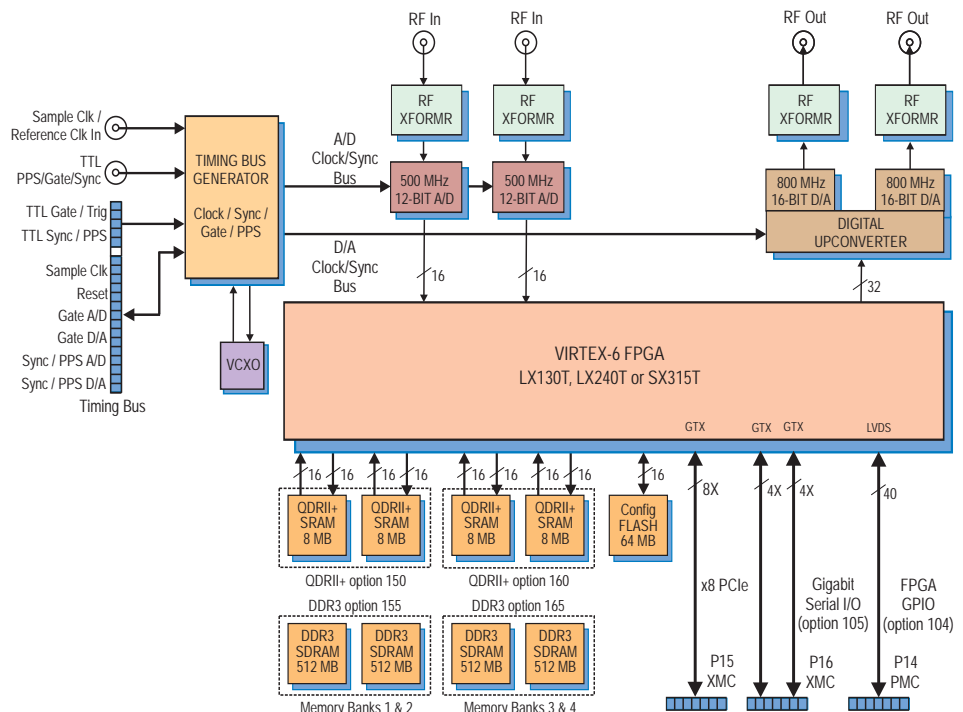

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53650 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfers, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 53650 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts two full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

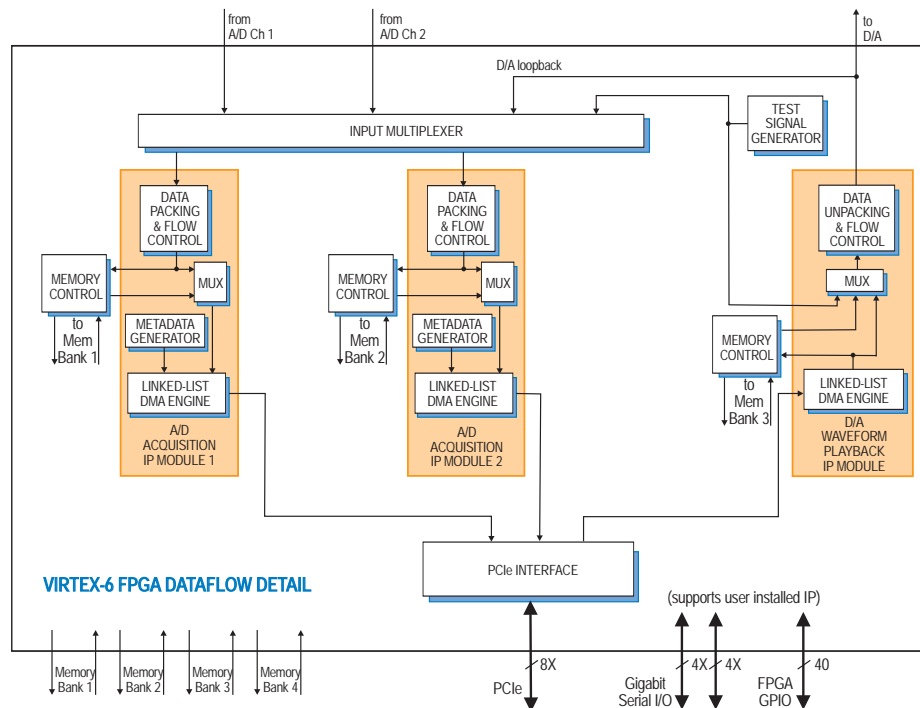

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53650’s can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 53650 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board’s DMA capabilities, providing FIFO memory space for creating DMA packets. ➤

## PCI Express Interface

The Model 53650 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers.

## Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

## Ordering Information

Model	Description
53650	Two 500 MHz A/Ds, one DUC, Two 800 MHz D/As, Virtex-6 FPGA - 3U VPX
<b>Options:</b>	
-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep.

## Fabric-Transparent Crossbar Switch

The 53650 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

### A/D Converters (option 014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Option:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

## Custom I/O

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector for serial protocols

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen.1: x4 or x8;

Gen. 2: x4

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

## VPX Families

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53651 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53651 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A two-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53651 includes two A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53651 factory installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for either DDR3

or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53651 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

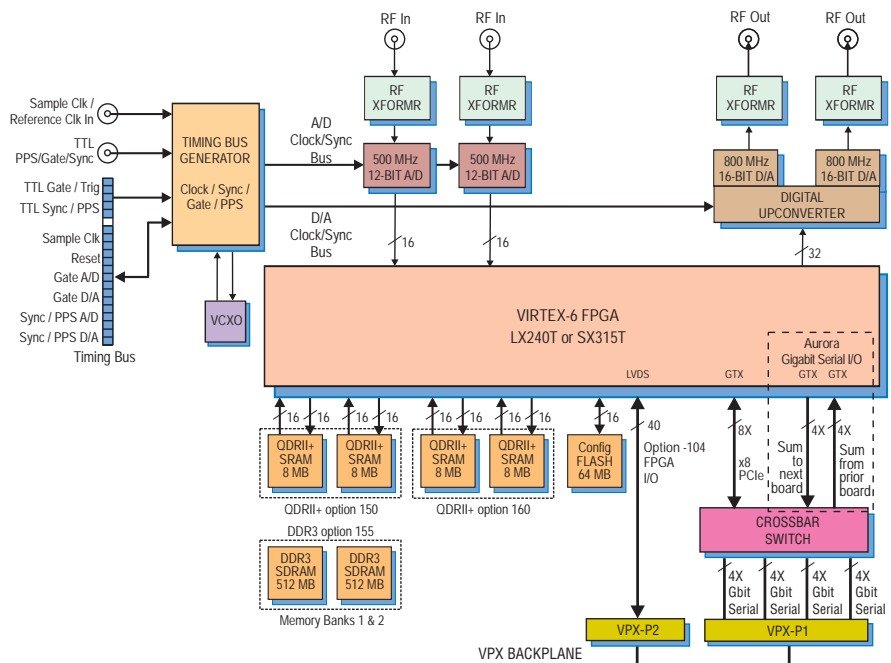

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

**A/D Acquisition IP Modules**

The 53651 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53651 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

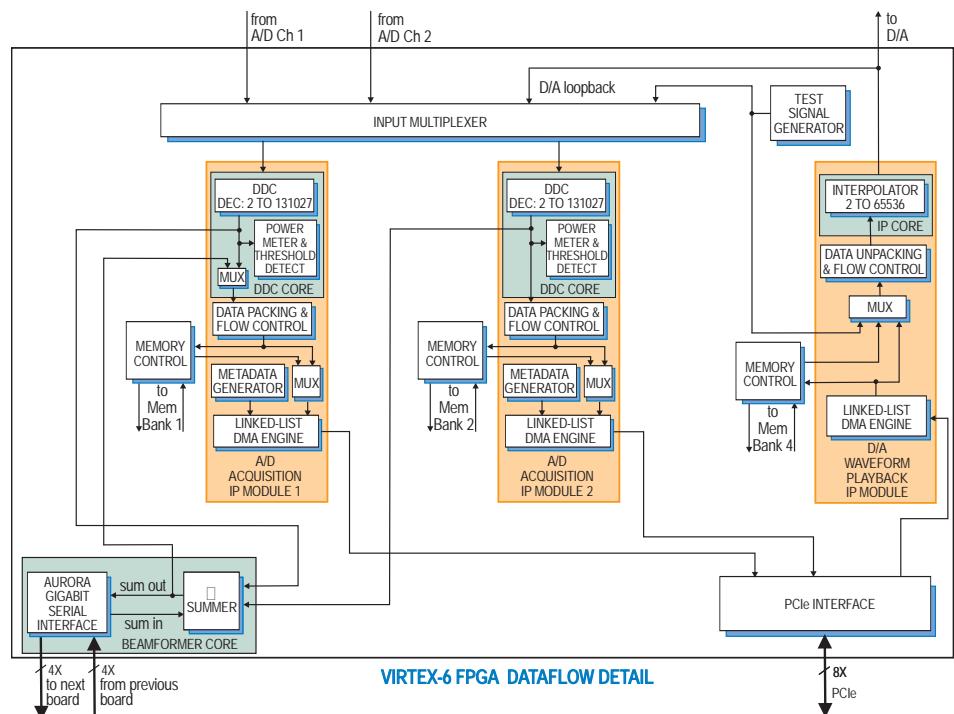

A programmable summation block provides summing of any of the two DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53651's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 53651 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53651's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53651 architecture supports up to three independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as a combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the boards's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 53651 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Fabric-Transparent Crossbar Switch

The 53651 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240 FPGA
-064	XC6VSX315 FPGA
-104	LVDS FPGA I/O through the VPX P2 connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► **A/D Converters (option -014)**

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

**Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator**

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

**Beamformer**

**Summation:** Two channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link over the VPX P1 connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz),

front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T-2  
**Optional:** Xilinx Virtex-6 XC6VSX315T-T2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Option -150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option -155 or -165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53660 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Supports gigabit serial fabrics including PCI Express, Serial RapidIO and Xilinx Aurora
- Four 200 MHz 16-bit A/Ds
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53660 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

The 53660 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53660 factory-installed functions include four A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable

the 53660 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

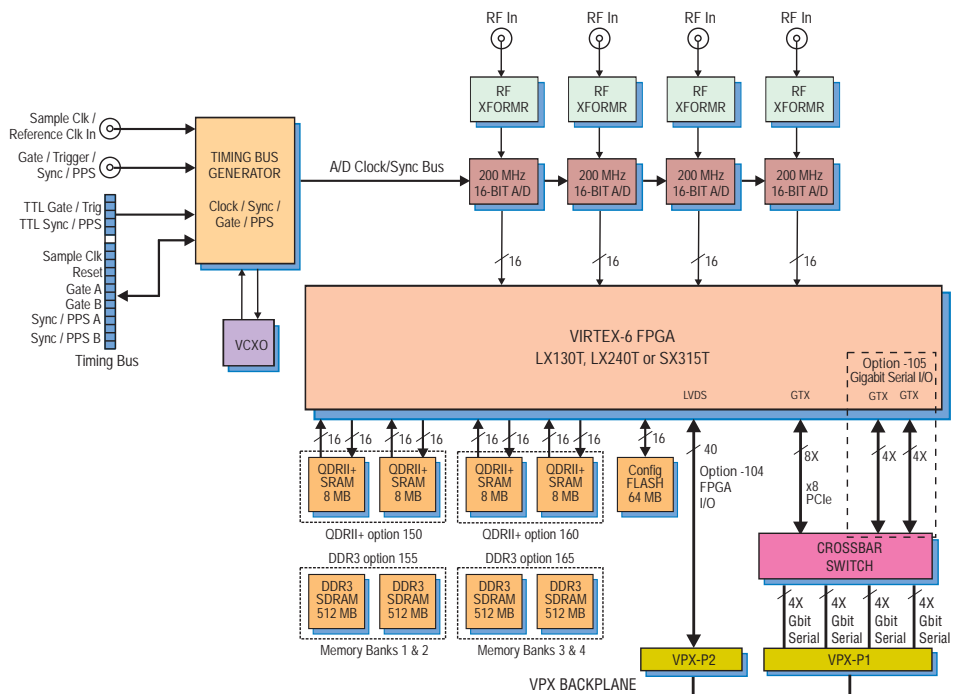

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53660's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

Memory Resources

The 53660 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

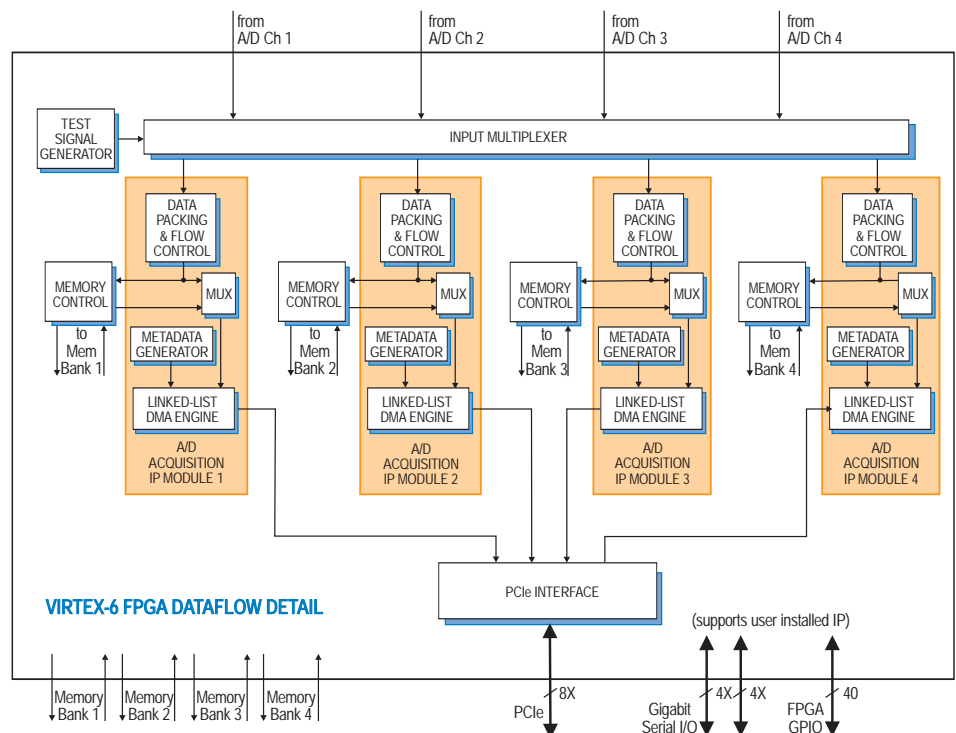

The Model 53660 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

A/D Acquisition IP Modules

The 53660 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

-150	Two 8 MB QDR II+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDR II+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

**Fabric-Transparent Crossbar Switch**

The 53660 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

- Input Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +8 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

- Type:** Texas Instruments ADS5485
- Sampling Rate:** 10 MHz to 200 MHz
- Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6V SX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

- Option 150 or 160:** Two 8 MB QDR II+ SRAM memory banks, 400 MHz DDR
- Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53661 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDR11+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53661 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53661 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53661 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (digital downconverter) IP core. IP modules for either DDR3 or QDR11+ memories, a controller for all data clocking and synchro-

nization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53661 to operate as a complete turnkey solution without the need to develop any FPGA IP.

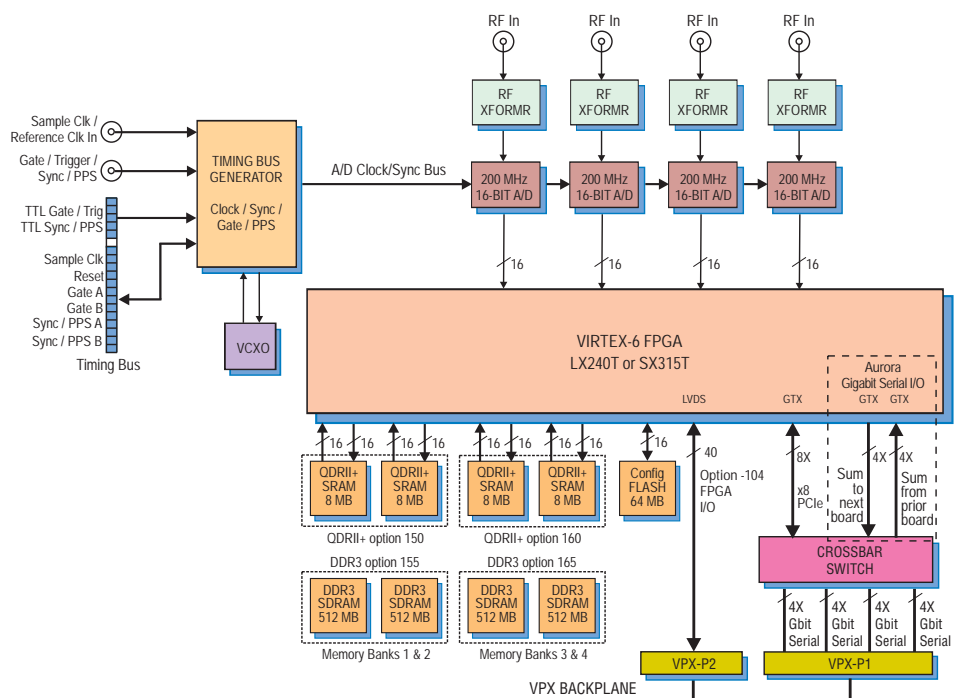

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 53661 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53661 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the

summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

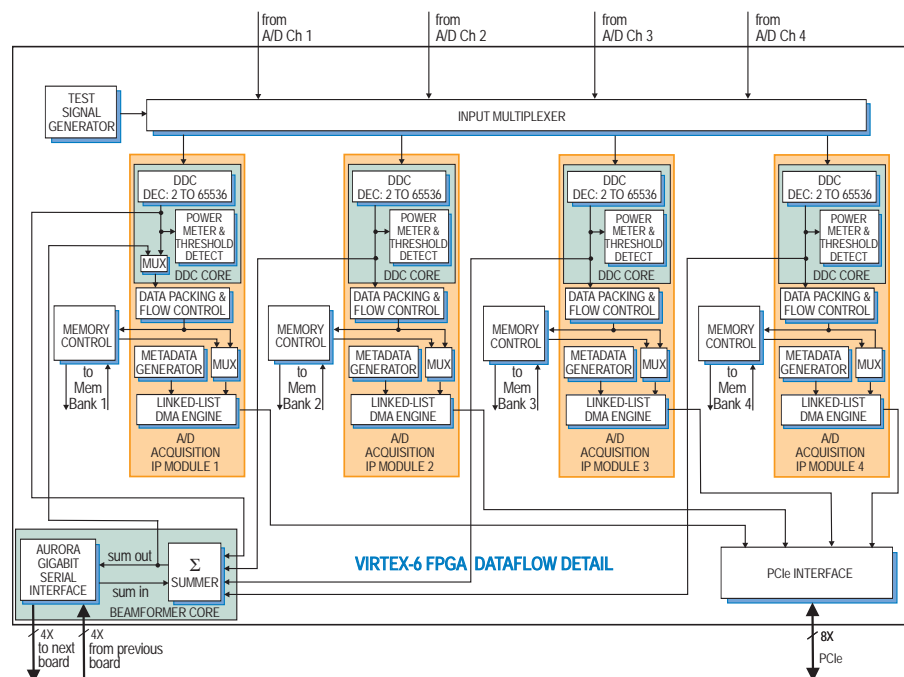

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

**PCI Express Interface**

The Model 53661 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53661	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - 3U VPX
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VXSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

**Memory Resources**

The 53661 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. DDR3 SDRAM banks can each be up to 512 MB deep.

**Fabric-Transparent Crossbar Switch**

The 53661 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

- Input Type:** Transformer-coupled, front panel female SSMC connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +8 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

- Type:** Texas Instruments ADS5485
- Sampling Rate:** 10 MHz to 200 MHz
- Resolution:** 16 bits

**Digital Downconverters**

- Quantity:** Four channels
- Decimation Range:** 2x to 65,536x in two stages of 2x to 256x
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$
- LO SFDR:** >120 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

- Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain
- Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol
- Phase Shift Coefficients:** I & Q with 16-bit resolution
- Gain Coefficients:** 16-bit resolution
- Channel Summation:** 24-bit
- Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

- Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or timing bus
- Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz
- Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, **Functions:** trigger, gate, sync and PPS

**Field Programmable Gate Array**

- Standard:** Xilinx Virtex-6 XC6VLX240T
- Optional:** Xilinx Virtex-6 XC6VXSX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Memory**

- Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR
- Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCIe Bus:** Gen. 1: x4 or x8; Gen. 2: x4

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53662 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Up to 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53662 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed data converter with programmable DDCs (digital downconverters) is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution.

The 53662 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board’s data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 53662 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of all data clocking, synchronization, gate and trigger functions, a test signal generator, voltage and temperature monitoring, DDR3

SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable the 53662 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

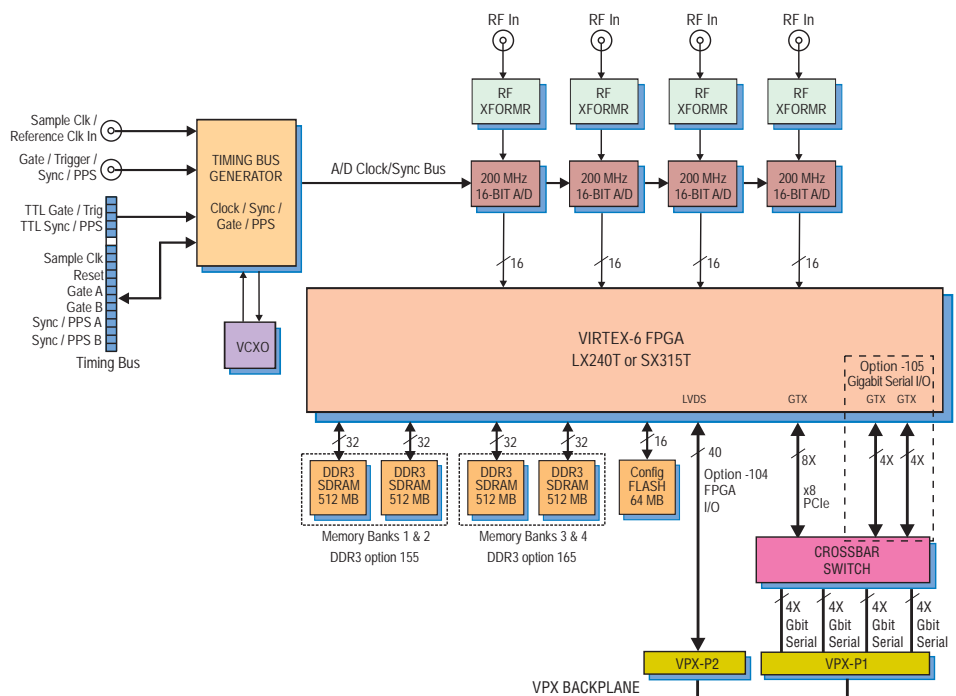

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53662 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range is programmable in steps of 8 from 16 to 1024 and steps of 64

from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

**► A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

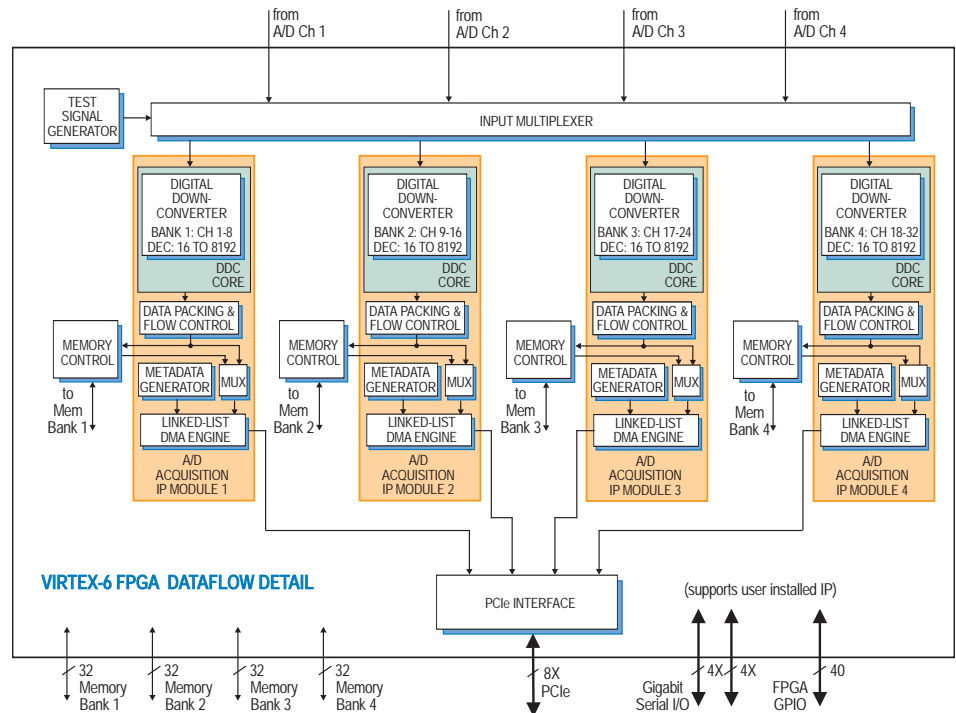

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53662’s can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 53662 architecture supports up to four independent memory banks which can be configured with DDR3 SDRAM. ►

**PCI Express Interface**

The Model 53662 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53662	4-Ch 200 MHz A/D with 32-Ch DDC and Virtex-6 FPGA - 3U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through VPX P2
-105	Gigabit serial FPGA I/O through VPX P1
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**Fabric-Transparent Crossbar Switch**

The 53662 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency.

Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user-programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock, or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VSX315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2

# Model 53663

# 1100-Channel GSM Channelizer with Quad A/D - VPX

Model 53663 Commercial (left) and rugged version

### Features

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express Gen. 2 x8
- 3U VPX form factor provides a compact, rugged platform

### General Information

Model 53663 is a member of the Cobalt® family of high-performance VPX boards based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

### The Cobalt Architecture

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 53663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

### A/D Converter Stage

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

### Clocking and Synchronization

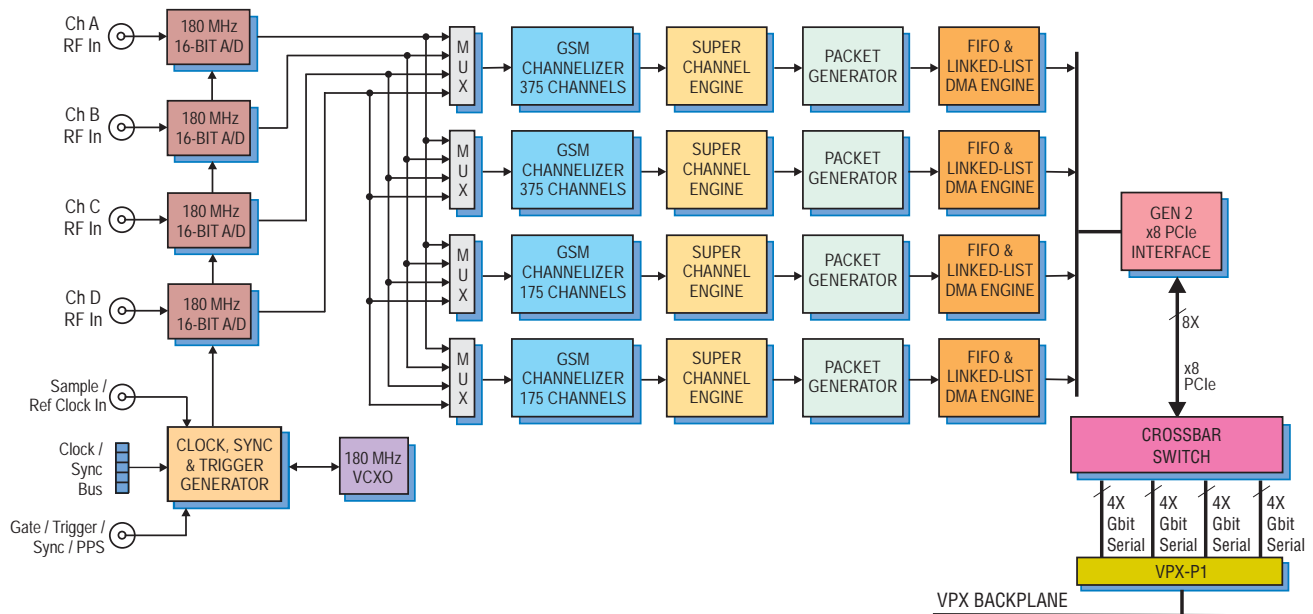

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### GSM Channelizer Cores

The 53663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ➤

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 53663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 53663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single “superchannel”. This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data “payload” samples can be identified and recovered by the host.

### PCI Express Interface

The Model 53663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 53663 and host.

### Fabric-Transparent Crossbar Switch

The 53663 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X). ►

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 10 MHz system reference

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**GSM Channel Banks**

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs  
**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks  
**IF (Center) Freq:** 45, 135 or 225 MHz

**DDC Channels**

**Channel Spacing:** 200 kHz, fixed  
**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where k = 0 to 87, or 0 to 187

**DDC Channel Filter Characteristics:**

- < 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)
- > 18 dB attenuation at  $\pm 100$  kHz
- > 78 dB attenuation at  $\pm 170$  kHz
- > 83 dB attenuation at  $\pm 600$  kHz
- > 93 dB attenuation at  $\pm 800$  KHz
- > 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to 180 MHz\*13/2160 = 1.0833333 MS/sec

**DDC Data Output Format:** 24 bits I + 24 bits Q

**Superchannels**

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

**Frequency Offsets for each DDC:**

- First:  $-f_s/4$  (-270.8333 kHz)
- Second: 0 Hz
- Third:  $+f_s/4$  (+270.8333 kHz)
- Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

**Superchannel Output Format:** 26 bits I + 26 bits Q

**Number of Superchannels per Bank:** 175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6VXSX315T

**PCI Express Interface**

**PCI Express Bus:** Gen. 2 x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53664

# 4-Ch. 200 MHz A/D w. DDCs, VITA 49.0, Virtex-6 FPGA - 3U VPX

Model 53664 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- PCIe output supports VITA-49.0 Radio Transport (VRT) Standard
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs (digital downconverters)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53664 is a member of the Cobalt® family of high-performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution. The 53664 PCIe output supports fully the VITA-49.0 Radio Transport (VRT) Standard.

The 53664 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

### The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53664 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (digital downconverter) IP core. IP modules

for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53664 to operate as a complete turnkey solution without the need to develop any FPGA IP.

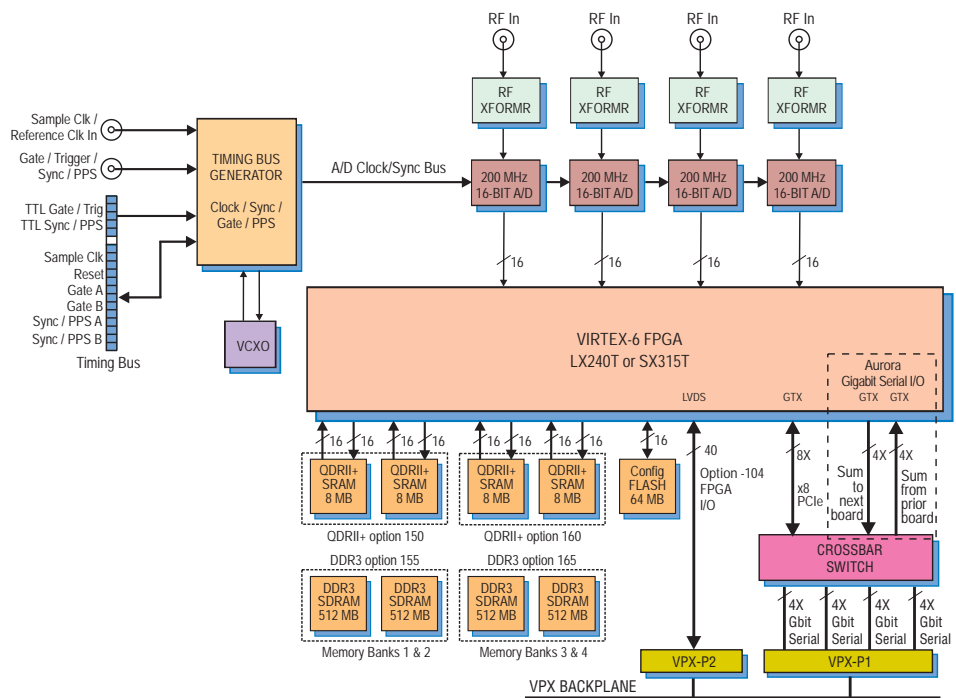

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ▶

**A/D Acquisition IP Modules**

The 53664 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53664 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and

threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53663's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the VPX P1 connector. This allows summation across channels on multiple boards.

**VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA-49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

The 53664 supports fully the VITA 49.0 specification. ➤

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53664's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53664 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 53664 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Fabric-Transparent Crossbar Switch

The 53664 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X). ►

► Specifications

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector,  
**Functions:** trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6V5X315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCIe Bus:** Gen. 1: x4 or x8; Gen. 2: x4

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53664	4-Channel 200 MHz A/D with DDCs, VITA 49.0 and Virtex-6 FPGA - 3U VPX

**Options:**

-062	XC6VLX240T FPGA
-064	XC6V5X315T FPGA
-104	LVDS FPGA I/O to VPX P2
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

Model 53670 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- User-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53670 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 over the 3U VPX backplane, the Model 53670 includes general purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53670 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions,

a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 53670 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

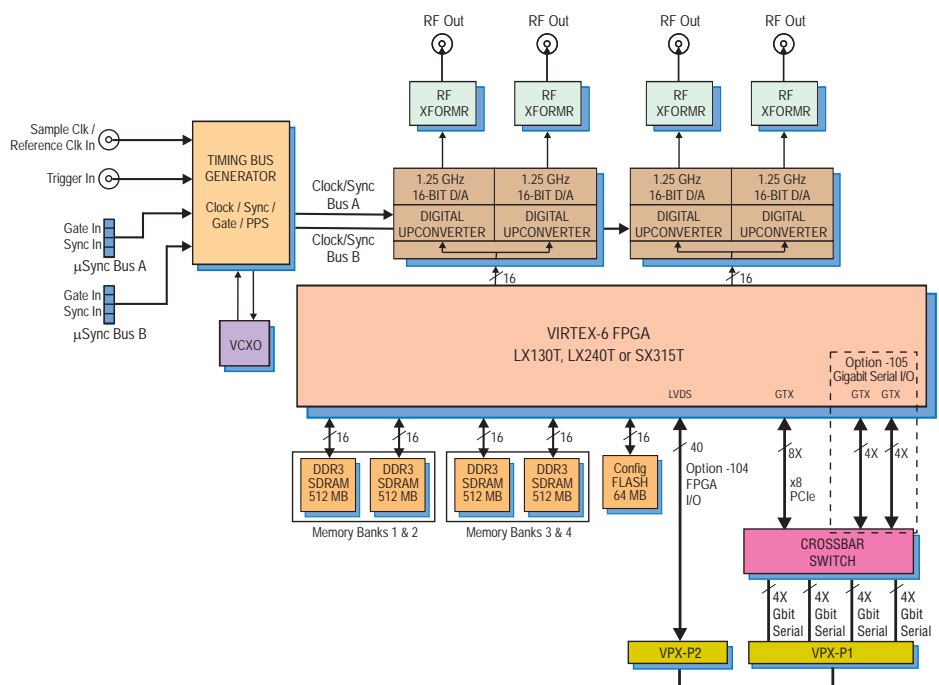

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by

2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 5392 or 9192 Cobalt Synchronizers can drive multiple 53670 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 53670 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

PCI Express Interface

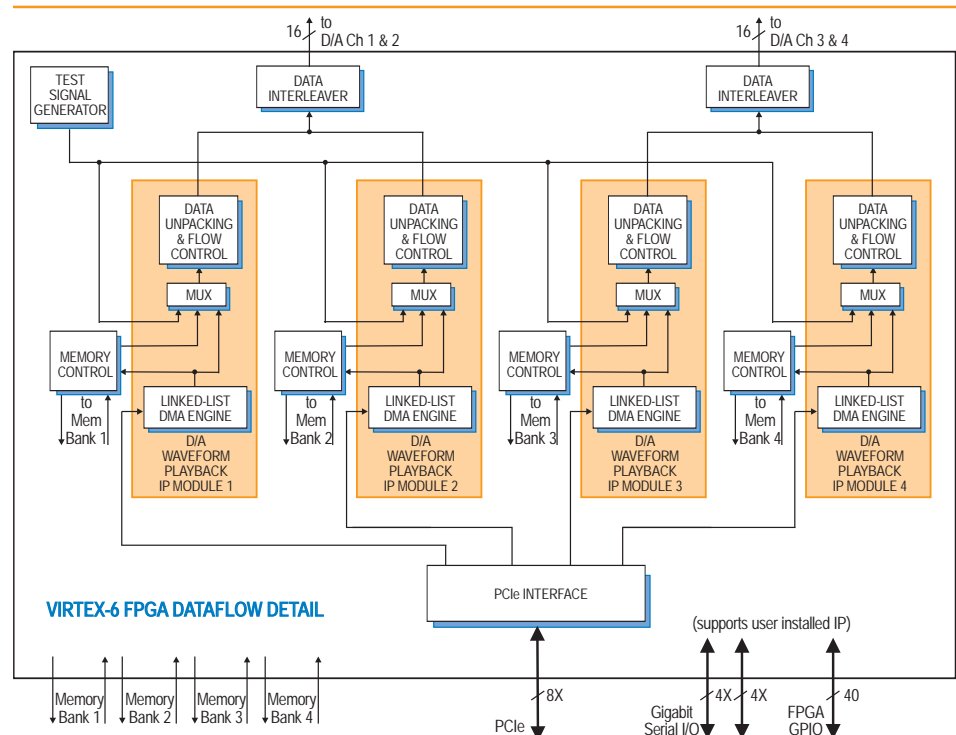

The Model 53670 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the board. ►

D/A Waveform Playback IP Module

The Model 53670 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4. Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53670	4-Channel 1.25 GHz D/A with Virtex-6 FPGA - 3U VPX

**Options:**

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* These options are always required

8267	VPX Development System. See 8267 Datasheet for Options

**Fabric-Transparent Crossbar Switch**

The 53670 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**D/A Converters**

- Type:** TI DAC3484
- Input Data Rate:** 312.5 MHz max.
- Output Bandwidth:** 250 MHz max.
- Output Sampling Rate:** 1.25 GHz max. with interpolation
- Interpolation:** 2x, 4x, 8x or 16x
- Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

- Quantity:** Four D/A outputs
- Output Type:** Transformer-coupled, front panel female SSMC connectors
- Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps
- Full Scale Output Programming:** 1.0x(G+1)/16 Vp-p, where 4-bit integer G = 0 to 15

**Clock Synthesizer**

- Clock Source:** Selectable from on-board programmable VCXO or front panel external clock
- VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz
- Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz
- Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

**External Clock**

- Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

**External Trigger Input**

- Type:** Front panel female SSMC connector
- Function:** Programmable functions include: trigger, gate, sync and PPS
- Timing Bus:** 19-pin µSync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

**Field Programmable Gate Array**

- Standard:** Xilinx Virtex-6 XC6VLX130T-2
- Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

**Custom I/O**

- Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O
- Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

**Environmental**

- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-cond.
- Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53671 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- Extended interpolation range from 2x to 1,048,576x
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53671 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As with a wide range of programmable interpolation factors, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 over the 3U VPX backplane, the Model 53671 includes optional general-purpose and gigabit serial connectors for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53671 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all

data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 53671 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

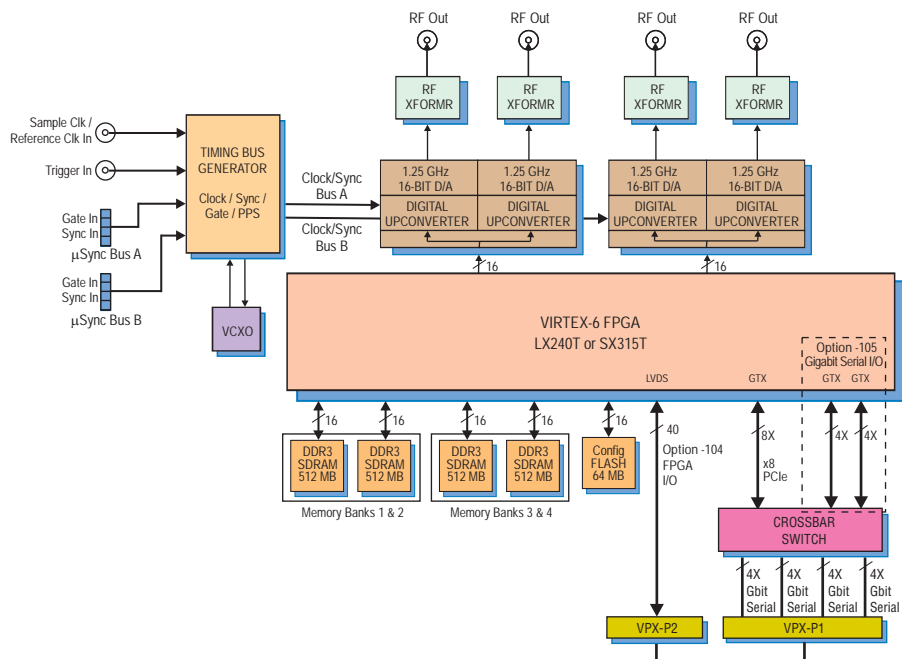

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, the 53671 features an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample

clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 5392 or 9192 Cobalt Synchronizers can drive multiple 53671 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 53671 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the board’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

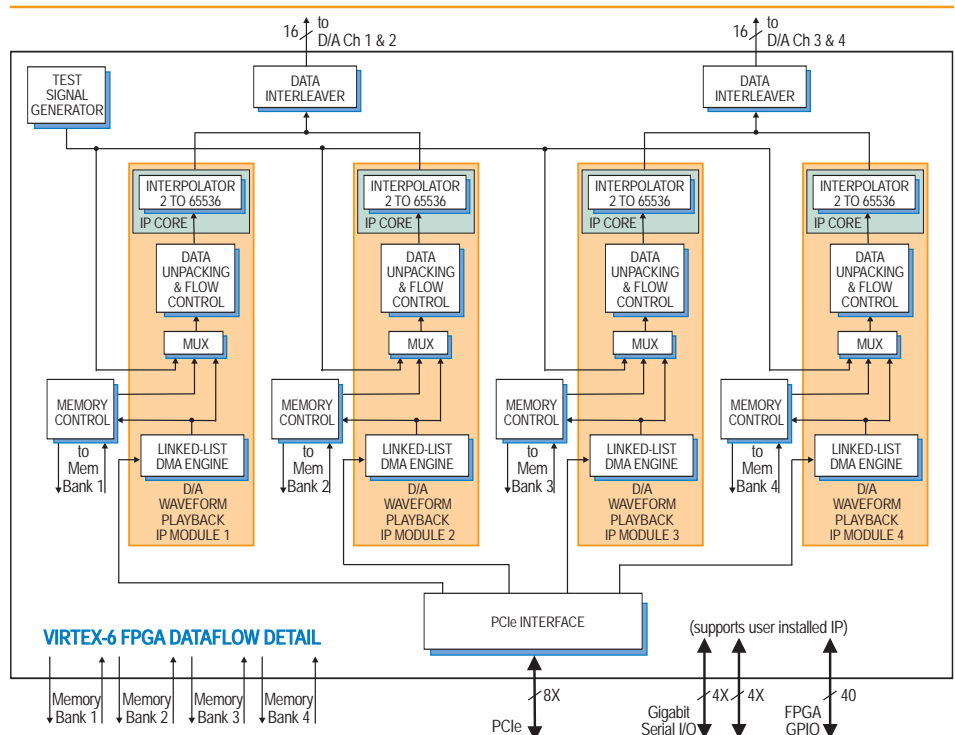

D/A Waveform Playback IP Module

The Model 53671 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked-list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Model 53690 COTS (left) and rugged version

**Features**

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA boosts LNB antenna signal levels with up to 60 dB gain
- Programmable analog downconverter provides I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two 200 MHz 16-bit A/Ds
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Clock/sync bus for multiboard synchronization
- Optional LVDS connections to the Virtex-6 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53690 is a member of the Cobalt® family of high performance 3U VPX boards based on the Xilinx Virtex-6 FPGA. A 2-Channel high-speed data converter, it is suitable for connection directly to the RF port of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The Model 53690 includes an L-Band RF tuner, two A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53690 factory-installed functions include two A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the

factory-installed functions and enable the 53690 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

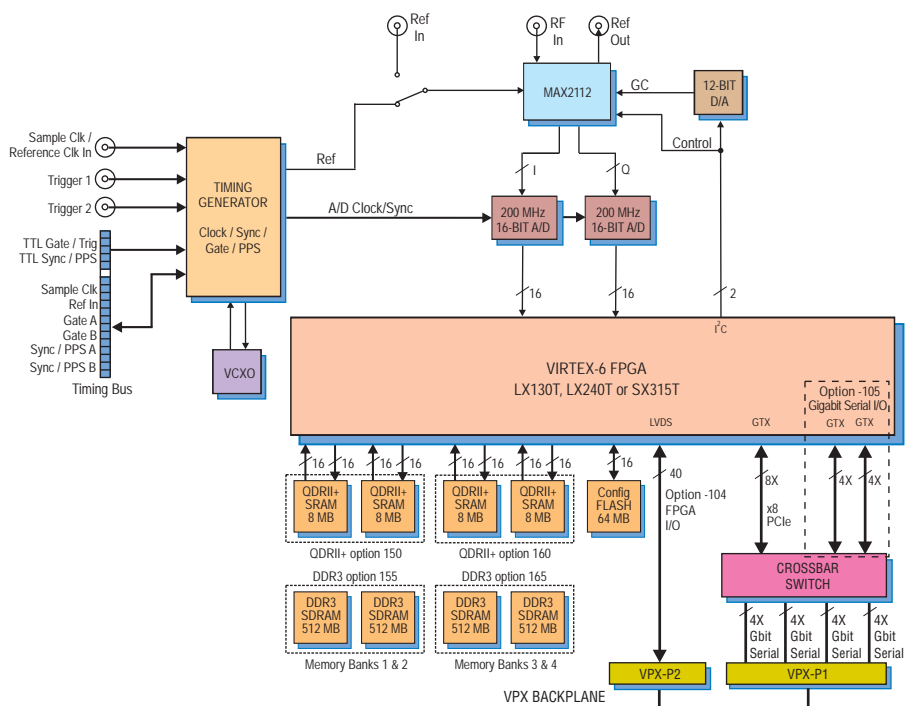

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides dual 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► **RF Tuner Stage**

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz from an antenna LNB (low noise block). A Maxim MAX2112 tuner directly converts these L-Band signals to baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA (low noise amplifier), a PLL (phase-locked loop) synthesized local oscillator, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

An integrated lowpass filter with variable bandwidth provides bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

**A/D Converter Stage**

The analog baseband I and Q analog tuner outputs are then applied to two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other board resources.

**A/D Clocking and Synchronization**

An internal timing generator provides all timing, gating, triggering and synchro-

nization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

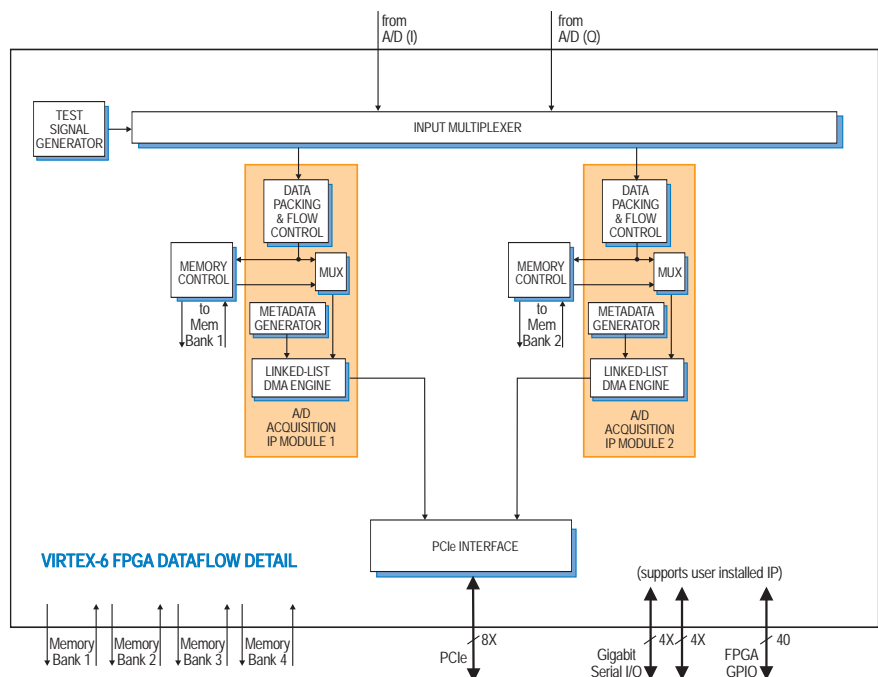

The 53690 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. ►

**A/D Acquisition IP Modules**

The 53690 features two A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**PCI Express Interface**

The Model 53690 includes an industry standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53690	L-Band RF Tuner with 2-Channel 200 MHz A/D and Virtex-6 FPGA - 3U VPX
<b>Options:</b>

Model	Description
8267	VPX Development System. See 8267 Datasheet for Options

► Built-in memory functions include multichannel A/D data capture, tagging and streaming. The factory-installed A/D Acquisition Modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user IP within the FPGA.

**Fabric-Transparent Crossbar Switch**

The 53690 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency.

Programmable signal input equalization and output pre-emphasis settings enable optimization. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Input**

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

**L-Band Tuner**

**Type:** Maxim MAX2112  
**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:** -97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$freq_{VCO} = (N.F) \times freq_{REF}$  where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference** ( $freq_{REF}$ ): Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

**\*Usable Full-Scale Input Range:** -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board timing generator/synthesizer

**A/D Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Input**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T or XC6VXS315T

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector for serial protocols

**Memory**

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 x4 or x8; Gen. 2 x4

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53720 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 and 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53720 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53720 includes three A/Ds, one upconverter, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 53720 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 53720 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

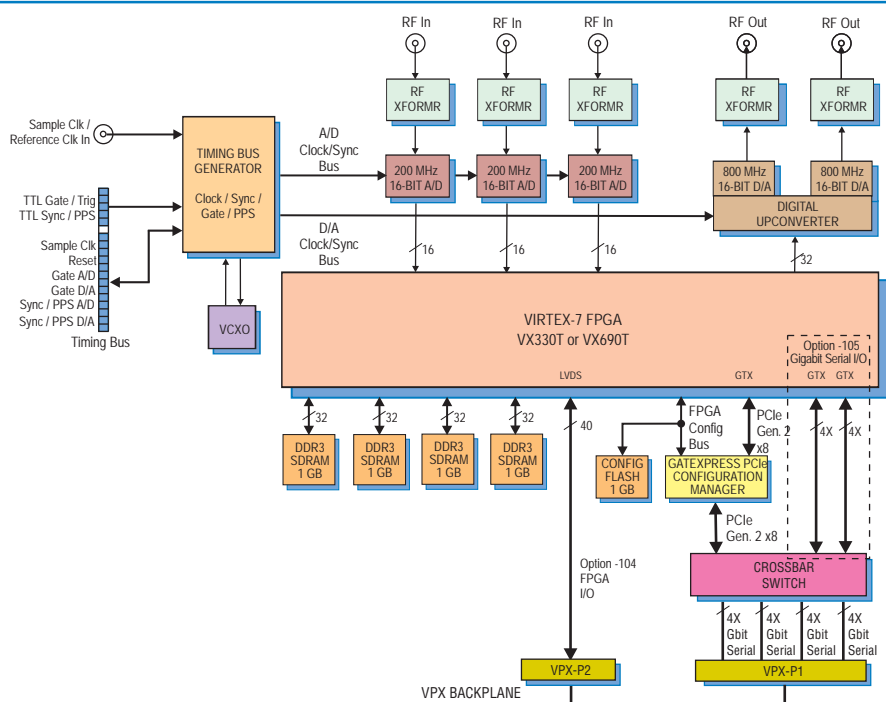

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53720 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 53720 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

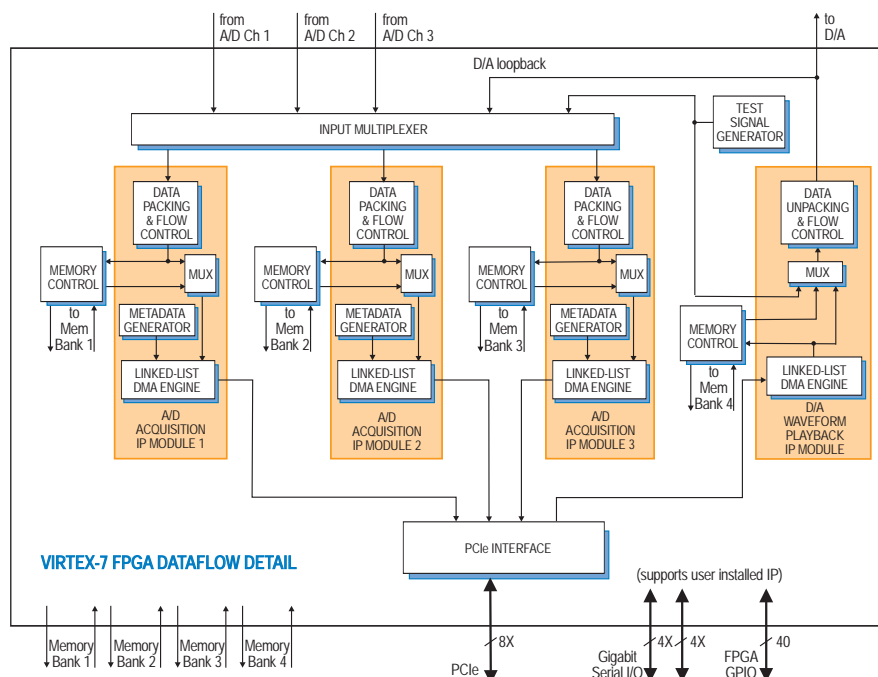

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of SSMC connectors. ►

**Memory Resources**

The 53720 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 53720 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - 3U VPX

**Options:**

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

► If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable VCXO (Voltage-Controlled Crystal Oscillator).

**Crossbar Switch**

The 53720 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with interpolation  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8;

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53721

## 3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 3U VPX

Model 53721 COTS (left) and rugged version

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2 ) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53721 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53721 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation

IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53721 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

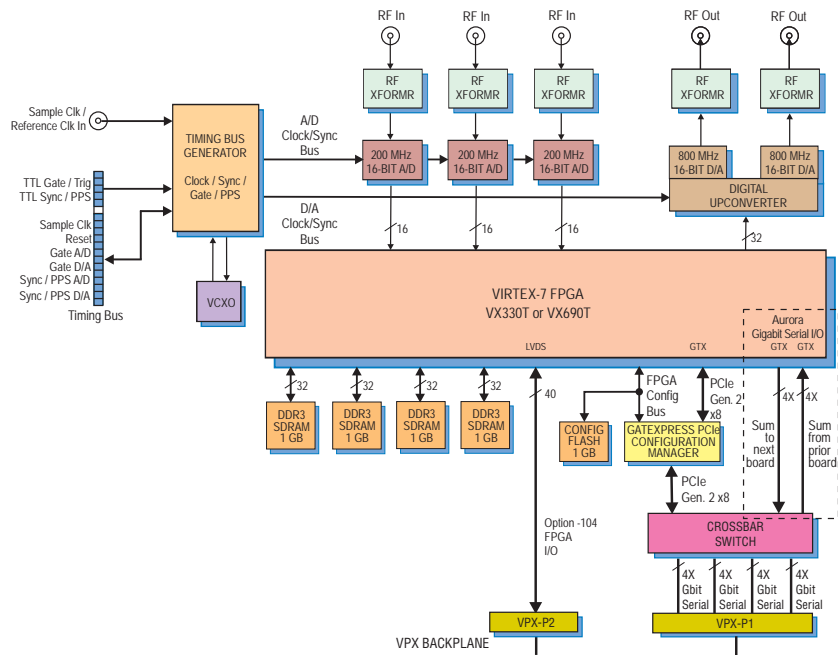

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 53721 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53721 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

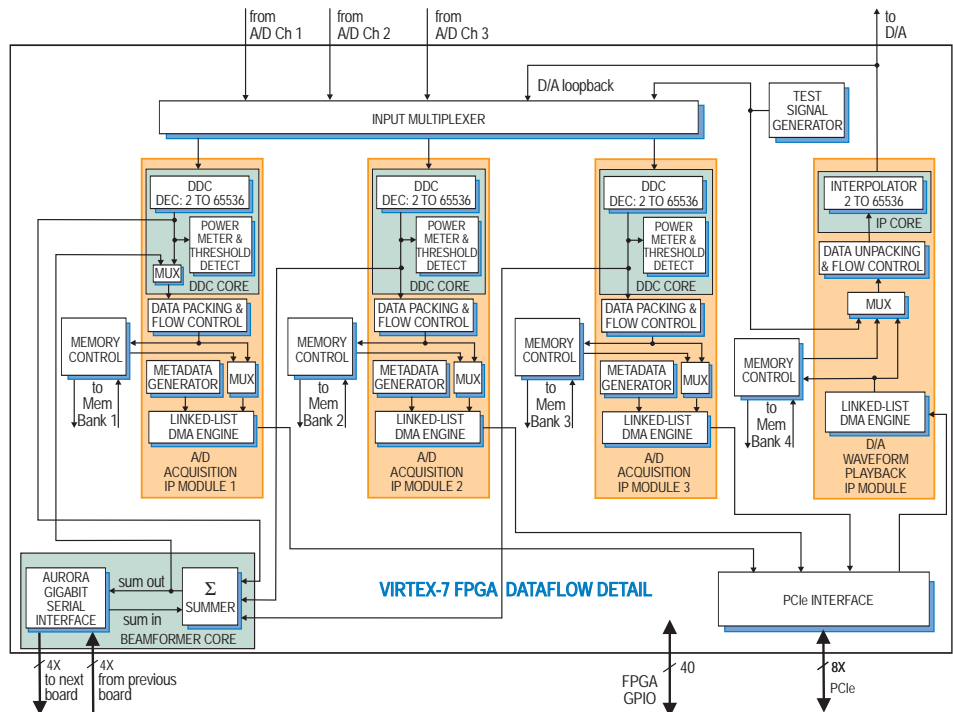

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53721's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 53721 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

## Memory Resources

The 53721 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## PCI Express Interface

The Model 53721 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Crossbar Switch

The 53721 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

## ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

## Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53721's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. ►

► Specifications

Front Panel Analog Signal Inputs

**Input:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

Digital Downconverters

**Quantity:** Three channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Ordering Information

Model	Description
53721	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 3U VPX

Options:

-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2

Contact Pentek for availability of rugged and conduction-cooled versions

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison	
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53730 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53730 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes 1 GHz A/D and D/A converters and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 53730 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 53730 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

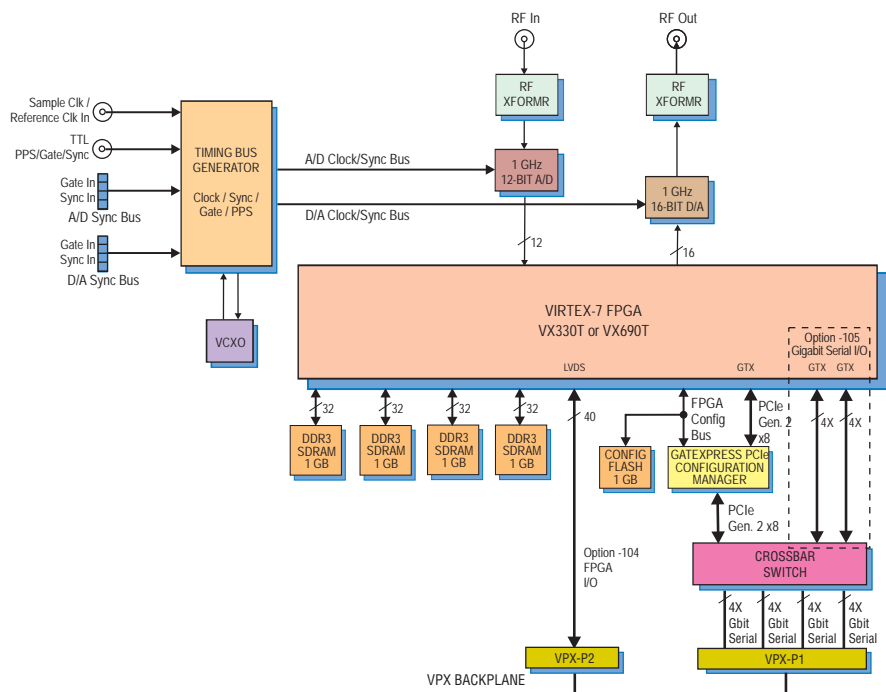

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 53730 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 53730 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

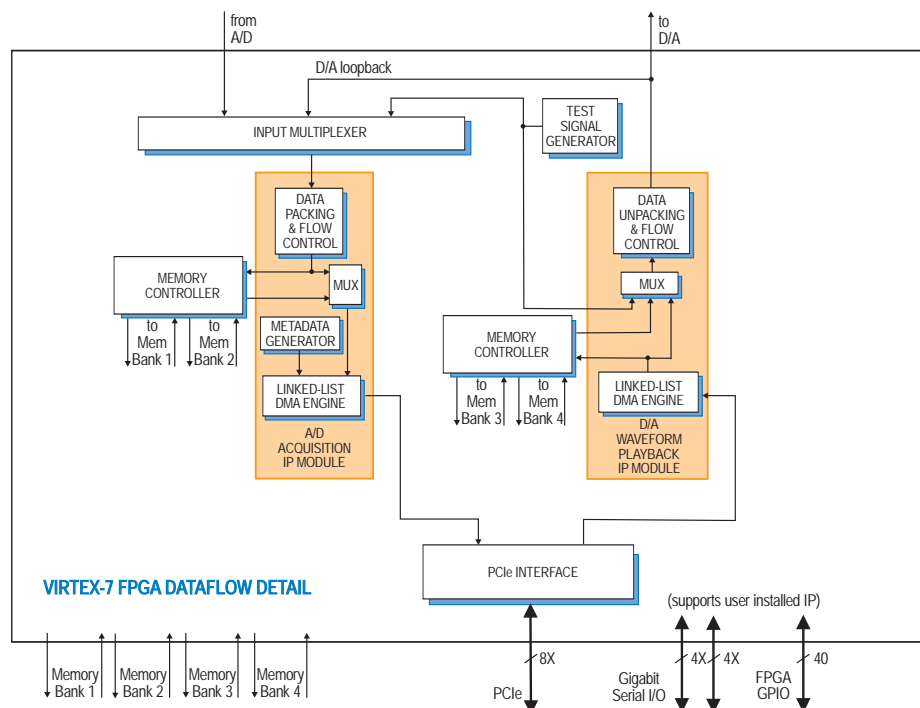

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 53730 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector. ➤

**Memory Resources**

The 53730 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**PCI Express Interface**

The Model 53730 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

Model	Description
53730	1 GHz A/D and D/A, Virtex-7 FPGA - 3U VPX

**Options:**

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

*Contact Pentek for availability of rugged and conduction-cooled versions*

Model	Description
8267	VPX Development System See 8267 Datasheet for Options

**► Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel µSync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

**Crossbar Switch**

The 53730 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

**D/A Converter**

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

**Front Panel Analog Signal Outputs**

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock  
**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz  
**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 to support serial protocols

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8;

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53741

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Virtex-7 FPGA - 3U VPX

Model 53741 COTS (left) and rugged version

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 4 GB of DDR3 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)

## General Information

Model 53741 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 53741 includes an optional connection to the Virtex-7 FPGA for custom I/O.

## The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53741 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR3 SDRAM

memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 53741 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

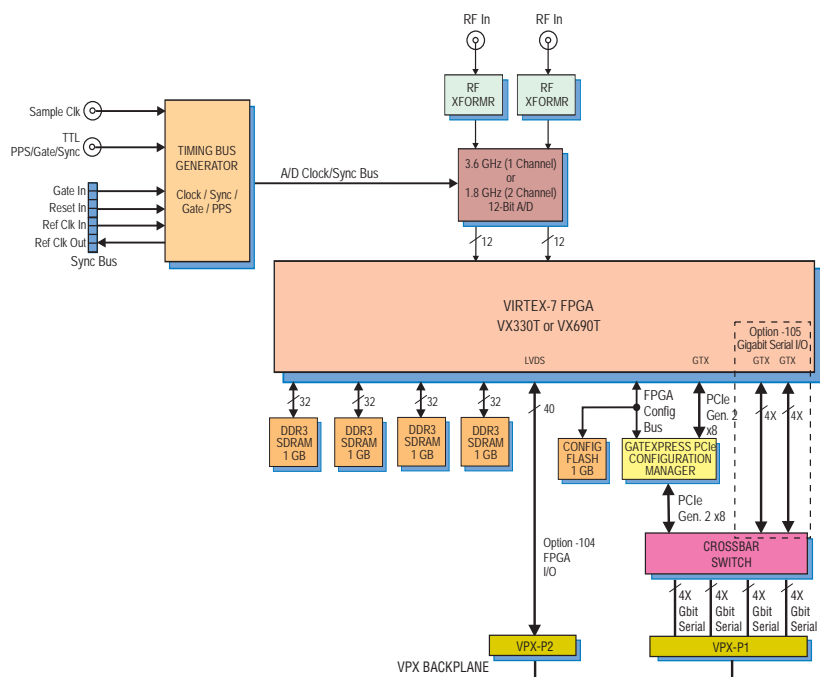

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Module**

The 53741 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

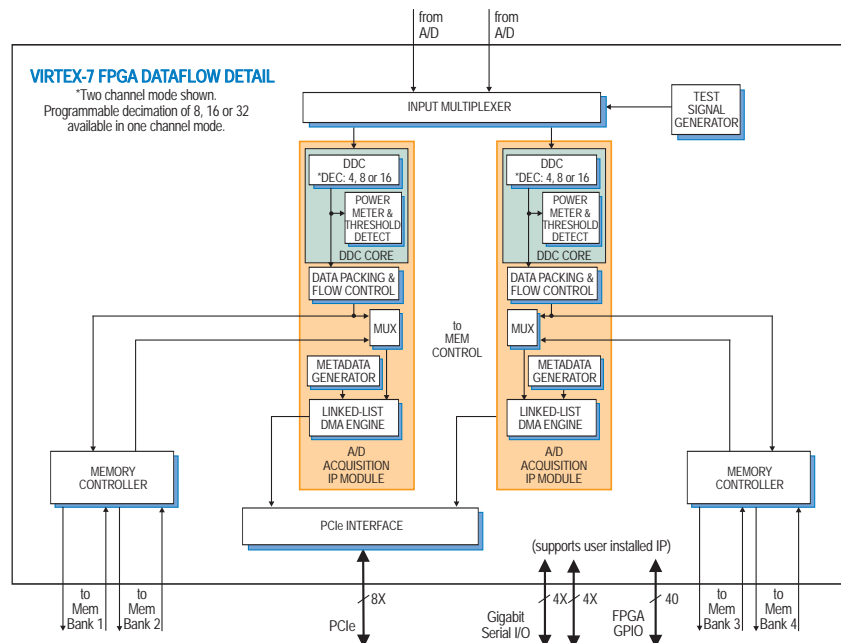

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID. ►

**Memory Resources**

The 53741 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets.

**Crossbar Switch**

The 53741 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 53741 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

**Clocking and Synchronization**

The 53741 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 53741's can be synchronized with a simple cable. For larger systems, multiple 53741's can be synchronized using the Model 5392 high-speed sync board to drive the sync bus.

**PCI Express Interface**

The Model 53741 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz  
**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 to support serial protocols

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	VPX Family Comparison

# Model 53751

## 2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A and a Virtex-7 FPGA - 3U VPX

Model 53751 commercial (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 and 2) interface up to x8
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)

### General Information

Model 53751 is a member of the Onyx® family of high performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A two-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

The 53751 includes two A/Ds, two D/As and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53751 factory installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates

to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 53751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

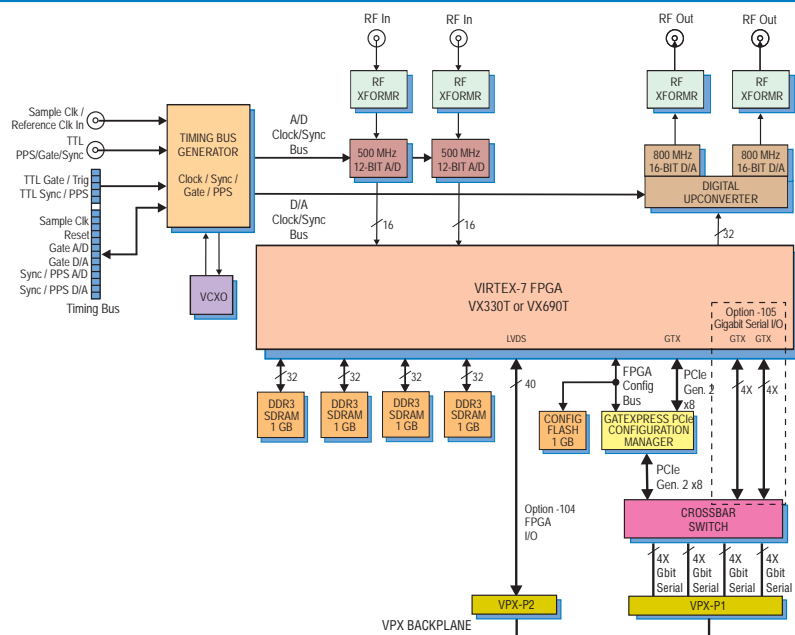

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 53751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

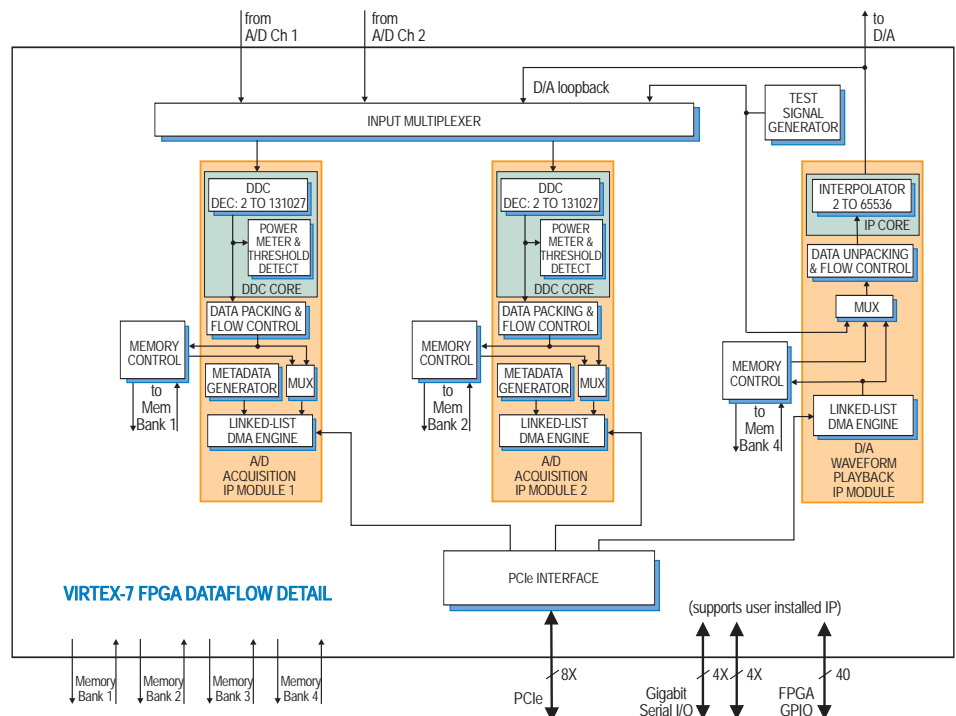

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### Fabric-Transparent Crossbar Switch

The 53751 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

### PCI Express Interface

The Model 53751 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

► Specifications

Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

Timing Bus: 26-pin connector LVPECL

bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

Environmental

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

Model 8267

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

Ordering Information

Model	Description
53751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - 3U VPX

Options:

-014	400 MHz, 14-bit A/Ds
-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1

Contact Pentek for availability of rugged and conduction-cooled versions

VPX Families

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

VPX Family Comparison		
	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Model 53760 COTS (left) and rugged version

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- Advanced reconfigurability features
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

**General Information**

Model 53760 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

The 53760 includes four A/Ds and four banks of memory. It features built-in support for PCI Express over the 3U VPX backplane.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt Family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53760 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer. IP modules for DDR3 SDRAM memories, a controller for all data clocking

and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 53760 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

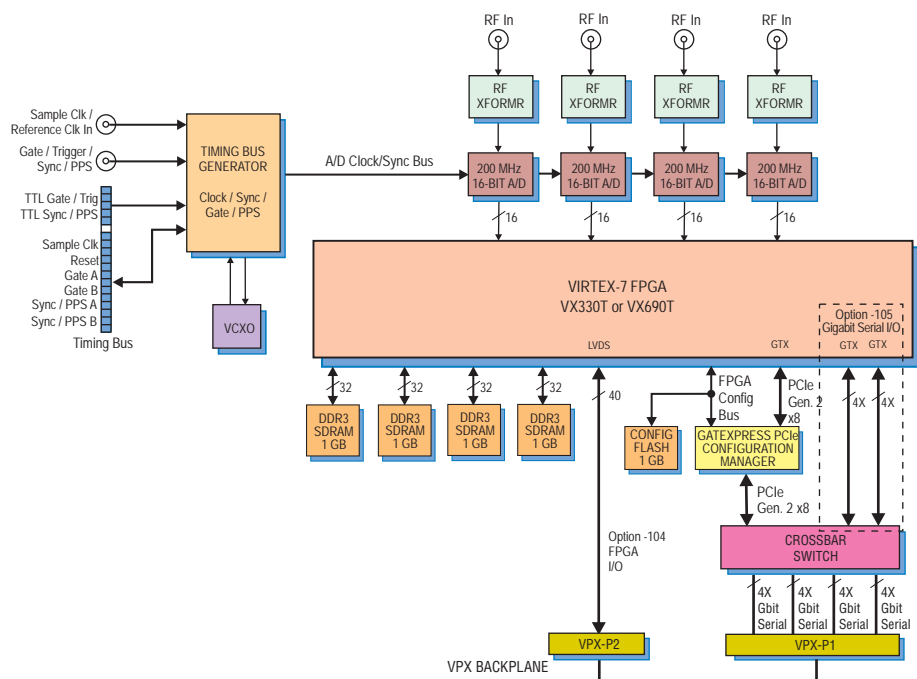

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

Clocking and Synchronization

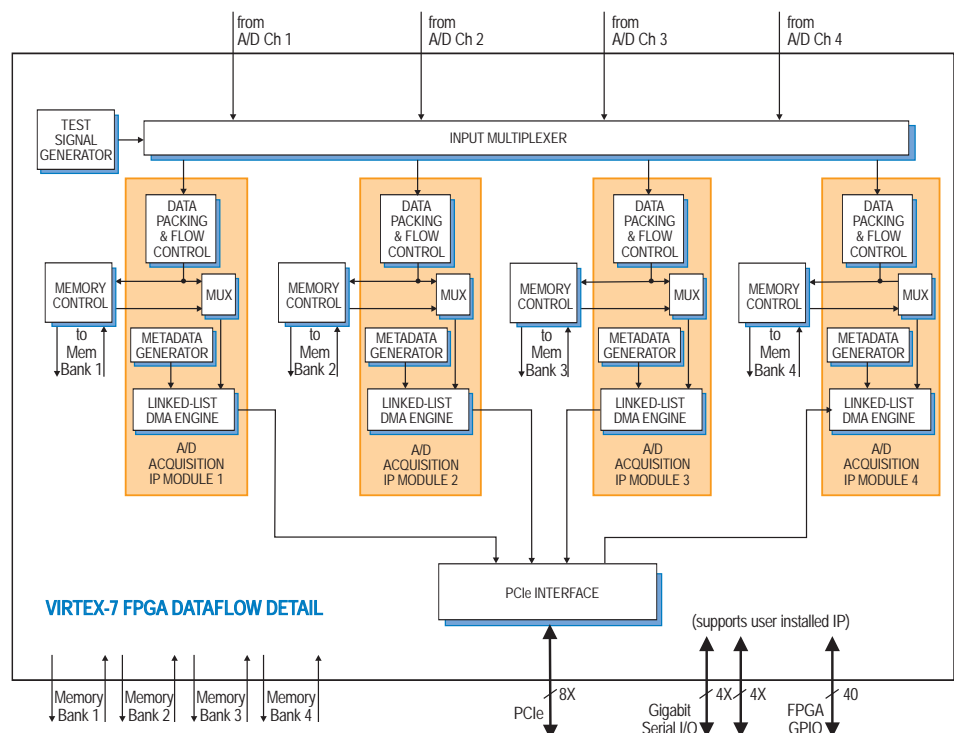

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel ►

A/D Acquisition IP Modules

The 53760 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**PCI Express Interface**

The Model 53760 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Fabric-Transparent Crossbar Switch**

The 53760 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Model 53761

# 4-Channel 200 MHz A/D with DDCs, Virtex-7 FPGA - 3U VPX

Model 53761 COTS (left) and rugged version

### Features

- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- 3U VPX form factor provides a compact, rugged platform
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53761 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with programmable DDCs (Digital Downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53761 includes an optional connection to the Virtex-7 FPGA for custom I/O.

### The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53761 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and data transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 53761 to operate as a complete turnkey solution without the need to develop any FPGA IP.

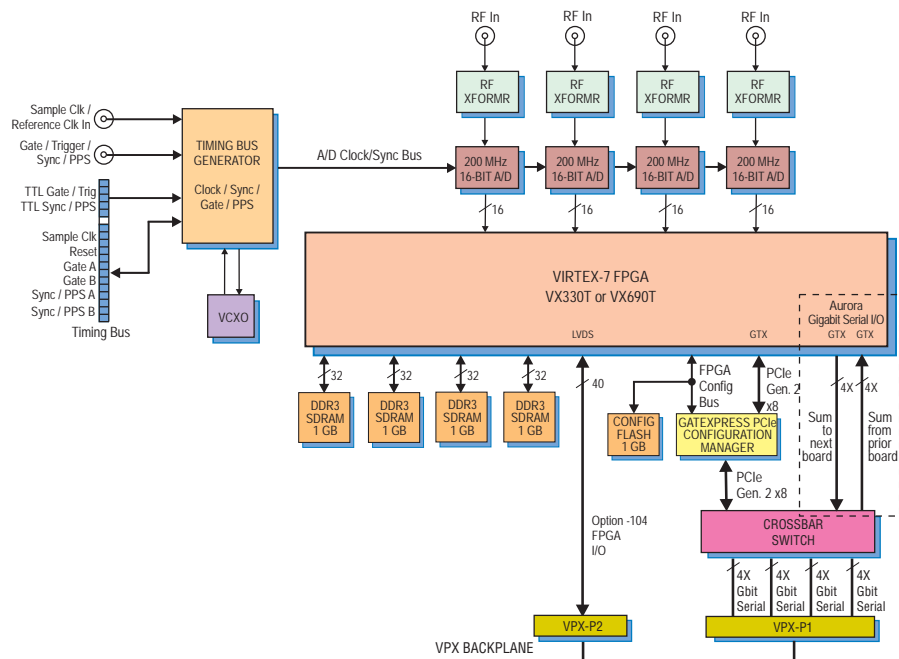

### Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O. ➤

**A/D Acquisition IP Modules**

The 53761 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 53761 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation

change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 53761's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

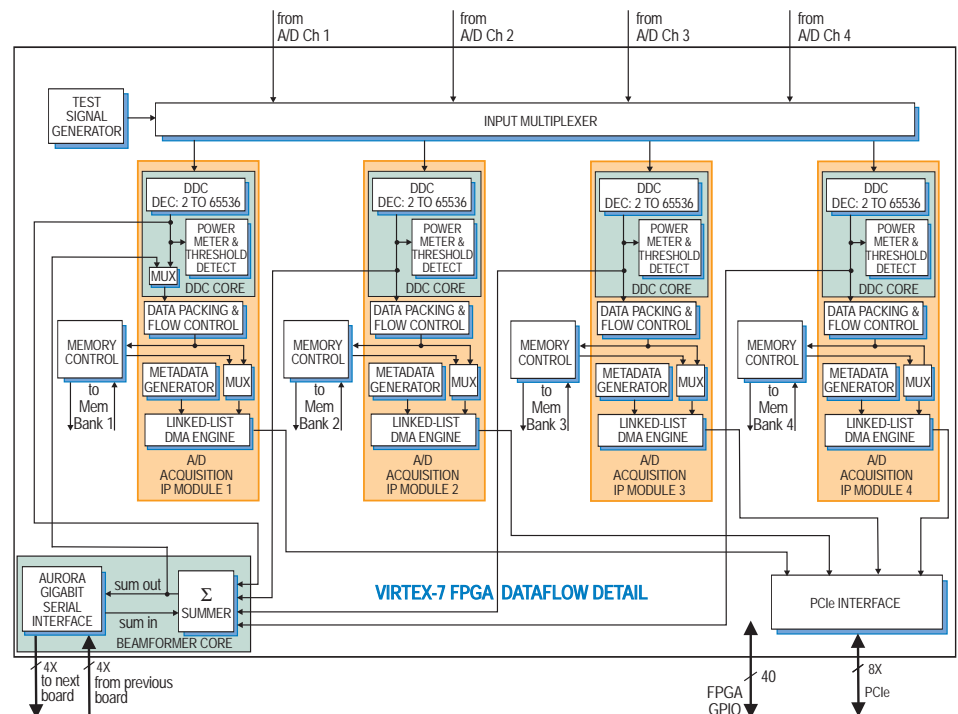

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_{sr}$  where  $f_{sr}$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536

► FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing or routing to other board resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous

sampling and sync functions across all connected boards.

### Memory Resources

The 53761 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 53761 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Crossbar Switch

The 53761 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization. ►

► Specifications

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Beamformer**

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2  
**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Memory**

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.  
**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Ordering Information**

# Model 53791

# L-Band RF Tuner, 2-Chan. 500 MHz A/D, Virtex-7 FPGA - 3U VPX

Model 53791 COTS (left) and rugged version

## Features

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA handles L-Band input signal levels from -50 dBm to +10 dBm
- Programmable analog downconverter provides IF or I+Q baseband signals at frequencies up to 123 MHz
- Two 500 MHz 12-bit A/Ds digitize IF or I+Q signals synchronously; optional: 400 MHz 14-bit A/Ds
- Two FPGA-based multiband digital downconverters
- Xilinx Virtex-7 VX330T or VX690T FPGAs
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- PCI Express (Gen. 1, & 2) interface, up to x8
- Clock/sync bus for multiboard synchronization
- Optional user-configurable gigabit serial interface
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

## General Information

Model 53791 is a member of the Onyx® family of high-performance 3U VPX boards based on the Xilinx Virtex-7 FPGA. It is suitable for connection directly to an L-band signal for SATCOM and communications systems. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 53791 includes general purpose and gigabit serial connectors for application-specific I/O.

## The Onyx Architecture

The Pentek Onyx Architecture features a Virtex-7 FPGA. All of the board's data and control paths are accessible by the FPGA, to support factory-installed functions including data acquisition, control, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

The 53791 factory-installed functions include two A/D acquisition IP modules, four DDR3 memory controllers, two DDCs (digital downconverters), an RF tuner controller, a clock and synchronization generator, a test signal generator, and a Gen 2 PCIe interface.

Thus, the 53791 can operate as a complete turnkey solution with no need to develop FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for control or data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

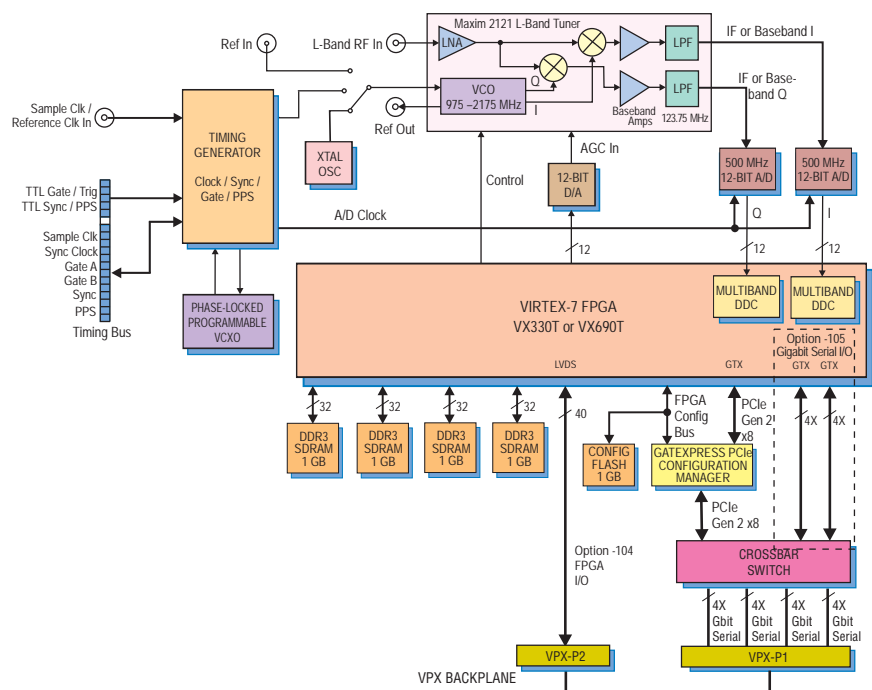

## Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the received signals.

For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X or two 4X gigabit links between the FPGA and the VPX P1 connector to support serial protocols. ➤

**A/D Acquisition IP Modules**

The 53791 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds or a test signal generator.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. Both memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer automatically adapts to the length of the acquisition gate. This is extremely useful in applications where acquisition is driven by an external gate of unknown or variable length.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting two different output bandwidths. Decimations can be set from 2 to 131,072 to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**RF Tuner Stage**

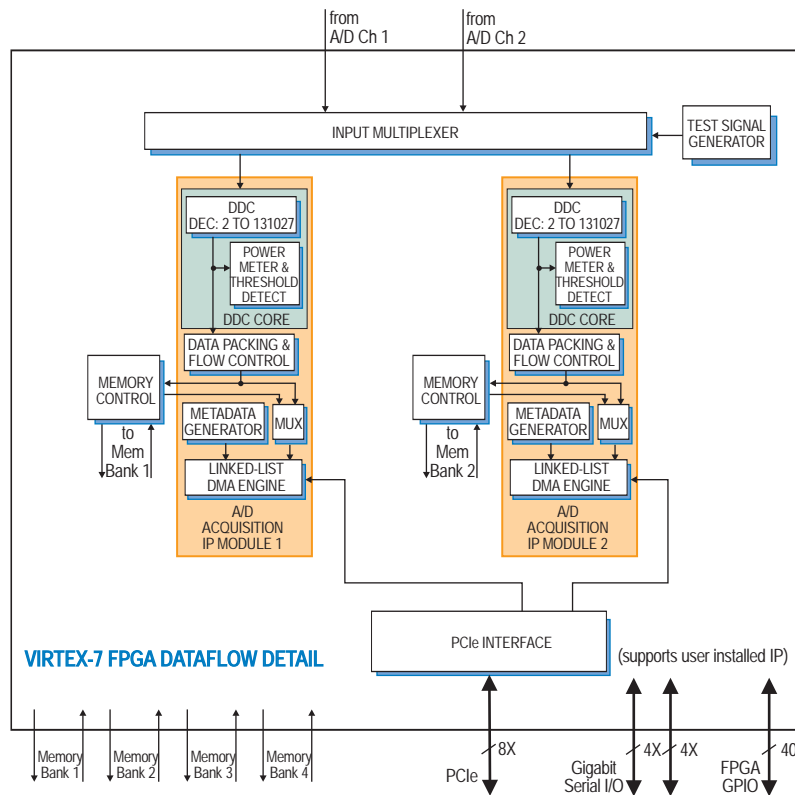

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz, typically from an L-Band antenna or an LNB (low noise block). The Maxim MAX2121 tuner directly converts these L-Band signals to IF or baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA, a PLL (phase-locked loop) synthesized local oscillator, quadrature (I+Q) down-converting mixers, output low pass filters, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to one of three selectable frequency references: the timing generator output, an external reference input between 12 and 30 MHz, or an on-board crystal oscillator.

Together, the RF LNA and baseband amplifiers accommodate input signal levels from -50 dBm to +10 dBm. The integrated low pass filter has a 3 dB bandwidth of 123.75 MHz.

For best performance, the analog outputs of the MAX2121 should be used in the IF mode instead of the analog baseband I+Q mode. In this case, the IF signal is digitized by the A/D converter and then delivered to the DDC to produce perfectly balanced digital I+Q complex samples, 16 bits each. ▶

► In this case the IF signal frequency is chosen by setting an appropriate VCO tuning frequency, A/D sample clock frequency, and DDC decimation factor to achieve optimal flatness, anti-aliasing, SNR and SFDR performance, based on the Maxim 2121 datasheet specifications. All three of these parameters are programmable by the user.

### GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and re-loading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converters and DDCs

The two analog tuner outputs are digitized by two Texas Inst. ADS5463 500 MHz 12-bit A/D converters. Another benefit of using the preferred IF analog output mode is that two independent A/D and DDC channels are now available for digitizing and downconverting two signals with different center frequencies and bandwidths.

### A/D Clocking & Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the board. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave boards, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53791 architecture supports four independent 1 GB DDR3 SDRAM for transient capture and buffering data to PCIe.

The factory-installed A/D acquisition modules use memory banks 1 and 2. Banks 3 and 4 can be used to support custom user-installed IP within the FPGA.

### Fabric-Transparent Crossbar Switch

The 53791 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

Data paths can be selected as single (1X) lanes, or groups of four lanes (4X). ►

► **PCI Express Interface**

The Model 53791 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Input**

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

**L-Band Tuner**

**Type:** Maxim MAX2121  
**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:**

-97 dBc/Hz at 10 kHz

**Fractional-N PLL Synthesizer:**

$$freq_{VCO} = (N.F.) \times freq_{REF}$$

where integer N = 19 to 251 and fractional F is a 20-bit binary value

**PLL Reference (freq<sub>REF</sub>):** Front panel

SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz

**LNA Gain:** 60 dB range, controlled by a

programmable 12-bit D/A converter

**Usable Full-Scale Input Range:**

-50 dBm to +10 dBm

**Baseband Low Pass Filter:**

3 dB cutoff frequency: 123.75 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 10 MHz to 500 MHz

**Resolution:** 12 bits

**Option -014:** 400 MHz, 14-bit A/Ds

**Sample Clock Sources:** On-board timing generator/synthesizer

**A/D Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

**Timing Generator External Clock Input**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

**Custom I/O**

**Option -104:** Provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O

**Option -105:** Provides one 8X or two 4X gigabit links between the FPGA and VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

# Model 53131

# 8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

Model 53131 COTS (left) and rugged version

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53131 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53131 is a multichannel, high-speed data converter with multiband DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multi-board clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53131 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53131 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

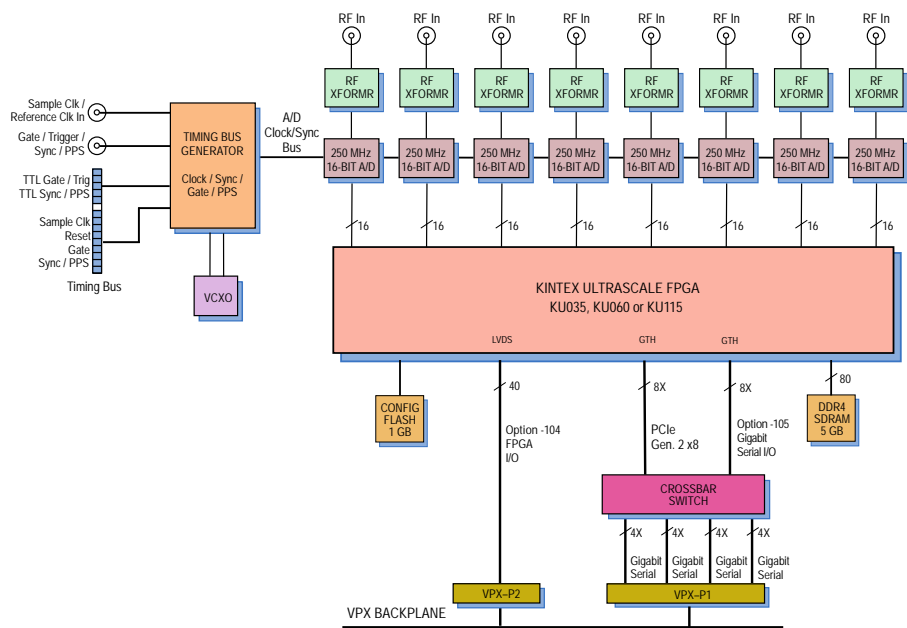

Each of the eight acquisition IP modules contains a powerful, multiband DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 53131 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through ➤

**A/D Acquisition IP Modules**

The 53131 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all eight DDCs or each of the eight A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as eight different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an

output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **KU115.** The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 connects one 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer-coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the

A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

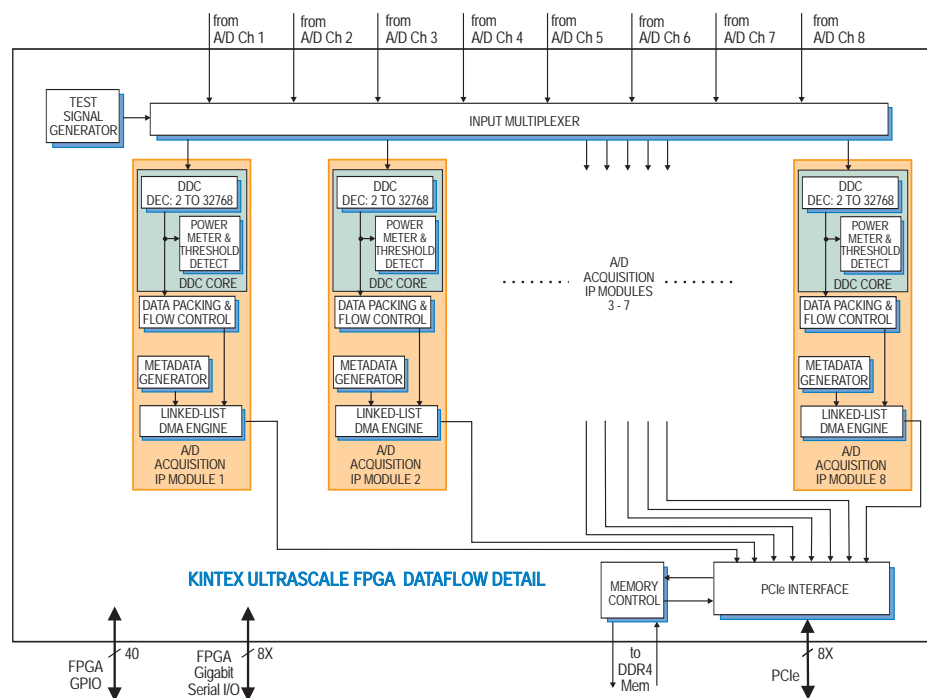

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 7893 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The 53131 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Crossbar Switch**

The 53131 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Ordering Information**

Model	Description
52131	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

**Options:**

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O
-105	Gigabit serial FPGA I/O
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**► PCI Express Interface**

The Model 53131 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

- Input Type:** Transformer-coupled, front panel female MMCX connectors
- Transformer Type:** Coil Craft WBC4-6TLB
- Full Scale Input:** +4 dBm into 50 ohms
- 3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

- Type:** Texas Instruments ADS42LB69
- Sampling Rate:** 10 MHz to 250 MHz
- Resolution:** 16 bits

**Digital Downconverters**

- Quantity:** Eight channels
- Decimation Range:** 2x to 32,768x in three stages of 2x to 32x
- LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$
- LO SFDR:** >108 dB
- Phase Offset Resolution:** 32 bits, 0 to 360 degrees

- FIR Filter:** 18-bit coefficients, 24-bit output, user-programmable coefficients
- Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

- Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus
- Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz
- Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

- Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

- Type:** Front panel female MMCX connector, LVTTTL
- Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

- Option -104:** Connects 20 LVDS pairs between the FPGA and VPX P2
- Option -105:** Connects eight gigabit serial lanes between the FPGA and VPX P1

**Memory**

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

- PCI Express Bus:** Gen. 1 or 2: x4 or x8

**Environmental**

- Standard:** L0 (air cooled)
- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C
- Relative Humidity:** 0 to 95%, non-condensing
- Option -702: L2 (air cooled)**
- Operating Temp:** -20° to 65° C
- Storage Temp:** -40° to 100° C
- Relative Humidity:** 0 to 95%, non-condensing
- Option -713: L3 (conduction cooled)**
- Operating Temp:** -40° to 70° C
- Storage Temp:** -50° to 100° C
- Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100.00 mm x 170.60 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
<b>Form Factor</b>	3U VPX	
<b># of XMCs</b>	One XMC	
<b>Crossbar Switch</b>	No	Yes
<b>PCIe path</b>	VPX P1	VPX P1 or P2
<b>PCIe width</b>	x4	x4 or x8
<b>Option -104 path</b>	24 pairs on VPX P2	20 pairs on VPX P2
<b>Option -105 path</b>	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
<b>Lowest Power</b>	Yes	No
<b>Lowest Price</b>	Yes	No

# Model 53132

# 8-Channel 250 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - 3U VPX

Model 53132 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Eight 250 MHz 16-bit A/Ds
- Eight wideband DDCs (digital downconverters)
- 64 multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

### General Information

Model 53132 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53132 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes eight A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53132 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container

for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53132 factory-installed functions include eight A/D acquisition IP modules for simplifying data capture and transfer.

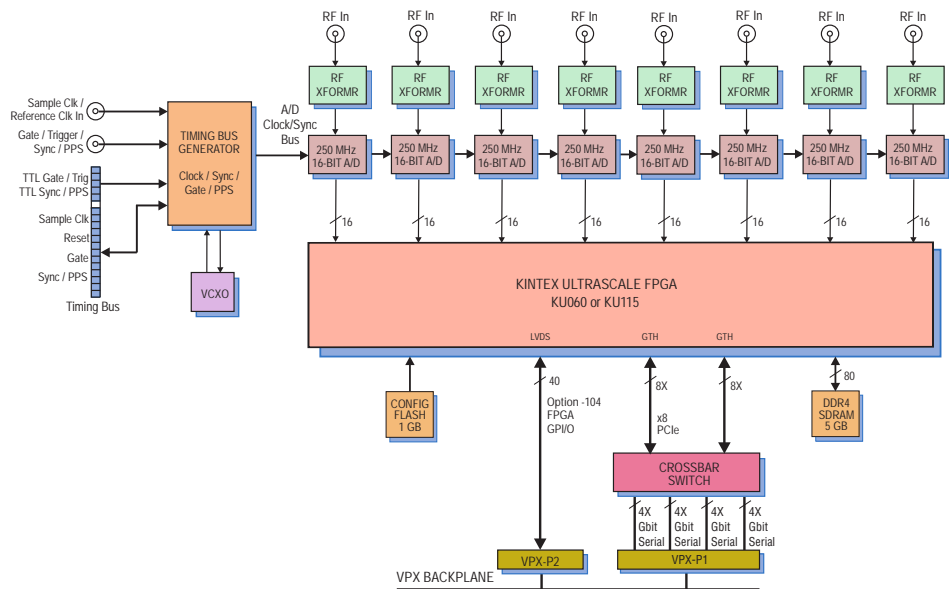

Each of the eight acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 53132 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with FPGAs to match the specific requirements of the processing task. Included are the KU060 and the KU 115. ▶

**A/D Acquisition IP Modules**

The 52862 features eight A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the eight A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each acquisition module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 16 to 1024 in steps of 8.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the KU060 FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts eight analog HF or IF inputs on front panel MMCX connectors with transformer coupling into four Texas Instruments ADS42LB69 dual 250 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal-processing or routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, a sync and gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel MMCX connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

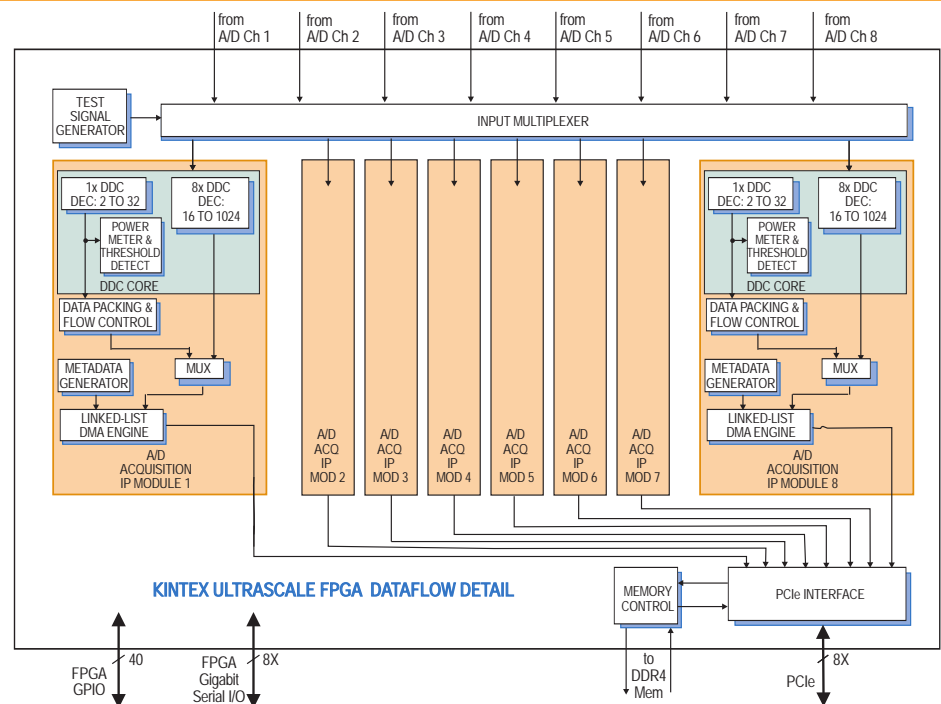

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel MMCX connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 12-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Up to three additional boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards. For larger systems, the Model 5293 System Synchronizer supports additional boards in increments of eight.

**Memory Resources**

The architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of it for custom applications. ►

► **PCI Express Interface**

The Model 53132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Crossbar Switch**

The 53132 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (**Model 8266**), a 3U VPX chassis (**Model 8267**) or a 6U VPX chassis (**Model 8264**), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

New

# Model 53141

# 1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - 3U VPX

Model 53141CORS (left) and Rugged versions

## Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 6.4 GHz, 12-bit A/D
- Two-channel mode with 3.2 GHz, 12-bit A/Ds
- Programmable DDCs (Digital Downconverters)
- Two 6.4 GHz, 14-bit D/As
- Programmable DUCs (Digital Upconverters)
- 5 GB of DDR4 SDRAM
- $\mu$ Sync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

## General Information

Model 53141 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53141 is a high-speed analog-to-digital and digital-to-analog converter with programmable DDCs (digital downconverters) and DUCs (digital upconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and generator features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 6.4 GHz, 12-bit A/D converter, dual 6.4 GHz, 14-bit D/As and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 53141 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

## The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-

installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

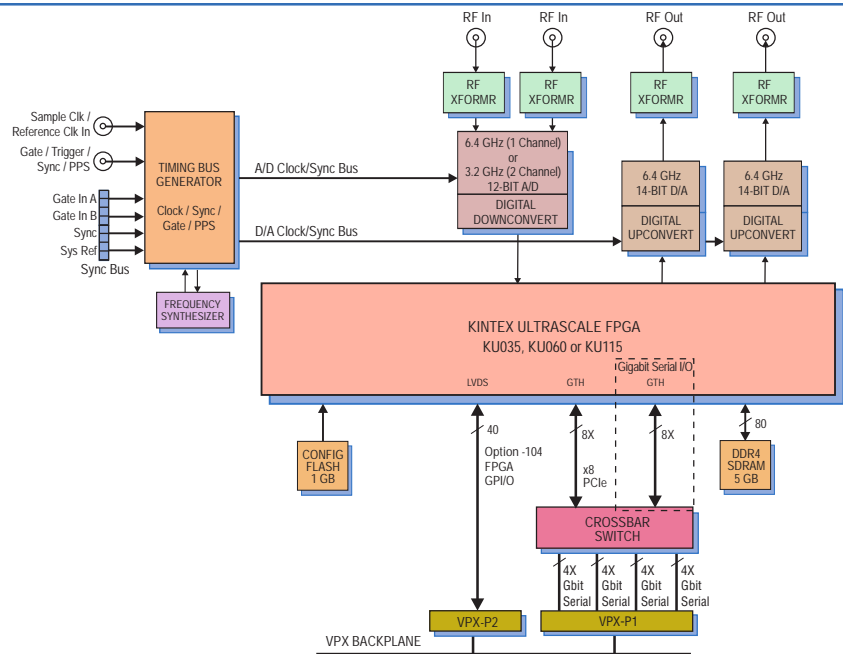

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53141 factory-installed functions include two A/D acquisition and two D/A waveform generator IP modules. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 53141 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

## Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

## Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

**A/D Acquisition IP Module**

The 53141 features two A/D Acquisition IP Modules for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated a 5 GB DDR4 memory for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Generator IP Module**

The Model 53141 factory installed functions include a sophisticated D/A Waveform Generator IP module. It allows users to easily record to the dual D/As waveforms stored in either on-board memory or off-board host memory.

► and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 installs 24 pairs of LVDS connections between the FPGA and the VPX P2 connector the for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and a serial connector to support serial protocols.

**A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer-coupling into a Texas Instruments ADC12DJ3200 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 6.4 GHz and an input bandwidth of 7.9 GHz; or, in dual-channel mode with a sampling rate of 3.2 GHz and input bandwidth of 8.1 GHz.

The A/D’s built-in digital down-converters support 2x decimation in real output mode and 4x, 8x, or 16x decimation in complex output mode. The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC38RF82 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. When operating as a DUC, it interpolates and translates real

or complex baseband input signals. It delivers real or quadrature (I+Q) analog outputs to the dual 14-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC38RF82 acts as a dual interpolating 14-bit D/A. In both modes the DAC38RF82 provides interpolation factors from 1x to 24x.

**Memory Resources**

The 53141 architecture supports a 5 GB bank of DDR4 SDRAM memory.

User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

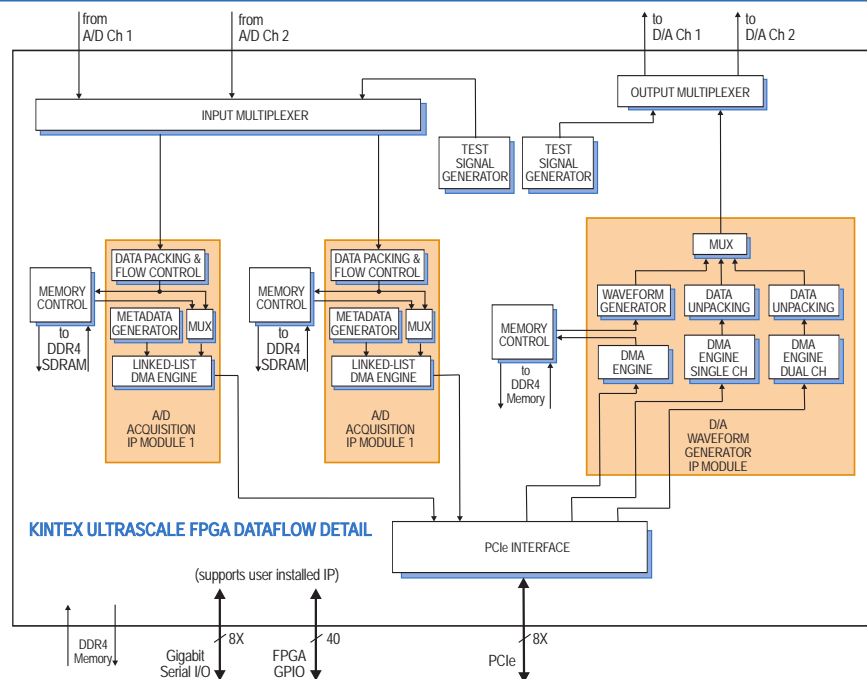

**PCI Express Interface**

The Model 53141 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x4, the interface includes multiple DMA controllers for efficient transfers to and from the module.

**Clocking and Synchronization**

The 53141 accepts a sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel µSync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The µSync bus includes gate, reset, and in and out reference clock signals. The Model 5292 high-speed sync board can be used to drive the sync bus to synchronize multichannel systems. ►

**Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PC rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
53141	1-Ch. 6.4 GHz or 2-Ch. 3.2 GHz A/D, 2-Ch. 6.4 GHz D/A, Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O
- 105	Gigabit serial FPGA I/O
- 702	Air cooled, Level L2
- 713	Convection cooled, Level L3

**Fabric-Transparent Crossbar Switch**

The 53161 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** ADC12DJ3200

**Sampling Rate:** Single-channel mode: 6.4 GHz; dual-channel mode: 3.2 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 7.9 GHz; dual-channel mode: 8.1 GHz

**D/A Converters**

**Type:** Texas Instruments DAC38RF82

**Output Sampling Rate:** 6.4 GHz.

**Resolution:** 14 bits

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin µSync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105** provides one 4X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.037 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 53xxx product, please refer to the product datasheet. The table below provides a comparison of their many features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

Note: Not all combinations of sample rates, decimations and interpolations are available due to JESD204B and PCIe rate limitations.

# Model 53821

## 3-Channel 200 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - 3U VPX

Model 53821 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53821 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53821 is a 3-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes three A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, three DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53821 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating,

triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

The 53821 factory-installed functions include three A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

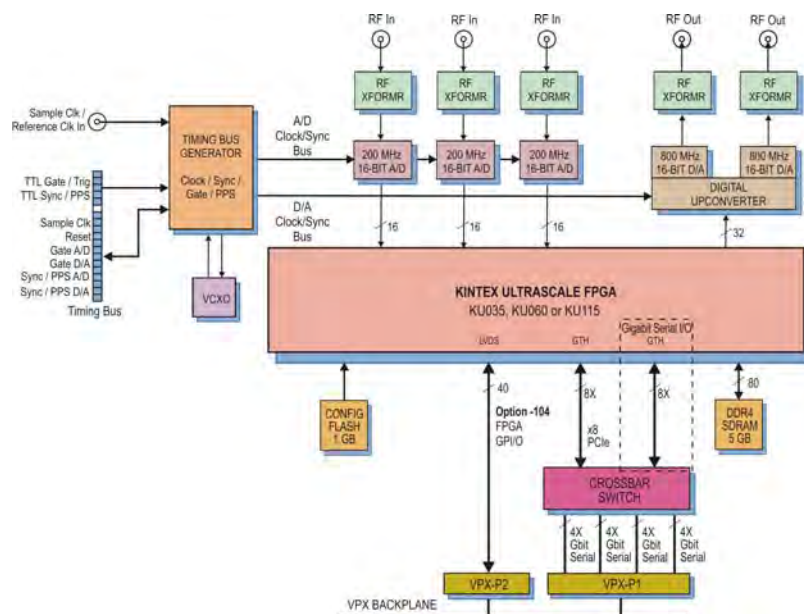

Additional IP includes: three powerful, programmable DDC IP cores; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 53821 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115. ➤

**A/D Acquisition IP Modules**

The 53821 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 53821 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

► The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other board resources.

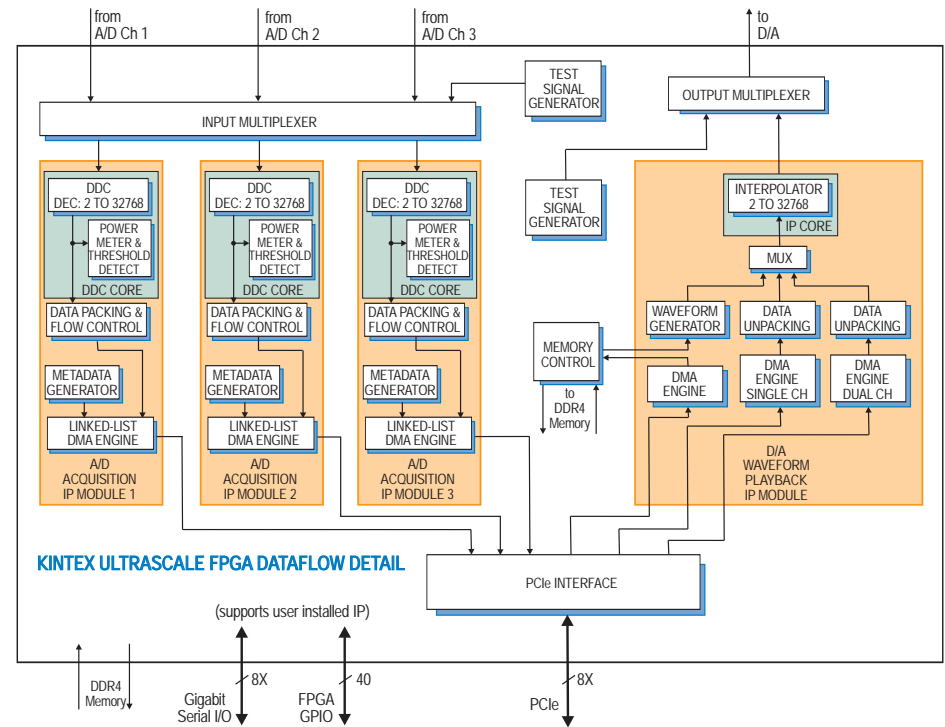

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output band-

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency from DC to the sample rate. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53821's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53821 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 53821 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
53821	3-Channel 200 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 3U VPX

**Options:**

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through VPX P2
-105	Gigabit serial FPGA I/O through VPX P1
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator Core**

**Interpolation Range:** 2x to 32,768x in three stages of 2x to 32x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.937 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes

# Model 53841

# 1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Kintex UltraScale FPGA - 3U VPX

Model 53841 COTS (left) and rugged version

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Down-converter)
- 5 GB of DDR4 SDRAM
- $\mu$ Sync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53841 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53841 is a high-speed data converter with programmable DDCs (digital down-converters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 53841 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

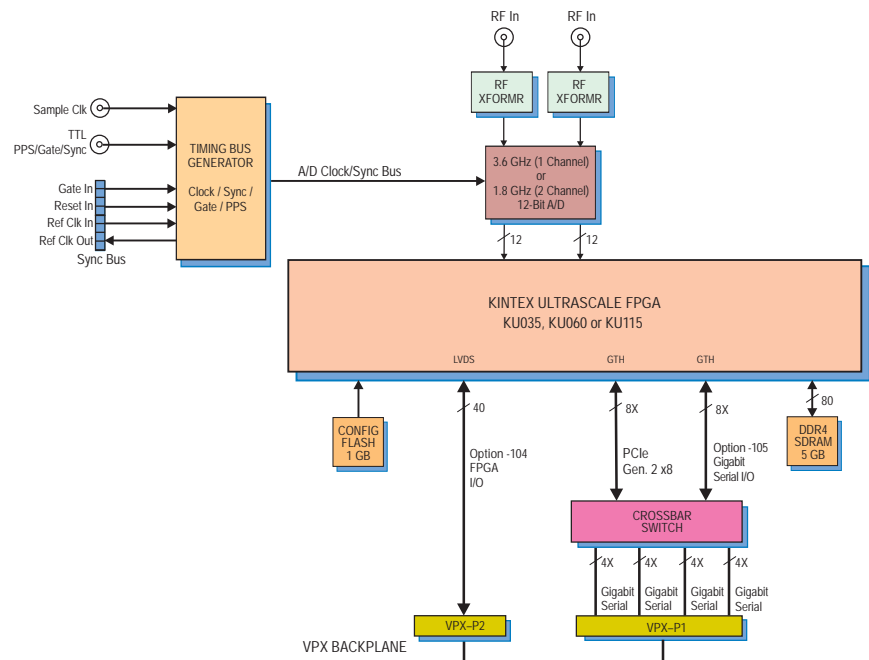

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53841 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In addition, IP modules for DDR4 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 53841 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek Navigator FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices ➤

**A/D Acquisition IP Module**

The 53841 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has an associated 5 GB memory bank for buffering data in FIFO mode or for storing data in transient capture mode.

In single-channel mode, all of 5 GB are used to store the single-channel of input data. In dual-channel mode, one half of the memory stores data from input channel 1 and the other half stores data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory bank is supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In single-channel mode, decimation can be programmed to 8 or 16 to 512 in steps of 16.

In dual-channel mode, decimation can be programmed to 4 or 8 to 256 in steps of 8. In dual-channel mode, both channels share the same decimation rate.

In either mode, the DDC can be bypassed completely.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

➤ and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 connects one 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

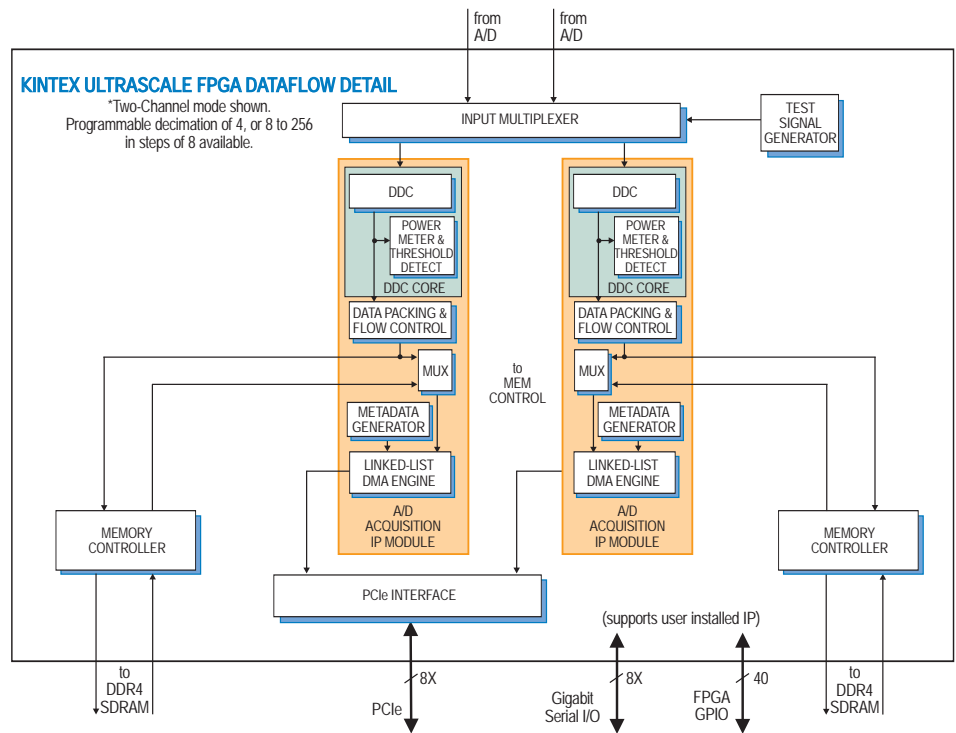

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The full-scale input level of the ADC12D1800 can be digitally trimmed from +2 dBm to +4 dBm to simplify system calibration. A built-in AutoSync feature supports A/D synchronization across multiple boards

The A/D digital outputs are delivered into the Kintex UltraScale FPGA for signal processing, data capture or for routing to other board resources.

**PCI Express Interface**

The Model 53841 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board ➤

**Model 8267**

The Model 8267 is a fully-integrated development system for Pentek Cobalt, Onyx and Flexor 3U VPX boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

**Memory Resources**

The 53841 architecture supports an optional 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

**Crossbar Switch**

The 53841 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Programmable signal input equalization and output pre-emphasis settings enable optimization.

**Ordering Information**

Model	Description
53841	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D with Wideband DDC, Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
- 104	LVDS FPGA I/O
- 105	Gigabit serial FPGA I/O
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**Clocking and Synchronization**

The 53841 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 53841's can be synchronized with a simple cable. For larger systems, multiple 53841's can be synchronized using the Model 7192 high-speed sync module to drive the sync bus.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**A/D Converter**

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input Level:** may be trimmed from +2 dBm to +4 dBm with a 15-bit integer

**Digital Downconverters**

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Single-channel mode:** decimation can be programmed to 8 or 16 to 512 in steps of 16

**Dual-channel mode:** decimation can be programmed to 4 or 8 to 256 in steps of 8; both channels

share the same decimation value

**Either mode:** the DDC can be bypassed completely

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** Connects 20 LVDS pairs between the FPGA and VPX P2

**Option -105:** Connects 8X gigabit serial links between the FPGA and VPX P1 or P2

**Memory**

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3.937 in. x 6.717 in. (100 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 53xxx and the 52xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

**VPX Family Comparison**

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x8
Option -104 path	20 pairs on VPX P2	
Option -105 path	Two x4 or one x8 on VPX P1	Two x4 or one x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53851

## 2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and Kintex UltraScale FPGA - 3U VPX

Model 53851 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Optional 400 MHz 14-bit A/Ds
- Ruggedized and conduction-cooled versions available

### General Information

Model 53851 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53851 is a 2-channel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes two A/Ds, a complete multiboard clock and sync section, a large DDR4 memory, two DDCs, one DUC and two D/As. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53851 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces.

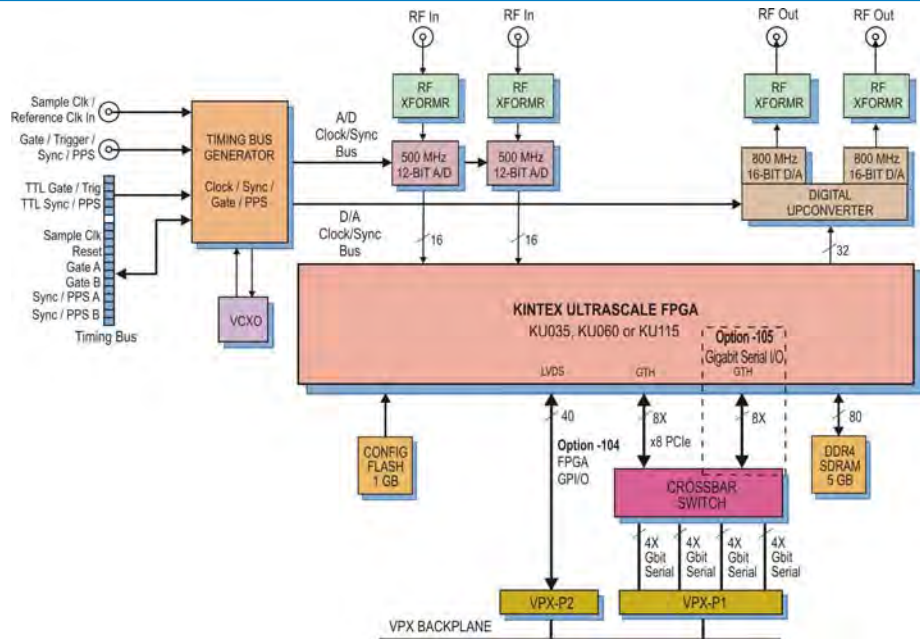

The 53851 factory-installed functions include two A/D acquisition and a waveform playback IP module for simplifying data capture and playback, and data transfer between the board and a host computer.

Additional IP includes: a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; two test signal generators; a programmable interpolator, and a PCIe interface. These complete the factory-installed functions and enable the 53851 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 53851 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, or a test signal generator.

Each acquisition module has a DMA engine for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

widths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 53851 factory-installed functions include a sophisticated D/A Waveform Playback IP module. It allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

**Xilinx Kintex UltraScale FPGA**

Depending on the requirements of the processing task, the Kintex Ultrascale can be selected from a range of FPGAs spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

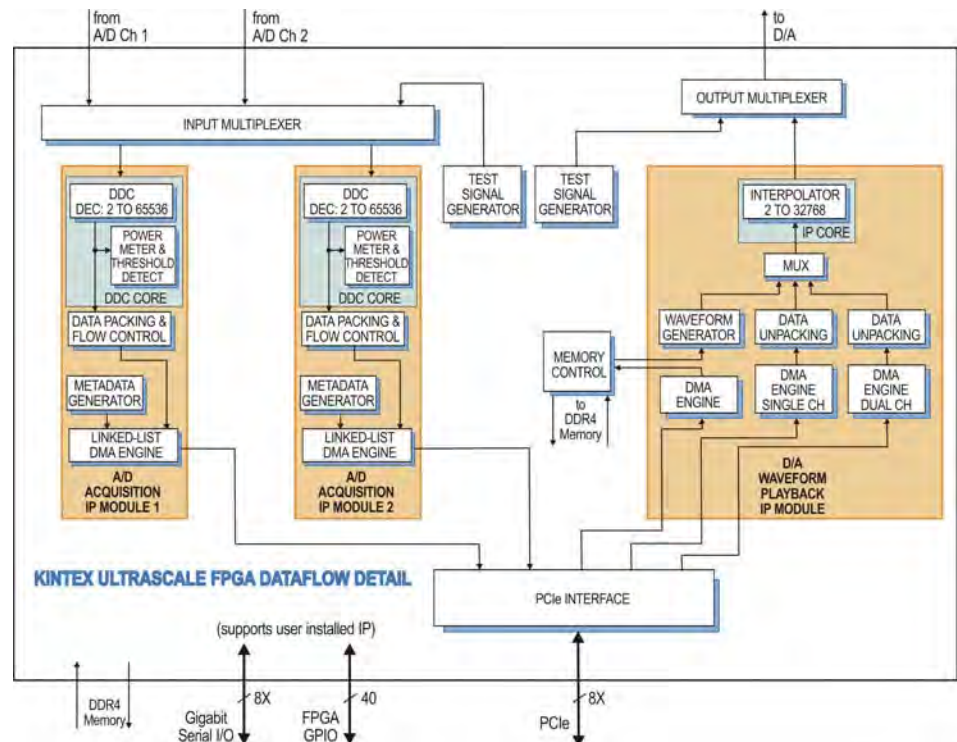

Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be factory-installed instead of the ADS5463.

The digital outputs are delivered into the Kintex FPGA for signal processing, data capture and for routing to other module resources. ➤

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output band-

### ► Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 32,768x. The two interpolators can be combined to create a total range from 2x to 262,144x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 53851's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### Memory Resources

The 53851 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications.

### PCI Express Interface

The Model 53851 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Fabric-Transparent Crossbar Switch

The 53851 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
53851	2-Channel 500 MHz A/D with DDCs, DUC with 2-Channel 800 MHz D/A, and Kintex UltraScale FPGA - 3U VPX

**Options:**

-014	400 MHz, 14-bit A/Ds
-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through VPX P2 connector
-105	Gigabit serial FPGA I/O through VPX P1 connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► **Digital Downconverters**

**Quantity:** Two channels  
**Decimation Range:** 2x to 65,536x in three stages of 2x to 32x and one fixed stage of 2x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**D/A Converters**

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

**Digital Interpolator Core**

**Interpolation Range:** 2x to 32,768x in one stage of 2x to 256x and one stage of 2x to 128x

**Total Interpolation Range (D/A and interpolator core combined):** 2x to 262,144x

**Front Panel Analog Signal Outputs**

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104:** provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O  
**Option -105:** Provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** 3U VPX board 3.937 in x 6.717 in (100.00 mm x 170.61 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	One x8 on VPX P1	One x8 on VPX P1 or P2

# Model 53861

# 4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

Model 53861 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53861 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53861 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53861 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

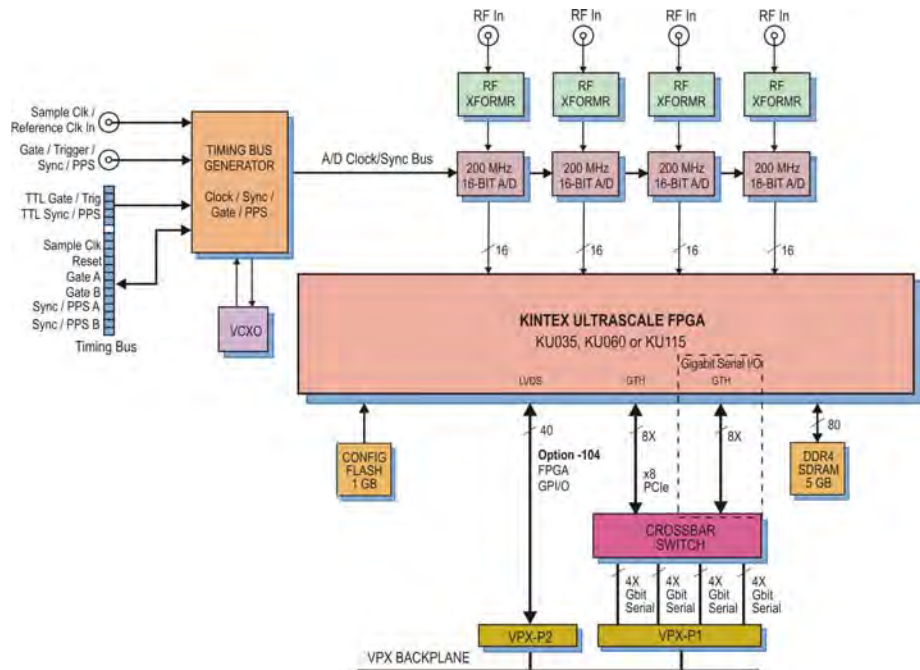

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53861 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 53861 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 53861 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 32,768 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ ,

where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Kintex UltraScale FPGA for signal processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

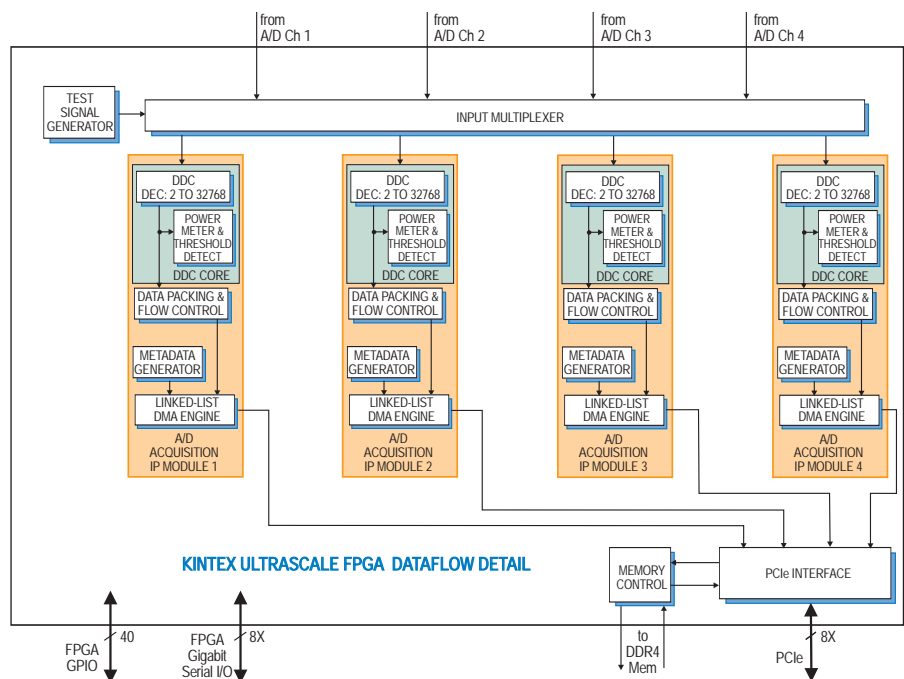

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 53861 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**► Fabric-Transparent Crossbar Switch**

The 53861 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system. Each SPARK system is delivered with the Pentek board(s) and required software installed and equipped with sufficient cooling and power to ensure optimum performance.

**Ordering Information**

Model	Description
53861	4-Channel 200 MHz A/D with DDCs and Kintex UltraScale FPGA - 3U VPX

**Options:**

- 084	XCKU060-2 FPGA
- 087	XCKU115-2 FPGA
-104	LVDS FPGA I/O to VPX P2
-105	Gigabit serial FPGA I/O to VPX P1
- 702	Air cooled, Level L2
- 713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

**PCI Express Interface**

The Model 53861 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

**Specifications**

**Front Panel Analog Signal Inputs**

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**A/D Converters**

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Digital Downconverters**

**Quantity:** Four channels  
**Decimation Range:** 2x to 32,768x in three stages of 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

**Clock Synthesizer**

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

**External Clock**

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

**External Trigger Input**

**Type:** Front panel female SSMC connector, LVTTTL  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Field Programmable Gate Array**

**Standard:** Xilinx Kintex UltraScale XCKU035-2  
**Option -084:** Xilinx Kintex UltraScale XCKU060-2  
**Option -087:** Xilinx Kintex UltraScale XCKU115-2

**Custom I/O**

**Option -104** provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.  
**Option -105** provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**Memory**

**Type:** DDR4 SDRAM  
**Size:** 5 GB  
**Speed:** 1200 MHz (2400 MHz DDR)

**PCI-Express Interface**

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

**Environmental**

**Standard: L0 (air cooled)**  
**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-condensing  
**Option -702: L2 (air cooled)**  
**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing  
**Option -713: L3 (conduction cooled)**  
**Operating Temp:** -40° to 70° C  
**Storage Temp:** -50° to 100° C  
**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Board 3.937 in. x 6.717 in. (100.0 mm x 170.6 mm)

**VPX Families**

Pentek offers two families of 3U VPX products: the 52xxx and the 53xxx. For more information on a 52xxx product, please refer to the product datasheet. The table below provides a comparison of their main features.

	52xxx	53xxx
Form Factor	3U VPX	
# of XMCs	One XMC	
Crossbar Switch	No	Yes
PCIe path	VPX P1	VPX P1 or P2
PCIe width	x4	x4 or x8
Option -104 path	24 pairs on VPX P2	20 pairs on VPX P2
Option -105 path	One x8 on VPX P1	One x8 on VPX P1 or P2
Lowest Power	Yes	No
Lowest Price	Yes	No

# Model 53862

# 4-Channel 200 MHz A/D with Multiband DDCs and Kintex UltraScale FPGA - 3U VPX

Model 53862 COTS (left) and rugged version

### Features

- Complete radar and software radio interface solution
- Supports Xilinx Kintex UltraScale FPGAs
- Four 200 MHz 16-bit A/Ds
- Four wideband DDCs and
- 32 multiband DDCs (digital downconverters)
- 5 GB of DDR4 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Compatible with several VITA standards including: VITA-46, VITA-48 and VITA-65 (OpenVPX™ System Specification)
- Ruggedized and conduction-cooled versions available

### General Information

Model 53862 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA-based boards, simplifying the design to reduce power and cost, while still providing some of the highest-performance FPGA resources available today. Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data acquisition and processing.

The 53862 is a multichannel, high-speed data converter with programmable DDCs (digital downconverters). It is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA-processing IP.

It includes four A/Ds, a complete multiboard clock and sync section and a large DDR4 memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53862 includes optional high-bandwidth connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing,

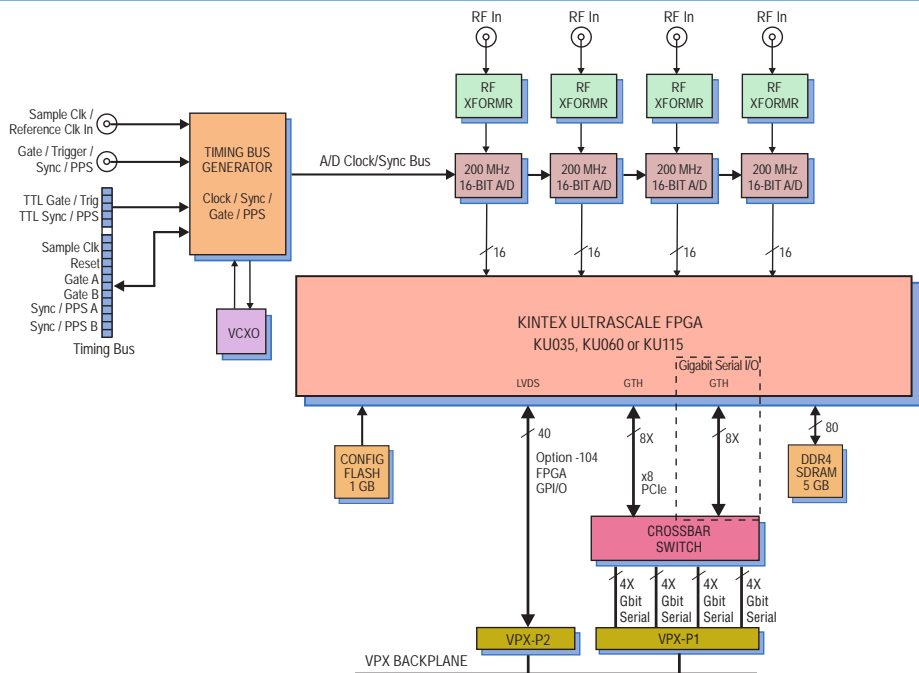

channel selection, data packing, gating, triggering and memory control. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 53862 factory-installed functions include four A/D acquisition IP modules for simplifying data capture and transfer.

Each of the four acquisition IP modules contains a powerful, programmable DDC IP core; an IP module for DDR4 SDRAM memory; a controller for all data clocking and synchronization functions; a test signal generator; and a PCIe interface. These complete the factory-installed functions and enable the 53862 to operate as a complete turnkey solution for many applications, thereby saving the cost and time of custom IP development.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite. In addition to the block diagrams, all source code and complete IP core documentation is included.) Developers can integrate their own IP along with the Pentek factory-installed functions or use the Navigator kit to completely replace the Pentek IP with their own. ➤

**A/D Acquisition IP Modules**

The 53862 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated DMA engine for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module are two powerful DDC IP cores. A single-channel wideband DDC core and an eight-channel multiband DDC core. Each Acquisition Module can choose between the two cores allowing for a very flexible downconversion solution.

Each wideband DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting. Decimations can be programmed from 2 to 32.

Each multiband DDC has eight DDC channels each with its own independent 32-bit tuning frequency setting that ranges from DC to  $f_s$  where  $f_s$  is the A/D sampling frequency. Decimations can be programmed from 2 to 1024.

The decimating filters for all DDCs accept a unique set of user-supplied 24-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

► **Xilinx Kintex UltraScale FPGA**

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115. The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 provides 20 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

Option -105 provides one 8X gigabit link between the FPGA and the VPX P1 connector to support serial protocols.

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four TI ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Kintex UltraScale FPGA for signal processing or routing to other board resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit.

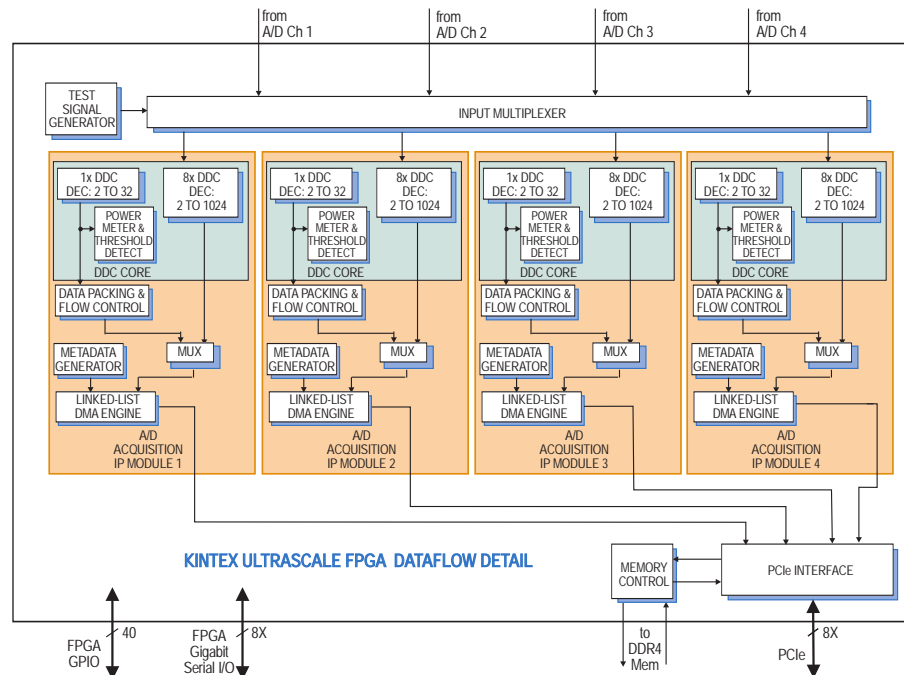

In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple boards can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

**Memory Resources**

The 53862 architecture supports a 5 GB bank of DDR4 SDRAM memory. User-installed IP along with the Pentek-supplied DDR4 controller core within the FPGA can take advantage of the memory for custom applications. ►

**► Fabric-Transparent Crossbar Switch**

The 53862 features a unique high-speed switching configuration. A fabric-transparent crossbar switch bridges numerous interfaces and components on the board using gigabit serial data paths with no latency. Data paths can be selected as single (1X) lanes, or groups of four lanes (4X).

**PCI Express Interface**

The Model 53862 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board. ►

**SPARK Development Systems**

The SPARK Development Systems are fully-integrated platforms for Pentek Cobalt, Onyx, Jade and Flexor boards. Available in a PCIe rackmount (Model 8266), a 3U VPX chassis (Model 8267) or a 6U VPX chassis (Model 8264), they were created to save engineers and system integrators the time and expense associated with building and testing a development system.

# Model 53800

# Kintex UltraScale FPGA Coprocessor- 3U VPX

Model 5380 COTS (left) and rugged version

### General Information

Model 53800 is a member of the Jade™ family of high-performance 3U VPX boards. The Jade architecture embodies a new streamlined approach to FPGA based boards, simplifying the design to reduce power and cost, while still providing some of the highest performance FPGA resources available today.

Designed to work with Pentek's new Navigator™ Design Suite of tools, the combination of Jade and Navigator offers users an efficient path to developing and deploying FPGA-based data processing IP.

In addition to supporting PCI Express Gen. 3 as a native interface, the Model 53800 includes optional high-bandwidth serial and parallel connections to the Kintex UltraScale FPGA for custom digital I/O.

### The Jade Architecture

Evolved from the proven designs of the Pentek Cobalt and Onyx families, Jade raises the processing performance with the new flagship family of Kintex UltraScale FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths. The Jade architecture organizes the FPGA as a container for data-processing applications where each function exists as an intellectual property (IP) module.

Each member of the Jade family is delivered with factory-installed applications ideally matched to the board's interfaces. The 53800 factory-installed functions include a test signal generator, a metadata generator, a DDR4 SDRAM controller, and DMA engines for moving data on and off the board.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. The Pentek Navigator FPGA Design Kits include the board's entire FPGA design as a block diagram that can be edited in Xilinx's Vivado tool suite.

In addition to the block diagrams, all source code and complete IP core documentation is included. Developers can integrate their own IP along with the wide range of IP functions contained in the Navigator IP library, or use the Navigator kit to completely replace the Pentek IP with their own.

### Xilinx Kintex UltraScale FPGA

The Kintex UltraScale FPGA site can be populated with a range of FPGAs to match the specific requirements of the processing task, spanning the KU035 through KU115.

The KU115 features 5520 DSP48E2 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, a lower-cost FPGA can be installed.

Option -104 connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.

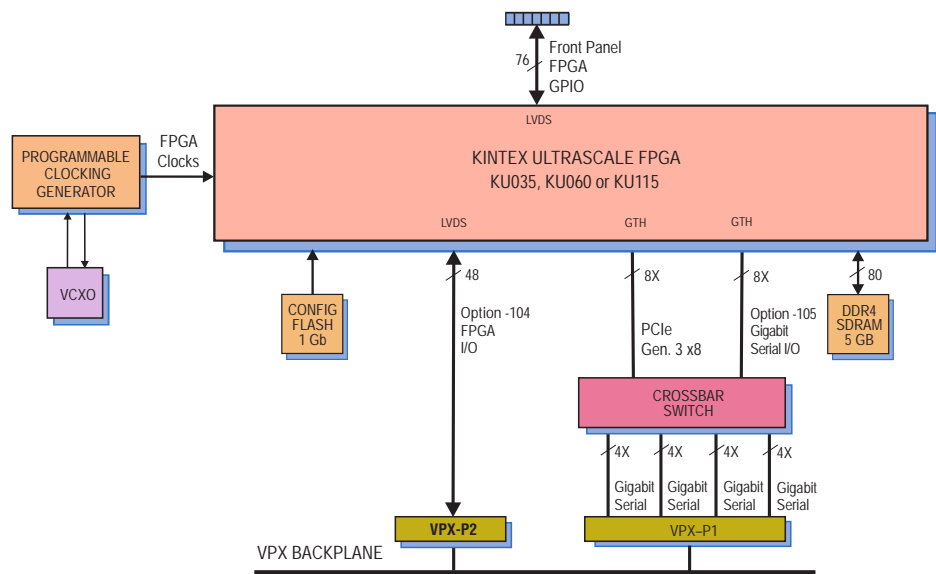

Option -105 connects an 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

### Front Panel Digital I/O Interface

The 53800 includes an 80-pin front panel connector that provides 38 LVDS pairs connected to the FPGA. With user IP, these can be utilized for a control and status interface to other components of the system or as a data path.

### Features

- Hi-performance coprocessor platform
- Supports Xilinx Kintex UltraScale FPGAs
- Front panel digital I/O can be used as a status and control or data interface
- PCI Express (Gen. 1, 2 & 3) interface up to x4
- Optional LVDS and gigabit serial connections to the FPGA for custom I/O
- Ruggedized and conduction-cooled versions available

## Specifications

### Front Panel Digital I/O

- Connector Type:** 80-pin connector, mates to a ribbon cable connector
- Signal Quantity:** 38 pairs
- Signal Type:** LVDS

### Field Programmable Gate Array

- Standard:** Xilinx Kintex UltraScale XCKU035-2
- Option -084:** Xilinx Kintex UltraScale XCKU060-2
- Option -087:** Xilinx Kintex UltraScale XCKU115-2

### Custom I/O

- Option -104** connects 24 pairs of LVDS connections between the FPGA and the VPX P2 connector for custom I/O.
- Option -105** connects an 8X gigabit serial link from the FPGA to the VPX P1 connector to support serial protocols.

### Memory

- Type:** DDR4 SDRAM
- Size:** 5 GB
- Speed:** 1200 MHz (2400 MHz DDR)

### PCI-Express Interface

- PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### Environmental

- Standard:** L0 (air cooled)
- Operating Temp:** 0° to 50° C
- Storage Temp:** -20° to 90° C

### Option -702: L2 (air cooled)

- Operating Temp:** -20° to 65° C
- Storage Temp:** -40° to 100° C

### Option -713: L3 (conduction cooled)

- Operating Temp:** -40° to 70° C
- Storage Temp:** -50° to 100° C

**Relative Humidity in all options:** 0 to 95%, non-condensing

**Size:** 3U VPX card 3.937 in x 6.717 in (100.00 mm x 149.00 mm)

# Model 8267

# 3U VPX Development System for Cobalt, Onyx and Flexor Boards

### Features

- 9-slot, 4U 19-inch rackmount, 12-inch deep chassis which houses 3U VPX boards
- 64-bit Windows® 7 Professional or Linux® workstation
- Intel® Core™ i7 3.6 GHz processor
- 16 GB DDR3 SDRAM
- ReadyFlow® drivers and board support libraries installed
- Out-of-the-box ready-to-run examples

### Ordering Information

Model	Description
8267	3U VPX Development System for Cobalt, Onyx and Flexor Boards

#### Options:

-094	64-bit Linux OS
-095	64-bit Windows 7 OS
-101	Upgrade to 16 GB DDR3 SDRAM

The addition of third-party VPX boards may affect system performance. Please consult with us before doing so.

### General Information

The Model 8267 is a fully-integrated, 3U VPX development system for Pentek Cobalt®, Onyx® and Flexor™ software radio, data acquisition, and I/O boards. It was created to save engineers and system integrators the time and expense associated with building and testing a development system that ensures optimum performance of Pentek boards.

A fully-integrated system-level solution, the 8267 provides the user with a streamlined out-of-the-box experience. It comes preconfigured with Pentek hardware, drivers and software examples installed and tested to allow development engineers to run example applications out of the box.

### ReadyFlow Software

Pentek ReadyFlow drivers and board support libraries are preinstalled and tested with the 8267. ReadyFlow includes example applications with full source code, a command line interface for custom control over hardware, and Pentek's Signal Analyzer, a full-featured analysis tool that continuously displays live signals in both time and frequency domains.

### System Implementation

Built on a professional 4U rackmount workstation, the 8267 is equipped with the latest Intel i7 processor, DDR3 SDRAM and a high-performance single-board computer. These features accelerate application code development and provide unhindered access to the high-bandwidth data available with Cobalt, Onyx and Flexor analog and digital interfaces. The 8267 can be configured with 64-bit Windows or Linux operating systems.

The 8267 uses a 19" 4U rackmount chassis that is 12" deep. Nine VPX slots provide ample space for an SBC, a switch card and multiple Pentek boards. Enhanced forced-air ventilation assures adequate cooling for all boards and dual 250-W power supplies guarantee more than adequate power for all installed boards. Mounting provisions for two 3.5 in. drives with front-accessible trays allow for easy removable storage. Front-panel access to USB, display, Ethernet and RS-232 ports simplifies development; an optional rear transition module supplements the front-panel connections with SATA, audio, a second video interface, and additional USB ports.

### Configuration

All 8267 systems come with software and hardware installed and tested. Up to seven Pentek boards in the 8267 can be supported. Please contact Pentek to configure a system that matches your specific requirements.

### Options

Available options include high-end multi-core CPUs and extended memory support.

### Specifications

**Operating System:** 64-bit Windows 7 Professional or Linux

**Processor:** Intel Core i7 processor

**Clock Speed:** 3.6 GHz

**SDRAM:** 16 GB standard

**Dimensions:** 4U Chassis, 19" W x 12" D x 7" H

**Weight:** 35 lb, approx.

**Operating Temp:** 0° to +50° C

**Storage Temp:** -40° to +85° C

**Relative Humidity:** 5 to 95%, non-condensing

**Power Requirements:** 100 to 240 VAC, 50 to 60 Hz, 1000 W max.

# RADAR & SDR I/O - AMC

## MODEL

## DESCRIPTION

<a href="#">Cobalt 56620</a>	3-Channel 200 MHz A/D, 2-Channel 800 MHz D/A, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56621</a>	3-Channel 200 MHz A/D with DDC, DUC, 2-Channel 800 MHz D/A, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56624</a>	Dual-Channel, 34-Signal Adaptive IF Relay - AMC
<a href="#">Cobalt 56630</a>	1 GHz A/D and D/A, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56640</a>	1-Channel 3.6 GHz or 2-Channel 1.8 GHz 12-bit A/D, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56641</a>	1-Channel 3.6 GHz or 2-Channel 1.8 GHz 12-bit A/D, Wideband DDC, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56650</a>	Two 500 MHz A/Ds, DUC, 800 MHz D/As, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56651</a>	2-Chan 500 MHz A/D with DDC, DUC with 2-Chan 800 MHz D/A, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56660</a>	4-Channel 200 MHz, 16-bit A/D, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56661</a>	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - AMC
<a href="#">Cobalt 56662</a>	4-Channel 200 MHz A/D with 32-Channel DDC and Virtex-6 FPGA - AMC
<a href="#">Cobalt 56663</a>	1100-Channel GSM Channelizer with Quad A/D - AMC
<a href="#">Cobalt 56664</a>	4-Channel 200 MHz A/D with DDCs, VITA-49, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56670</a>	4-Channel 1.25 GHz D/A with DUC, Virtex-6 FPGA - AMC
<a href="#">Cobalt 56671</a>	4-Channel 1.25 GHz D/A with DUC, Extended Interpolation and Virtex-6 FPGA - AMC
<a href="#">Cobalt 56690</a>	L-Band RF Tuner, 2-Channel 200 MHz A/D, Virtex-6 FPGA - AMC
<a href="#">Onyx 56720</a>	3-Channel 200 MHz A/D with DDC, DUC, 2-Channel 800 MHz D/A, Virtex-7 FPGA - AMC
<a href="#">Onyx 56721</a>	3-Channel 200 MHz A/D with DDC, DUC, 2-Channel 800 MHz D/A, Virtex-7 FPGA - AMC
<a href="#">Onyx 56730</a>	1 GHz A/D and D/A, Virtex-7 FPGA - AMC
<a href="#">Onyx 56741</a>	1-Ch. 3.6 GHz or 2-Ch. 1.8 GHz, 12-bit A/D, w/ Wideband DDC, Virtex-7 FPGA - AMC
<a href="#">Onyx 56751</a>	2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A, Virtex-7 FPGA - AMC
<a href="#">Onyx 56760</a>	4-Channel 200 MHz, 16-bit A/D, Virtex-7 FPGA - AMC
<a href="#">Onyx 56761</a>	4-Channel 200 MHz, 16-bit A/D with DDCs and Virtex-7 FPGA - AMC

### ► PCI Express Interface

The Model 56132 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### AMC Interface

The Model 56132 complies with the AMC.1 specification by providing an x8 PCIe connection to Advanced TCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female MMCX connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS42LB69  
**Sampling Rate:** 10 MHz to 250 MHz  
**Resolution:** 16 bits

#### Wideband Digital Downconverters

**Quantity:** Eight channels  
**Decimation Range:** 2x to 32x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Multiband Digital Downconverters

**Quantity:** Eight banks, 8 channels per bank  
**Decimation Range:** 16x to 1024x in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$ , independent tuning for each channel  
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 24-bit coefficients, 24-bit output, user-programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female MMCX connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 12-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female MMCX connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Option -084:** Xilinx Kintex UltraScale XCKU060-2

**Option -087:** Xilinx Kintex UltraScale XCKU115-2

#### Custom I/O

**Option -104** provides 24 pairs of LVDS connections between the FPGA and a front-panel connector for custom I/O

#### Memory

**Type:** DDR4 SDRAM

**Size:** 5 GB

**Speed:** 1200 MHz (2400 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

#### Environmental

**Standard:** L0 (air cooled)

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -702: L2 (air cooled)**

**Operating Temp:** -20° to 65° C

**Storage Temp:** -40° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Option -713: L3 (conduction cooled)**

**Operating Temp:** -40° to 70° C

**Storage Temp:** -50° to 100° C

**Relative Humidity:** 0 to 95%, non-condensing

**Size:** Single-width, full-height AMC module  
2.890 in x 7.110 in (73.40 mm x 180.6 mm)

### Ordering Information

Model	Description
56132	8-Channel 250 MHz A/D with DDCs and Kintex UltraScale FPGA - AMC

#### Options:

-084	XCKU060-2 FPGA
-087	XCKU115-2 FPGA
-104	LVDS FPGA I/O through front-panel connector
-702	Air cooled, Level L2
-713	Conduction cooled, Level L3

Contact Pentek for complete specifications of rugged and conduction-cooled versions

► module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56620 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or µTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56620 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft

WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T

**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8; Gen. 2: x4

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56620	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-6 FPGA - AMC
<b>Options:</b>	
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through front panel connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56621 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56621 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56621 factory installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to

the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56621 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

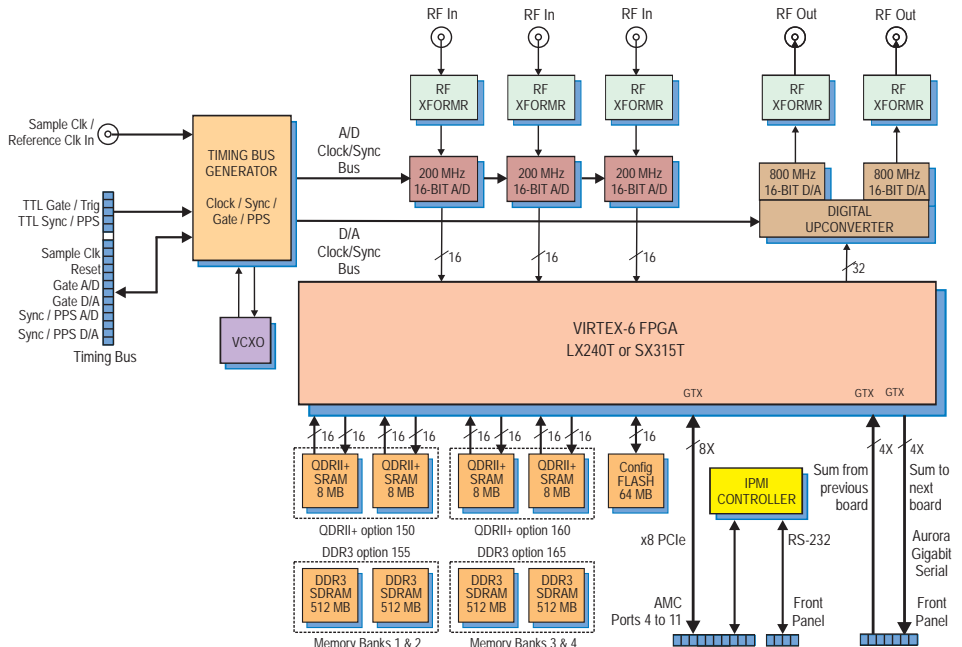

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 56621 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56621 features a complete beamforming subsystem. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

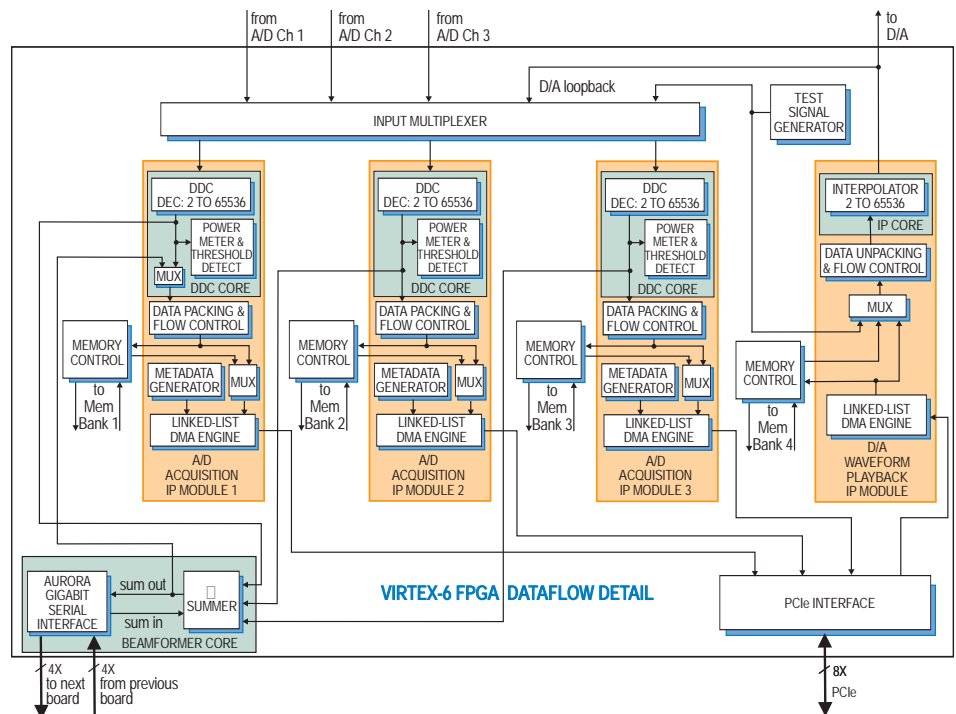

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56621's can be chained together via a built-in Xilinx Aurora gigabit serial interface which allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 56621 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56621's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 56621 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56621 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56621 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Three channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VSX315T

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

#### AMC Interface

**Type:** AMC.1  
**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56621	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - AMC

#### Options:

-062	XC6VLX240T
-064	XC6VSX315T
-104	LVDS FPGA I/O through front panel connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

New!

Features

- Modifies 34 IF signals between input and output
- Up to 80 MHz IF bandwidth
- Two 200 MHz 16-bit A/Ds
- Two 800 MHz 16-bit D/As
- 34 DDCs and 34 DUCs (digital downconverters and digital upconverters)
- Signal drop/add/replace
- Frequency shifting and hopping
- Amplitude boost and attenuation
- PCI Express Gen. 1: x4 or x8

General Information

Model 56624 is a member of the Cobalt® family of high-performance AMC boards based on the Xilinx Virtex-6 FPGA. As an IF relay, it accepts two IF analog input channels, modifies up to 34 signals, and then delivers them to two analog IF outputs. Any signal within each IF band can be independently enabled or disabled, and changed in both frequency and amplitude as it passes through the module.

The 56624 supports many useful functions for both commercial and military communications systems including signal drop/add/replace, frequency shifting and hopping, amplitude equalization, and bandwidth consolidation. Applications include countermeasures, active tracking and monitoring, channel security, interception, adaptive spectral management, jamming, and encryption.

The Pentek Cobalt product family features the Virtex-6 FPGA. All of the board's data converters, interfaces and control lines are connected to the FPGA, which performs the data-routing and DSP functions for the adaptive relay.

A PCIe Gen. 1 system interface supports control, status and data transfers.

Adaptive Relay Input Overview

The Model 56624 digitizes two analog IF inputs using two 200 MHz 16-bit A/D converters. The bandwidth of each IF signal can be up to 80 MHz, and may contain multiple signals, each centered at a different frequency. An array of 34 DDCs (digital downconverters) can be independently

programmed to translate any signal to baseband and then bandlimit the signal as required. DDC tuning frequency is programmable from 0 Hz to the A/D sample rate. Output bandwidth is programmable from around 20 kHz to 312 kHz for a sample rate of 200 MHz. Each DDC can independently source IF data from either of the two A/Ds.

Baseband I+Q DDC outputs are scaled in a programmable gain/attenuation block before being delivered across the PCIe system interface to target memory, typically associated with a system processor. Here, the signals can be analyzed, classified, demodulated, decrypted or decoded, depending on the application.

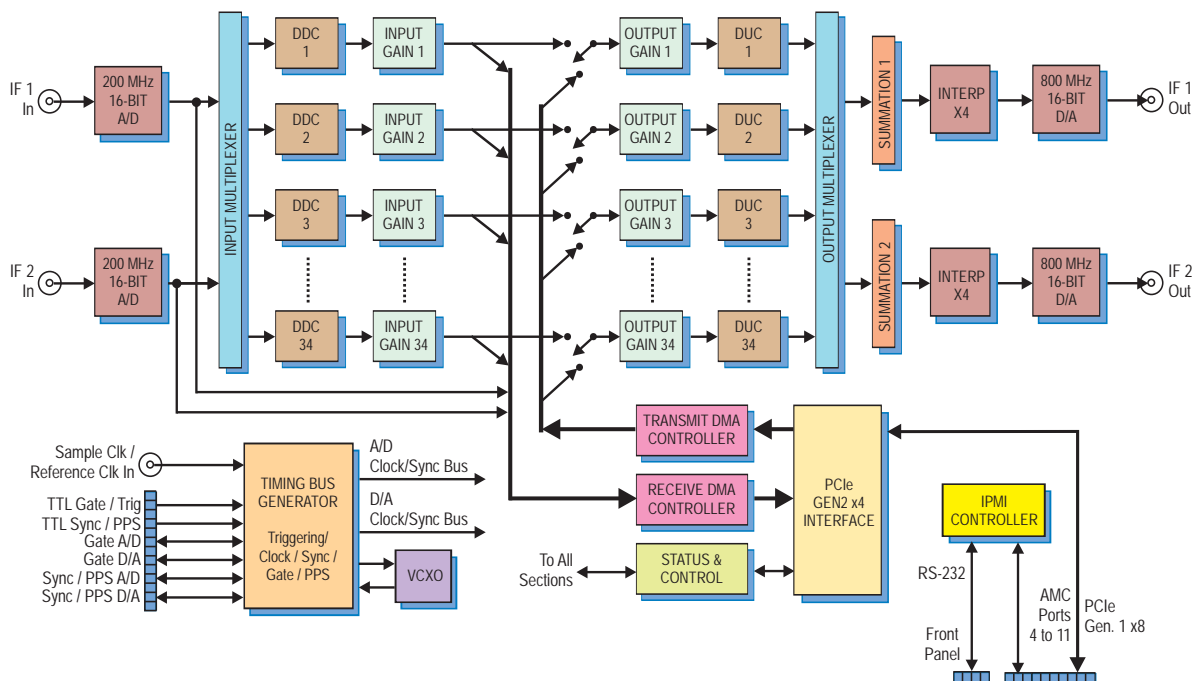

Samples from each A/D converter can also be delivered across PCIe to system memory so that the processor can access wideband IF data. By performing an FFT, the processor can identify signals and then tune the DDCs accordingly.

Adaptive Relay Output Overview

The Model 56624 output stage consists of 34 DUCs (digital upconverters) and two 800 MHz 16-bit D/A converters. Each DUC accepts baseband I+Q signals from either the local DDCs or from system memory.

DUC inputs are scaled in programmable gain/attenuation blocks similar to those in the input stage. Each DUC is independently programmable for data source selection (DDC or memory), upconvert tuning frequency and bandwidth (interpolation).

The translated DUC outputs are directed to either of two summation blocks, each ➤

► associated with one of the two D/A converters using a final interpolation factor of x4. After conversion, the IF analog outputs of each D/A can contain signals from any combination of the 34 DUCs.

### Xilinx Virtex-6 FPGA

The SX315T Virtex-6 FPGA with 1344 DSP48E engines is well suited for the demanding signal processing tasks required by the Model 56624 adaptive relay. Because of the complexity and proprietary nature of these functions, the FPGA cannot be extended or modified by the user.

### A/D Converters

The front-end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer-coupling into two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for the data capture and all of the remaining adaptive relay signal processing operations.

### Digital Downconverters

Each of the FPGA-based DDCs has an independent mixer and local oscillator with a 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency, nominally 200 MHz. An IF input signal can be downconverted to a complex (I+Q) signal centered at 0 Hz by setting the DDC tuning frequency to its center frequency.

The DDC output bandwidth is determined by its decimation setting, which is programmable from 512 to 8192 in steps of 8. Each DDC can have a different decimation, thereby supporting up to 34 different signal bandwidths.

The fixed 80% decimating output filters deliver an output bandwidth equal to  $0.8 \cdot f_s / N$ , where  $N$  is the decimation setting and  $f_s$  is the A/D sample rate. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

### Input Gain Blocks

Each DDC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated. Each input gain block, which is a complex digital multiplier, accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in

gain values ranging from approximately +48 dB to -48 dB.

### Receive DMA Controller

Two output DMA engines deliver data across the PCIe interface into user-specified memory locations in PCIe target memory. DMA engine #1 can deliver either raw samples from A/D Ch 1 or channel-interleaved 24-bit I and Q baseband samples from the 34 DDCs. Data samples from each DDC can be independently enabled/disabled for output. DMA engine #2 can deliver raw samples from A/D Ch 2.

When a target memory buffer is filled, the 56624 issues an interrupt to the system processor and then begins filling an alternate buffer. In this way, the processor is always informed when and where data is available for retrieval. Packet headers identify the DDC and show the number of subsequent data samples.

### Transmit DMA Controller

Each of the FPGA-based 34 DUCs interpolates complex (I+Q) baseband signals and translates them to the desired IF output center frequency.

The data source for each DUC can be independently selected from its corresponding DDC output, or from PCIe target memory buffers fetched by the transmit DMA controller, where header information steers the memory data to the appropriate DUC channel.

Like the receive DMA controllers, once a data buffer is emptied, the 56624 signals the processor with an interrupt and moves to the next assigned buffer to continue fetching data.

### Output Gain Blocks

The complex baseband input for each DUC complex output is delivered through a complex gain stage where the baseband signal can be amplified or attenuated.

Each of the output gain blocks accepts a unique 16-bit binary gain coefficient in Q8.8 format (8 bits integer + 8 bits fractional). This results in gain values ranging from approximately +48 dB to -48 dB.

### Digital Upconverters

The interpolation filter increases the baseband input sample rate by an interpolation factor typically equal to the decimation factor of the corresponding DDC. This interpolation factor is programmable from 512 to 8192 in steps of 8. Using this strategy, the interpolation sample rate equals the A/D sample rate, nominally 200 MHz. ►

► A complex digital mixer upconverts the interpolated baseband signal to the desired IF output center frequency. This frequency is determined by a local oscillator programmable with a 32-bit integer from DC to  $f_s$ , where  $f_s$  is the interpolator output frequency, nominally 200 MHz.

Each of the DUCs can have an independent interpolation factor and tuning frequency. However, all DUC outputs sharing a common summation block must have the same sample rate.

### Summation Blocks

Two summation blocks accept any combination of the upconverted DUC signals by setting an enable bit for each DUC's contribution. Each DUC output can be enabled for none, one or both of the summation blocks.

The summation blocks deliver only real output samples to the subsequent D/A converter stage.

### D/A Converters

A TI DAC5688 dual-channel D/A accepts two summed upconverted data streams, one from each summation block, and operates in its non-translating dual, real baseband mode. Its built-in interpolation filter is typically set to x4 mode, boosting the summation output sample rate from a nominal 200 MHz to 800 MHz. This simplifies the output low pass reconstruction filtering requirements.

Two transformer-coupled analog IF outputs are delivered through a pair of front panel SSMC connectors.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks.

In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz

reference clock to phase-lock the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 56624's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### AMC Interface

The Model 56624 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56624 includes an industry-standard interface fully compliant with PCIe Gen. 1 x8 bus specifications. The interface automatically adjusts to accommodate fewer lanes, and includes dual DMA controllers for efficient transfers to and from the board.

### Form Factor Adaptors

All Pentek Cobalt XMC modules can be adapted to other standard embedded system form factors through the use of adaptor boards. Available versions include PCIe, 3U and 6U OpenVPX, 3U and 6U cPCI, and AMC. For more information and the Pentek's Product Selector Tool visit our website at: [www.pentek.com](http://www.pentek.com). ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Quantity:** 2  
**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** 34  
**Decimation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >100 dB  
**Phase Offset:** 1 bit, 0 or 180 degrees  
**FIR Filter:** 18-bit coefficients  
**Output:** Complex, 16-bit I + 16-bit Q  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Input Gain Blocks

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

#### Output Gain Blocks

**Quantity:** 34  
**Data:** Complex, 16-bit I + 16-bit Q  
**Gain Range:** 16-bit Q8.8 format, approximately +/- 48 dB

#### Digital Upconverters

**Quantity:** 34  
**Interpolation Range:** 512 to 8192, in steps of 8  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**FIR Filter:** 18-bit coefficients, 16-bit output  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Analog Output Channels:** 2  
**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 200 MHz max.  
**Output Signal:** Real  
**Output Sampling Rate:** 800 MHz max. with 4x interpolation  
**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz  
**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference  
**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Required:** Xilinx Virtex-6 XC6V56X315T  
**AMC Interface**  
**Type:** AMC.1  
**Module Management:** IPMI Version 2.0

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8

#### Environmental

##### Standard:

**Operating Temp:** 0° to 50° C  
**Storage Temp:** -20° to 90° C  
**Relative Humidity:** 0 to 95%, non-cond.

##### Option 702 L2 Extended Temp (air-cooled):

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

##### Option 712 L2 Extended Temp (conduction-cooled):

**Operating Temp:** -20° to 65° C  
**Storage Temp:** -40° to 100° C  
**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

-702	L2 (air cooled) environmental level
-712	L2 (conduction cooled) environmental level
-730	2-slot heatsink

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56630 is a member of the Cobalt® family of high performance AMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and D/A converters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56630 includes a front panel general-purpose connector for application-specific I/O .

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56630 factory-installed functions include an A/D acquisition and a D/A waveform playback IP module. In addition, IP modules for either DDR3 or QDRII+

memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56630 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

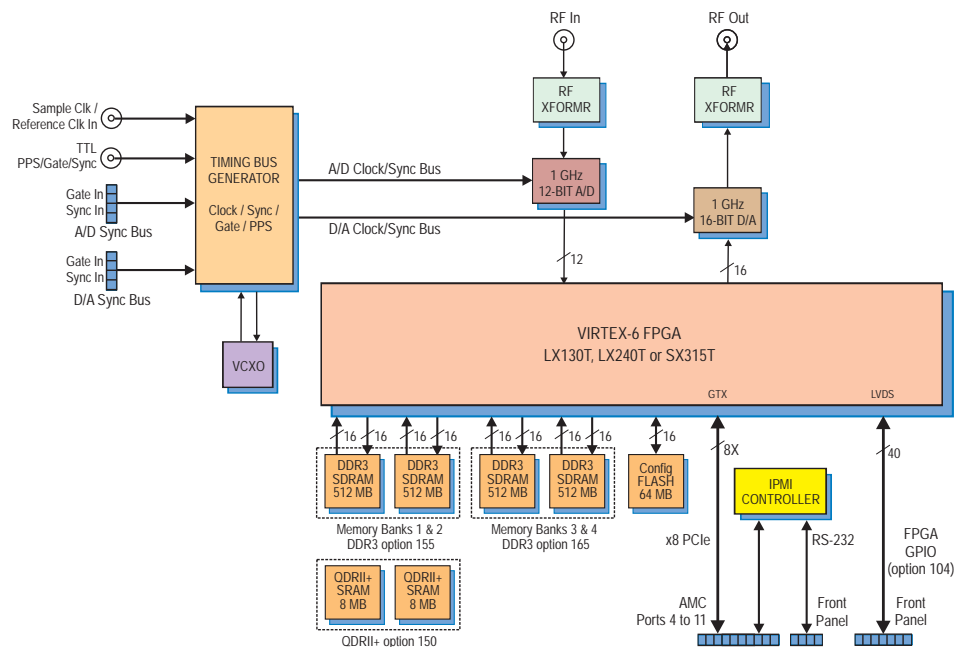

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Module**

The 56630 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 56630 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 56630 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO.

Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

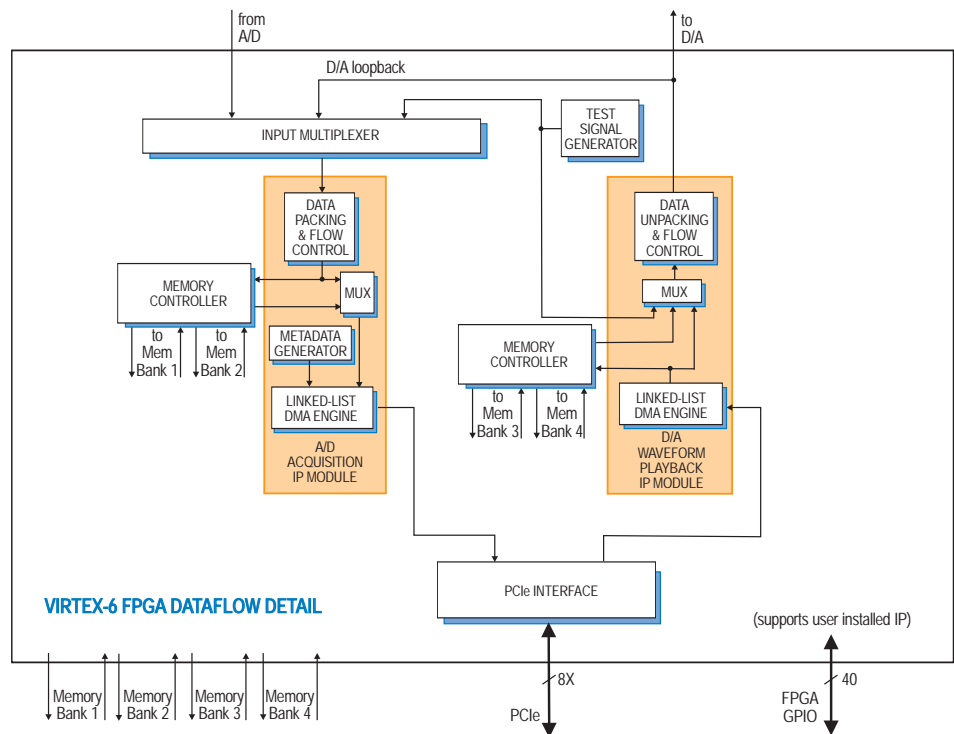

A pair of front panel μSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 5692 and Model 9192 Cobalt Synchronizers can drive multiple 53730 μSync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

**Memory Resources**

The 56630 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory. Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ➤

### ► AMC Interface

The Model 56630 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56630 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

#### A/D Converter

**Type:** Texas Instruments ADS5400

**Sampling Rate:** 100 MHz to 1 GHz

**Resolution:** 12 bits

#### D/A Converter

**Type:** Texas Instruments DAC5681Z

**Input Data Rate:** 1 GHz max.

**Interpolation Filter:** bypass, 2x or 4x

**Output Sampling Rate:** 1 GHz max.

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen.1: x4 or x8; Gen 2: x4

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### General Information

Model 56640 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56640 includes a front panel general-purpose connector for application-specific I/O.

### The Cobalt Architecture

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56640 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a

controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56640 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

### Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow® FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

### Xilinx Virtex-6 FPGA

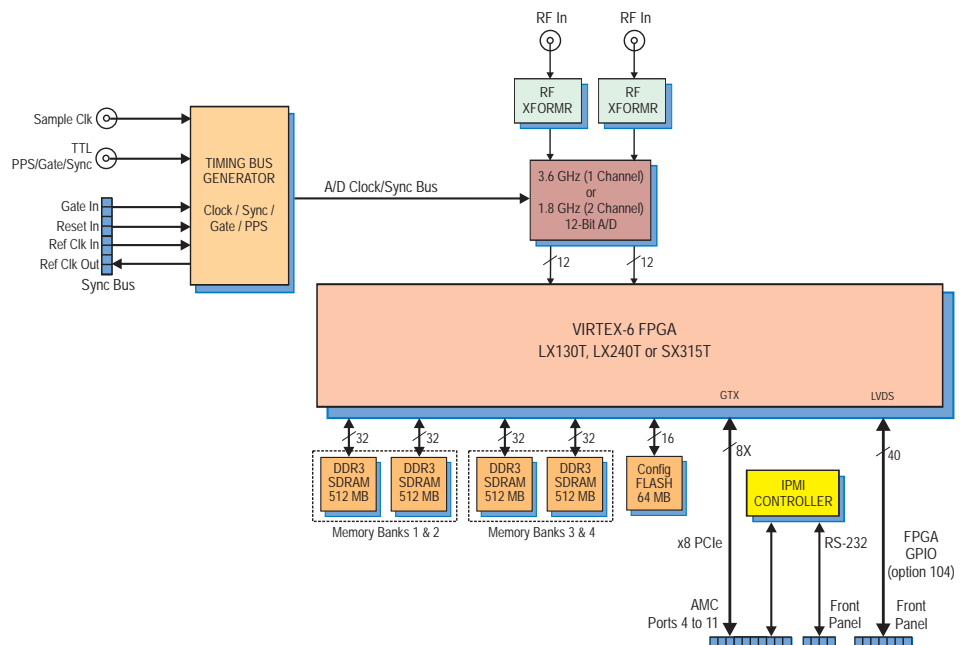

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

### Features

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

► **A/D Converter Stage**

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 56640 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Clocking and Synchronization**

The 56640 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multi-pin sync bus connector allows multiple modules to be

synchronized, ideal for larger multichannel systems. The sync bus includes gate, reset and in and out reference clock signals. Multiple 56640's can be synchronized using the Cobalt high speed sync module to drive the sync bus.

**Memory Resources**

The 56640 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

**AMC Interface**

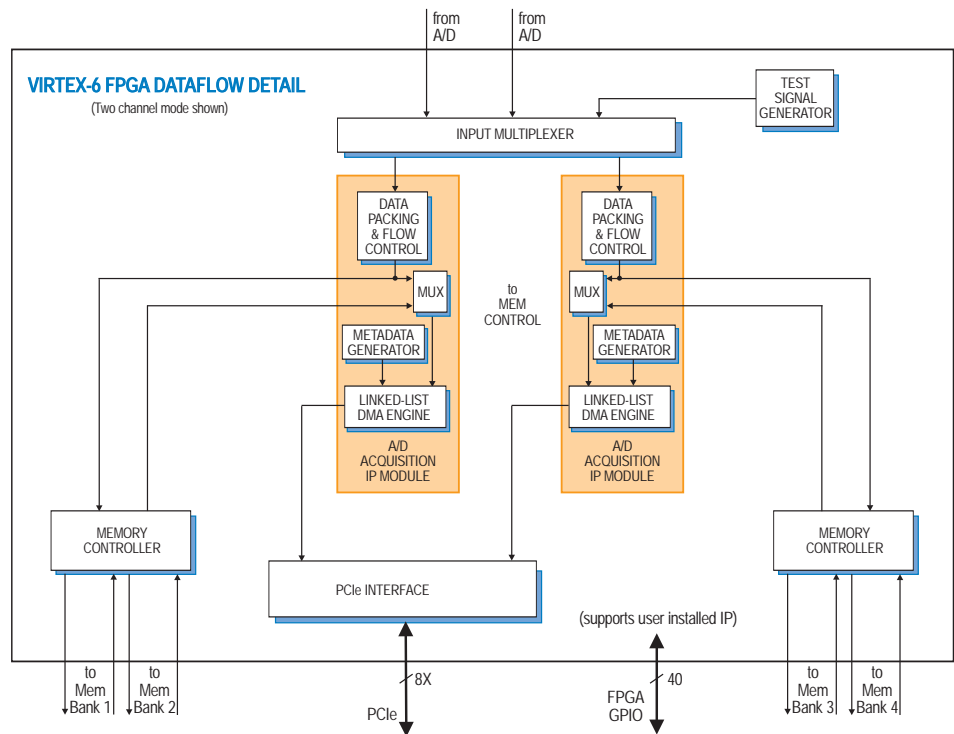

The Model 56640 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or µTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

**A/D Acquisition IP Module**

The 56640 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### ► PCI Express Interface

The Model 56640 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

#### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multi-pin connectors, bus includes gate, reset and in and out ref clock

#### External Trigger Input

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2, or XC6VSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**General Information**

Model 56641 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56641 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56641 factory-installed functions include an A/D acquisition IP module. In addition, IP modules for DDR3 memories, a

controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56641 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

For applications that require additional control and status signals, option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O.

**A/D Converter Stage**

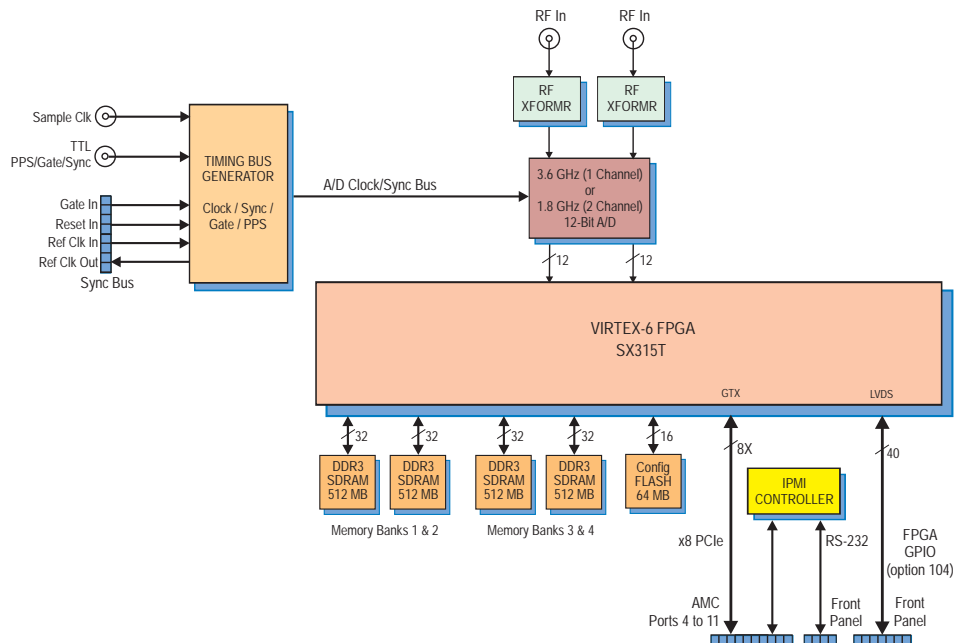

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 71641 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple modules.

The A/D digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources. ➤

**Features**

- Ideal radar and software radio interface solution
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Module**

The 56641 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

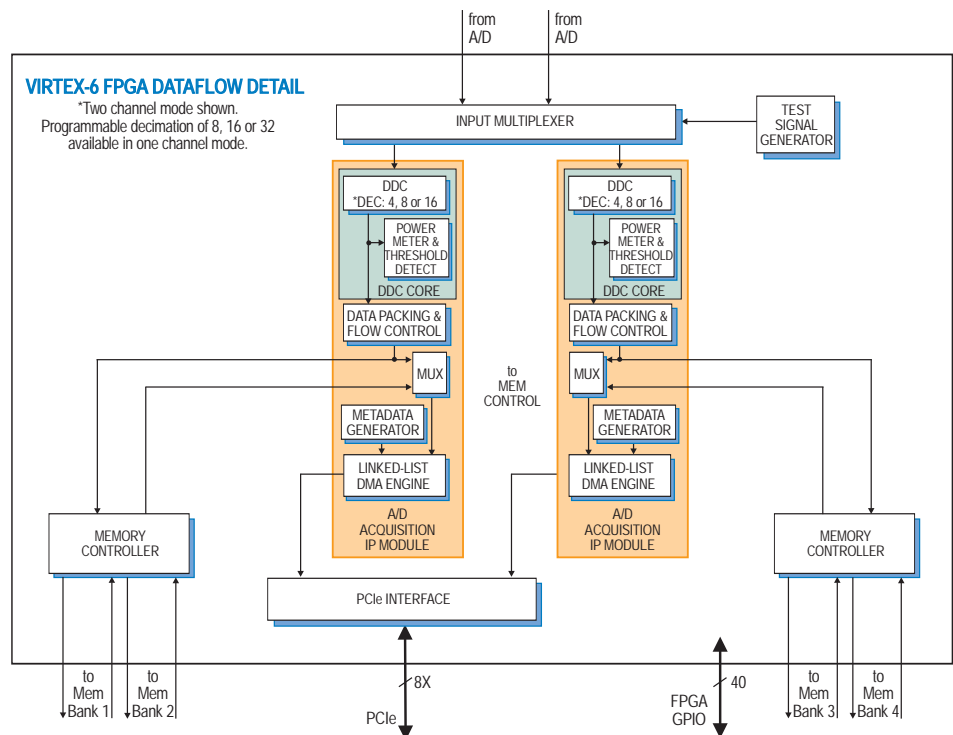

**▶ Clocking and Synchronization**

The 56641 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel multipin sync bus connector allows multiple modules to be synchronized, ideal for multichannel systems. The sync bus includes gate, reset, and in and out reference clock signals. Two 56641's can be synchronized with a simple cable. For larger systems, multiple 56641's can be synchronized using the Cobalt 7192 high-speed sync module to drive the sync bus.

**Memory Resources**

The 56641 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module's DMA and data capture capabilities. Built-in memory functions include an A/D data transient capture mode for taking snapshots of data for transfer to a host computer. ▶

### ► AMC Interface

The Model 56641 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56641 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

#### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

#### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Sources:** Front panel SSMC connector

**Sync Bus:** Multipin front panel connector, includes gate, reset, and in and out ref clock

#### External Trigger Input

**Type:** Front panel female SSMC connector, TTL

**Function:** Programmable functions include trigger and gate

#### Field Programmable Gate Array:

Xilinx Virtex-6 XC6VVSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen. 2: x4 or x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**General Information**

Model 56650 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, one DUC (Digital Upconverter), two D/As, and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56650 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56650 factory-installed functions include two A/D acquisition and one D/A waveform playback IP modules. In addition,

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56650 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

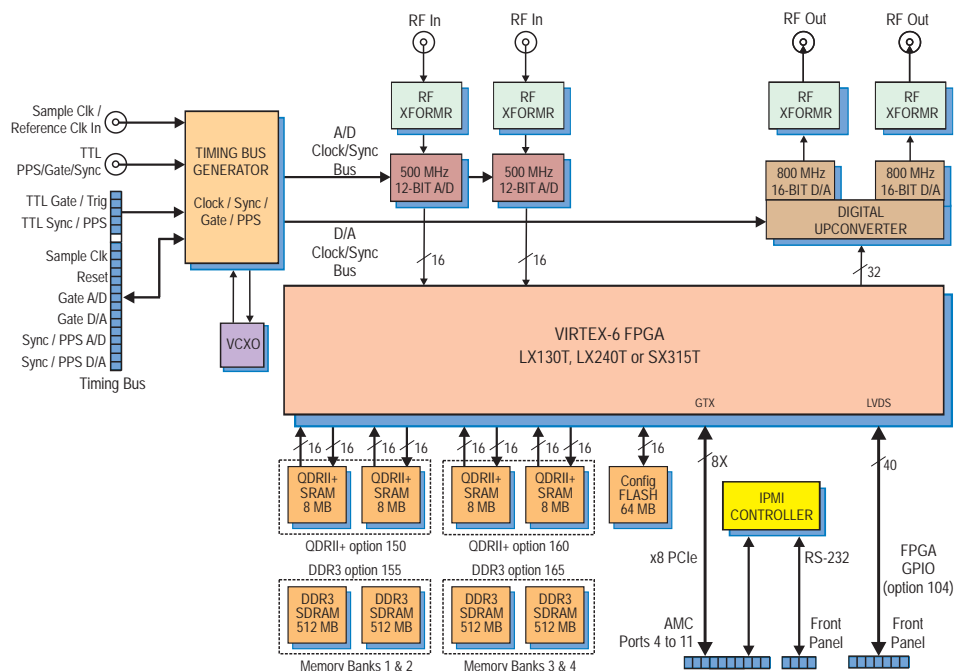

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 56650 features two A/D Acquisition IP Modules for easy capture and data moving. Each IP module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode. Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfers, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp, and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 56650 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the dual D/As.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform. Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**A/D Converter Stage**

The front end accepts two full scale analog HF or IF inputs on front panel SSMC connectors at +5 dBm into 50 ohms with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TI DAC5688 DUC and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

**Clocking and Synchronization**

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an onboard programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

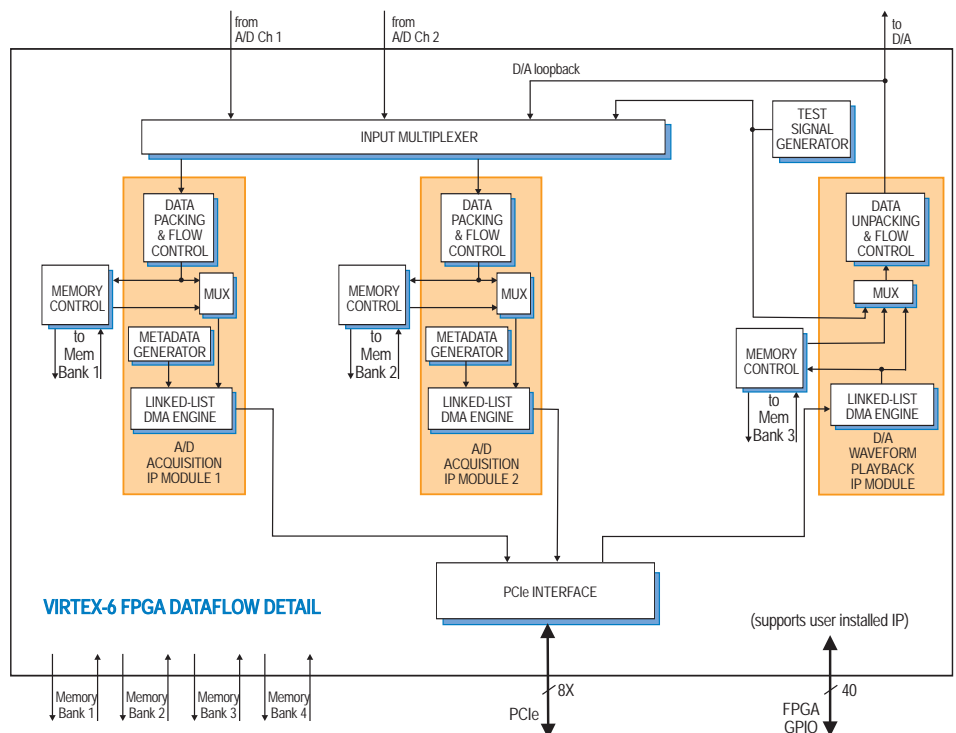

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56650’s can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 56650 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the

► module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56650 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56650 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463

**Sampling Rate:** 20 MHz to 500 MHz

**Resolution:** 12 bits

#### A/D Converters (option 014)

**Type:** Texas Instruments ADS5474

**Sampling Rate:** 20 MHz to 400 MHz

**Resolution:** 14 bits

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz, max.

**Output IF:** DC to 400 MHz, max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz, max. with interpolation

**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2

**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen.1 or Gen.2, x4 or x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 16 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56651 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56651 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56651 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to

the data and decimation rates of the acquisition modules. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56651 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

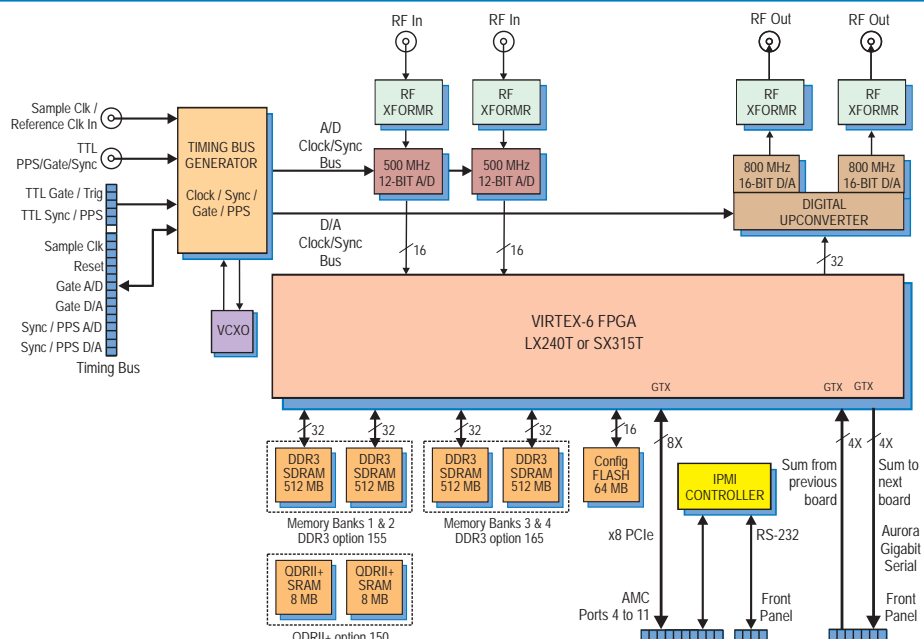

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 56651 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling

frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56651 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

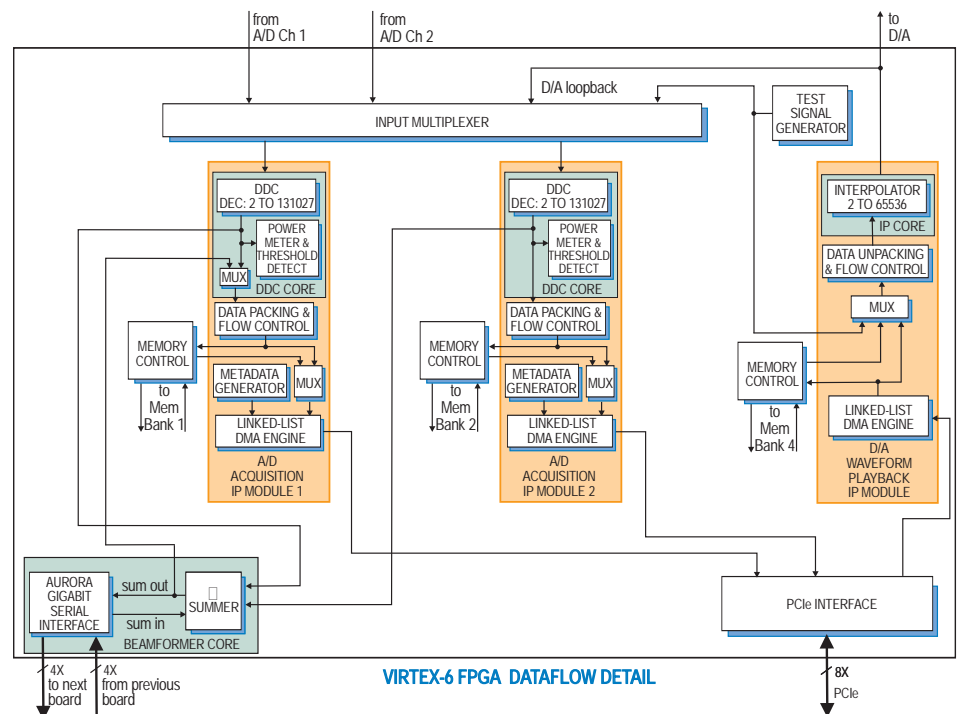

A programmable summation block provides summing of any of the two DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56651's can be chained together via a built-in Xilinx Aurora gigabit serial interface to allow summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 56651 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56651's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 56651 architecture supports up to three independent memory banks which can be configured with QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deep memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56651 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56651 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

#### Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Beamformer

**Summation:** Two channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T-2  
**Optional:** Xilinx Virtex-6 XC6VSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option -150:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR

**Option -155 or -165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 2: x4 or x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56651	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-6 FPGA - AMC

#### Options:

-002*	-2 FPGA speed grade
-014	400 MHz, 14-bit A/Ds
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through front panel connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

\* This option is always required

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56660 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56660 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56660 factory-installed functions include four A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56660 to operate as a complete turnkey solution without the need to develop any FPGA IP.

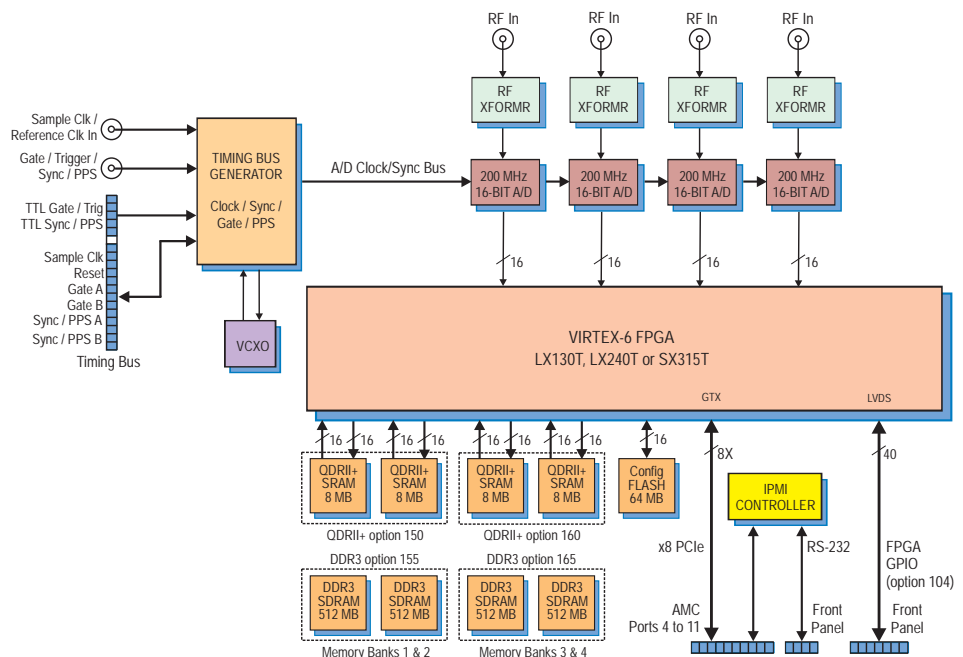

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

► A/D Converter Stage

The front end accepts four full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the

LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56660's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

Memory Resources

The 56660 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

AMC Interface

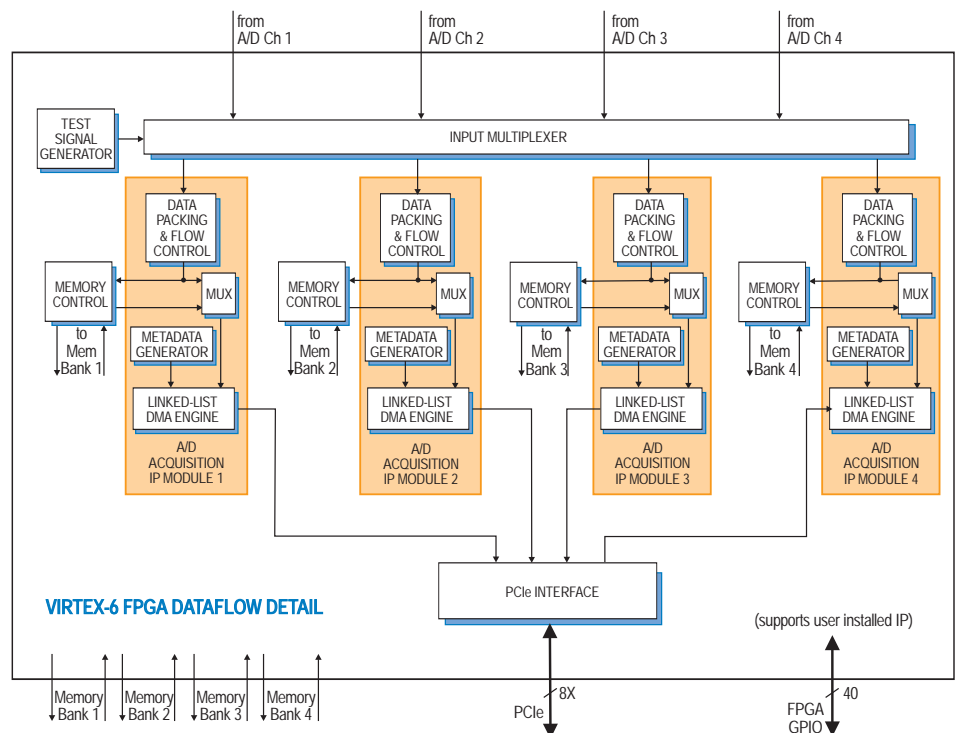

The Model 56660 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or µTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

A/D Acquisition IP Modules

The 56660 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

### ► PCI Express Interface

The Model 56660 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**General Information**

Model 56661 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs (digital downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56661 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56661 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC (Digital Downconverter) IP core. IP modules

for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56661 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

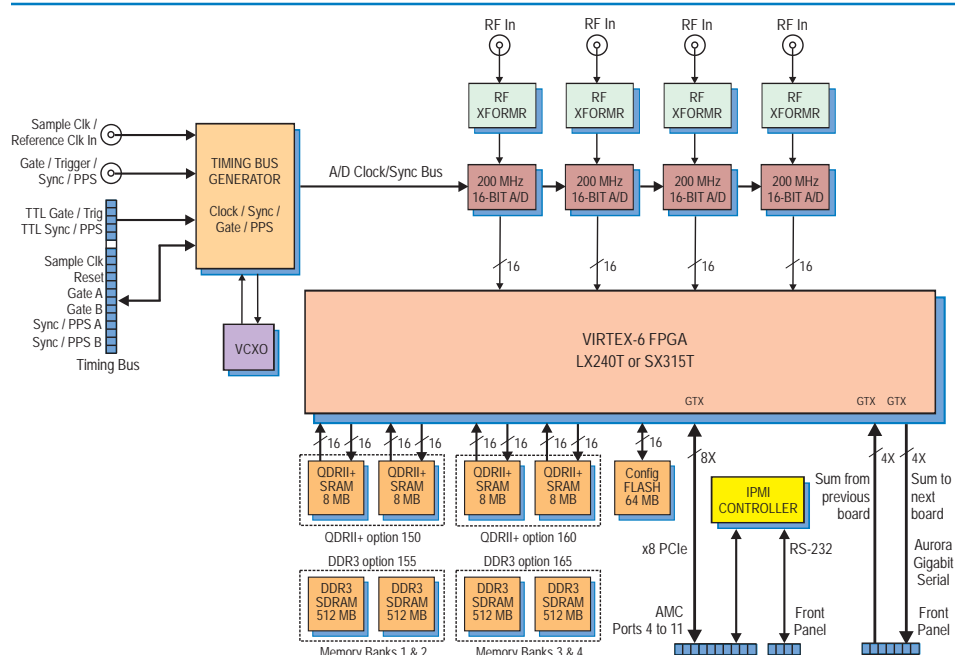

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 56661 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56661 features a complete beamforming subsystem. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and

threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56661's can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

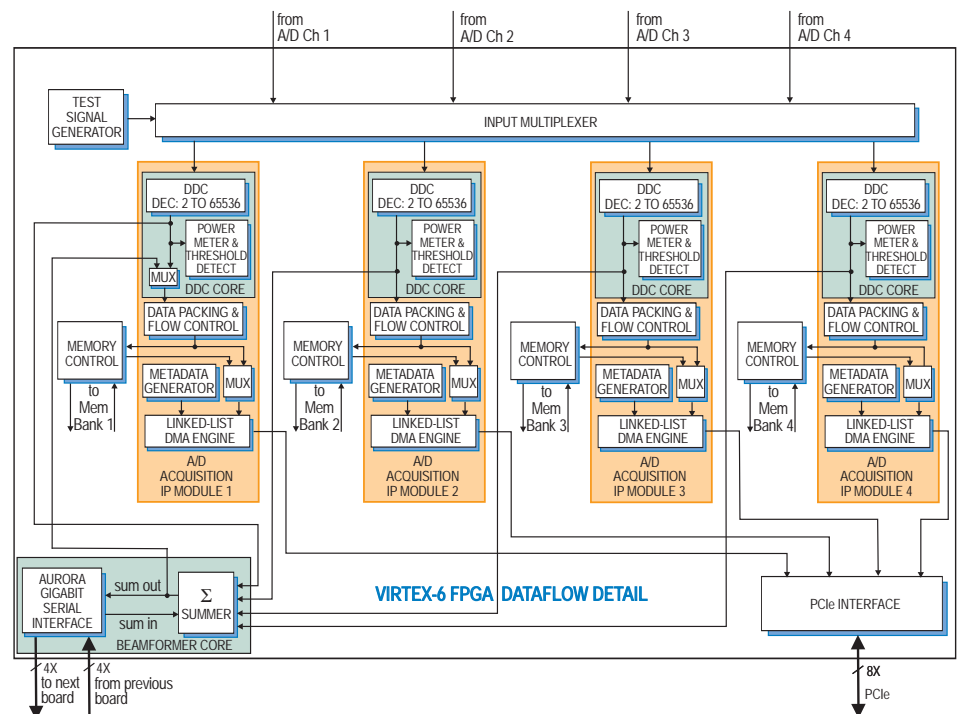

**A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this

## AMC Interface

The Model 56661 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

## PCI Express Interface

The Model 56661 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Ordering Information

Model	Description
56661	4-Channel 200 MHz A/D with DDCs and Virtex-6 FPGA - AMC
<b>Options:</b>	
-062	XC6VLX240T
-064	XC6VXS315T
-104	LVDS FPGA I/O through front panel connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

► mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56661's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

## Memory Resources

The 56661 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

## Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

## Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

## External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

## External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

## Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T

**Optional:** Xilinx Virtex-6 XC6VXS315T

## Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

## Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

## PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

## AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

## Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Up to 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56662 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed data converter with programmable DDCs (digital downconverters) is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56662 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, and triggering. The Cobalt architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56662 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable 8-channel DDC IP core. IP modules for control of

all data clocking, synchronization, gate and trigger functions, a test signal generator, voltage and temperature monitoring, DDR3 SDRAM memory controllers, and a PCIe interface complete the factory-installed functions and enable the 56662 to operate as a complete turnkey solution without the need to develop any FPGA IP.

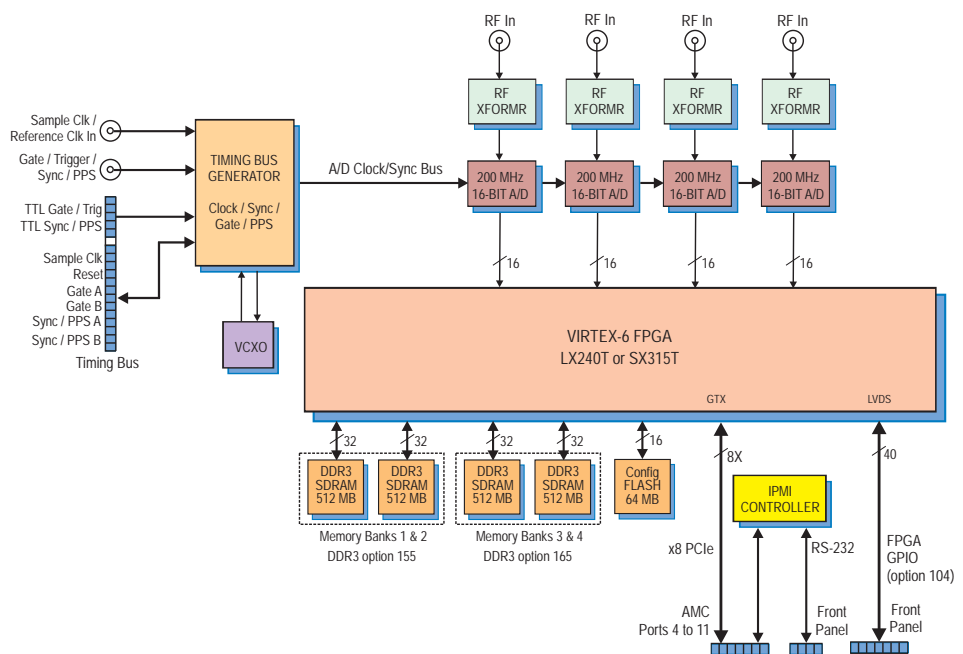

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 56662 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful 8-channel DDC bank. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all 32 DDC channels or each of the four A/Ds driving its own DDC bank.

Each of the 32 channels has an independent setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. All of the 8 channels within a bank share a common decimation setting that can range from 16 to 8192. The decimation range is programmable in steps of 8 from 16 to 1024 and steps of 64

from 1024 to 8192. The decimating filter for each DDC bank accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB.

For example, with a sampling rate of 200 MHz, the available output bandwidths range from 19.53 kHz to 10.0 MHz. Each 8-channel bank can have its own unique decimation setting supporting a different bandwidth associated with each of the four acquisition modules.

Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q samples at a rate of  $f_s / N$ . Any number of channels can be enabled within each bank, selectable from 0 to 8. Each bank includes an output sample interleaver that delivers a channel-multiplexed stream for all enabled channels within a bank.

**► A/D Converter Stage**

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

**Clocking and Synchronization**

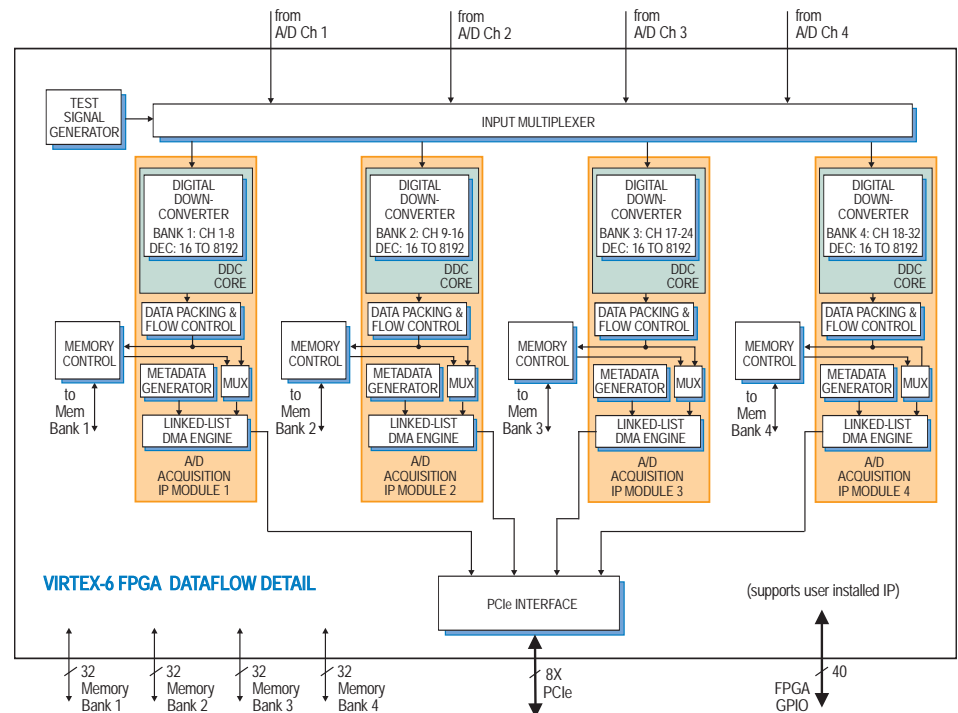

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56662's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**Memory Resources**

The 56662 architecture supports up to four independent memory banks which can be configured with DDR3 SDRAM. ►

► Each DDR3 SDRAM bank can be up to 512 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory and capture space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56662 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56662 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Four 8-channel banks, one per acquisition module

**Decimation Range:** 16 to 1024 in steps of 8 and 1024 to 8192 in steps of 64

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, >100 dB stopband attenuation

**Features**

- Complete GSM channelizer with analog IF interface
- Four 180 MHz 16-bit A/Ds
- Two banks of 375 DDCs for upper GSM band
- Two banks of 175 DDCs for lower GSM band
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express Gen. 2 x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)

**General Information**

Model 56663 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. This four-channel, high-speed A/D converter with 1100 GSM DDCs (digital downconverters) accepts IF signals from an RF tuner. It is ideal for capturing all transmit and receive signals in both upper and lower GSM bands.

It includes four A/Ds and four banks of DDCs. Channelizer data and control signals flow across the PCI Express Gen. 2 native interface, providing peak rates of up to 4 GB/sec.

**The Cobalt Architecture**

The Pentek Cobalt architecture connects all of the board's data converters, digital interfaces, clocks and timing signals to the FPGA. Here, four factory-installed GSM channelizer IP cores are supported with additional FPGA functions including packet formation, four DMA controllers, PCIe interface, gating, and triggering.

The 56663 is a complete, full-featured subsystem, ready to use with no additional FPGA development required.

**A/D Converter Stage**

The front end accepts four analog IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters clocked at 180 MHz.

The digital outputs are delivered into the FPGA for GSM channelizer signal processing.

**Clocking and Synchronization**

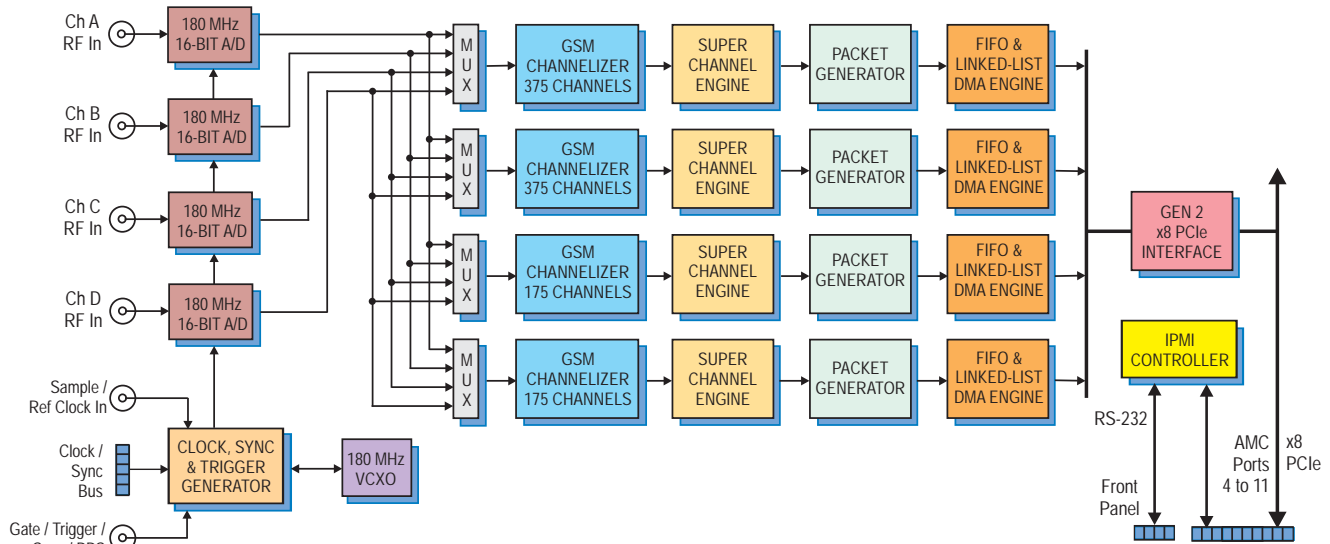

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator accepts an external 180 MHz sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board 180 MHz voltage-controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a reference clock, typically 10 MHz, for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56663's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

**GSM Channelizer Cores**

The 56663 contains four powerful GSM channelizer cores, two with 375 DDCs and two with 175 DDCs. Flexible input routing allows the independent, non-blocking assignment of any A/D converter to serve as the input source for any of the four GSM channelizers. ➤

► The 375-channel cores are designed for the upper GSM bands which contain two 75 MHz bands, one for uplink and one for downlink. The 175-channel cores are designed for the lower GSM band and handle two 35 MHz bands, one for uplink and one for downlink.

Before connection to the 56663, these GSM RF bands must first be separately downconverted to an IF frequency centered at 45 MHz, 135 MHz or 225 MHz using an external analog RF tuner.

These IF signals are then digitized by the 56663 A/Ds at 180 MS/sec in the first, second, or third Nyquist zones, respectively. In order to prevent aliasing, careful filtering must ensure that no signals appear in adjacent Nyquist zones.

Each of the channelizers is designed to accept real digital samples of the IF signal from the A/D converter. The first stage of the GSM channelizer is a complex mixer that shifts the center frequency of the IF signal (45, 135 or 225 MHz) to 0 Hz, thereby producing complex I+Q samples.

The DDCs split the IF input into either 175 or 375 parallel DDC baseband channels, equally spaced at 200 kHz. The DDC output sample rate is resampled to precisely  $180 \text{ MHz} \times 13 / 2160$ , or approximately 1.08333 MHz. This is four times the GSM symbol rate of 270.666 kSymbols/sec. The output passband of each DDC channel is nominally 160 kHz, with filter characteristics fully defined in the channel response chart in the specifications.

### Channelizer Output Formatting

All 1100 DDCs generate parallel, complex output sample streams. At a sample rate of 1.08333 MS/sec, this represents an aggregate output rate of 9.533 GB/sec, greatly exceeding the 4 GB/sec peak rate of PCIe Gen 2 x8 interface.

To mitigate this situation, every four DDC channels are frequency-multiplexed into a single "superchannel". This is allowed because of the 4x oversampling, and results in a reduction of the aggregate PCIe traffic by a factor of 4 to 2.383 GB/sec, which is now well within the capability of the PCIe Gen 2 x8 interface.

During superchannel formation, the 24-bit I + 24-bit Q output samples from four DDCs are summed to superchannel samples with 26-bit I + 26-bit Q.

As a result, the two 375-channel banks each deliver 94 superchannels, while the two 175-channel banks each deliver 44 superchannels. The last superchannel in each bank contains only three DDC channels.

A superchannel enable mask word containing one enable bit for each superchannel allows independent selection of which superchannel samples are delivered across the PCIe. There are four superchannel mask words, one for each bank.

### Superchannel Packets and Headers

Superchannel packets are formed by appending enabled superchannel samples sequentially from each bank. Once complete, a unique superchannel packet header is inserted at the beginning of each packet for identification.

The header contains a time stamp, a sequential packet count, the number of enabled superchannels, the DMA channel identifier, and other information. By inspecting the header, the remaining superchannel data "payload" samples can be identified and recovered by the host.

### PCI Express Interface

The Model 56663 includes an industry-standard interface fully compliant with PCI Express Gen. 2 bus specifications. Supporting PCIe links up to x8, the interface includes four DMA controllers for efficient packet transfers from each of the four DDC banks to system memory.

The PCIe interface is also used as the programming interface for all status and control between the 56663 and host.

### AMC Interface

The Model 56663 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board 180 MHz VCXO, front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 10 MHz system reference

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, 50 ohms, AC-coupled, accepts 180 MHz sample clock or 10 MHz system reference

**Timing Bus:** 26-pin front panel connector; LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### GSM Channel Banks

**DDCs per bank:** two banks of 175 DDCs and two banks of 375 DDCs

**Overall bandwidth per bank:** 35 MHz & 75 MHz for 175- & 375-channel banks

**IF (Center) Freq:** 45, 135 or 225 MHz

#### DDC Channels

**Channel Spacing:** 200 kHz, fixed

**DDC Center Freqs:** IF Freq  $\pm k * 200$  kHz, where  $k = 0$  to 87, or 0 to 187

#### DDC Channel Filter Characteristics

< 0.1 dB passband flatness across  $\pm 80$  kHz from center (160 kHz BW)

> 18 dB attenuation at  $\pm 100$  kHz

> 78 dB attenuation at  $\pm 170$  kHz

> 83 dB attenuation at  $\pm 600$  kHz

> 93 dB attenuation at  $\pm 800$  kHz

> 96 dB attenuation at  $> \pm 3$  MHz

**DDC Output Rate  $f_s$ :** Resampled to

180 MHz \* 13 / 2160 = 1.0833333 MS/sec

#### DDC Data Output Format:

24 bits I + 24 bits Q

#### Superchannels

**Content:** Four consecutive DDC channels are frequency-offset from each other and then summed together

#### Frequency Offsets for each DDC:

First:  $-f_s/4$  (-270.8333 kHz)

Second: 0 Hz

Third:  $+f_s/4$  (+270.8333 kHz)

Fourth:  $+f_s/2$  (+541.666 kHz)

**Superchannel Sample Rate:**  $f_s$

#### Superchannel Output Format:

26 bits I + 26 bits Q

#### Number of Superchannels per Bank:

175-Channel banks: 44; 375-Channel banks: 94

**Field Programmable Gate Array:** Xilinx Virtex-6 XC6VSX315T

#### PCI Express Interface

**PCI Express Bus:** Gen. 2 x8

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56663	1100-Channel GSM Channelizer with Quad A/D - AMC

Contact Pentek for availability of rugged and conduction-cooled versions

**General Information**

Model 56664 is a member of the Cobalt family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A multi-channel, high-speed data converter with programmable DDCs (digital downconverters), it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture feature offers an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP. The 56664 PCIe output supports fully the VITA 49.0 Radio Transport (VRT) Standard.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56664 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56664 factory-installed functions include four A/D acquisition IP modules.

Each of the four acquisition IP modules contains a powerful, programmable DDC

(Digital Downconverter) IP core. IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56664 to operate as a complete turnkey solution without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

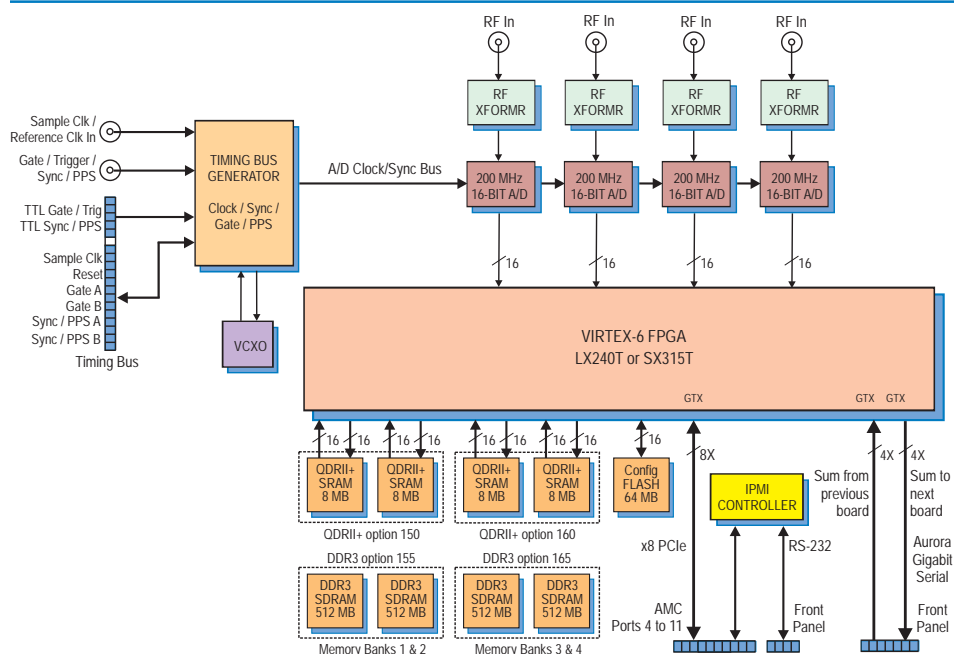

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**Features**

- Complete radar and software radio interface solution
- PCIe output supports VITA 49.0 Radio Transport (VRT) Standard
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 200 MHz 16-bit A/Ds
- Four multiband DDCs
- Multiboard programmable beamformer
- Up to 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**A/D Acquisition IP Modules**

The 56664 features four A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from any of the four A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor’s job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all four DDCs or each of the four A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as four different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 \cdot f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56664 features a complete beamforming subsystem. Each DDC core contains programable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average power level of any DDC core falls below or exceeds a programmable threshold.

A programmable summation block provides summing of any of the four DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and

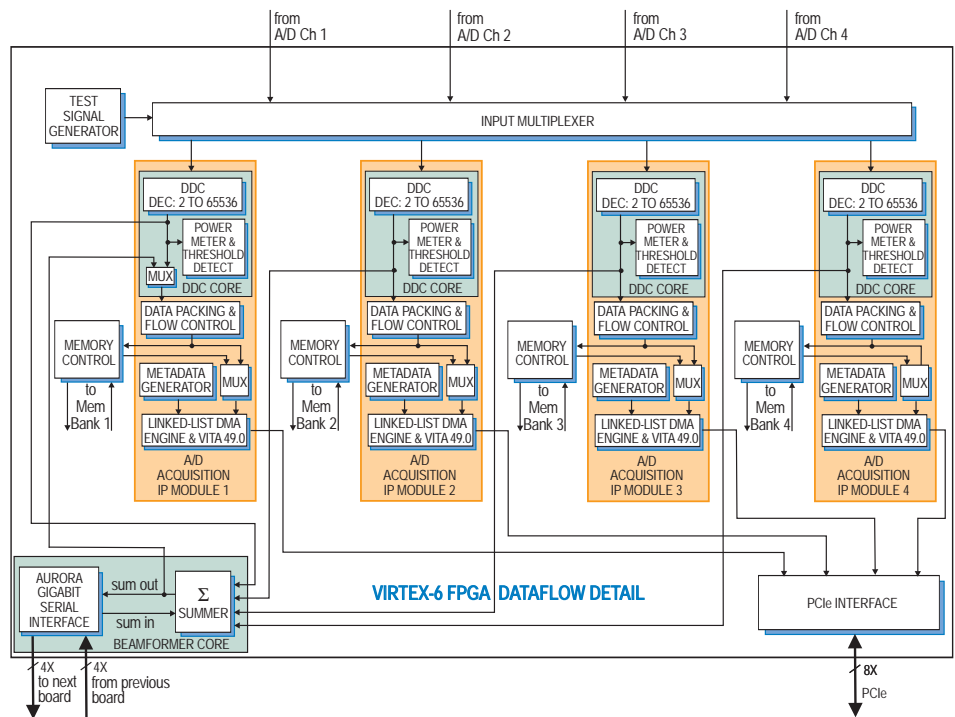

threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56664’s can be chained together via a built-in Xilinx Aurora gigabit serial interface through the P16 XMC connector. This allows summation across channels on multiple boards.

**VITA 49.0**

The VITA 49.0 specification addresses the problem of interoperability between different elements of Software Defined Radio (SDR) systems. Specifically each SDR receiver manufacturer typically develops custom and proprietary digitized data and metadata formats, making interoperability of data from different receivers impossible.

VITA 49.0 solves this problem by providing a framework for SDR receivers used for analysis of RF spectrum and localization of RF emissions. It is based upon a transport protocol layer to convey time-stamped digital data between components in the system. With a common protocol, SDR receivers can be interchanged, thereby enabling hardware upgrades and mitigating hardware lifecycle limitations. This eliminates the need to create new software to support each new receiver.

The 56664 supports fully the VITA 49.0 specification. ➤

### ► A/D Converter Stage

The front end accepts four analog HF or IF inputs on front panel SSMC connectors with transformer coupling into four Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture and for routing to other module resources.

### Clocking and Synchronization

An internal timing bus provides all timing and synchronization required by the A/D converters. It includes a clock, two sync and two gate or trigger signals. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly by the A/D or divided by a built-in clock synthesizer circuit. In an alternate mode, the sample clock can be sourced from an on-board programmable voltage controlled crystal oscillator. In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56664's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 56664 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, DDR3 SDRAM, or as combination of two banks of each type of memory.

Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56664 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56664 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB  
**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Four channels  
**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### Beamformer

**Summation:** Four channels on-board; multiple boards can be summed via Summation Expansion Chain  
**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol  
**Phase Shift Coefficients:** I & Q with 16-bit resolution  
**Gain Coefficients:** 16-bit resolution  
**Channel Summation:** 24-bit  
**Multiboard Summation Expansion:** 32-bit

**Sample Clock Sources:** On-board clock synthesizer

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus  
**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX240T  
**Optional:** Xilinx Virtex-6 XC6VVSX315T

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1: x4 or x8; Gen. 2: x4

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in. ►

### Ordering Information

Model	Description
56664	4-Channel 200 MHz A/D with DDCs, VITA 49.0 and Virtex-6 FPGA - AMC

#### Options:

-062	XC6VLX240T
-064	XC6VVSX315T
-104	LVDS FPGA I/O through front panel connector
-150	Two 8 MB QDRII+ SRAM Memory Banks (Banks 1 and 2)
-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

*Contact Pentek for availability of rugged and conduction-cooled versions*

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56670 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56670 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56670 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through the D/A converters. IP modules for DDR3

SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56670 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

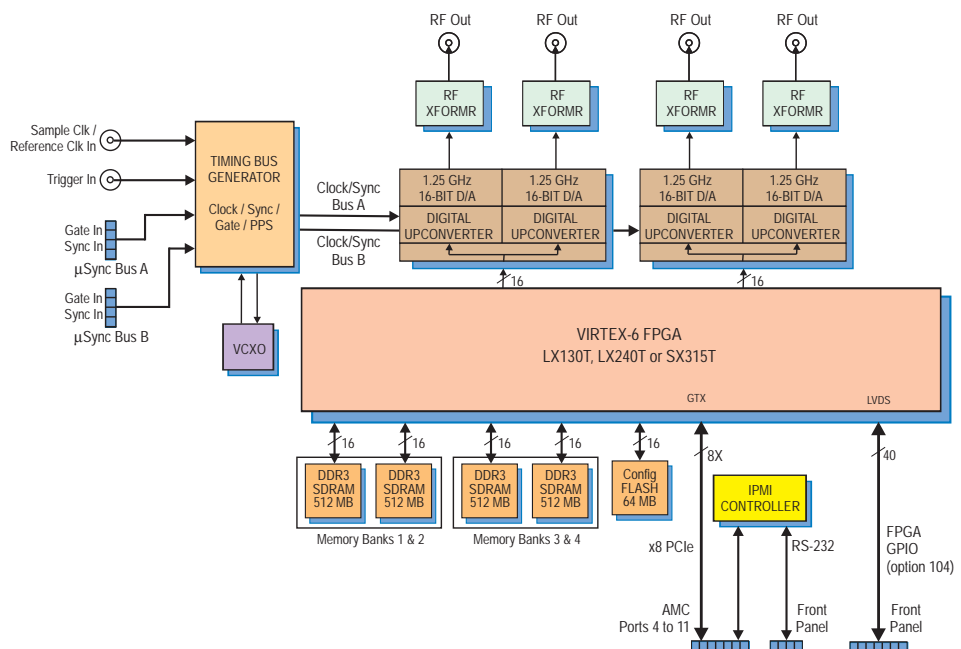

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by

2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board’s sync and trigger/gate signals. The Pentek Models 5692 or 9192 Cobalt Synchronizers can drive multiple 56670 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 56670 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module’s DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

AMC Interface

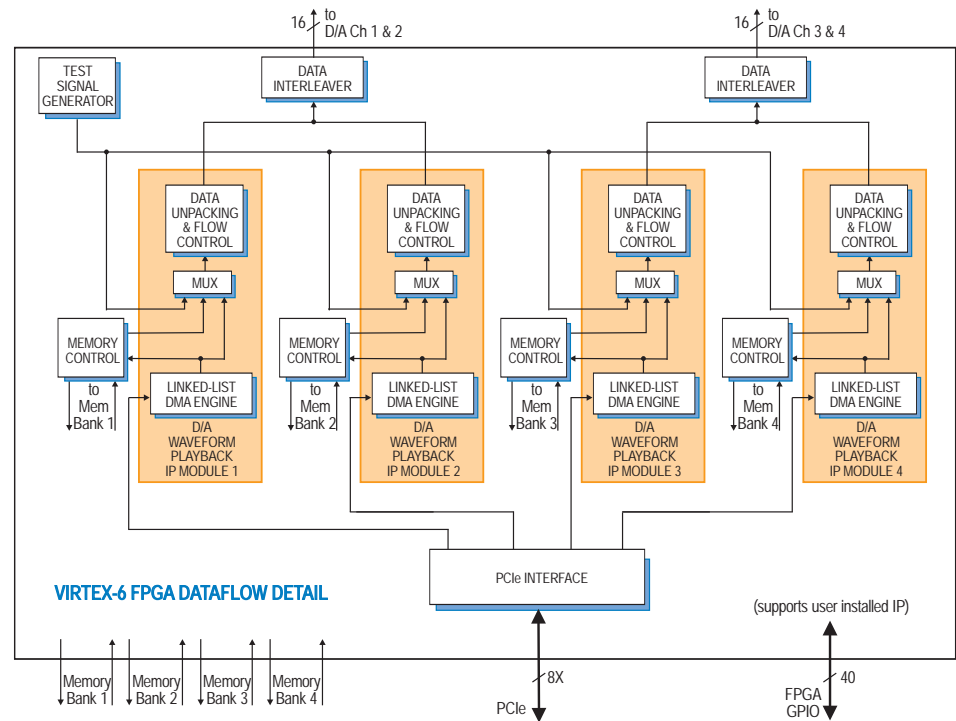

The Model 56670 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or µTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

D/A Waveform Playback IP Module

The Model 56670 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4. Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

### ► PCI Express Interface

The Model 56670 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### D/A Converters

**Type:** TI DAC3484  
**Input Data Rate:** 312.5 MHz max.  
**Output Bandwidth:** 250 MHz max.  
**Output Sampling Rate:** 1.25 GHz max. with interpolation  
**Interpolation:** 2x, 4x, 8x or 16x  
**Resolution:** 16 bits

#### Front Panel Analog Signal Outputs

**Quantity:** Four D/A outputs  
**Output Type:** Transformer-coupled, front panel female SSMC connectors  
**Full Scale Output:** Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps  
**Full Scale Output Programming:**  $1.0 \times (G+1) / 16$  Vp-p, where 4-bit integer  $G = 0$  to 15

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock  
**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz  
**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz  
**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

#### External Trigger Input

**Type:** Front panel female SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T-2  
**Optional:** Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

### External Trigger Input

**Type:** Front panel female SSMC connector  
**Function:** Programmable functions include: trigger, gate, sync and PPS

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

### Field Programmable Gate Array:

Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

**Memory:** Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or Gen 2: x4 or x8;

### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**Features**

- Accepts RF signals from 925 MHz to 2175 MHz
- Programmable LNA boosts LNB (low-noise block) antenna signal levels with up to 60 dB gain
- Programmable analog downconverter provides I + Q baseband signals with bandwidths ranging from 4 to 40 MHz
- Two 200 MHz 16-bit A/Ds digitize the I + Q signals synchronously
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- 2 GB of DDR3 SDRAM or 32 MB of QDRII+ SRAM
- Sample clock synchronization to an external system reference
- Clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface, up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

**General Information**

Model 56690 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. A 2-Channel high-speed data converter, it is suitable for connection directly to the RF port of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes an L-Band RF tuner, two A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56690 includes a front panel general-purpose connector for application-specific I/O.

**The Cobalt Architecture**

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56690 factory-installed functions include two A/D acquisition IP modules.

IP modules for either DDR3 or QDRII+ memories, a controller for all data clocking

and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56690 to operate as a complete turnkey solution without the need to develop any FPGA IP.

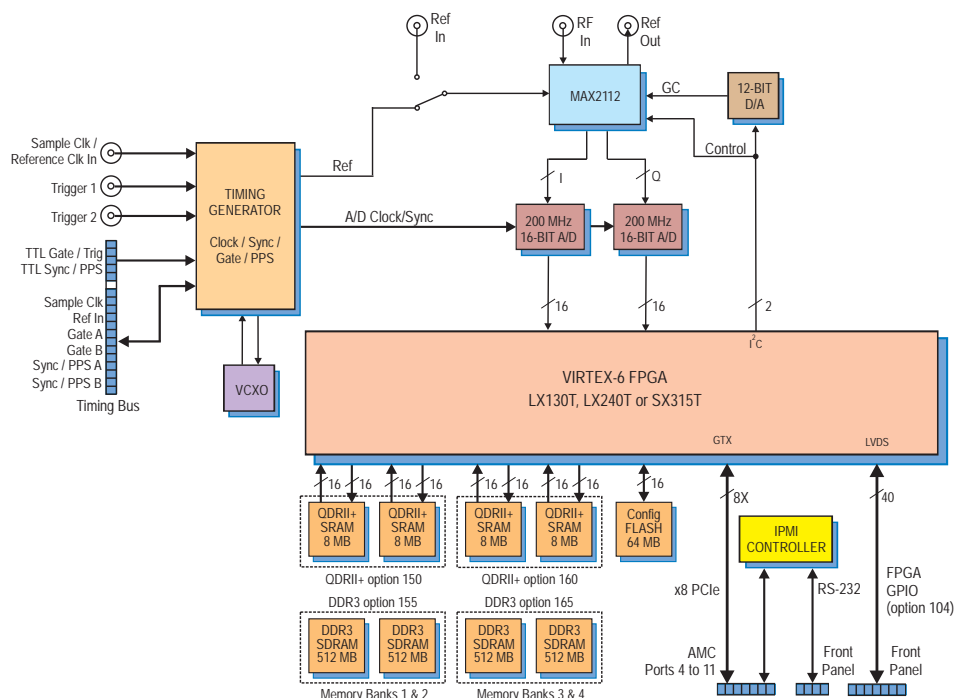

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-6 FPGA**

The Virtex-6 FPGA site can be populated with a variety of different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX130T, LX240T, or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, one of the lower-cost LXT FPGAs can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

► RF Tuner Stage

A front panel SSMC connector accepts L-Band signals between 925 MHz and 2175 MHz from an antenna LNB (low noise block). A Maxim MAX2112 tuner directly converts these L-Band signals to baseband using a broadband I/Q downconverter.

The device includes an RF variable-gain LNA (low noise amplifier), a PLL (phase-locked loop) synthesized local oscillator, quadrature (I + Q) downconverting mixers, baseband lowpass filters with programmable cutoff frequency, and variable-gain baseband amplifiers.

The fractional-N PLL synthesizer locks its VCO to the timing generator output, or to an external reference input between 12 and 30 MHz. Together, the baseband amplifiers and the RF LNA offer a programmable linear gain range of 60 dB.

An integrated lowpass filter with variable bandwidth provides bandwidths ranging from 4 to 40 MHz, programmable with 8 bits of resolution.

A/D Converter Stage

The analog baseband I and Q analog tuner outputs are then applied to two Texas Instruments ADS5485 200 MHz, 16-bit A/D converters. The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

A/D Clocking and Synchronization

An internal timing generator provides all timing, gating, triggering and synchronization functions required by the A/D converters. It also serves as an optional source for the L-Band tuner reference.

The front panel SSMC clock input can be used directly as the A/D sample clock. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (voltage-controlled crystal oscillator). In this mode, the front panel SSMC clock input connector accepts a 10 MHz reference signal for synchronizing the VCXO using a PLL.

The timing generator uses a front panel LVPECL 26-pin clock/sync connector for one clock, two sync, and two gate/trigger signals. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate/trigger signals within the module. In the master mode, the LVPECL bus drives output timing signals to synchronize multiple slave modules, supporting synchronous sampling and sync functions across all connected modules.

Memory Resources

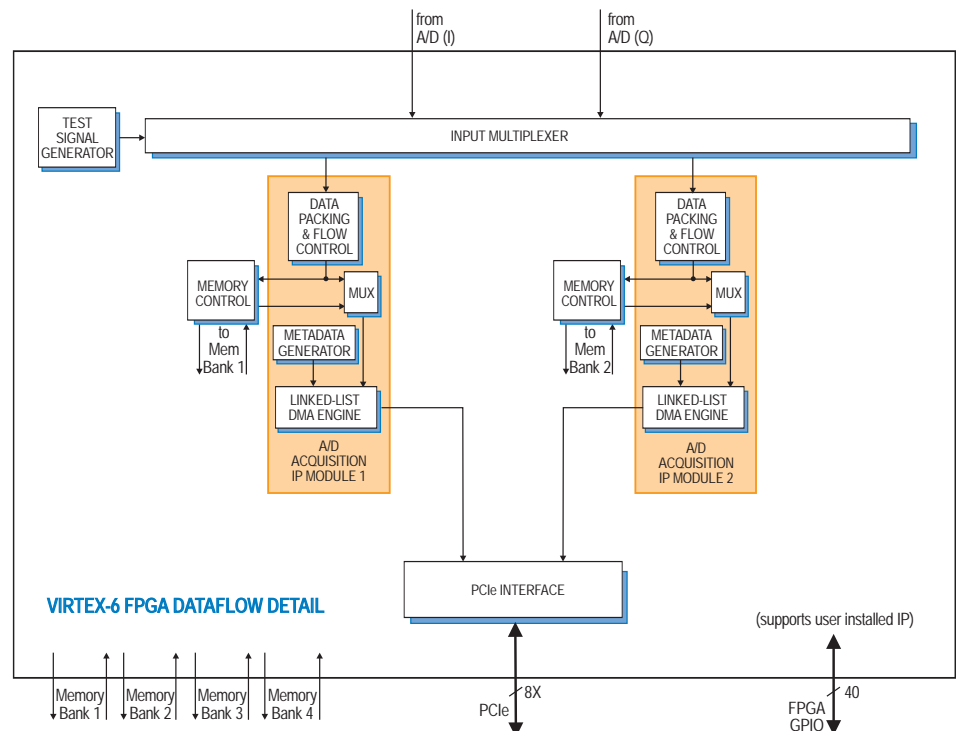

The 56690 architecture supports up to four independent memory banks which can be configured with all QDRII+ SRAM, all DDR3 SDRAM, or as combination of two banks of each type of memory. ►

A/D Acquisition IP Modules

The 56690 features two A/D Acquisition IP Modules for easily capturing and moving data. Each IP module can receive data from either of the two A/Ds or a test signal generator

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface. These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

► Each QDRII+ SRAM bank can be up to 8 MB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. For applications requiring deeper memory resources, DDR3 SDRAM banks can each be up to 512 MB deep. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

The factory-installed A/D acquisition modules use memory banks 1 & 2. Banks 3 & 4 can be optionally installed to support custom user-installed IP within the FPGA.

### AMC Interface

The Model 56690 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56690 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

### Specifications

#### Front Panel Analog Signal Input

**Connector:** Front panel female SSMC  
**Impedance:** 50 ohms

#### L-Band Tuner

**Type:** Maxim MAX2112  
**Input Frequency Range:** 925 MHz to 2175 MHz

**Monolithic VCO Phase Noise:** -97 dBc/Hz at 10 kHz

#### Fractional-N PLL Synthesizer:

$\text{freq}_{\text{VCO}} = (N.F) \times \text{freq}_{\text{REF}}$   
where integer N = 19 to 251 and fractional F is a 20-bit binary value  
**PLL Reference** ( $\text{freq}_{\text{REF}}$ ): Front panel SSMC connector or on-board 27 MHz crystal (Option -100), 12 to 30 MHz  
**LNA Gain:** 0 to 65 dB, controlled by a programmable 12-bit D/A converter\*

**Baseband Amplifier Gain:** 0 to 15 dB, in 1 dB steps\*

**\*Usable Full-Scale Input Range:** -50 dBm to +10 dBm

**Baseband Low Pass Filter:** Cutoff frequency programmable from 4 to 40 MHz with 8-bit resolution

#### A/D Converters

**Type:** Texas Instruments ADS5485  
**Sampling Rate:** 10 MHz to 200 MHz  
**Resolution:** 16 bits

**Sample Clock Sources:** On-board timing generator/synthesizer

#### A/D Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, for the A/D clock

#### Timing Generator External Clock Input

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 200 MHz (up to 800 MHz when Timing Generator divider is enabled) or PLL system reference

**Timing Generator Bus:** 26-pin front panel connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### External Trigger Input

**Quantity:** 2

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-6 XC6VLX130T  
**Optional:** Xilinx Virtex-6 XC6VLX240T, or XC6VSX315T

#### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

#### Memory

**Option 150 or 160:** Two 8 MB QDRII+ SRAM memory banks, 400 MHz DDR  
**Option 155 or 165:** Two 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 x4 or x8; Gen. 2 x4

#### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

-160	Two 8 MB QDRII+ SRAM Memory Banks (Banks 3 and 4)
-155	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- One digital upconverter
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 56720 is a member of the Onyx® family of high-performance AMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56720 includes a front panel general-purpose connector for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56760 factory-installed functions include three A/D acquisition and a D/A waveform

playback IP modules for simplifying data capture and data transfer.

IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56720 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

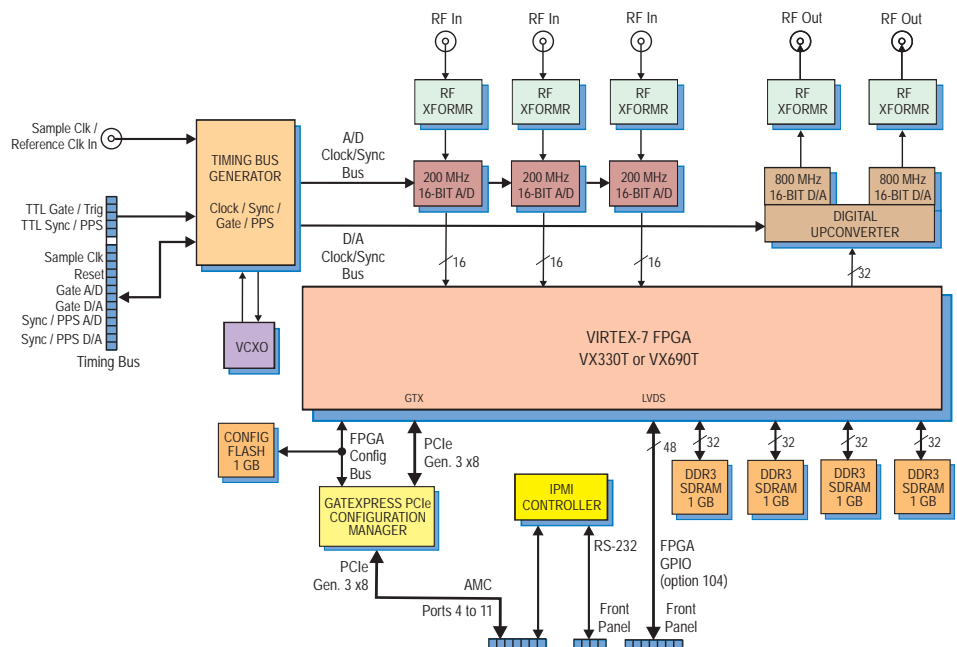

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Modules**

The 56720 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 56720 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of

a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

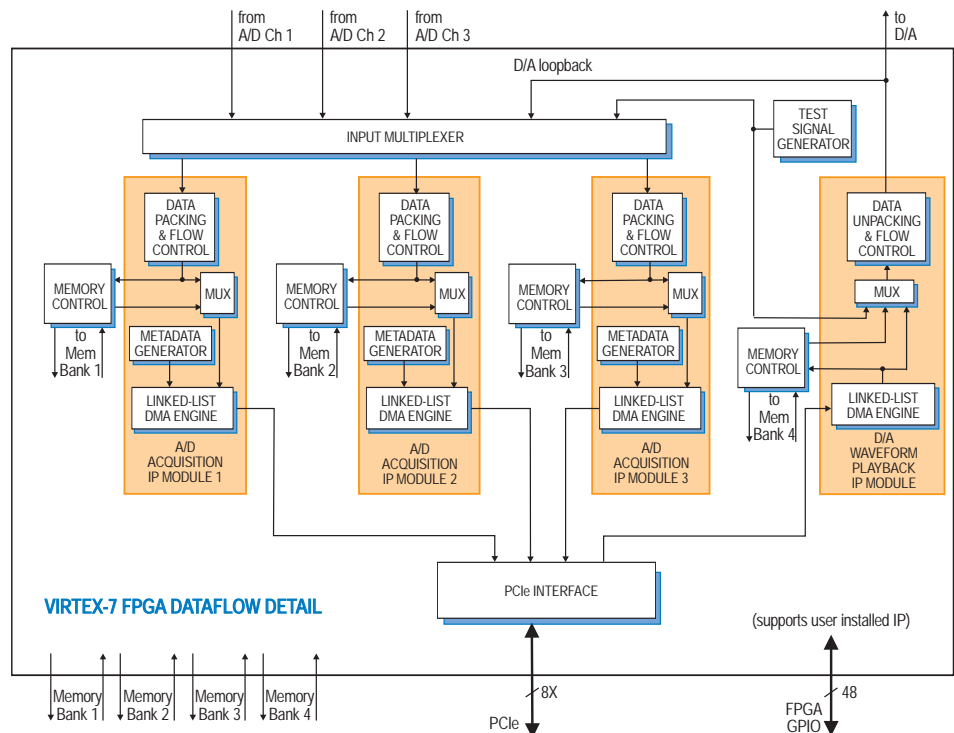

**A/D Converter Stage**

The front end accepts three full-scale analog HF or IF inputs on front panel SSMC connectors at +8 dBm into 50 ohms with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other module resources.

**Digital Upconverter and D/A Stage**

A TIDAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages. ►

## Memory Resources

The 56720 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## AMC Interface

The Model 56720 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

## PCI Express Interface

The Model 56720 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Ordering Information

Model	Description
56720	3-Channel 200 MHz A/D and 2-Channel 800 MHz D/A with Virtex-7 FPGA - AMC

### Options:

-073	XC7VX330T-2 FPGA
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through front panel connector

Contact Pentek for availability of rugged and conduction-cooled versions

► When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x.

## Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56720's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with interpolation

**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the A/D clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz sample clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs a front panel connector with 20 LVDS pairs to the FPGA

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8; Gen. 3 available only with the VX330T-2 and VX690T-2 FPGAs

### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**General Information**

Model 56721 is a member of the Onyx® family of high performance AMC boards based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution.

It includes three A/Ds, two D/As and four banks of memory. It features built-in support for Gen. 1 and 2 PCI Express.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56721 factory-installed functions include three A/D acquisition and a D/A waveform playback IP modules. Each of the three acquisition IP modules contains a powerful, programmable DDC IP core. The waveform

playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, a programmable beamforming IP core, an Aurora gigabit serial interface, and a PCIe interface complete the factory-installed functions and enable the 56721 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

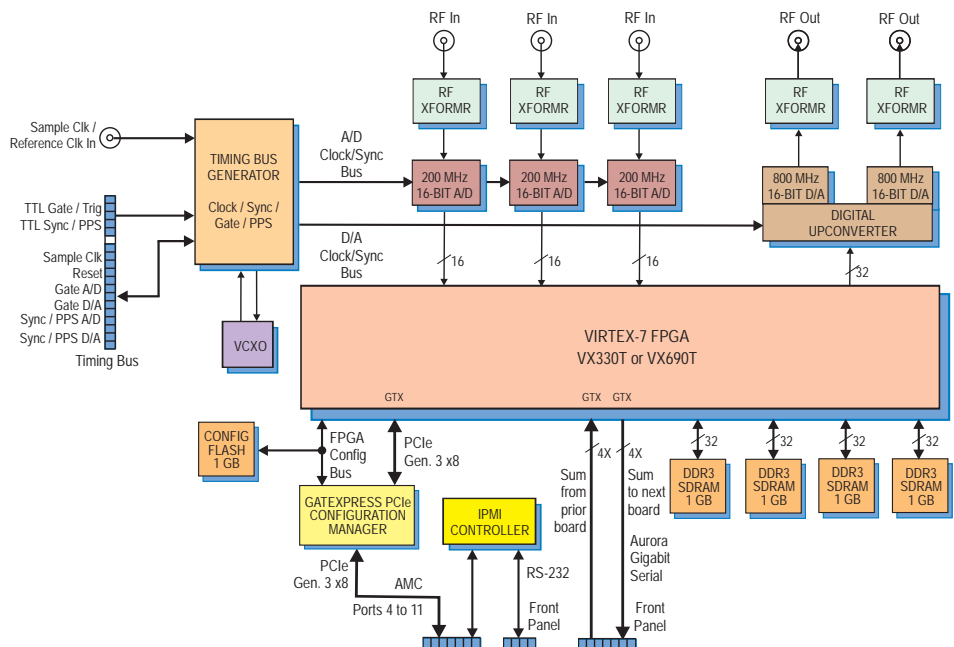

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed. ▶

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Three 200 MHz 16-bit A/Ds
- Three multiband DDCs
- Two 800 MHz 16-bit D/As
- One DUC (digital upconverter)
- Multiboard programmable beamformer
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1 and 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)

**A/D Acquisition IP Modules**

The 56721 features three A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from any of the three A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving all three DDCs or each of the three A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to

$f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as three different output bandwidths for the board. Decimations can be programmed from 2 to 65,536 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 18-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**Beamformer IP Core**

In addition to the DDCs, the 56721 features a complete beamforming subsystem. Each DDC core contains programmable I & Q phase and gain adjustments followed by a power meter that continuously measures the individual average power output. The time constant of the averaging interval for each meter is programmable up to 8K samples. The power meters present average power measurements for each DDC core output in easy-to-read registers.

In addition, each DDC core includes a threshold detector to automatically send an interrupt to the processor if the average

power level of any DDC core falls below or exceeds a programmable threshold.

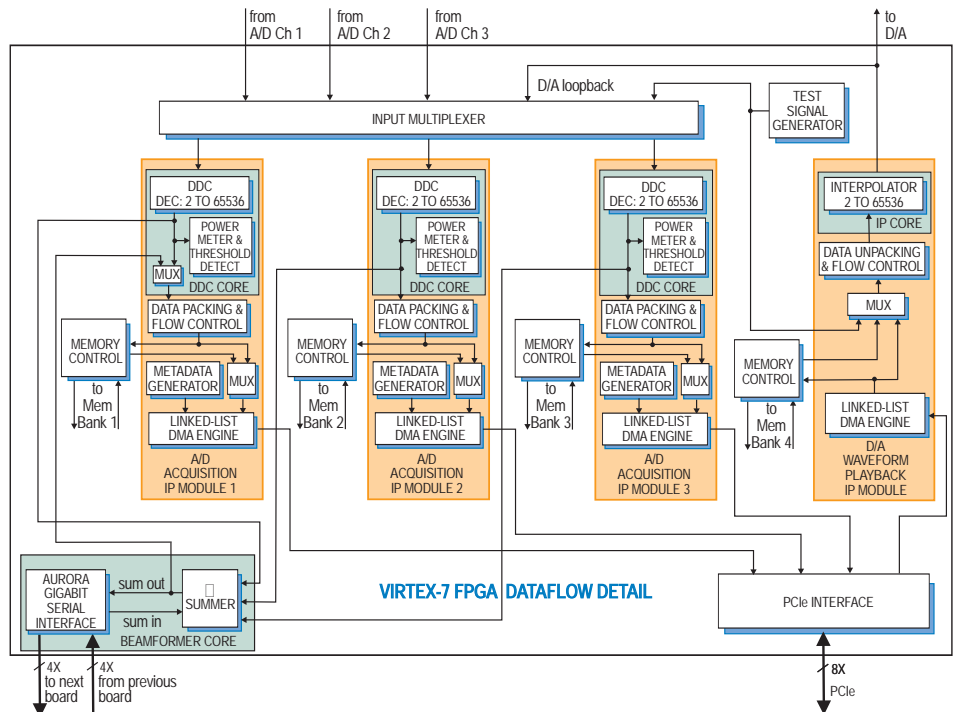

A programmable summation block provides summing of any of the three DDC core outputs. An additional programmable gain stage compensates for summation change bit growth. A power meter and threshold detect block is provided for the summed output. The output is then directed back into the A/D Acquisition IP Module 1 FIFO for reading over the PCIe. For larger systems, multiple 56721's can be chained together via a built-in Xilinx Aurora gigabit serial interface. This allows summation across channels on multiple boards.

**D/A Waveform Playback IP Module**

The Model 56721 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily playback to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming. ➤

### ► GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts three analog HF or IF inputs on front panel SSMC connectors with transformer coupling into three Texas Instruments ADS5485 200 MHz, 16-bit A/D converters.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other board resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple boards to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple boards.

Multiple 56721's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected boards.

### AMC Interface

The Model 56721 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller). ►

### ► Memory Resources

The 56721 architecture supports up to four independent DDR3 SDRAM memory banks.

Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### PCI Express Interface

The Model 56721 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

### Specifications

#### Front Panel Analog Signal Inputs

**Input:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Input:** +8 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters

**Type:** Texas Instruments ADS5485

**Sampling Rate:** 10 MHz to 200 MHz

**Resolution:** 16 bits

#### Digital Downconverters

**Quantity:** Three channels

**Decimation Range:** 2x to 65,536x in two stages of 2x to 256x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** 18-bit coefficients, 24-bit output, with user programmable coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688

**Input Data Rate:** 250 MHz max.

**Output IF:** DC to 400 MHz max.

**Output Signal:** 2-channel real or 1-channel with frequency translation

**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation

**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Beamformer

**Summation:** Three channels on-board; multiple boards can be summed via Summation Expansion Chain

**Summation Expansion Chain:** One chain in and one chain out link via XMC connector using Aurora protocol

**Phase Shift Coefficients:** I & Q with 16-bit resolution

**Gain Coefficients:** 16-bit resolution

**Channel Summation:** 24-bit

**Multiboard Summation Expansion:** 32-bit

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors

**Transformer:** Coil Craft WBC4-6TLB

**Full Scale Output:** +4 dBm into 50 ohms

**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen. 1 or 2: x4 or x8

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56721	3-Channel 200 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - AMC
<b>Option:</b>	
-076	XC7VX690T-2 FPGA

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One 1 GHz 12-bit A/D
- One 1 GHz 16-bit D/A
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 56730 is a member of the Onyx® family of high performance AMC modules based on the Xilinx Virtex-7 FPGA. A high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes 1 GHz A/D and D/A converters and four banks of memory. In addition to supporting PCI Express Gen.3 as a native interface, the Model 56730 includes a front panel general-purpose connector for application-specific I/O .

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 56730 factory-installed functions include an A/D acquisition and a D/A wave-

form playback IP module for simplifying data capture and data transfer.

IP modules for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56730 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

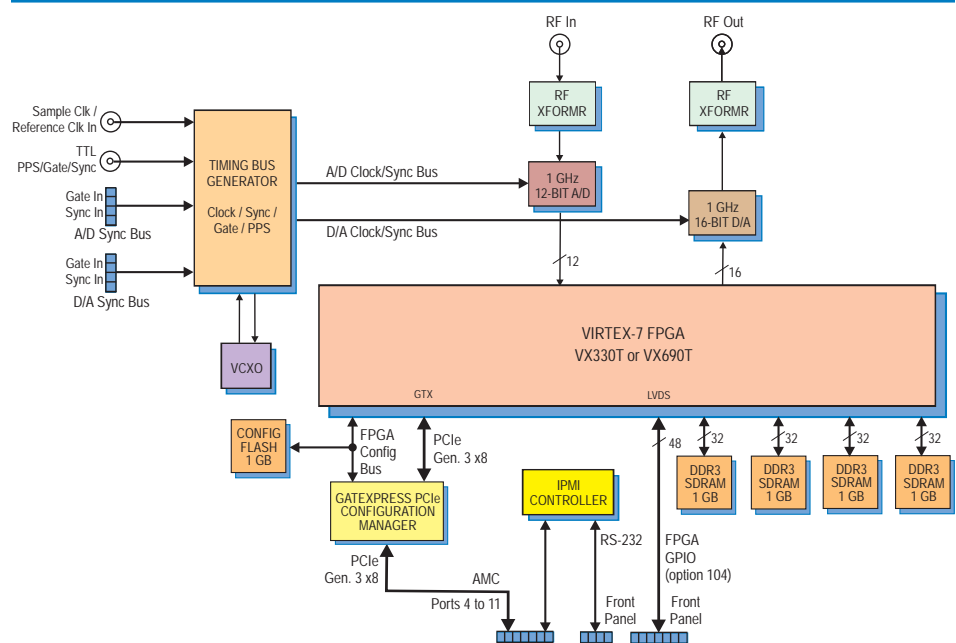

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Module**

The 56730 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, a test signal generator, or from the D/A Waveform Playback IP Module in loopback mode. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface.

This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp, and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**D/A Waveform Playback IP Module**

The Model 56730 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back waveforms stored in either on-board memory or off-board host memory to the D/A.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

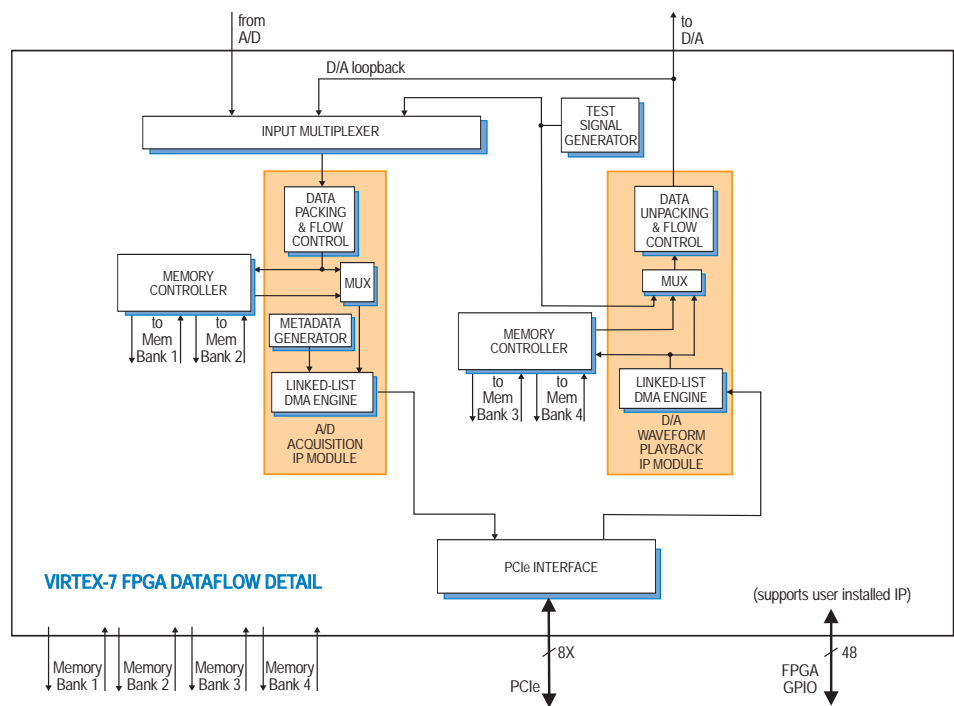

**A/D Converter Stage**

The front end accepts an analog HF or IF input on a front panel SSMC connector with transformer coupling into a Texas Instruments ADS5400 1 GHz, 12-bit A/D converter.

The digital outputs are delivered into the Virtex-6 FPGA for signal processing, data capture or for routing to other module resources.

**D/A Converter Stage**

The 56730 features a TI DAC5681Z 1 GHz, 16-bit D/A. The converter has an input sample rate of 1 GSPS, allowing it to accept full rate data from the FPGA. Additionally, the D/A includes a 2x or 4x interpolation filter for applications that provide 1/2 or 1/4 rate input data. Analog output is through a front panel SSMC connector. ►

## AMC Interface

The Model 56730 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

## PCI Express Interface

The Model 56730 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module.

## Ordering Information

*Contact Pentek for availability of rugged and conduction-cooled versions*

## ► Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided independently by 2, 4, 8, or 16 to provide different lower frequency A/D and D/A clocks.

A pair of front panel  $\mu$ Sync connectors allows multiple modules to be synchronized. They accept CML inputs that drive the board's sync and gate/trigger signals.

The Pentek Model 5692 and Model 9192 Cobalt Synchronizers can drive multiple 56730  $\mu$ Sync connectors enabling large, multichannel synchronous configurations. Also, an LVTTTL external gate/trigger input is accepted on a front panel SSMC connector.

## Memory Resources

The 56730 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include an A/D data transient capture mode and D/A waveform playback mode.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADS5400  
**Sampling Rate:** 100 MHz to 1 GHz  
**Resolution:** 12 bits

### D/A Converter

**Type:** Texas Instruments DAC5681Z  
**Input Data Rate:** 1 GHz max.  
**Interpolation Filter:** bypass, 2x or 4x  
**Output Sampling Rate:** 1 GHz max.  
**Resolution:** 16 bits

### Front Panel Analog Signal Outputs

**Output Type:** Transformer-coupled, front panel female SSMC connectors

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO or front panel external clock

**VCXO Frequency Ranges:** 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz

**Synchronization:** VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 100 MHz to 1 GHz divider input clock, or PLL system reference

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8;

### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**Features**

- Ideal radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- One-channel mode with 3.6 GHz, 12-bit A/D
- Two-channel mode with 1.8 GHz, 12-bit A/Ds
- Programmable one- or two-channel DDC (Digital Downconverter)
- 4 GB of DDR3 SDRAM
- μSync clock/sync bus for multiboard synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 56741 is a member of the Onyx® family of high-performance AMC modules based on the Xilinx Virtex-7 FPGA. A high-speed data converter with a programmable digital downconverter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution.

It includes a 3.6 GHz, 12-bit A/D converter and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, Model 56741 includes an optional front-panel connection to the Virtex-7 FPGA for custom I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 56741 factory-installed functions include an A/D acquisition IP module and a programmable digital downconverter. In

addition, IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator and a PCIe interface complete the factory-installed functions and enable the 56741 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

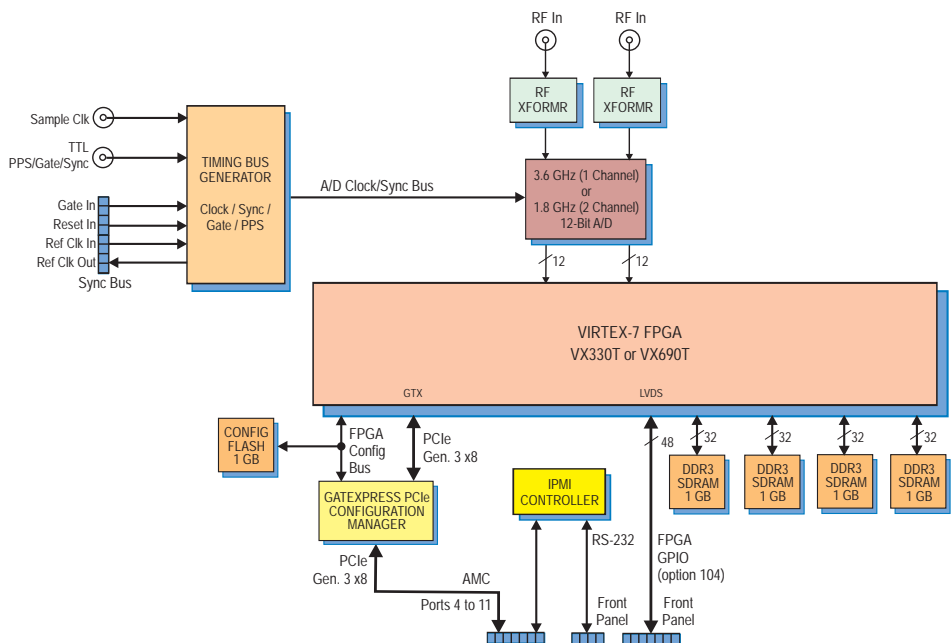

**Extendable IP Design**

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow Design Kit to completely replace the Pentek IP with their own.

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**A/D Acquisition IP Module**

The 56741 features an A/D Acquisition IP Module for easy capture and data moving. The IP module can receive data from the A/D, or a test signal generator. The IP module has associated memory banks for buffering data in FIFO mode or for storing data in transient capture mode. In single-channel mode, all four banks are used to store the single-channel of input data. In dual-channel mode, memory banks 1 and 2 store data from input channel 1 and memory banks 3 and 4 store data from input channel 2. In both modes, continuous, full-rate transient capture of 12-bit data is supported.

The memory banks are supported with a DMA engine for moving A/D data through the PCIe interface. This powerful linked-list DMA engine is capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within the FPGA is a powerful DDC IP core. The core supports a single-channel mode, accepting data samples from the A/D at the full 3.6 GHz rate. Additionally, a dual-channel mode supports the A/D's 1.8 GHz two-channel operation.

In dual-channel mode, each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency.

In single-channel mode, decimation can be programmed to 8x, 16x or 32x. In dual-channel mode, both channels share the same decimation rate, programmable to 4x, 8x or 16x.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

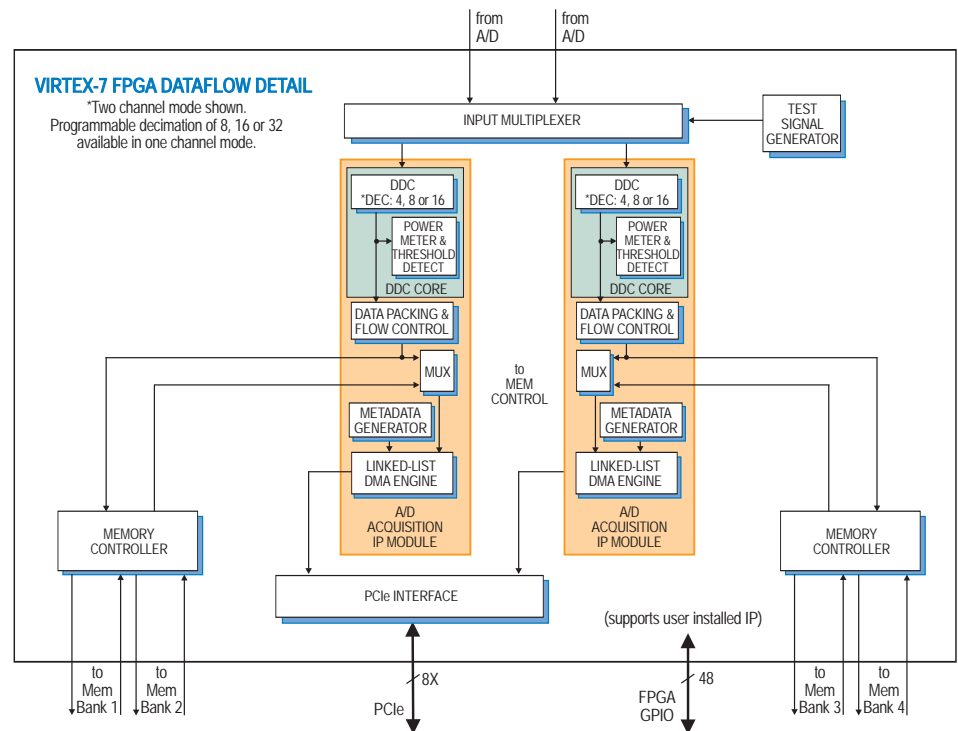

**► GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course of a mission, images can be stored ►

## Memory Resources

The 56741 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the board's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

## AMC Interface

The Model 56741 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

## PCI Express Interface

The Model 56741 includes an industry-standard interface fully compliant with PCI Express Gen. 1, 2 and 3 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the board.

## Ordering Information

Model	Description

► on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

## A/D Converter Stage

The front end accepts analog HF or IF inputs on a pair of front panel SSMC connectors with transformer coupling into a Texas Instruments ADC12D1800 12-bit A/D. The converter operates in single-channel interleaved mode with a sampling rate of 3.6 GHz and an input bandwidth of 1.75 GHz; or, in dual-channel mode with a sampling rate of 1.8 GHz and input bandwidth of 2.8 GHz.

The ADC12D1800 provides a programmable 15-bit gain adjustment allowing the 56741 to have a full scale input range of +2 dBm to +4 dBm. A built-in AutoSync feature supports A/D synchronization across multiple boards.

The A/D digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture or for routing to other board resources.

## Clocking and Synchronization

The 56741 accepts a 1.8 GHz dual-edge sample clock via a front panel SSMC connector. A second front panel SSMC accepts a TTL signal that can function as Gate, PPS or Sync.

A front panel  $\mu$ Sync bus connector allows multiple boards to be synchronized, ideal for multichannel systems. The  $\mu$ Sync bus includes gate, reset, and in and out reference clock signals. Two 56741's can be synchronized with a simple cable. For larger systems, multiple 56741's can be synchronized using the Model 5692 high-speed sync board to drive the sync bus.

## Specifications

### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors

### A/D Converter

**Type:** Texas Instruments ADC12D1800

**Sampling Rate:** Single-channel mode: 500 MHz to 3.6 GHz; dual-channel mode: 150 MHz to 1.8 GHz

**Resolution:** 12 bits

**Input Bandwidth:** single-channel mode: 1.75 GHz; dual-channel mode: 2.8 GHz

**Full Scale Input:** +2 dBm to +4 dBm, programmable

### Digital Downconverters

**Modes:** One or two channels, programmable

**Supported Sample Rate:** One-channel mode: 3.6 GHz, two-channel mode: 1.8 GHz

**Decimation Range:** One-channel mode: 8x, 16x or 32x, two-channel mode: 4x, 8x, or 16x

**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$

**LO SFDR:** >120 dB

**Phase Offset Resolution:** 32 bits, 0 to 360 degrees

**FIR Filter:** User-programmable 18-bit coefficients

**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

**Sample Clock Source:** Front panel SSMC connector

**Timing Bus:** 19-pin  $\mu$ Sync bus connector includes sync and gate/trigger inputs, CML

### External Trigger Input

**Type:** Front panel female SSMC connector, LVTTTL

**Function:** Programmable functions include: trigger, gate, sync and PPS

### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

### Memory

**Type:** DDR3 SDRAM

**Size:** Four banks, 1 GB each

**Speed:** 800 MHz (1600 MHz DDR)

### PCI-Express Interface

**PCI Express Bus:** Gen. 1, 2 or 3: x4 or x8

### AMC Interface

**Type:** AMC.1

**Module Management:** IPMI Version 2.0

### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

**General Information**

Model 56751 is a member of the Onyx® family of high performance AMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56751 includes a general-purpose front-panel connector for application-specific I/O.

**The Onyx Architecture**

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board’s analog interfaces. The 56751 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful,

programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

**Extendable IP Design**

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

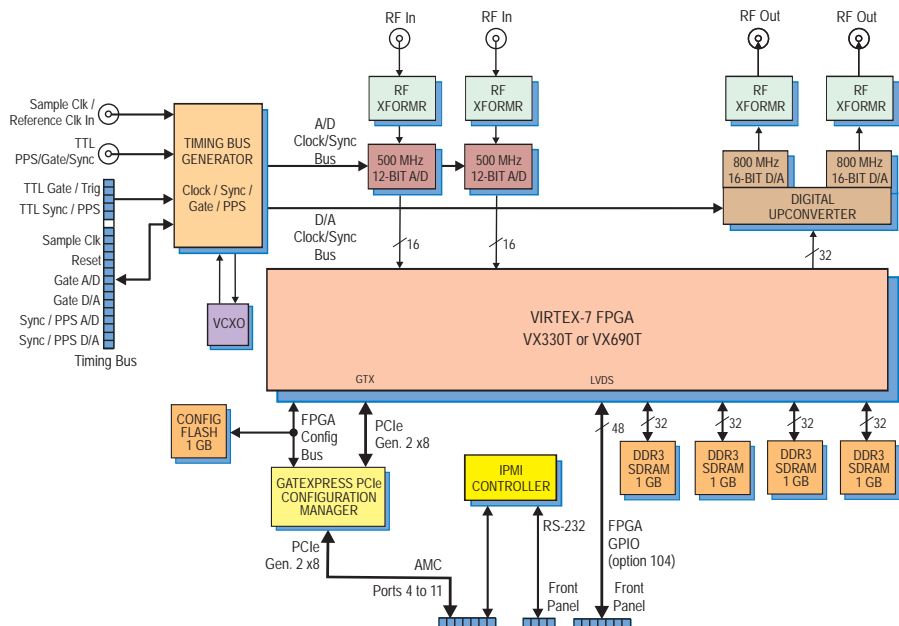

**Xilinx Virtex-7 FPGA**

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds

**A/D Acquisition IP Modules**

The 56751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

**DDC IP Cores**

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to  $f_s$ , where  $f_s$  is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as

two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of  $0.8 * f_s / N$ , where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or 16-bit I + 16-bit Q samples at a rate of  $f_s / N$ .

**D/A Waveform Playback IP Module**

The Model 56751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off-board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

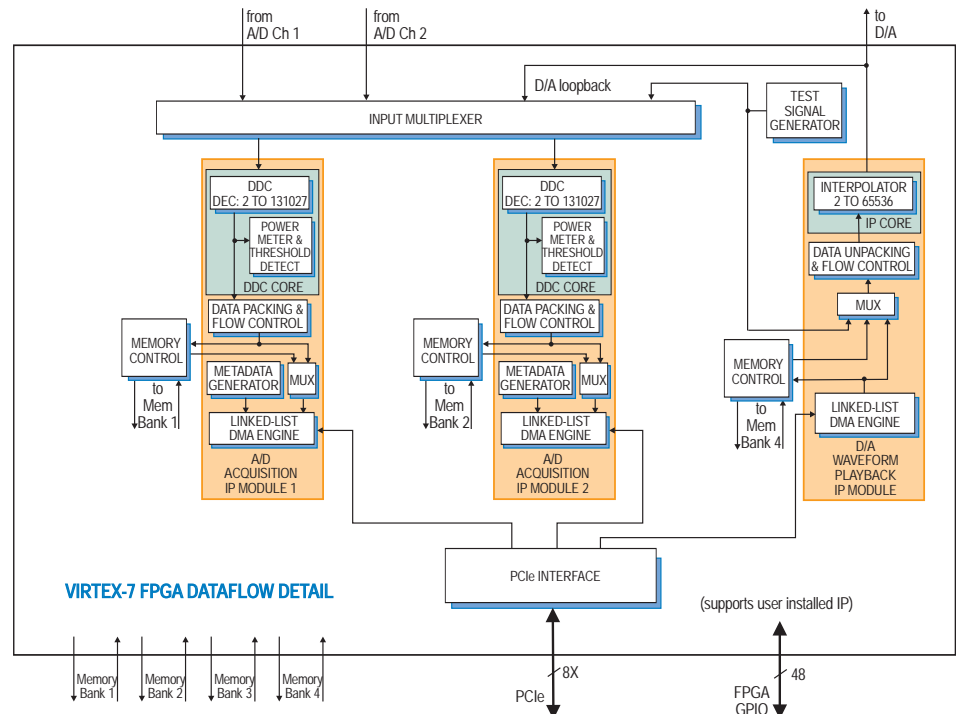

**GateXpress for FPGA Configuration**

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course

► of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

### A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other module resources.

### Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

### Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample

clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

### Memory Resources

The 56751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

### AMC Interface

The Model 56650 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or  $\mu$ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

### PCI Express Interface

The Model 56751 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ►

### ► Specifications

#### Front Panel Analog Signal Inputs

**Input Type:** Transformer-coupled, front panel female SSMC connectors  
**Transformer Type:** Coil Craft WBC4-6TLB

**Full Scale Input:** +5 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

#### A/D Converters (standard)

**Type:** Texas Instruments ADS5463  
**Sampling Rate:** 20 MHz to 500 MHz  
**Resolution:** 12 bits

#### A/D Converters (option -014)

**Type:** Texas Instruments ADS5474  
**Sampling Rate:** 20 MHz to 400 MHz  
**Resolution:** 14 bits

#### Digital Downconverters

**Quantity:** Two channels  
**Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage  
**LO Tuning Freq. Resolution:** 32 bits, 0 to  $f_s$   
**LO SFDR:** >120 dB  
**Phase Offset Resolution:** 32 bits, 0 to 360 degrees  
**FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients  
**Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

#### D/A Converters

**Type:** Texas Instruments DAC5688  
**Input Data Rate:** 250 MHz max.  
**Output IF:** DC to 400 MHz max.  
**Output Signal:** 2-channel real or 1-channel with frequency translation  
**Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation  
**Resolution:** 16 bits

#### Digital Interpolator

**Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

#### Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

#### Front Panel Analog Signal Outputs

**Output:** Transformer-coupled, front panel female SSMC connectors  
**Transformer:** Coil Craft WBC4-6TLB  
**Full Scale Output:** +4 dBm into 50 ohms  
**3 dB Passband:** 300 kHz to 700 MHz

**Sample Clock Sources:** On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

#### Clock Synthesizer

**Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus

**Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz

**Clock Dividers:** External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

#### External Clock

**Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

**Timing Bus:** 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

#### Field Programmable Gate Array

**Standard:** Xilinx Virtex-7 XC7VX330T-2

**Optional:** Xilinx Virtex-7 XC7VX690T-2

#### Custom I/O

**Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

#### Memory

**Type:** DDR3 SDRAM  
**Size:** Four banks, 1 GB each  
**Speed:** 800 MHz (1600 MHz DDR)

#### PCI-Express Interface

**PCI Express Bus:** Gen.1 or Gen.2, x4 or x8

#### AMC Interface

**Type:** AMC.1  
**Module Management:** IPMI Version 2.0

#### Environmental

**Operating Temp:** 0° to 50° C

**Storage Temp:** -20° to 90° C

**Relative Humidity:** 0 to 95%, non-cond.

**Size:** Single-width, full-height AMC module, 2.89 in. x 7.11 in.

### Ordering Information

Model	Description
56751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - AMC

#### Options:

-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector

Contact Pentek for availability of rugged and conduction-cooled versions

**Features**

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Four 200 MHz 16-bit A/Ds
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1, 2 & 3) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-7 FPGA for custom I/O

**General Information**

Model 56760 is a member of the Onyx® family of high-performance AMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes four A/Ds and four banks of memory. In addition to supporting PCI Express Gen. 3 as a native interface, the Model 56760 includes a front panel general-purpose connector for application-specific I/O.
